The PROFINET interfaces of the ET 200SP distributed I/O system are based on IEC 61158 Type 10.

PROFIBUS

The PROFIBUS interfaces of the ET 200SP distributed I/O system are based on IEC 61158 Type 3.

IO-Link

The ET 200SP distributed I/O system is based on IEC 61131-9.

Use in industrial environments

The ET 200SP distributed I/O system is suitable for use in industrial environments. It meets the following standards for this type of use:

- Requirements on interference emission EN 61000-6-4: 2007 + A1
- Requirements for immunity EN 61000-6-2

Use in mixed areas

Under specific prerequisites you can use the ET 200SP distributed I/O system in a mixed area. A mixed area is used for residential purposes and for commercial operations that do not significantly impact the residential purpose.

If you want to use the ET 200SP distributed I/O system in residential areas, you must ensure that its radio frequency interference emission complies with limit class B in accordance with EN 61000-6-3. Suitable measures for observing these limits for use in a mixed area are, for example:

- Installation of the ET 200SP distributed I/O system in grounded control cabinets
- Use of filters in the supply lines

An additional individual acceptance test is also required.

Use in residential areas

The ET 200SP distributed I/O system is **not** intended for use in residential areas. If you are using the ET 200SP distributed I/O system in residential areas, radio and TV reception may be affected.

Environmental Product Declaration (EPD)

Siemens is committed to the development and production of environmentally compatible and sustainably produced equipment.

With the help of an Environmental Product Declaration (EPD), you can obtain information on the "ecological footprint" of your Siemens product.

The EPD is based on the international ISO 14021 standard "Environmental labels and declarations – Self declared environmental claims – Type II".

EPDs are based on independently verified data from life cycle assessments, life cycle inventory analyses and information modules that comply with the ISO 14040 series of standards. The EPD contains comprehensive data relating to ingredients and substances (REACH, RoHS), fire load, energy consumption, packaging and disposal information for your Siemens product.

You can find the current Environmental Product Declarations (EPDs) for the ET 200SP distributed I/O system on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/14031/cert?ct=5669).

Importer addresses

In the following table, you can find the importer addresses for specific countries:

Countries	Address
United Kingdom (UK)	Siemens plc. Manchester M20 2UR
Türkiye (TR)	Siemens San. ve Tic. A.Ş. Yakacık Cad. No: 111 34870 Kartal/İstanbul

16.6 Electromagnetic compatibility

Definition

Electromagnetic compatibility (EMC) is the ability of an electrical installation to function satisfactorily in its electromagnetic environment without interfering with that environment.

The ET 200SP distributed I/O system meets the legal requirements for electromagnetic compatibility of equipment. The prerequisite is that the ET 200SP distributed I/O system complies with the requirements and guidelines relating to electrical equipment.

EMC in accordance with NE21

The ET 200SP distributed I/O system meets the EMC specifications of the NAMUR recommendation NE21.

Pulse-shaped disturbance variables of the ET 200SP system

The table below shows the electromagnetic compatibility of the ET 200SP distributed I/O system with regard to pulse-shaped disturbance variables.

Table 1-395 Pulse-shaped disturbance variables

Pulse-shaped disturbance variable	Tested with	Equivalent to severity
Electrostatic discharge in accordance with IEC 61000-4-2 *)	Air discharge ±8 kV Contact discharge: ±6 kV	3 3
Burst pulses (fast transient interference) in accordance with IEC 61000-4-4 *)	±2 kV (power supply line) ±2 kV (signal line >30 m) ±1 kV (signal cable <30 m)	3 4 3
High-energy single pulse (surge) in accordance with IEC 61000-4-5 **)		
• Asymmetric coupling (phase-ground) ***)	±1 kV (24 V DC supply cable)	2
	±1 kV (24 V DC signal/data line only > 30 m)	2
	2 kV (230 V AC supply cable)	3
• Symmetric coupling (phase-phase) ***)	±0.5 kV (24 V DC supply cable)	2
	±1 kV (230 V AC supply cable)	3
*) The maximum short-term influence of analog modules during the duration of the EMC tests can be ±10% of the full-scale value. **) Analog value deviation beyond the limits of the nominal range and diagnostics possible. ***) If higher phase-ground or phase-phase values are required, you will need an additional external protective circuit (see Designing interference-free controllers (https://support.automation.siemens.com/WW/view/en/59193566) Function Manual).		

Pulse-shaped disturbance variables of motor starters

The following table shows the electromagnetic compatibility of the ET 200SP motor starters with regard to pulse-shaped interference.

Table 1-396 Pulse-shaped disturbance variables

Pulse-shaped disturbance variable	Tested with	Equivalent to severity
Burst pulses (fast transients) in accordance with IEC 61000-4-4, tested with 5 kHz.	±2 kV (24 V supply cables) ±2 kV (500 V AC infeed*) ±1 kV (signal cable <30 m)	3
If you mount the motor starter to the right of a 15 mm or 20 mm I/O module or immediately next to a head module, use a dummy module. You will find more information in "Selecting a motor starter with suitable BaseUnit (Page 91)".		
High-energy single pulse (surge) in accordance with IEC 61000-4-5	500 V AC infeed: ±2 kV conducted interference - phase to ground ±1 kV conducted interference - phase to phase 24 V supply cable: ±1 kV conducted interference - phase to ground **)	3

Pulse-shaped disturbance variable	Tested with	Equivalent to severity
	±0.5 kV conducted interference - phase to phase **)	
**) An RC circuit is not required for hybrid switching devices. If higher values 2 kV (phase-ground) or 1 kV (phase-phase) are required, you will need an additional external protective circuit (see Designing interference-free controllers (https://support.automation.siemens.com/WW/view/en/59193566) Function Manual).		

Sinusoidal disturbance variables

The tables below show the electromagnetic compatibility of the ET 200SP distributed I/O system with regard to sinusoidal disturbance variables.

- RF radiation

RF radiation in accordance with IEC 61000-4-3/NAMUR 21 Electromagnetic RF field, amplitude-modulated		Corresponds to degree of severity
80 MHz to 2.7 GHz	10 V/m	3
2.7 GHz to 6 GHz	3 V/m	2
80% AM (1 kHz)		

- RF coupling

RF coupling in accordance with IEC 61000-4-6	Corresponds to degree of severity
(10 kHz) 150 kHz to 80 MHz	3
10 V_{rms} unmodulated	
80% AM (1 kHz)	
150 Ω source impedance	

The maximum short-term influence of analog modules during the duration of the EMC tests can be ±1% of the full-scale value.

Emission of radio frequency interference

Interference emission of electromagnetic fields according to EN 55016.

Table 1-397 Interference emission of electromagnetic fields

Frequency	Interference emission	Measuring distance
30 MHz to 230 MHz	<40 dB (µV/m) Q	10 m
230 MHz to 1000 MHz	<47 dB (µV/m) Q	10 m
1 GHz to 3 GHz	<76 dB (µV/m) P	3 m
3 GHz to 6 GHz	<80 dB (µV/m) P	3 m

Interference emission via the AC power supply according to EN 55016.

Table 1-398 Interference emission via the AC power supply

Frequency	Interference emission
0.15 MHz to 0.5 MHz	<89 dB (µV) Q < 66 dB (µV/m) M
0.5 MHz to 30 MHz	< 73 dB (µV/m)Q < 60 dB (µV/m) M

16.7 Electromagnetic compatibility of fail-safe modules

Protecting ET 200SP with fail-safe modules against overvoltages

If your equipment requires protection from overvoltage, we recommend that you use an external protective circuit (surge filter) between the load voltage power supply and the load voltage input of the BaseUnits to ensure surge immunity for the ET 200SP with fail-safe modules.

NOTE

Overvoltage protection measures always require a case-by-case examination of the entire plant. Almost complete protection from overvoltages, however, can only be achieved if the entire building surroundings have been designed for overvoltage protection. In particular, this involves structural measures in the building design phase.

For detailed information regarding overvoltage protection, we recommend that you contact your Siemens representative or a company specializing in lightning protection.

The following figure shows an example configuration with fail-safe modules. Voltage is supplied by one power supply unit. Note, however, that the total current of the modules fed by the power supply unit must not exceed the permissible limits. You can also use multiple power supply units.

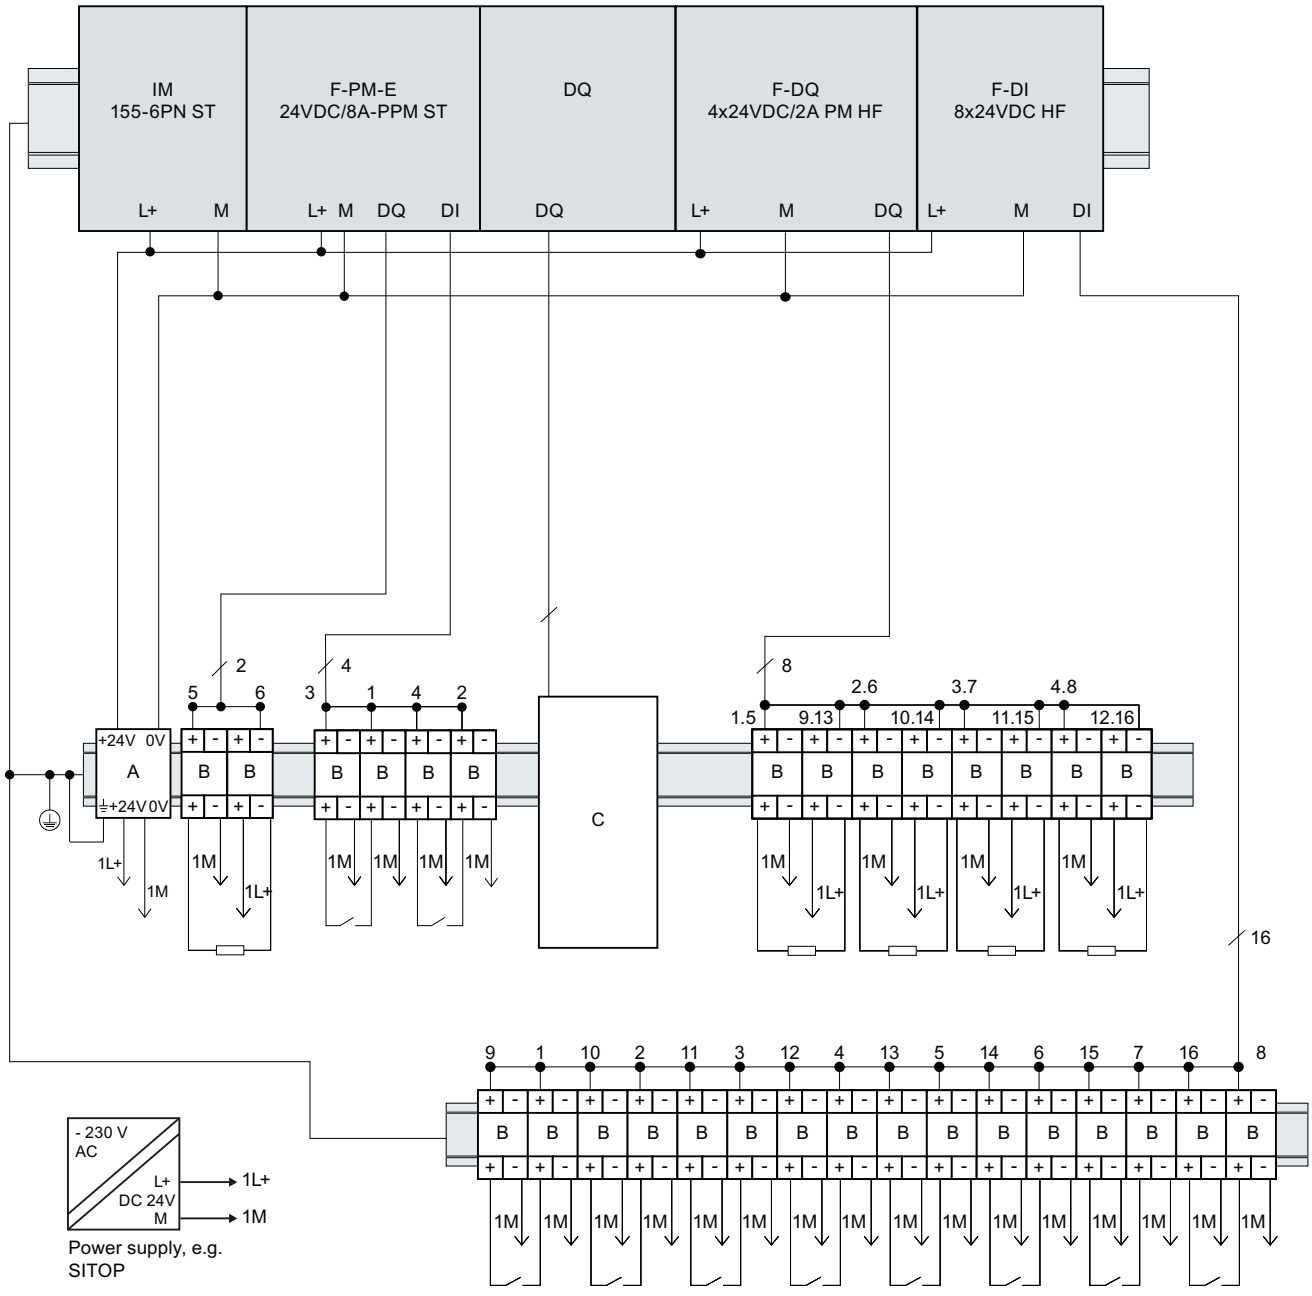

Figure 1-157 External protective circuit (surge filter) for ET 200SP with failsafe modules

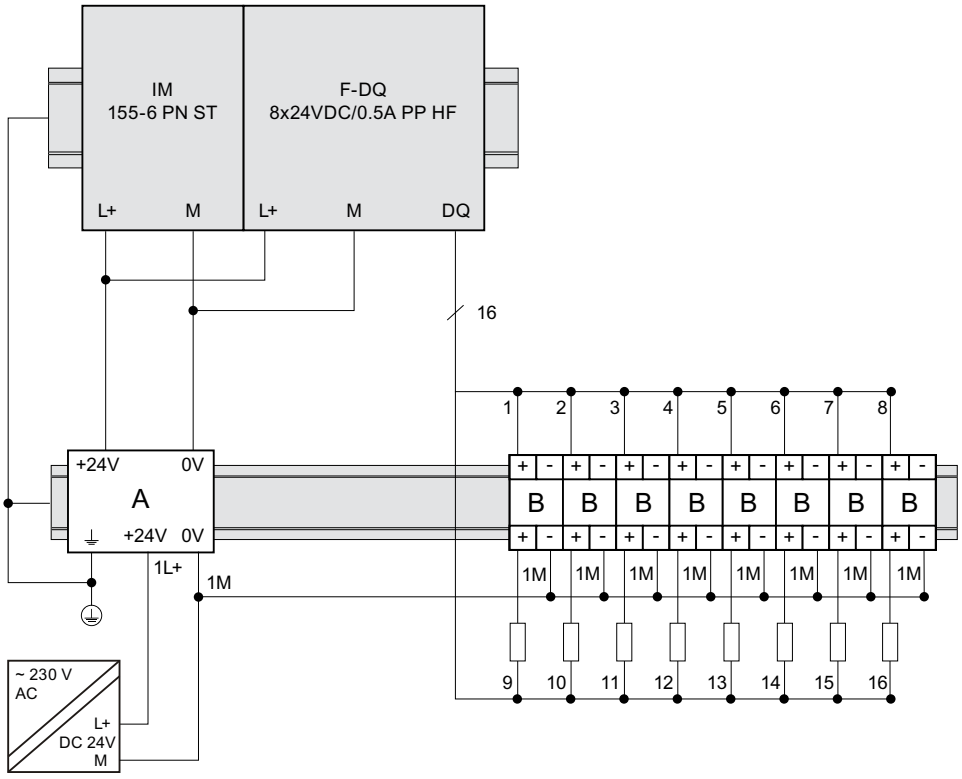

Figure 1-158 External protective circuit (surge filter) for ET 200SP with fail-safe modules

Name	Part number of Dehn Co.
A = BVT AVD 24	918 422
B = DCO RK D 5 24	919 986
C = The external protective circuit required at the outputs of the modules F-PM-E power module load group can be found in the Designing interference-free controllers (https://support.automation.siemens.com/WW/view/en/59193566) function manual.	

Electromagnetic compatibility of fail-safe motor starters

The safety versions of the motor starters are additionally tested according to the requirements of IEC 61000-6-7:2014 (taking into consideration the failure criteria for the STO safety function).

16.8 Shipping and storage conditions

Introduction

The ET 200SP distributed I/O system meets the requirements in terms of shipping and storage conditions according to IEC 61131-2. The following information applies to modules that are shipped and/or stored in their original packaging.

- Transport condition class: TTH4 (Minimum relative humidity 5%)
- Storage condition class: STH4 (Minimum ambient temperature -40 °C, minimum relative humidity 5%)

Table 1-399 Shipping and storage conditions for modules

Type of condition	Permissible range
Free fall (in shipping package)	≤1 m
Temperature	From -40 °C to +70 °C
Barometric pressure	from 1140 to 660 hPa (corresponds to an elevation of -1000 to 3500 m)
Relative humidity	5% to 95%, without condensation
Sinusoidal oscillations according to IEC 60068-2-6	5 - 8.4 Hz: 3.5 mm 8.4 - 500 Hz: 9.8 m/s^2
Impact acc. to IEC 60068-2-27[1)]	250 m/s^2, 6 ms, 1000 shocks

1) Not applicable to motor starters

16.9 Mechanical and climatic environmental conditions

Operating conditions

The ET 200SP distributed I/O system is suitable for use in weather-proof, fixed locations. The operating conditions are based on the requirements of IEC 61131-2.

- OTH4 (Minimum ambient temperature, see the Climatic ambient temperatures table)

You will find the permissible ambient conditions for the motor starter in the Technical data of the motor starter (https://support.industry.siemens.com/cs/ww/en/ps/21859/td).

Mechanical environmental conditions

The following table shows the mechanical environmental conditions in the form of sinusoidal vibrations.

Table 1-400 Mechanical environmental conditions

Frequency band	ET 200SP with IM 155-6 DP HF, BusAdapters BA 2×FC, BA 2xSCRJ, BA SCRJ/FC, BA 2xLC, BA LC/FC, BA 2xM12, BA 2xLC-LD and BA LC-LD/M12	ET 200SP with BusAdapters BA 2×RJ45, BA SCRJ/RJ45, BA LC/RJ45 and BA LC-LD/RJ45	ET 200SP with IM 155-6 PN BA and IM 155-6 PN R1	ET 200SP with digital output module F-RQ 1x24VDC/24..230V-AC/5A
5 ≤ f ≤ 8.4 Hz	3.5 mm amplitude			
8.4 ≤ f ≤ 150 Hz	1 g constant acceleration			
10 ≤ f ≤ 60 Hz	0.35 mm amplitude	---	---	---
60 ≤ f ≤ 1000 Hz	5 g constant acceleration			

Table 1-401 Mechanical environmental conditions for ET 200SP with CPU (from article number 6ES7xxx-xxx03-0AB0)

Frequency band	ET 200SP with CPU and BusAdapter BA 2×FC, BA 2xSCRJ, BA SCRJ/FC, BA 2xLC, BA LC/FC, BA 2xM12	ET 200SP with CPU and BusAdapter BA 2×RJ45, BA SCRJ/RJ45, BA LC/RJ45, BA 2×FC, BA 2xSCRJ, BA SCRJ/FC, BA 2xLC, BA LC/FC, BA 2xM12	ET 200SP with CPU and digital output module F-RQ 1x24VDC/24..230VAC/5A
5 ≤ f ≤ 8.4 Hz	3.5 mm amplitude		
8.4 ≤ f ≤ 150 Hz	1 g constant acceleration		
10 ≤ f ≤ 60 Hz	0.35 mm amplitude	---	---
60 ≤ f ≤ 1000 Hz	5 g constant acceleration[1)]		

[1)] Without using an RJ45 connector on the integrated PROFINET IO interface (RJ45 port) X1 Port 3 or X2 Port 1; the strain relief (6ES7193-6RA00-1AN0) must be mounted (for more information, refer to the ET 200SP BusAdapter Equipment Manual).

The mechanical ambient conditions for the Ex modules can be found in the system manual. T 200SP HA Distributed I/O system / ET 200SP Modules for devices used in an explosion hazardous environment (https://support.industry.siemens.com/cs/ww/en/view/109795533).

Tests of mechanical environmental conditions

The following table provides important information with respect to the type and scope of the tests of environmental mechanical conditions.

Table 1-402 Tests of mechanical environmental conditions

Condition tested	Test standard	Comment
Vibrations [2)]	Vibration test according to IEC 60068-2-6	Type of vibration: Frequency sweeps with a rate of change of 1 octave/minute.

Condition tested	Test standard	Comment
	(sinusoidal)	BA 2×RJ45, BA SCRJ/RJ45, BA LC/RJ45, BA LC-LD/RJ45, IM 155-6 PN BA, IM 155-6 PN R1, digital output module F-RQ 1x24VDC/24..230VAC/5A • 5 Hz ≤ f ≤ 8.4 Hz, 3.5 mm constant amplitude • 8.4 Hz ≤ f ≤ 150 Hz, 1 g constant acceleration IM 155-6 DP HF, BA 2×FC, BA 2xSCRJ, BA SCRJ/FC, BA 2xLC, BA LC/FC, BA 2xM12, BA 2xLC-LD, BA LC-LD/M12 • 10 Hz ≤ f ≤ 60 Hz, 0.35 mm constant amplitude • 60 Hz ≤ f ≤ 1000 Hz, 5 g constant acceleration Duration of vibration: 10 frequency sweeps per axis at each of three vertically aligned axes
Shock [2]	Shock, tested according to IEC 60068-2-27	Type of shock: Half-sine Shock intensity: 15 g peak value, 11 ms duration Direction of shock: 3 shocks in each direction (+/-) at each of three vertically aligned axes
Repetitive shock [1] [2]	Shock, tested according to IEC 60068-2-27	Type of shock: Half-sine Shock intensity: 25 g peak value, 6 ms duration Direction of shock: 1000 shocks in each direction (+/-) at each of three vertically aligned axes

1) Not applicable in the case of the digital output module F-RQ 1x24VDC/24..230VAC/5A

2) Not applicable for motor starters

The type and scope of the tests for mechanical ambient conditions for the Ex modules can be found in the system manual. ET 200SP HA Distributed I/O system / ET 200SP Modules for devices used in an explosion hazardous environment (https://support.industry.siemens.com/cs/ww/en/view/109795533).

Climatic environmental conditions

The following table shows the permissible climatic ambient conditions for the ET 200SP distributed I/O system during operation.

Table 1-403 Climatic environmental conditions

Environmental conditions	Permissible range	Comments
Temperature: horiz. mounting position: vertical mounting position:	 -30 °C to 60 °C -30 °C to 50 °C	The lower permissible ambient temperature was extended for the ET 200SP system to -30 °C. Differences may exist for specific modules and depending on the mounting position and, if applicable, load. Detailed information on this is described in the technical specifications of the respective equipment manual. The product data sheets with daily updated technical specifications can be found on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/td) at Industry Online Support. Enter the article number or the short description of the desired module on the website.
Permitted temperature change	10 K/h	-

Environmental conditions	Permissible range	Comments
Relative humidity	from 10 to 95%	Without condensation or icing.
Barometric pressure	from 1140 to 795 hPa	Corresponds to an altitude of -1000 to 2000 m. Note the following section "Using the distributed I/O system ET 200SP more than 2000 m above sea level".
Pollutant concentration	ANSI/ISA-71.04 severity level G1; G2; G3	-

SIPLUS products based on ET 200SP are offered for reliable operation under heavy to extreme operating conditions.

Using the distributed I/O system ET 200SP more than 2000 m above sea level

The maximum "operating height above sea level" depends on the module and is described in the technical specifications of the respective module. The product data sheets with daily updated technical specifications can be found on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/td) at Industry Online Support. Enter the article number or the short description of the desired module on the website.

For altitudes > 2000 m, the following constraints apply to the maximum specified ambient temperature:

Restrictions of the specified maximum ambient temperature in reference to the installation altitude

Installation altitude	Derating factor for ambient temperature [1]
-1000 m to 2000 m	1.0
2000 m to 3000 m	0.9
3000 m to 4000 m	0.8
4000 m to 5000 m	0.7

[1] Base value for application of the derating factor is the maximum permissible ambient temperature in °C for 2000 m.

NOTE

- Linear interpolation between altitudes is permissible.
- The derating factors compensate for the decreasing cooling effect of air at higher altitudes due to lower density.
- Note the mounting position of the respective module in the technical specifications. This is based on the IEC 61131-2 standard.
- Make sure that the power supplies you use are rated for altitudes > 2000 m.

Effects on the availability of modules
The higher cosmic radiation present during operation at altitudes above 2000 m will also start to have an effect on the failure rate of electronic components (the so-called soft error rate). In rare cases this can result in a transition of modules to the safe state, especially for fail-safe modules. However, the functional safety of the modules is fully retained.

NOTE
Fail-safe modules are certified for operation in safety mode up to the maximum altitude listed in the product data sheet.
All other markings and certifications are currently based on an altitude of up to 2000 m.

Information on PFDavg, PFH values for ET 200SP F
PFDavg and PFH values for F-CPUs at operating altitudes up to 5,000 m. Below you will find the probability of failure values (PFDavg and PFH values) for the F-CPUs with a service life of 20 years and with a repair time of 100 hours:

Operation in low demand mode low demand mode **According to IEC 61508:2010:** **PFDavg = Average probability of a dangerous failure on demand**	**Operation in high demand or continuous mode** high demand/continuous mode **According to IEC 61508:2010:** **PFH = Average frequency of a dangerous failure [h-1]**
< 2E-05	< 1E-09

NOTE
For fail-safe I/O modules, you can find the relevant details on PFDavg and PFH values on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109481784).

16.10 Insulation, protection class, degree of protection and rated voltage

Insulation

The isolation for the I/O modules is dimensioned according to the requirements of EN 61131-2 and EN 61010-2-201: The insulation for the motor starters is designed in accordance with the requirements of IEC 60947-1.

NOTE
In the case of modules with 24 V DC (SELV/PELV) supply voltage, galvanic isolations are tested with 707 V DC (type test).

Severity for voltage interruption according to IEC 61131-2

Interface modules, CPUs meet the severity class PS1 for voltage interruptions (1 ms).

Pollution degree/overvoltage category in accordance with IEC 61131 and IEC 61010-2-201

- Pollution degree: 2 (macro environment)
- Overvoltage category: II

Pollution degree/overvoltage category according to IEC 60947

- Pollution degree 2
- Overvoltage category: III

Protection class according to IEC 61131-2:2007 and IEC 61010-2-201

The ET 200SP distributed I/O system meets protection class I and includes parts of protection classes II and III.

The grounding of the mounting rail must meet the requirements for a functional earth FE.

Recommendation: For an interference-proof installation, the ground conductor should have a cross-section > 6 mm^2.

The installation location (e.g. enclosure, control cabinet) must have a protective conductor connection that meets the standard to maintain protection class I.

Degree of protection IP20

Degree of protection IP20 according to IEC 60529 for all modules of the ET 200SP distributed I/O system, which means:

- Protection against contact with standard probes
- Protection against foreign objects with diameters in excess of 12.5 mm
- No protection against water

NOTE

Use a BU cover

To meet the requirements of the degree of protection "IP20", fit a BU cover onto unfitted BaseUnits.

To ensure touch safety, fit a cover onto the opening of the infeed bus contacts belonging to the last plugged-in motor starter BaseUnit.

Rated voltage for operation

The ET 200SP distributed I/O system works with the rated voltage and corresponding tolerances listed in the following table.

Note the supply voltage of each module when selecting the rated voltage.

Table 1-404 Rated voltage for operation

Rated voltage	Tolerance range
24 V DC	19.2 to 28.8 V DC [1]
	18.5 to 30.2 V DC [2]
120 V AC (50/60 Hz)	93 to 132 V AC
230 V AC (50/60 Hz)	187 to 264 V AC
400 V AC (50/60 Hz) [3]	48 to 500 V AC

[1] Static value: Generation as protective extra low voltage with safe electrical separation in accordance with IEC 61131-2 or. IEC 61010-2-201.

[2] Dynamic value: Including ripple, e.g. as in the case of three-phase bridge power rectification

[3] Valid for the infeed bus of the modules and BaseUnits of motor starters only

16.11 Use of the ET 200SP distributed I/O system in zone 2 potentially explosive atmospheres

See product information "Use of subassemblies/modules in Zone 2 Hazardous Area" (https://support.automation.siemens.com/WW/view/en/19692172).

NOTE

Use of Ex modules

When you use Ex modules and the ET 200SP is located in a hazardous area of Zone 2, observe the notes in the System Manual ET 200SP HA Distributed I/O system / ET 200SP Modules for devices used in an explosion hazardous environment (https://support.industry.siemens.com/cs/ww/de/view/109795533/en).

NOTE

Zone 22: Observe standards and regulations, and individual acceptance test required

If you install, use and maintain the ET 200SP in hazardous area Zone 22, you must comply with the relevant standards, installation/setup regulations and country-specific regulations for Zone 22 (for example, the ET 200SP must be installed in an enclosure suitable for Zone 22). A individual acceptance test by a certification body (Ex) is also required.

[1] For the I/O modules, mechanical or electronic coding elements are supplied ex works, depending on the module. Variants A, B, C, D, F and H are available as spare parts. The appropriate coding element can be found in the technical specifications of the respective I/O module. The procedure for changing the coding element is described in the section Changing the type of an I/O module (Page 317).

[2] The length of the DIN rails and SIMATIC system rails can be shortened as required.

Table 1-406 Accessories, color identification labels (push-in terminals), 15 mm wide

Accessories, color identification labels (push-in terminals), 15 mm wide	Packing unit	Article number
16 process terminals (see I/O module manual)		
• Gray (terminals 1 to 16); color code CC00	10 units	6ES7193-6CP00-2MA0
• Gray (terminals 1 to 8), red (terminals 9 to 16); color code CC01	10 units	6ES7193-6CP01-2MA0
• Gray (terminals 1 to 8), red (terminals 9 to 16); color code CC01	50 units	6ES7193-6CP01-4MA0
• Gray (terminals 1 to 8), blue (terminals 9 to 16); color code CC02	10 units	6ES7193-6CP02-2MA0
• Gray (terminals 1 to 8), blue (terminals 9 to 16); color code CC02	50 units	6ES7193-6CP02-4MA0
• Gray (terminals 1 to 8), red (terminals 9 to 12), gray (terminals 13 to 16); color code CC03	10 units	6ES7193-6CP03-2MA0
• Gray (terminals 1 to 8), red (terminals 9 to 12), blue (terminals 13 to 16); color code CC04	10 units	6ES7193-6CP04-2MA0
• Gray (terminals 1 to 12), red (terminals 13 and 14), blue (terminals 15 and 16)	10 units	6ES7193-6CP05-2MA0
10 AUX terminals (for BU15-P16+**A10**+2D, BU15-P16+**A10**+2B)		
• Yellow-green (terminals 1 A to 10 A); color code CC71	10 units	6ES7193-6CP71-2AA0
• Red (terminals 1 A to 10 A); color code CC72	10 units	6ES7193-6CP72-2AA0
• Blue (terminals 1 A to 10 A); color code CC73	10 units	6ES7193-6CP73-2AA0
• Blue (terminals 1 A to 10 A); color code CC73	50 units	6ES7193-6CP73-4AA0
10 add-on terminals (for BU15-P16+A0+**12**D/T, BU15-P16+A0+**12**B/T)		
• Red (terminals 1B to 5B), blue (terminals 1 to 5C); color code CC74	10 units	6ES7193-6CP74-2AA0
16 potential terminals (for PotDis-BU-**P1**/x-R)		
• Red (terminals 1 to 16); color code CC62	10 units	6ES7193-6CP62-2MA0
16 potential terminals (for PotDis-BU-**P2**/x-B)		
• Blue (terminals 1 to 16); color code CC63	10 units	6ES7193-6CP63-2MA0
18 potential terminals (for PotDis-TB-**P1**-R)		
• Red (terminals 1 to 18); color code CC12	10 units	6ES7193-6CP12-2MT0
• Gray (terminals 1 to 18); color code CC10	10 units	6ES7193-6CP10-2MT0
18 potential terminals (for PotDis-TB-**P2**-B)		
• Blue (terminals 1 to 18); color code CC13	10 units	6ES7193-6CP13-2MT0

Accessories, color identification labels (push-in terminals), 15 mm wide	Packing unit	Article number
• Gray (terminals 1 to 18); color code CC10	10 units	6ES7193-6CP10-2MT0
18 potential terminals (for PotDis-TB-**BR**-W)		
• Yellow/green (terminals 1 to 18); color code CC11	10 units	6ES7193-6CP11-2MT0
• Red (terminals 1 to 18); color code CC12	10 units	6ES7193-6CP12-2MT0
• Blue (terminals 1 to 18); color code CC13	10 units	6ES7193-6CP13-2MT0
• Gray (terminals 1 to 18); color code CC10	10 units	6ES7193-6CP10-2MT0
18 potential terminals (for PotDis-TB-**n.c.**-G)		
• Gray (terminals 1 to 18); color code CC10	10 units	6ES7193-6CP10-2MT0

Table 1-407 Accessories, color identification labels (push-in terminals), 20 mm wide

Accessories, color identification labels (push-in terminals), 20 mm wide	Packing unit	Article number
12 process terminals (see I/O module manual)		
• Gray (terminals 1 to 4), red (terminals 5 to 8), blue (terminals 9 to 12); color code CC41	10 units	6ES7193-6CP41-2MB0
• Gray (terminals 1 to 8), red (terminals 9 and 10), blue (terminals 11 and 12), color code CC42	10 units	6ES7193-6CP42-2MB0
6 process terminals (see I/O module manual)		
• Gray (terminals 1 to 4), red (terminal 5), blue (terminal 6); color code CC51	10 units	6ES7193-6CP51-2MC0
• Gray (terminals 1, 2 and 5), red (terminals 3 and 4), blue (terminal 6); color code CC52	10 units	6ES7193-6CP52-2MC0
4 AUX terminals (for BU20-P12+**A4**+0B)		
• Yellow-green (terminals 1 A to 4 A); color code CC81	10 units	6ES7193-6CP81-2AB0
• Red (terminals 1 A to 4 A); color code CC82	10 units	6ES7193-6CP82-2AB0
• Blue (terminals 1 A to 4 A); color code CC83	10 units	6ES7193-6CP83-2AB0
2 AUX terminals (for BU20-P6+**A2**+4D, BU20-P6+**A2**+4B)		
• Yellow-green (terminals 1 A and 2 A); color code CC84	10 units	6ES7193-6CP84-2AC0
• Red (terminals 1 A and 2 A); color code CC85	10 units	6ES7193-6CP85-2AC0
• Blue (terminals 1 A and 2 A); color code CC86	10 units	6ES7193-6CP86-2AC0

Components for lightning protection

If you need surge protection devices for lightning protection, you can find additional information in the function manual Designing interference-free controllers (https://support.automation.siemens.com/WW/view/en/59193566).

Online catalog

Additional article numbers for ET 200SP can be found on the Internet (https://mall.industry.siemens.com) in the online catalog and online ordering system.

B.1 Lightning protection and overvoltage protection for fail-safe modules

Overvoltage arrestors for fail-safe modules

NOTE

This section only lists the overvoltage arrestors that may be used to protect the fail-safe modules.

Be sure to observe the detailed information on lightning protection and overvoltage protection of the ET 200SP distributed I/O system in Electromagnetic compatibility of fail-safe modules (Page 357).

Components for overvoltage protection of fail-safe modules (lightning protection zone transition 0_B to 1)

The overvoltage arrestors are only required for unshielded cables. The Configuring interference-free controllers (https://support.automation.siemens.com/WW/view/en/59193566) Function Manual lists the overvoltage arrestors which you may use for fail-safe modules.

Use over 2 000 m above sea level and extended temperature range

C

C.1 Ambient temperature and installation altitude

Extension of the temperature range and the installation altitude

The previously permissible range of ambient temperatures of **0 °C** to 60 °C for the horizontal mounting position has been extended for a large number of modules to a range of ambient temperatures of **-30 °C** to 60 °C or **-25 °C** to 60 °C (in each case without condensation or icing). Furthermore, the permissible installation altitude have been extended to installation altitudes of up to 5 000 m depending on the module.

The accessory components offered for ET 200SP (labeling strips, shield terminals, etc.) can also be used down to -30 °C and for altitudes up to 5 000 m.

The following tables show an overview of the current climatic ambient conditions for ambient temperature and installation altitude of modules of the ET 200SP product families.

For modules that are not listed, the current information in the "Technical specifications" section of the corresponding Equipment Manual applies.

Reference

The current status of the respective modules can be found in the online published technical specifications.

In general, the module-dependent extended climatic operating conditions are described in the "Technical specifications" section of the respective modules in the equipment manuals.

C.2 CPUs

CPUs

Standard CPU	Article number	Ambient temperature		Maximum installation altitude above sea level [m]

C.6 I/O modules

Information on PFDavg, PFH values for ET 200SP fail-safe I/O modules

The safety parameters specified in the Equipment Manual of the fail-safe I/O module ET 200SP (PFD_{avg}, PFH values) already reflect the influence of higher cosmic radiation (soft error rate) for operation up to 4 000 m above sea level.

C.9 Restrictions

Restrictions of the max. ambient temperature specified with regard to the installation altitude

Installation altitude	Derating factor for ambient temperature [1)]
-1 000 to 2 000 m	1.0
2 000 to 3 000 m	0.9
3 000 to 4 000 m	0.8
4 000 to 5 000 meters	0.7

1) Base value for the application of the derating factor is the maximum permissible ambient temperature in °C for 2 000 m

NOTE

- Linear interpolation between altitudes is permissible.
- The derating factors compensate for the decreasing cooling effect of air in higher altitudes due to lower density.
- Note the mounting position of the respective module in the technical specifications. The basis is the standard IEC 61131-2.
- Make sure that the power supplies you use are also rated for altitudes > 2 000 m.
- The "Safety-related shutdown of standard modules" function, as described on the Internet (https://support.industry.siemens.com/cs/ww/en/view/39198632), is only released up to a maximum of 2 000 m.

Effects on availability

The higher cosmic radiation present during operation at altitudes above 2 000 m will also start to have an effect on the failure rate of electronic components (referred to as the soft error rate). In rare cases this can result in a transition of the module into the safe state, especially for safety modules. However, the functional safety of the module is fully retained.

NOTE

Information on the components of the ET 200SP I/O system
The markings and approvals printed on the components of the ET 200SP I/O system are currently based on operation at an altitude of up to 2 000 m above sea level. The fail-safe components are certified for operation in safety mode up to the specified maximum altitudes (according to "Z10 067803 0020" certificate (https://support.industry.siemens.com/cs/ww/de/view/57141281/en)).

Reference

You can find more information in the Mechanical and climatic environmental conditions (Page 360) section.

Calculating the leakage resistance

D

Introduction

If you wish to protect the ET 200SP using a ground-fault detector or a residual current circuit breaker, then you need the leakage resistance to select the correct safety components.

Ohmic resistance

When determining the leakage resistance of the ET 200SP, you must take into account the ohmic resistance from the RC combination of the module in question:

Table 1-410 Ohmic resistance

Module	Ohmic resistance from RC network
CPU/interface module	10 MΩ (±5 %)
BaseUnit BU15...D	10 MΩ (±5 %)
BaseUnit BU30-MSx	10 MΩ (±5 %)

Formula

You can calculate the leakage resistance of the ET 200SP using the following formula if you protect all of the modules listed above with one ground-fault detector:

$R_{ET200SP} = R_{module} / N$

$R_{ET200SP}$ = Leakage resistance of the ET 200SP

R_{module} = Leakage resistance of a module

N = Number of BaseUnits BU15...D and interface module in the ET 200SP

$R_{CPU/IM} = R_{BU15...D} = R_{Module} = 9.5\ M\Omega$

$R_{CPU/IM}$ = Leakage resistance of CP/interface module

$R_{BU15...D}$ = Leakage resistance of the BaseUnit BU15...D

If you protect the modules listed above within an ET 200SP with several ground-fault detectors, you must determine the leakage resistance for each individual ground-fault detector.

Example

The structure of an ET 200SP system consists of an IM 155-6 PN ST, two BaseUnits BU15...D and various input and output modules. The entire ET 200SP is protected with **one** ground-fault detector:

$$R_{ET\ 200SP} = \frac{9{,}5\ M\Omega}{3} = 3{,}17\ M\Omega$$

Figure 1-163 Calculation example for leakage resistance

SIMATIC ET 200SP data

E

E.1 Introduction

The EU Data Act, a key component of the European data strategy, went into effect on January 11, 2024.

The following information provides an overview of data that the ET 200SP automation system generates and that is accessible to you.

E.2 CPU data

Type, format, and estimated scope of data that the product is capable of generating

Type of data	Formats	Estimated scope
Process data (input and output data, states, alarms)	Numeric formats, binary formats	Cyclic processing Depending on application
Configuration and program data (upload to programming device/PC)	Binary formats, string formats	Depending on application
Diagnostics data, system and security events, service data	Time formats, string formats, CSV, binary formats	Depending on application Several hundred bytes per event
Operating data (runtimes, cycle times, CPU utilization)	Numeric formats, time formats, JSON	Depending on application
Log data	Time formats, string formats, CSV	Depending on application

Continuous and real-time data generation

The ET 200SP is able to generate data continuously and in real time. Data acquisition takes place continuously throughout the entire operation. The CPU operates with defined cycle times in which process data is acquired and processed.

Data storage and storage duration

Local data storage

The ET 200SP stores data in integrated memory areas of the CPU and on the SIMATIC Memory Card.

Local data storage	Storage capacity	Storage duration
Load memory (via SIMATIC Memory Card)	4 MB to 32 GB, depending on SIMATIC Memory Card	Permanent
Code work memory	100 kB to 900 kB, depending on CPU	During operation of the CPU
Data work memory	750 kB to 3.5 MB	During operation of the CPU
Retentive memory	Up to 512 KB, depending on CPU	Permanent

More information
You can find more information on memory areas, retentivity, and memory usage in the Structure and Use of the CPU Memory function manual (https://support.industry.siemens.com/cs/ww/en/view/59193101).

Remote data storage
Data can be transmitted to external systems via various communications interfaces of ET 200SP, such as PROFINET and Industrial Ethernet.

The ET 200SP can send data to various remote systems, including SCADA systems, SQL databases, cloud platforms (e.g. Insights Hub), and file servers.

The ET 200SP can send logging data to a SIEM system in the form of Syslog messages.

The storage duration on external systems depends on the configuration of the respective system.

The ET 200SP CPU can be integrated as a data source into the Siemens Industrial Edge concept.

Data access/retrieval, terms of use, and quality of service

Type of data	Access/retrieval via	Terms of use	Quality of service*
Process data (input and output data, states, alarms)	TIA Portal Web server OPC UA HMI/SCADA systems	User management Authentication Certificates	Prioritization of control tasks over data access Data throughputs up to 1 Gbps via PROFINET Encrypted data transmission available (HTTPS, TLS)
Configuration and program data	TIA Portal Web server SIMATIC Memory Card	User management Authentication Certificates	Encrypted data transmission available (HTTPS, TLS)
Diagnostics data, system and security events, service data	TIA Portal SIMATIC Automation Tool Web server	User management Authentication Certificates	Encrypted data transmission available (HTTPS, TLS)
Operating data (runtimes, cycle times, CPU utilization)	TIA Portal Web server HMI/SCADA systems SIMATIC Controller Profiling	User management Authentication Certificates	Encrypted data transmission available (HTTPS, TLS)
Log data	TIA Portal Trace and logic analyzer function	User management Authentication	Encrypted data transmission available (HTTPS, TLS)

* "Quality of service" refers to the ability of ET 200SP to efficiently manage network resources and ensure that certain performance requirements relating to data transfer are fulfilled.

Deletion of data from CPUs

To delete all data from the data memories of the CPU, the "Reset to factory settings" function is available.

A reset of the CPU to factory settings can be implemented using any of the following:

- Mode selector keys/switches of the CPU
- TIA Portal
- SIMATIC Automation Tool

More information
You can find more information on deleting data in the System Manual ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/58649293), in the sections “Securely removing data” and “Reset to factory settings”.

E.3 Data of the interface and I/O modules

Type, format, and estimated scope of data that the product is capable of generating

Type of data	Formats	Estimated scope
Process data (input and output data, states, alarms)	Numeric formats, binary formats	Cyclic processing Depending on application
Configuration and parameter data (upload to programming device/PC)	Binary formats, string formats	Depending on application
Diagnostics data, service data	Binary formats	Depending on application Less than 100 bytes per diagnostic event; several kilobytes of service data
Fieldbus* metadata: I&M data, log data, statistics data	Binary formats, string formats	Approximately 100 bytes per read-out data record

* PROFIBUS, PROFINET, EtherNet/IP, Modbus TCP (only for interface modules as MultiFieldbus devices)

Continuous and real-time data generation

The interface and I/O modules are able to generate data continuously and in real time. Data acquisition takes place continuously throughout the entire operation. The cycle time is specified by the CPU.

Data storage and storage duration

Local data storage
The interface and I/O modules store data in integrated memory areas.

Local data storage	Storage capacity	Storage duration
Retentive memory (for I&M data, configuration and parameter data*, service data, energy meters **)	Up to 16 MB for interface modules 1 To 6 MB for I/O modules	Permanent
Work memory (for process data, diagnostics data, fieldbus metadata, configuration and parameter data, service data)	Up to 1 MB for interface modules Several hundred KB for I/O modules	During operation of the module

* only interface modules as MultiFieldbus devices, IO-Link masters and CM 1xDALI

** only AI Energy Meter

Data access/retrieval, terms of use, and quality of service

Type of data	Access/retrieval via	Terms of use	Quality of service*
Process data (input and output data, states, alarms)	CPU TIA Portal SIMATIC Automation Tool PRONETA S7-PCT (for IO-Link masters) MFCT	Via fieldbus without authentication Via CPU (Page 388)	Prioritization of control tasks over data access Standard fieldbus transmission mechanisms Data throughputs up to 1 Gbps via PROFINET
Configuration and parameter data (upload to programming device/PC)	TIA Portal (via CPU) S7-PCT (for IO-Link masters) MFCT	Via fieldbus without authentication Via CPU (Page 388)	Standard fieldbus transmission mechanisms
Diagnostics data, service data	CPU TIA Portal SIMATIC Automation Tool PRONETA S7-PCT (for IO-Link masters) MFCT	Via fieldbus without authentication Via CPU (Page 388)	Standard fieldbus transmission mechanisms
Fieldbus metadata: I&M data, log data, statistics data	CPU TIA Portal SIMATIC Automation Tool PRONETA S7-PCT (for IO-Link masters) MFCT	Via fieldbus without authentication Via CPU (Page 388)	Standard fieldbus transmission mechanisms

* "Quality of service" refers to the ability of the interface and I/O modules to manage network resources efficiently and to ensure that specific performance requirements for data transmission are met.

Deletion of data from interface and I/O modules

Interface modules

To delete all data from the data memories of the interface module, the "Reset to factory settings" function is available.

A reset of the IM to factory settings can be implemented using any of the following:

- TIA Portal
- SIMATIC Automation Tool
- MultiFieldbus Configuration Tool (MFCT)
- PRONETA
- STEP 7

I/O modules

The data of an IO-Link master can be deleted using S7-PCT by executing the "Reset to factory settings" function.

The data of a CM 1xDALI can be deleted via the CPU. For all other I/O modules, no delete function is available.

More information

You can find more information on deleting data in the System Manual ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/58649293), in the sections “Securely removing data” and “Reset to factory settings”.

SIEMENS
SIMATIC

Product information on the system manuals

Product Information

Cybersecurity information

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines and networks.
In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.
Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.
For additional information on industrial cybersecurity measures that may be implemented, please visit https://www.siemens.com/cybersecurity-industry.
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.
To stay informed about product updates, subscribe to the Siemens Industrial Cybersecurity RSS Feed under https://new.siemens.com/cert.

General amendments to the documentation

This product information contains amendments to the system manuals. The product information is part of the product supplied. Consider the statements provided in it as more up-to-date than other documentation if uncertainties arise.
This product information is valid for all products which reference this product information.

Operation of a system in an environment with low relative humidity

You have the possibility to operate the products in an environment with low relative humidity (calculated values: Dew point temperature -60 °C, 100 % humidity).
To do this, follow the following points in this product information.

Shock, vibrations
In the chapter "Mechanical and climatic environmental conditions" of the system manuals the "Tests for mechanical environmental conditions" table is replaced by the following table:

Table 1 Tests of mechanical environmental conditions

Condition tested	Test standard	Comment
Vibrations	Vibration test according to IEC 60068-2-6 (sinusoidal)	Type of vibration: Frequency sweeps with a rate of change of 1 octave/minute. • 5 Hz ≤ f ≤ 8.4 Hz, 3.5 mm constant amplitude • 8.4 Hz ≤ f ≤ 150 Hz, 1 g constant acceleration Duration of vibration: 10 frequency sweeps per axis at each one of the three vertically aligned axes
Shock	Shock, tested according to IEC 60068-2-27	Type of shock: Half-sine Shock intensity: 150 m/s^2 peak value, 11 ms duration Direction of shock: 3 shocks in each direction (+/-) at each of three vertically aligned axes

ESD
Comply with the requirements of the table "Pulse-shaped disturbance variables" in the chapter "Electromagnetic compatibility" of the system manuals.

⚠ WARNING

Loss of the safety function, personal injury, property damage and destruction of the modules
When operating the system in an environment with low relative humidity (RH) < 10 % expect a rise of the electrostatic charge.
Take appropriate measures to ensure that the test levels specified in the "Pulse-shaped disturbance variables" table are not exceeded during this use.

Product Information

Module overview of ET 200SP
Module firmware corrected for R1 redundancy

A firmware update is required for some electronic modules to obtain the full compatibility for the ET 200SP R1 system. If an older firmware version of the module is used than the one specified below, a process data surge can occur during a redundancy switchover of the interface modules.

NOTE

All electronic modules not listed here do not require a firmware update to obtain full compatibility for the ET 200SP R1 system.

The following table shows which modules support a bumpless R1 switchover as of which firmware version:

Module	Article number	As of firmware version

** No firmware update with the error correction is currently offered for these modules

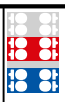
You can find the latest firmware versions for the modules on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109804718).
You can find a description of how to update the firmware of the modules in the "Firmware update" section of the System Manual (https://support.industry.siemens.com/cs/ww/en/view/58649293).

Possible combinations of BaseUnits and I/O modules

Contents



This product information includes amendments and corrections to the documentation of the ET 200SP Distributed I/O System (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Which I/O modules / motor starters fit on a BaseUnit?

The following table provides an overview of the I/O modules / motor starters that fit on the corresponding compatible BaseUnits:

Table 1 Possible combinations of BaseUnits and I/O modules

NOTE

The CM AS-i master ST and F-CM AS-i Safety ST communications modules are supported as of firmware V1.8 of the CPUs. Note the following additional requirements:

CM AS-i master ST:

- Firmware version of the CM AS-i master ST: V1.1
- STEP 7 (TIA Portal): V13 SP1 Update 4 or higher

F-CM AS-i Safety ST

- Firmware version of the CM AS-i Safety ST: V1.0
- STEP 7 (TIA Portal): as of V13 SP1 Update 4 and HSP0070 V3.0

Accessories

Accessories

General accessories	Packing unit	Article number
Strain relief units incl. screws	Pack of 5	6ES7193-6RA00-1AN0
Cover for the BusAdapter interface	Pack of 5	6ES7591-3AA00-0AA0
PROFIBUS FastConnect bus connector	Pack of 1	6ES7972-0BB70-0XA0
Female connector, 2x2 pin	Pack of 1	6ES7193-4JB00-0AA0
Server module (spare part)	Pack of 1	6ES7193-6PA00-0AA0
BU cover		
• 15 mm wide	Pack of 5	6ES7133-6CV15-1AM0
• 20 mm wide	Pack of 5	6ES7133-6CV20-1AM0
24 V DC plug (spare part)	Pack of 10	6ES7193-4JB00-0AA0
Shield connector for BaseUnit (shield contacts and shield terminals)	Pack of 5	6ES7193-6SC20-1AM0
Reference identification label, sheet with 16 labels	Pack of 10	6ES7193-6LF30-0AW0
Labeling strips (for labeling the I/O modules)		
• Roll, light gray (with a total of 500 labeling strips)	Pack of 1	6ES7193-6LR10-0AA0
• Roll, yellow (with a total of 500 labeling strips)	Pack of 1	6ES7193-6LR10-0AG0
• DIN A4 sheets, light gray (with a total of 1000 labeling strips)	Pack of 10	6ES7193-6LA10-0AA0
• DIN A4 sheets, yellow (with a total of 1000 labeling strips)	Pack of 10	6ES7193-6LA10-0AG0
Electronic coding element (spare part)[1)]		
• Coding element (type A)	Pack of 20	6ES7193-6KA00-3AA0
• Coding element (type B)	Pack of 20	6ES7193-6KB00-3AA0
• Coding element (type C)	Pack of 20	6ES7193-6KC00-3AA0
• Coding element (type D)	Pack of 20	6ES7193-6KD00-3AA0

1) For the I/O modules, mechanical or electronic coding elements are supplied ex works, depending on the module. Variants A, B, C, D, F and H are available as spare parts. The appropriate coding element can be found in the technical specifications of the respective I/O module. The procedure for changing the coding element is described in the section Changing the type of an I/O module.

2) You may shorten the length of the standard mounting rails and SIMATIC system rails as needed.

General accessories	Packing unit	Article number
Electronic coding element (spare part)[1]		
• Coding element (type F, for fail-safe modules)	Pack of 1	6ES7193-6EF00-1AA0
• Coding element (type H)	Pack of 1	6ES7193-6EH00-1AA0
Mounting rails, tin-plated steel strip[2]		
• Length: 483 mm	Pack of 1	6ES5710-8MA11
• Length: 530 mm	Pack of 1	6ES5710-8MA21
• Length: 830 mm	Pack of 1	6ES5710-8MA31
• Length: 2000 mm	Pack of 1	6ES5710-8MA41
SIMATIC system rails[2]		
• Length 483 mm	Pack of 1	6ES7193-6MR00-0AA0
• Length 530 mm	Pack of 1	6ES7193-6MR00-0BA0
• Length 830 mm	Pack of 1	6ES7193-6MR00-0CA0
• Length: 2000 mm	Pack of 1	6ES7193-6MR00-0DA0

1) For the I/O modules, mechanical or electronic coding elements are supplied ex works, depending on the module. Variants A, B, C, D, F and H are available as spare parts. The appropriate coding element can be found in the technical specifications of the respective I/O module. The procedure for changing the coding element is described in the section Changing the type of an I/O module.

2) You may shorten the length of the standard mounting rails and SIMATIC system rails as needed.

Supplements to ET 200SP documentation

BaseUnits manual

Special consideration for BaseUnits with functional versions < 04

The following BaseUnits with functional version < 04 can only be used in potential groups with rated voltages ≤ 48 V DC or 24 V AC:

- BaseUnit BU20-P12+A0+4B (6ES7193-6BP20-0BB1).
- BaseUnit BU20-P12+A0+0B (6ES7193-6BP00-0BD0).

BusAdapter Equipment Manual

Strain relief
The strain relief 6ES7193-6RA00-1AN0 with FS01 is not suitable for the optical PROFINET cables of the BusAdapters.

BusAdapter BA 2xFC
A further cable has been added to the recommended types of Fast Connect Cable: IE FC TP Marine Cable (6XV1840-4AH10)

CPU manuals

CPU Equipment Manuals, Edition 11/2024

Section Product overview, New functions

New functions for FW version 4.1	Applications	Customer benefits
Backup and restore of the configuration of the CPU by a central user	As of FW version V4.1 of a CPU, a central user can also back up and restore the configuration.	Rules you need to follow for backup and restore. More information is available in the ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/58649293) System Manual, in the section Backing up and restoring the CPU configuration.
Integrated security		
Temporary account lockout for local user accounts	Starting from STEP 7 V21, you can set up a temporary account lockout for local user accounts in the case of CPUs as of FW version V4.1.	The temporary account lockout provides protection against brute force attacks.
SIMATIC ET 200SP data	This appendix provides you with an overview of the data that the CPU generates and makes available to you.	More information is available in the ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/58649293) System Manual, in the appendix SIMATIC ET 200SP data.

New functions for FW version 4.1	Applications	Customer benefits
Communication of the CPU		
New function for OPC UA	Enables cross-vendor communication.	For more information, please refer to the Communication (https://support.industry.siemens.com/cs/ww/en/view/59192925) Function Manual
Activating IP forwarding through a data record transfer	For CPUs as of FW version V4.1, you can also activate/deactivate the "IP forwarding" function for local interfaces of the CPU through data record transfer.	
Technology functions of the CPU		
General functions	Distribution of the processing of motion jobs across multiple cores Improved performance	S7-1500 Motion Control Overview (https://support.industry.siemens.com/cs/ww/en/view/109751049) Function Manual
Axis functions (only CPU 1514SP T-2 PN)	Specification of the motion setpoints of a superimposing axis in addition to the basic motion of the axis Extended range of functions	Axis functions (https://support.industry.siemens.com/cs/us/en/view/109817884) Function Manual
Synchronous operation functions (only CPU 1514SP T-2 PN)	Cam can be used as a time-based position profile Extended range of functions	Synchronous operation functions (https://support.industry.siemens.com/cs/us/en/view/109817888) Function Manual
	Area scaling at a cam before or during active camming Extended range of functions	
	Cross-PLC synchronous operation with communication via isochronous I-device Extended range of functions	
Kinematics functions (only CPU 1514SP T-2 PN)	New predefined kinematics type "6-axis articulated arm with offset wrist" available Extended range of functions	Kinematics functions (https://support.industry.siemens.com/cs/us/en/view/109817886) Function Manual
Interpreter functions (only CPU 1514SP T-2 PN)	Value of a tag can be changed at a breakpoint in debug program mode Extended range of functions	Interpreter functions (https://support.industry.siemens.com/cs/us/en/view/109817891) Function Manual
Trace functionality of the CPU		
Creating a long-term trace configuration from a long-term trace measurement	Extended range of functions	Using the trace and logic analyzer function (https://support.industry.siemens.com/cs/us/en/view/64897128) Function Manual
Recording, display and analysis of events in TIA Portal	Diagnostics of Motion Control jobs Extended range of functions	S7-1500 Motion Control Overview (https://support.industry.siemens.com/cs/ww/en/view/109751049) Function Manual
PID control		
New version V2.0 of PID_Temp controller	Use for cooling-only applications	PID control (https://support.industry.siemens.com/cs/ww/en/view/108210036) Function Manual
	Temporary shutdown of the heating	
	Manual stopping of the integral-action component	
	Active limiting of the integral-action component and change of output value limits in automatic mode	
	Improved anti-windup behavior in the cascade

Interface module manuals

Compilation error up to STEP 7 V15.1 for IM 155-6 PN HF as of V2.1, IM 155-6 PN HS V4.0
Affected components:

- IM 155-6 PN HF as of V2.1
- IM 155-6 PN HS V4.0

A compilation error can occur in isochronous mode of the ET 200SP (IM 155-6 PN HF as of V2.1, IM 155-6 PN HS V4.0) with the setting "From OB" even if the settings are valid. The typical error message is: "The specific Ti value is invalid" or "The specific To value is invalid". But other error messages are possible as well.
Solution:
Upgrade the module description of the IM in this case. You can upgrade the module description of the IM in the network view or in the device view of the Inspector window using the "Update module description" function. The error can still occur with the current module description after the first compilation. If you have selected valid settings, the error will no longer occur with the subsequent compilation.

Equipment Manual IM 155-6 PN BA, Edition 03/2015
Status of the supply voltage
Load voltage diagnostics are only valid if the station started up with a valid and complete configuration.

- For modules in the following table without a parameter assignment, the status of the supply voltage is always signaled as "1" regardless of the actual status of the supply voltage.
- If a potential group is exclusively made up of modules without parameter assignment from the table below, no group diagnostics "Missing supply voltage L+" is signaled for this potential group.

Modules	Order number
DI 8x24VDC ST	6ES7131-6BF00-0BA0
DI 16x24VDC ST	6ES7131-6BH00-0BA0
DI 8x24VDC HF	6ES7131-6BF00-0CA0
DQ 4x24VC/2A ST	6ES7132-6BD20-0BA0
DQ 8x24VDC/0,5A ST	6ES7132-6BF00-0BA0
DQ 16x24VDC/0,5A ST	6ES7132-6BH00-0BA0
DQ 8x24VDC/0,5A HF	6ES7132-6BF00-0CA0

Equipment Manual IM 155-6 PN ST, Edition 04/2017
Response times
The response time of the IM 155-6 PN ST is made up of:
- Backplane bus cycle time
- Operating system processing time.

NOTE
Validity of the formula
The following formula applies to the ET 200SP backplane bus.
The formula does not apply to the ET-Connection bus.

Backplane bus cycle time
The backplane bus cycle time is the time the interface module requires to output new output data, read new input data and then copy the data to the PROFINET send buffer.
The backplane bus cycle time is the result of the update time configured for the interface module as IO device and amounts to at least 1 ms.
- If the configured update time ≥ 1 ms, the backplane bus cycle time is equal to the configured update time.
- If the configured update time < 1 ms, the backplane bus cycle time is the product of an integer multiple of the configured update time.

Table 12 Example calculation

Configured update time	Backplane bus cycle time (integer multiple, minimum 1 ms)
250 µs	4 x 250 µs = 1000 µs
750 µs	2 x 750 µs = 1500 µs
1000 µs	1000 µs
2000 µs	2000 µs

Operating system processing time
The **operating system processing time** is calculated based on the following formula:
Operating system processing time output
Operating system processing time_output[µs] = 147 + 3.775 number_m + 0.275 bytes_out
Operating system processing time input
Operating system processing time_input[µs] = 158.3 + 2.325 number_m + 0.325 bytes_in

Explanation of the parameters:
Number_m: Total number of all modules (incl. server module)
Bytes_out: Sum of all output bytes
Bytes_in: Sum of all input bytes

Calculating the response time
Response time output
The response time output of the IM 155-6 PN ST is made up of:
- Backplane bus cycle time
- Operating system processing time_output.

Response time input
The response time input of the IM 155-6 PN ST is made up of:
- Backplane bus cycle time
- Operating system processing time_input.

Equipment Manual IM 155-6 PN ST, Edition 04/2017
You can perform a firmware update to V4.1 for IM 155-6 PN ST interface modules with the article number 6ES7155-6AU00-0BN0.
If you perform hardware detection of the IO device in the TIA Portal as of V15.0 after the firmware update to V4.1, the device name is displayed as not assigned in the "PROFINET device name" column in the "Topology comparison" tab of the interface module.
The reason is that the online combination of article number and firmware version of the IO device is not offered in the hardware catalog.
In this case, the hardware catalog for the interface module IM 155-6 PN ST offers the combination of article number 6ES7155-6AU00-0BN0 and FW up to V3.3.
Solution: In the "Topology comparison" tab, assign the device name offered from the selection list in the "PROFINET device name" column.

Equipment Manual IM 155-6 PN/2 HF, Edition 10/2018

Section 2.1 Properties

Maximum configuration
- 64 ET 200SP I/O modules + 16 ET 200AL modules
- 1 m backplane bus (without interface module)

Server module
The server module supports the identification data I&M 0 to 3.

Section 2.2 Functions

Module-to-Module Communication (MtM)
At a CPU STOP or failure of communication between the interface module and CPU, all modules of the ET 200SP output substitute values.

Equipment Manual IM 155-6 PN/3 HF, Edition 10/2018

Section 2.1 Properties

Maximum configuration
- 64 ET 200SP I/O modules + 16 ET 200AL modules
- 1 m backplane bus (without interface module)

Section 2.2 Functions
The "Interface-local coupling of IO data" function can also be used in addition to GSDML with STEP 7 (TIA Portal) as of V15.1 with HSP285.

Section 2.2.20 Interface-local coupling of I/O data
When using MSO local modules, make sure that you choose the same number of bytes in all shared configurations involved. Failure to do so will result in a parameterization error when establishing the connection.

Module-to-Module Communication (MtM)
At a CPU STOP or failure of communication between the interface module and CPU, all modules of the ET 200SP output substitute values.

Table 2-1 Version dependencies of the module functions
The "Interface-local coupling of IO data" function is possible with STEP 7 (TIA Portal) as of V15.1 with HSP285.

Section 3 Wiring
Notes

NOTE
To set up a ring topology, use only the P1 R and P2 R ports.

NOTE

Operation with only one BusAdapter

You can operate the interface module with only one BusAdapter on P1 R and P2 R. Disable the P3 port in the port options in STEP 7 for this. Cover the free BusAdapter port P3 with a BusAdapter interface cover (6ES7591-3AA00-0AA0).

NOTE

For IRT operation, both BusAdapters must be plugged in.

Section 5.3.4 Invalid configuration states of the ET 200SP on PROFINET IO

NOTE

Removal of the server module will trigger a station stop. All I/O modules of the ET 200SP distributed I/O system fail (substitute value behavior) but the interface module continues to exchange data.

The virtual MSO Local modules are not affected by the failure.

Revoking the station stop (by correcting the invalid configuration state) leads to a brief failure of the ET 200SP distributed I/O system and automatic restart.

Section 6 Compatibility

Restoring the factory settings on the interface module via the RESET button

There is a special operation for interface module IM 155-6 PN/3 HF to reset it to the factory settings using the Reset button.

Requirements

The supply voltage to the interface module must be switched on.

Required tool

3 To 3.5 mm screwdriver (for resetting with a RESET button)

Procedure

1. Remove the interface module from the mounting rail and swivel it downwards.
2. The RESET button is located on the back of the interface module behind a small opening: Push a screwdriver into the small opening, thus pressing the RESET button.
3. Release the RESET button.
4. Press the RESET button for another 3 seconds.
5. Look at the LED display of the interface module to see whether the reset was successful: RUN LED flashes for 3 seconds, ERROR and MAINT LED are off.
6. Install the interface module back on the mounting rail.
7. Configure the interface module again.

Equipment Manual IM 155-6 PN HF, Edition 12/2015

Section 3.1 Pin assignment

PROFINET interface X1 Port 2:

If autonegotiation is disabled, the RJ-45 socket (X1 Port 2) has the switch assignment (MDI-X).

Equipment Manual IM 155-6 PN HS, Edition 09/2016
Section 3.1 Pin assignment
PROFINET interface X1 Port 2:
If autonegotiation is disabled, the RJ45 socket (X1 Port 2) has the switch assignment (MDI-X).

Section 7 Technical specifications
- The PROFINET certification of network Class 3 is in preparation.
- Technical specifications of the BusAdapters BA 2×SCRJ, BA SCRJ/RJ45, BA SCRJ/FC:
  The maximum length of the PCF-GI fiber-optic cable is 250 m.

Equipment Manual IM 155-6 DP HF, Edition 10/2018

Section 2.2.1 Requirements

Table 13 Version dependencies of other module functions

Function	Product version of the module as of	Firmware version of the module as of	Configuration software		
			Configuration with GSD file (https://support.industry.siemens.com/cs/ww/en/view/57138621)/third-party software [1]	STEP 7 as of V5.5 SP3 with HSP0242	STEP 7 (TIA Portal) as of V13
Interface module; article number: 6ES7155-6BA01-0CN0	1	V4.2	X	X [2]	X (as of V15.1)

1 Systems of third-party manufacturers: dependent on the range of functions of the third-party system

2 Configure the module as version 6ES7155-6BA00-0CN0 FW V3.1 (as of HSP0242 V3)

Compatibility with BusAdapter BA 2xM12
The following table shows the compatibility of the BusAdapter BA 2xM12 with the interface modules:

Interface module	BA 2xM12 is supported	Configurable with		
		PROFINET GSD	STEP 7	STEP 7 (TIA Portal)
IM155-6 PN HS (6ES7155-6AU00-0DN0)	No	-	-	-
IM155-6 PN ST (6ES7155-6AU01-0BN0)	Yes, as of FW V4.2	Yes	-	V16 or higher with HSP205
IM155-6 PN HF (6ES7155-6AU00-0CN0)			V5.5.4.0 or higher with HSP0250 V5.0	V16 or higher with HSP302
IM155-6 PN/2 PN HF (6ES7155-6AU01-0CN0)				
IM155-6 PN/3 PN HF (6ES7155-6AU30-0CN0)				
IM155-6 MF HF (6ES7155-6MU00-0CN0)	Yes, as of FW V5.0		V5.5.4.0 or higher with HSP0250 V5.0 configured as IM155-6 PN/2 PN HF V4.2	V16 or higher with HSP302 configured as IM155-6 PN/2 PN HF V4.2

Compatibility with BusAdapter BA 2xLC-LD, BA LC-LD/RJ45 and BA LC-LD/M12
The following table shows the compatibility of the BusAdapter BA 2xLC-LD, BA LC-LD/RJ45 and BA LC-LD/M12 with the interface modules:

Interface module	BA 2xLC-LD	BA LC-LD/RJ45	BA LC-LD/M12	Configurable with		
				PROFINET GSD	STEP 7	STEP 7 (TIA Portal)
IM155-6 PN HS (6ES7155-6AU00-0DN0)	No			-	-	-
IM155-6 PN ST (6ES7155-6AU01-0BN0)						
IM155-6 PN HF (6ES7155-6AU00-0CN0)						
IM155-6 PN/2 PN HF (6ES7155-6AU01-0CN0)	Yes, as of FW V4.2 configured as BA 2xLC and monitor port disabled	Yes, as of FW V4.2 configured as BA LC/RJ45 and monitor port disabled		Yes	V5.5.4.0 or higher with HSP0250 V4 / HSP0255 V5.0	V15.1 or higher
IM155-6 PN/3 PN HF (6ES7155-6AU30-0CN0)						
IM155-6 MF HF (6ES7155-6MU00-0CN0)	Yes, as of FW V5.1 configured as BA 2xLC and monitor port disabled	Yes, as of FW V5.1 configured as BA LC/RJ45 and monitor port disabled; max. cable length 3 km			V5.5.4.0 or higher with HSP0250 V4 / HSP0255 V5.0 configured as IM155-6 PN2-/2 PN HF V4.2	V15.1 or higher, configured as IM155-6 PN/2 PN HF V4.2
IM155-6 R1 (6ES7155-6AU00-0HM0)	Yes				-	V18 or higher

IM 155-6 MF HF FW 5.2
For IM 155-6 MF HF with FW 5.2, the following applies in Function Manual "MultiFieldbus", section 4.2.3.5 "Data record interface":

Record response (big-endian, read-only access)

Register Offset	Block	Field	Size	Description
0x0041		Processed Length	Unsigned16	Processed length of the PROFINET data record in bytes **Read:** Length of the PROFINET data record read **for Request Control == "Execute read" (0x0000 for "Continue read")** **Write:** Record length of the executed write job = Record Length (Zero in case of an error)

Equipment Manual IM 155-6 MF HF, Edition 01/2022

NOTE

Use in STEP 7 or STEP 7 TIA Portal
To use the interface module in STEP 7 or STEP 7 TIA Portal, install the GSD file. You can find the latest GSD file on the Internet (https://support.industry.siemens.com/cs/ww/en/view/57138621).
After installation, the interface module can be found under "Other field devices".

Data record interface for MF Shared Device
The MF device supports the simultaneous use of the data record interface for max. 2 fieldbuses.

Section 2.2 Functions

Module-to-Module Communication (MtM)
At a CPU STOP or failure of communication between the interface module and CPU, all modules of the ET 200SP output substitute values.

Section 3.1.11 Configuration control (option handling)
Configuration control is possible, but modules with submodules distributed on different ARs/fieldbuses may not be part of the AR for active configuration control.

Section 7.2.5 Connection hold time
After the hold time has elapsed, the outputs react as described in the section "Substitute value behavior".

Section 7.2.5 Hold time after connection reset
After the hold time has elapsed, the outputs react as described in the section "Substitute value behavior".

Equipment Manual IM 155-6 PN ST (6ES7155-6AU02-0BN0), Edition 11/2023
Enhanced by the following two features:

1. Media redundancy (MRP and MRPD)
Function for ensuring communication and plant availability. A ring topology ensures that an alternative communication path is made available if a transmission link fails.
You can find more information on this topic in the STEP 7 online help and

- As of STEP 7 V12, in the PROFINET with STEP 7 (https://support.automation.siemens.com/WW/view/en/49948856) Function Manual.
- As of STEP 7 V5.5 in the PROFINET System Description (https://support.automation.siemens.com/WW/view/en/19292127) System Manual.

2. Interface-local coupling of I/O data
Module-internal shared output
In this example, IO data are transferred from one controller to other controllers over the PROFINET interface X1 by means of the module-internal shared output.

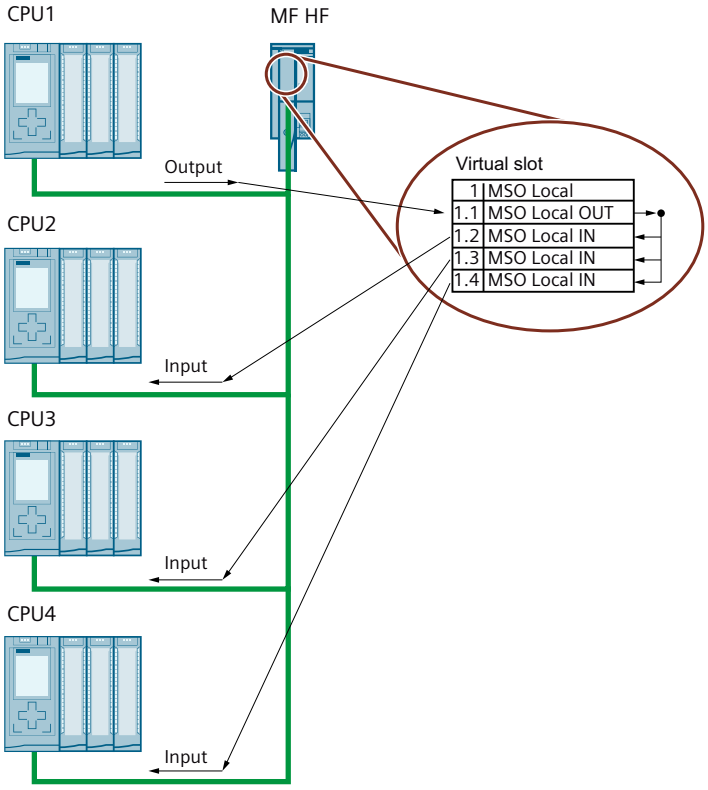

Figure 1 I/O data are transferred to other controllers in the same PROFINET network

Configuration

Table 14 Example configuration

Virtual slot	Type	I length	Q length	Access
1	MSO Local	-	-	-
1.1	MSO Local OUT	-	4 Bytes	CPU 1
1.2	MSO Local IN	5 bytes incl. 1 byte DS	-	CPU 2
1.3	MSO Local IN	5 bytes incl. 1 byte DS	-	CPU 3
1.4	MSO Local IN	5 bytes incl. 1 byte DS	-	CPU 4

Editing in the user program

The controller CPU 1 writes I/O data to the MSO Local OUT module with virtual slot 1.1 of the interface module. The data is available to CPUs 2 to 4 for reading with the remaining MSO Local IN modules. The validity of the provided user data is displayed by the data status byte (DS) of the MSO Local IN modules.

You can also use this example

- with fewer controllers and
- Configure it with other virtual modules.

NOTE

Virtual IO modules

Using virtual IO modules increases the communication load. This increases the data update time of all IO data accordingly.

I/O module manuals
Extended spare parts compatibility

Extended spare parts compatibility of DQ modules
The following table shows the modules you can replace without having to adapt the configuration.
If spare parts are installed, the functions of the configured module are retained.

You have configured and plugged in one of the following modules:	The following module is spare parts compatible:
• Digital output module DQ 16x24VDC/0.5A ST (6ES7132-6BH00-0BA0) • Digital output module DQ 16x24VDC/0.5A ST (6ES7132-6BH01-0BA0)	Digital output module DQ 16x24VDC/0.5A HF (6ES7132-6BH00-0CA0)
• Digital output module DQ 8x24VDC/0.5A BA (6ES7132-6BF00-0AA0) • Digital output module DQ 8x24VDC/0.5A BA (6ES7132-6BF01-0AA0)	Digital output module DQ 8x24VDC/0.5A HF (6ES7132-6BF01-0CA0) If you replace one of these modules with an HF module, you must observe the residual current at signal "0". More information can be found in the technical specifications of the respective modules.
• Digital output module DQ 8x24VDC/0.5A ST (6ES7132-6BF00-0BA0) • Digital output module DQ 8x24VDC/0.5A ST (6ES7132-6BF01-0BA0)	Digital output module DQ 8x24VDC/0.5A HF (6ES7132-6BF01-0CA0)
• Digital output module DQ 4x24VDC/2A ST (6ES7132-6BD20-0BA0) • Digital output module DQ 4x24VDC/2A ST (6ES7132-6BD21-0BA0)	Digital output module DQ 4x24VDC/2A HF (6ES7132-6BD21-0CA0)

Safety-related shutdown of standard modules
You can find the latest information on the standard modules that support safety-related shutdown, up to which SIL and Cat./PL and wiring examples, in this FAQ (https://support.industry.siemens.com/cs/ww/en/view/39198632) and in the online version of the technical specifications.

Configuration notes on the I/O modules (supplement to Product overview section in the manual)

I/O module		Article number	Firmware version	STEP 7 (TIA Portal)	STEP 7 V5.5 SP3

Digital module device manuals

I/O modules Equipment Manuals

LED DIAG

Table 15 LED DIAG fault display

LED DIAG	Meaning
Off	Backplane bus supply of the system is interrupted or switched off.
Flashes	Module parameters not assigned
On	Module parameters assigned and no module/channel diagnostics
Flashes	Module parameters assigned and module/channel diagnostics

Equipment Manuals for I/O modules ST, BA
When you have disabled all channels of the I/O module, a diagnostic message is still generated in the case of a fault if the "No supply voltage L+" diagnostics is enabled. For the following I/O modules, this behavior is corrected as of firmware version > V1.1.0:

- DI 16x24VDC ST
- DI 8x24VDC ST
- DQ 16x24VDC/0.5A ST
- DQ 8x24VDC/0.5 A ST
- DQ 4x24VDC/0.5A ST

Equipment Manuals for digital input modules with wire-break check
When wire-break check is configured the module requires a low quiescent current at the digital input in case of "0" signal for the monitoring. The parallel connection of a resistor with 25 kΩ to 45 kΩ is required in order that this quiescent current can flow when encoder contacts are open.
If wire-break check is disabled in the configuration, no parallel connection of the resistor is required.
If wire-break check is configured, connect a resistor with 25 kΩ to 45 kΩ parallel to each mechanical encoder contact.

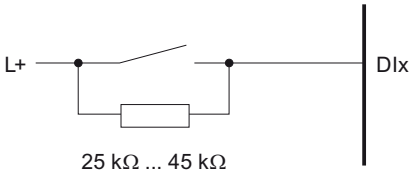

Figure 2 Connect mechanical encoder contact with resistor

Equipment Manual DI 8x24VDC HF, Edition 02/2014
Section 6.1 Technical specifications

- 24 V encoder supply
  - Output current, max.: 700 mA, total current

Equipment Manual DI 8xNAMUR HF, Edition 02/2014
Section A.2 Parameter assignment and structure of parameter data record
With data records 0 to 7, you can configure individual channels.
When the interface module IM 155-6 DP HF (PROFIBUS DP) is used and data records 0 and 1 are read, the module returns the diagnostics data records and not the parameter data records of the DI 8xNAMUR HF.

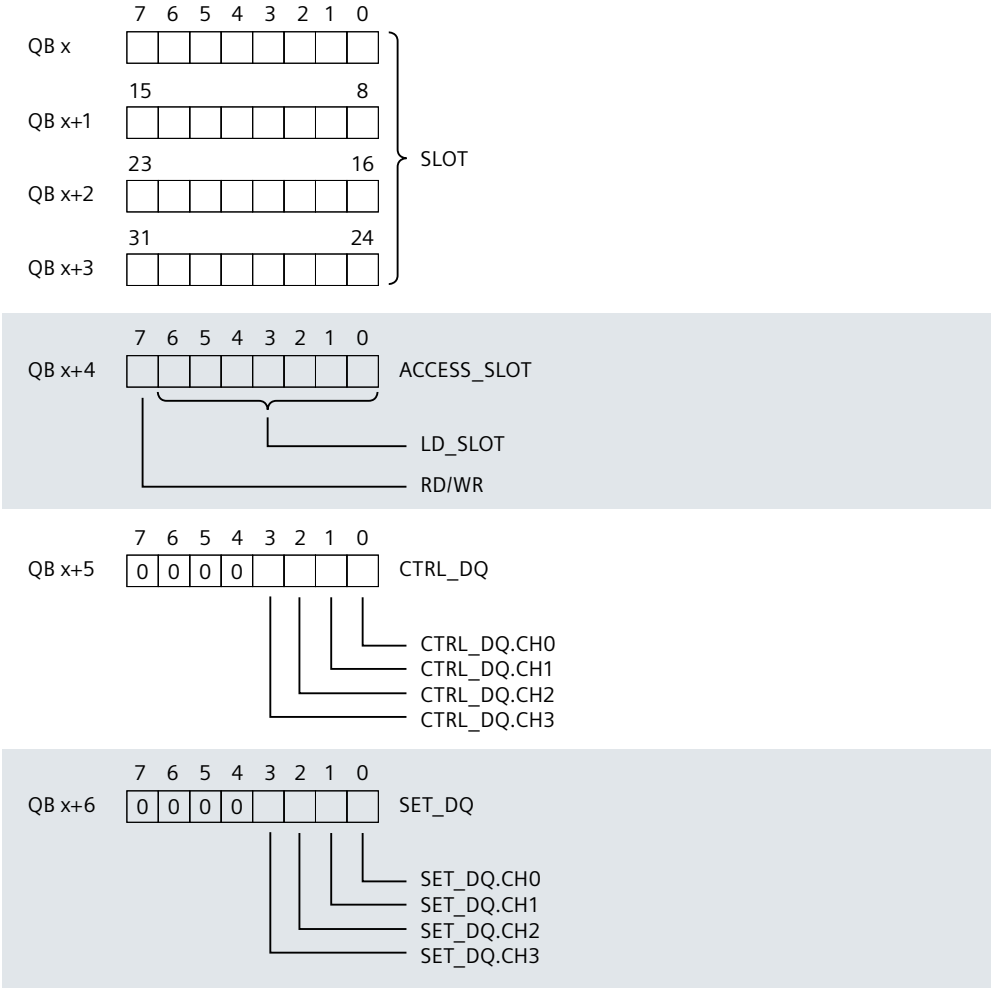
Section 6.4.1.3 Address space



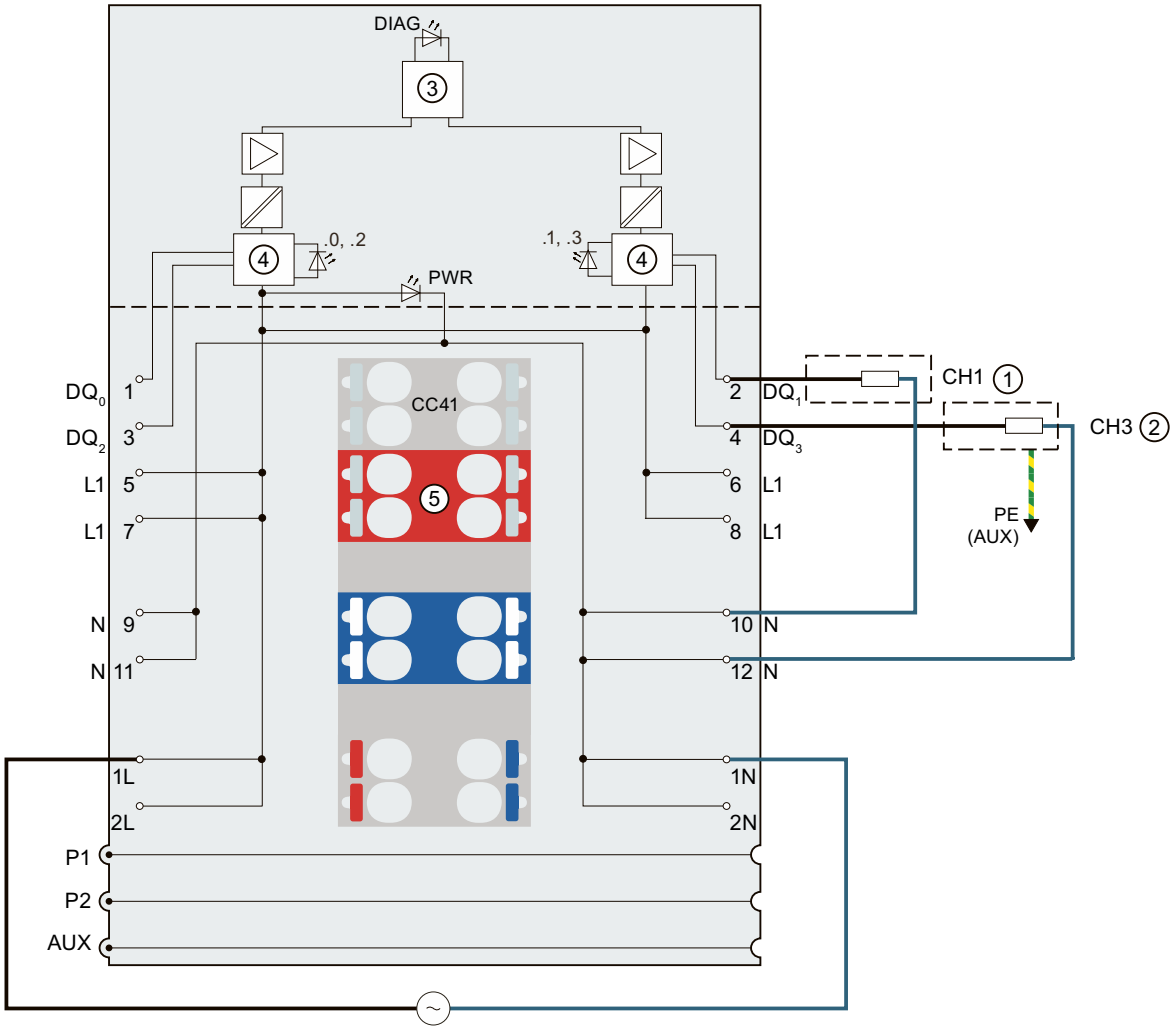


Figure 3 Assignment of the control interface

Section 3.1 Wiring and block diagram

The following figure shows the block diagram and an example of the pin assignment of the digital output module DQ 4x24..230VAC/2A ST on the BaseUnit BU type B1.

①	2-wire connection	N	Neutral conductor
②	3-wire connection	1L, 2L	Supply voltage 24 V AC to 230 V AC
③	Backplane bus interface	1N, 2N	Neutral conductor supply voltage
④	Output electronics	PE (AUX)	Protective conductor connection
⑤	Color-coded label CCxx (optional)	DIAG	Diagnostics LED (red/green)
DQ_n	Output signal, channel n	.0, .1, .2, .3	Channel status LED (green)
L1	Encoder supply	PWR	Power LED (green)
P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit)		

Figure 4 Wiring and block diagram for 2-wire and 3-wire connection of actuators

Section 3.1 Pin assignment; Supply voltage fuse protection

The module has neither short-circuit protection nor overload protection. Protect the module from being destroyed by impermissible high current and install a fine fuse in the supply line. The maximum rated current of the fine fuse depends on the hardware function status (FS) of the module.

HW functional status of the module	Max. rated current of fuse	Tripping characteristic
FS ≤ 3	8 A	Quick response
FS ≥ 4	10 A	Quick response

Section 6.1 Technical specifications, Switching frequency with inductive load

The switching frequency of the outputs with inductive loads is max. 0.5 Hz.
Higher switching frequency is possible in spite of this, and depends on the alternating voltage and switched inductors or the power factor of the electric motor used.

Alternating voltage	Condition	Max. switching frequency
200 VAC or lower	---	10 Hz
200 VAC or higher	• Power factor of the electric motor cos φ > 0.35 • Electric motor must only be turned off after startup (no jogging mode). Electric motors which are turned off during startup could create inductive shutoff voltages > 600 V, which could destroy the output electronics (Triac).	10 Hz

Section 6.1 Technical specifications

Supply voltage	
Rated value (AC)	24 V to 230 V

Equipment Manual DQ 4x24..230VAC/2A HF, Edition 02/2018
Section 3.1.1. and 4.1.1 Wiring and block diagram
The following figure shows an example of the pin assignment of the digital output module DQ 4x24..230VAC/2A HF on BaseUnit BU type U0 (3-wire connection) in combination with a potential distribution module and terminal block.
For a 3-wire connection you connect the protective earth (PE) of the actuator to the terminal block.

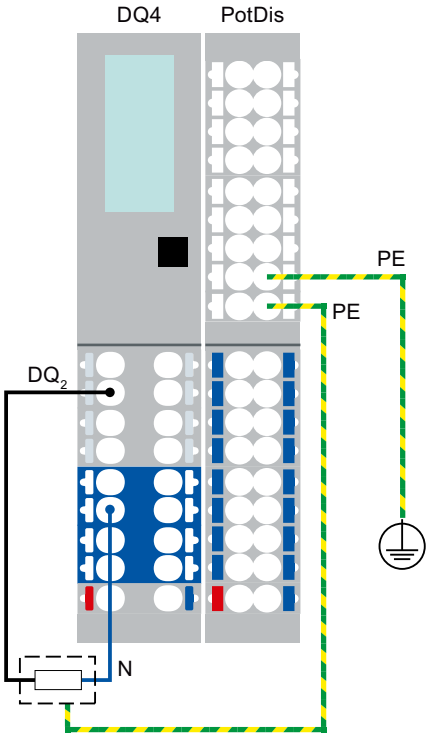

Figure 5 3-wire connection of actuators with potential distribution module at the digital output module DQ 4x24..230VAC/2A HF

Equipment Manuals DQ 16x24VDC/0.5A HF, Edition 01/2024; DQ 8x24VDC/0.5A HF, Edition 04/2024; DQ 4x24VDC/2A HF, Edition 04/2024
Section 7.1 Technical specifications

Module	Load resistance range (high limit, at nominal voltage)
DQ 16x24VDC/0.5A HF	2.4 kΩ
DQ 8x24VDC/0.5A HF	2.4 kΩ
DQ 4x24VDC/2A HF	1.6 kΩ

Equipment Manuals RQ 4x120VDC-230VAC/5A NO MA ST; Edition 06/2020, RQ 4x120VDC-230VAC/5A NO ST, Edition 06/2020
Section 3.1 Wiring and block diagram

NOTICE
The relay channels have no integrated short-circuit protection. Provide external short-circuit protection in the form of a miniature fuse with a maximum tripping current of 6.3 A and a fast tripping characteristic. A breaking capacity of at least 1500 A is required for mains voltages. For all other applications and for supply networks with a short-circuit current greater than 1500 A, you need to use a miniature fuse with an appropriately adapted breaking capacity.

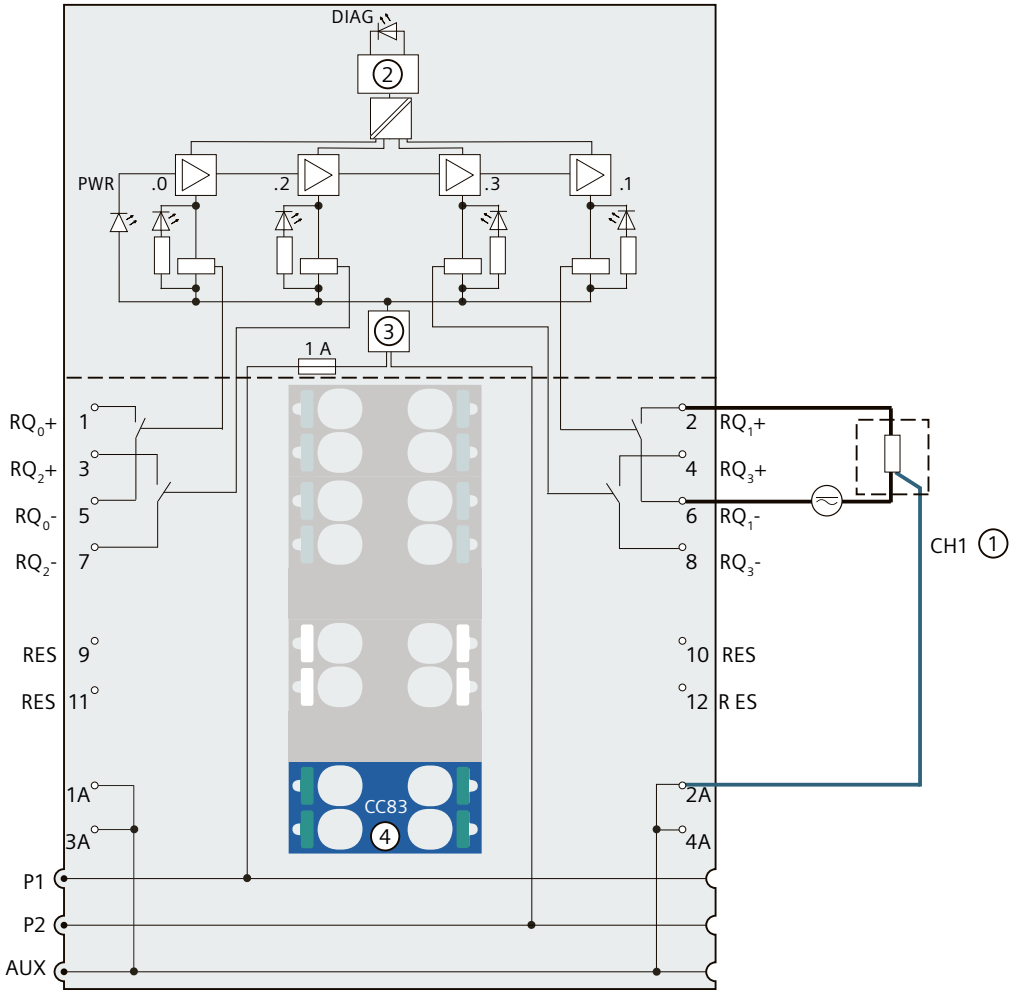
⚠ WARNING

Do not connect exposed extra-low-voltage (SELV/PELV) and dangerous live voltages between channels at the same time!
If you only use dangerously live voltages, keep a maximum voltage difference of 230 V between the channels.

Observe the information on the inductive DC loads in Section 6.1 "Technical specifications".

Section 6.1 Technical specifications

NOTICE



Required measures in the case of inductive DC loads and switching frequencies greater than 0.1 Hz
Install an external freewheel in the form of a diode for switching frequencies greater than 0.1 Hz.

Equipment Manual RQ 4x24VUC/2A CO ST, Edition 02/2019
Switching capacity and service life of contacts
The list shows the switching capacity and lifetime of the relay contacts:

- Resistive DC load 24VDC/1.0A: 0.5 million switching cycles (typical)
- Resistive DC load 24VDC/2.0A: 0.1 million switching cycles (typical)
- Resistive AC load 24V: 0.1 million switching cycles (typical)
- Mechanical service life (free of load): 100 million switching cycles (typical)

The voltage specifications are nominal voltages.

Section 3.1 Wiring and block diagram
Connection: 3-wire connection of actuators
The following figure shows the block diagram and an example of the pin assignment of the digital output module RQ 4x120VDC-230VAC/5A NO ST on the BaseUnit BU type B0.

①	3-wire connection	RES	Reserve, must remain unused for future function extensions
②	Backplane bus interface	1 A to 4 A	AUX terminals
③	Polarity reversal protection	DIAG	Diagnostics LED (green, red)

New Section 6.3 Mechanical environmental conditions
The mechanical ambient conditions are specified in the following table as sinusoidal oscillations.

Table 17 Test of mechanical environmental conditions

Condition tested	Test standard	Remarks
Vibrations	Vibration test according to IEC 60068-2-6 (Sinus)	Type of vibration: Frequency sweeps with a rate of change of 1 octave/minute. • 5 Hz ≤ f ≤ 8.4 Hz, 3.5 mm constant amplitude • 8.4 Hz ≤ f ≤ 150 Hz, 1 g constant acceleration Duration of oscillation: 10 frequency sweeps per axis, along each of the 3 mutually perpendicular axes
Shock	Shock, tested according to IEC 60068-2-27	Type of shock: Half-sine Shock intensity: 100 m/s^2 peak value, 11 ms duration Direction of shock: 3 shocks each in +/- direction, along each of the 3 perpendicular axes
Continuous shock	Shock, tested according to IEC 60068-2-27	Is not supported by the RQ module

Section 3.2 Connection examples
Any phase of the connected 3-phase system can be connected to the 4th measuring channel, not just the neutral conductor.

Section 3.1 Wiring and block diagram *and* section 3.2 Connection examples
Current transformer connection requirements
You must connect a current transformer to the infeed with K/P1 and to the ground/neutral point with L/P2.
The energy meter has the current transformer inputs ILx+ and ILx-. The current transformer on the secondary side via the outputs k/S1 and l/S2.
You must wire the k/S1 output of the current transformer to the ILx+ input of the energy meter. You must wire the output l/S2 of the current transformer to the input ILx- of the energy meter.

Chap. 4.2.1 Module versions at configuration with STEP 7
Module variants with fixed payload data assignment

Module version	Payload	Address space	Comment
2 I / 2 O	No cyclic payload. Access to measured values through "Read data record".	2-byte inputs 2-byte outputs	Information about the structure of the 2 I / 2 Q module version is available in the appendix "2 I / 2 Q" module version.
EE@Industry E0	Payload in accordance with EE@Industry measurement data profiles	12-byte inputs / 20-byte outputs	Information about the structure of the EE@Industry measured data profiles is available in the appendix Module version "EE@Industry measured data profile E0 / E1 / E2 / E3".
EE@Industry E1		4-byte inputs / 20-byte outputs	
EE@Industry E2		12-byte inputs / 20-byte outputs	

Section 7.2.4 Notes for the detection of wiring errors and incorrect rotating field
Based on the phase angle, you can recognize whether the flow direction of the current is correct and whether the voltage or current connections have been swapped. You cannot recognize, however, which phases are swapped and how. You can see whether the wiring is correct by referring to the figure "Quadrant in the quality bits" in section 7.2.3 "Operating quadrant".

Equipment Manual AI Energy Meter 480VAC ST, Edition 12/2015

For configuration with STEP 7 V13 or higher (TIA Portal), real values between -7x10^{28} and +7x10^{28} can be input. This is true for configuration via HSP and via GSD file (PROFINET).
For configuration with STEP 7 V5.5 SP4 as of HF7, configuration by means of GSD file (PROFINET) with REAL values of -1.175x10^{38} to +3.402x10^{38} is possible.
With STEP 7 SP4 to HF6, parameter assignment of REAL values is not possible. Functions that require REAL values are not available in this case.

Equipment Manuals AI Energy Meter 480VAC/CT HF, Edition 03/2021, and AI Energy Meter 480VAC/RC HF, Edition 03/2021

Below the "Measured variables for data records and user data" table in the section "Measured variables for connection type" it should correctly read in Italian:

[4] Valore medio aritmetico in virgola mobile calcolato su 10 s, disponibile se UL-N>3V

Section 7.2.2 "Quality information with measured value IDs"

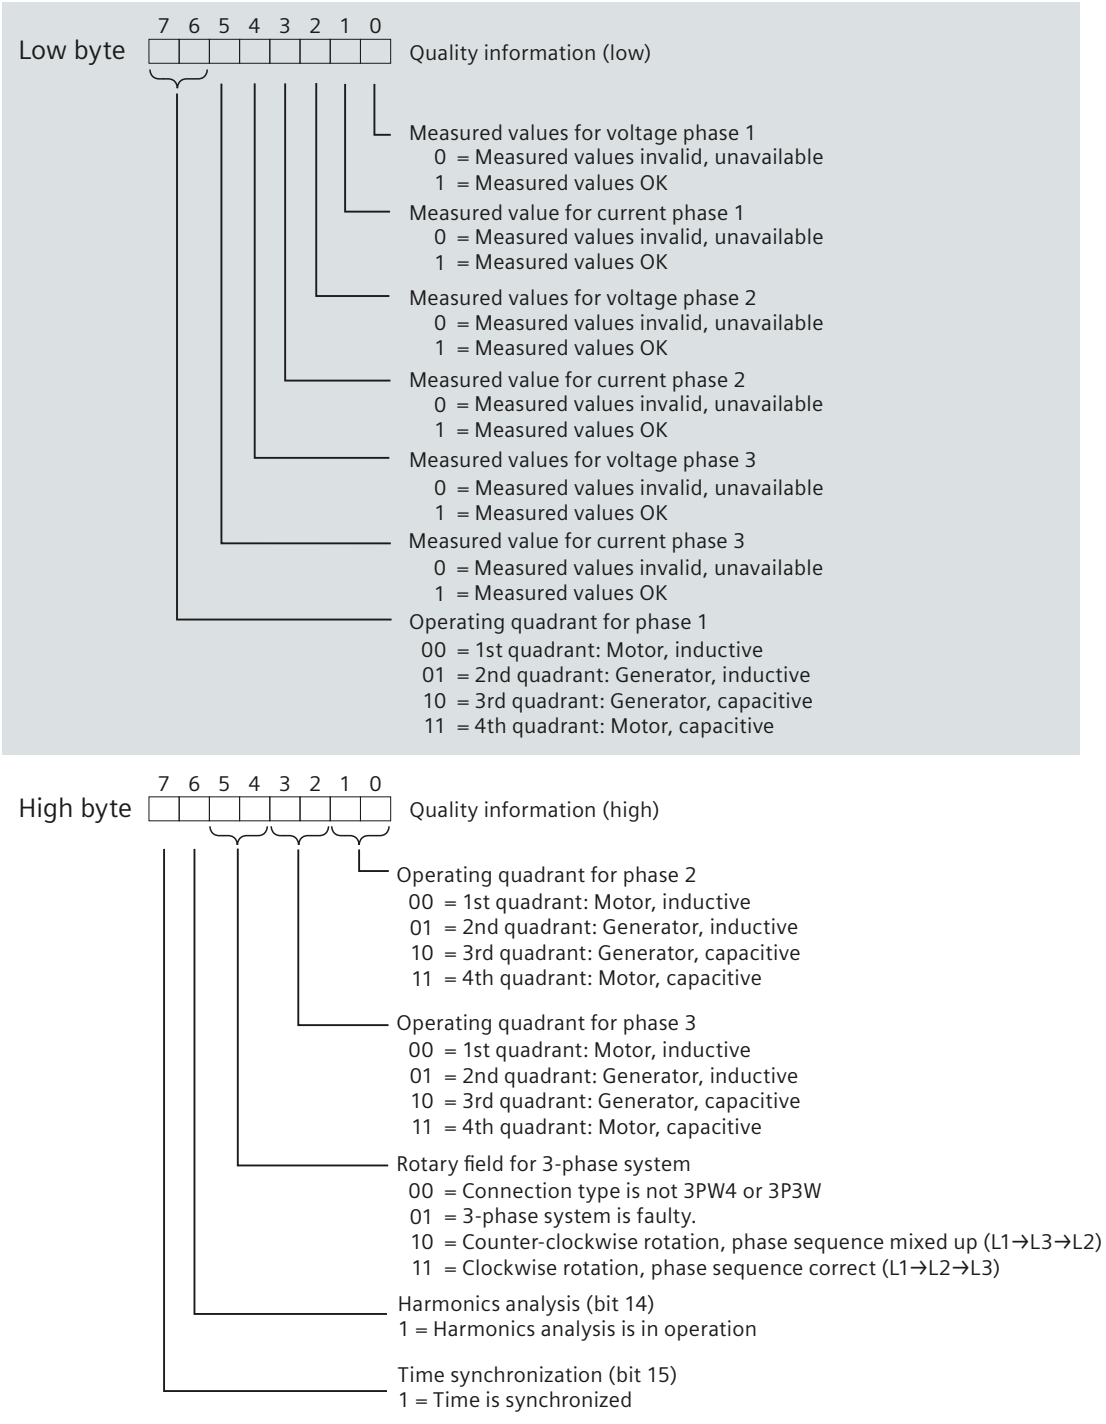

Figure 9 Quality information for low and high byte of the measured value ID 65503

Section "7.2.3 Operating quadrant"
The figure below shows the quality information of the operating quadrants.

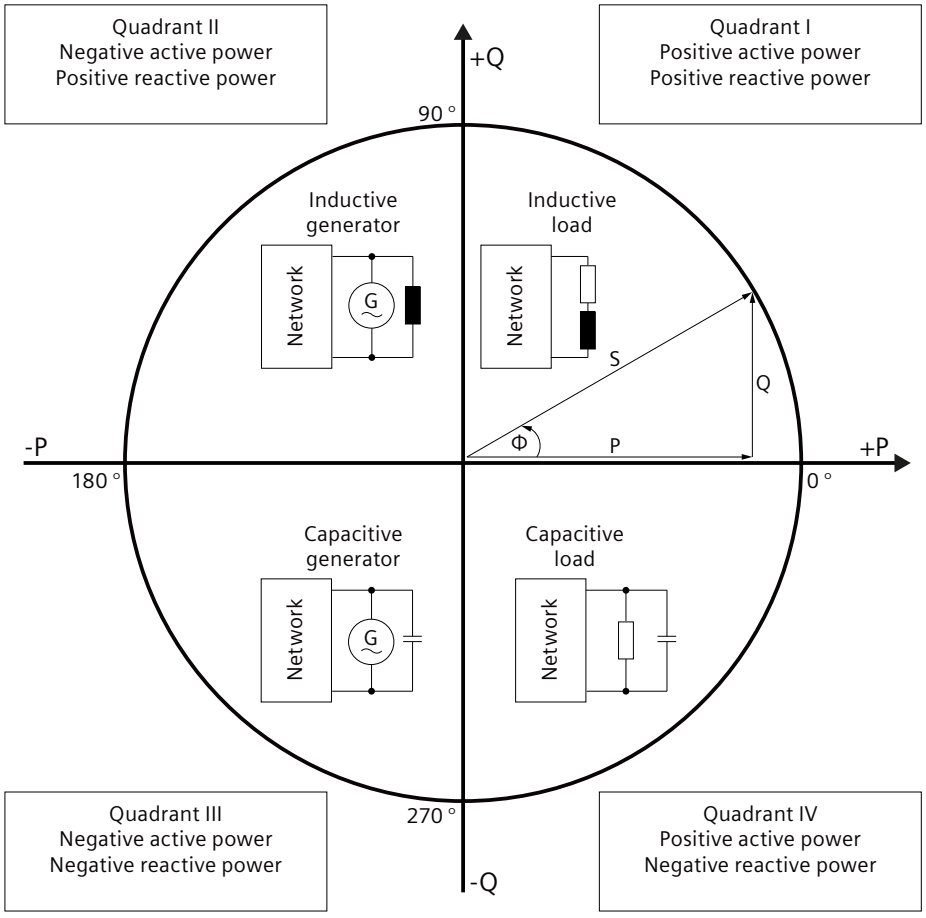

Figure 10 Quadrant in the quality bits

Section "7.2.4 Notes for the detection of wiring errors and incorrect rotating field"
Requirements
Detecting the rotating field requires 3-phase operation with 3P4W or 3P3W connection types.

The "See also" paragraph is omitted.

Section "8 Energy counter"
Introduction
"Outflow" describes the regenerative operation of the connected system.
"Inflow" describes the motor operation of the connected system.

Section 9.2.1 "Start values for operating hours counter"
Byte 158 ... byte 169: Start values for operating hours counter
The start values for operating hours counters in data record 143 are 32-bit floating point number. The format corresponds to the data type REAL in S7-1200 and in S7-1500.

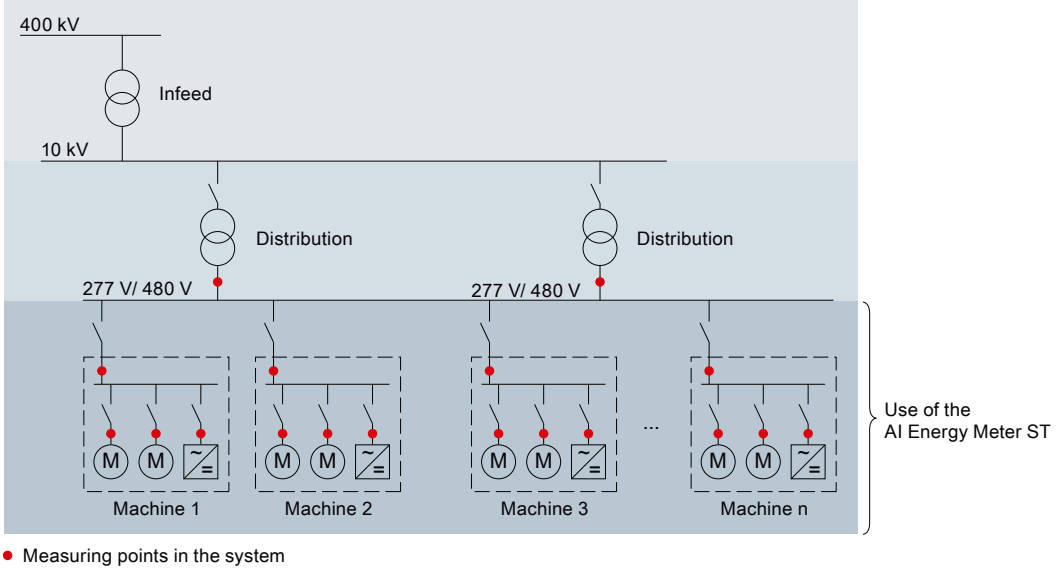
Appendix F.1 "Tips and tricks"
Rotating field
To recognize wiring errors and evaluate the generated rotating field, use the combined measurement functions from the section "Notes for the detection of wiring errors and incorrect rotating field".

Equipment Manuals AI Energy Meter 400VAC ST, Edition 12/2015; AI Energy Meter 480VAC ST, Edition 12/2015
Requirements for the operation of the AI Energy Meter on slot 1 of the ET 200SP:

Interface module / CPU	AI Energy Meter 400VAC ST (6ES7134-6PA01-0BD0)	AI Energy Meter 480VAC ST (6ES7134-6PA20-0BD0)
IM 155-6 PN BA (6ES7155-6AR00-0AN0)	Can be operated on slot 1 for all IM 155-6 PN BA	
IM 155-6 PN ST (6ES7155-6AU00-0BN0)	Can be operated on slot 1 for IM 155-6 PN ST from firmware version V3.1 and higher and functional status FS 07	
IM 155-6 PN HF (6ES7155-6AU00-0CN0)	Can be operated on slot 1 for IM 155-6 PN HF from firmware version V3.0 and higher and functional status FS 05	
IM 155-6 DP HF (6ES7155-6BU00-0CN0)	Can be operated on slot 1 for IM 155-6 DP HF from firmware version V3.0 and higher	
CPU 1510SP-1 PN, CPU 1512SP-1 PN, CPU 1515SP PC	Can be operated on slot 1 for all CPUs	

Incorrect value range for information on power (INT variables)
Refers to the table of measured quantities in Appendix B and the tables of useful data variants in Appendix D.
Correct value range: -32768 to 32767

Product overview, Figure 2-1 Use of the AI Energy Meter
Display incorrect.
Replace figures as follows:



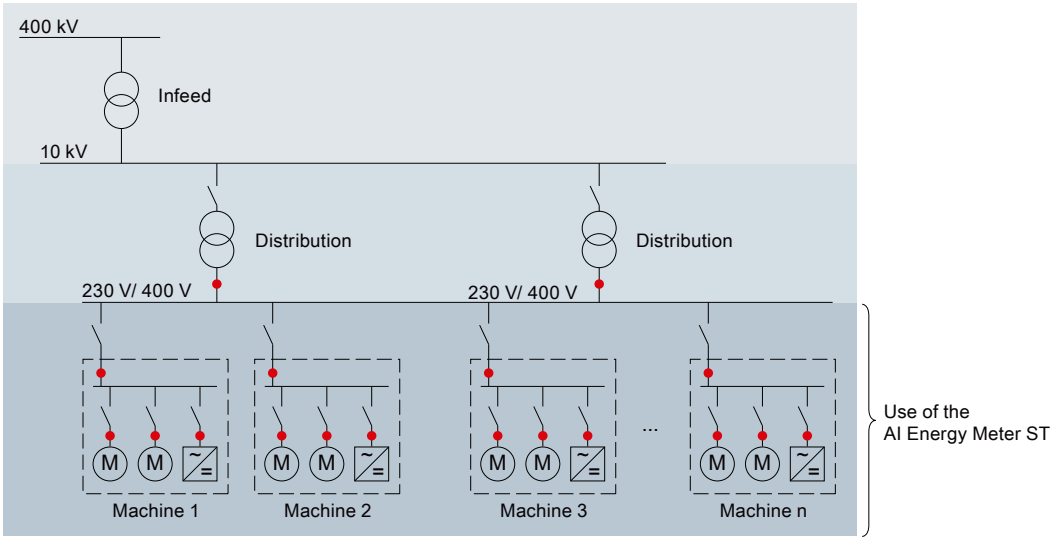


Figure 11 Use of the AI Energy Meter 480VAC ST

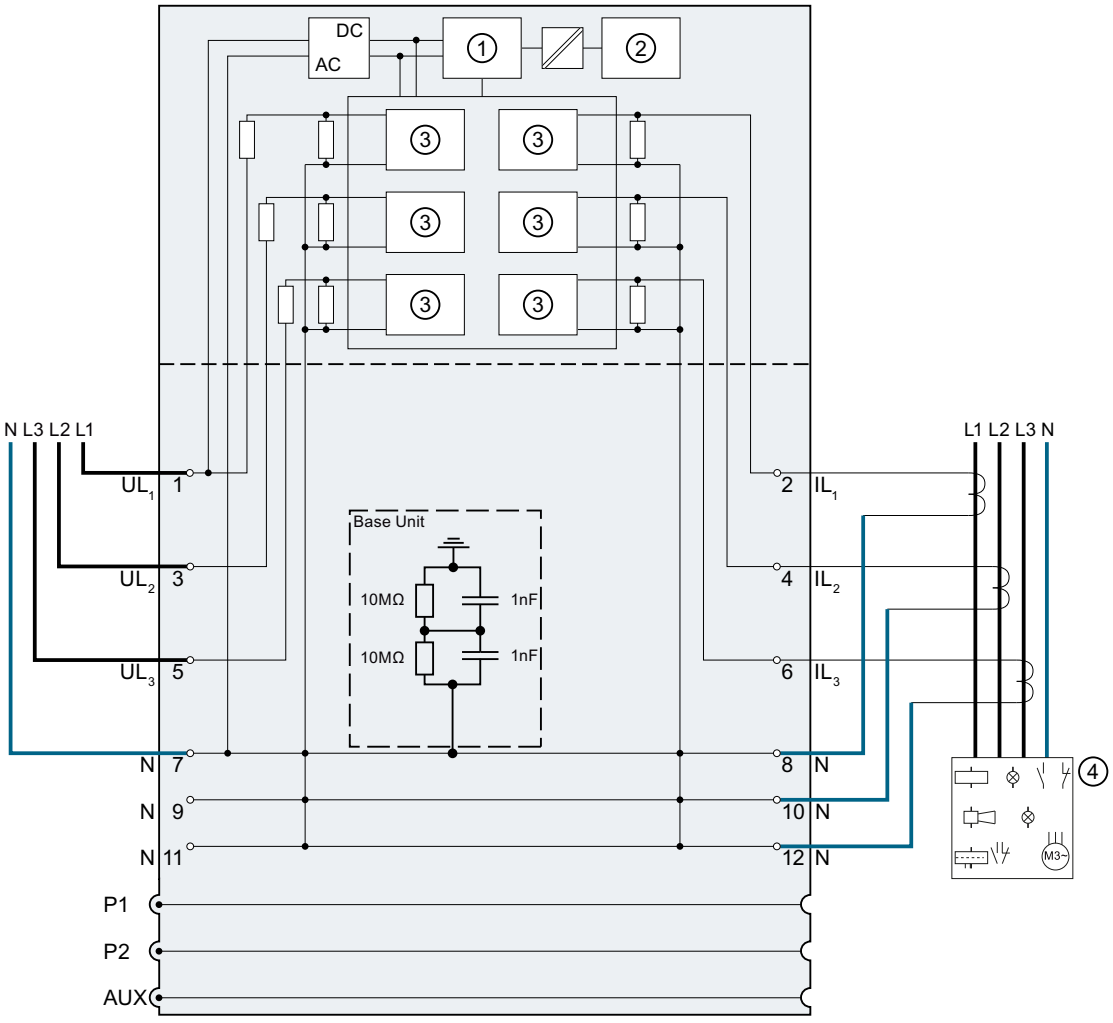

● Measuring points in the system

Figure 12 Use of the AI Energy Meter ST 400V

Section 3.1 Wiring and block diagram, paragraph on Fuse protection of the connection lines
AI Energy Meter 400VAC ST, replace set with:
If the cables are short-circuit proof according to IEC 61439-1:2009, e.g. in a conduit or on separate cable trays, separate line protection for the AI Energy Meter 400VAC ST can be omitted.
AI Energy Meter 480VAC ST, replace set with:
If the cables are short-circuit proof according to IEC 61439-1:2009, e.g. in a conduit or on separate cable trays, separate line protection for the AI Energy Meter 480VAC ST can be omitted.

Section 3.1 Wiring and block diagram, Figure 3-1
Replace wiring diagram, add note:

①	Microcontroller	UL_n	Voltage connection
②	Backplane bus interface	IL_n	Current connection
③	Analog-to-digital converter (ADC)	N	Neutral conductor
④	Power measurement		

Figure 13 Block diagram of the AI Energy Meter 480VAC ST

NOTE

The BaseUnit of the Energy Meter 400/480VAC, 6ES7193-6BP00-0BD0, BU20-P12+A0+0B, contains a connection from N to FE, or to the potential connected to the DIN rail. This connection consists of two Y2 capacitors in series, each with a capacitance of 1 nF, and two resistors in parallel, each with a resistance of 10 MOhm.

Equipment Manual for Energy Meter 480VAC ST, Edition 12/2015
In the Equipment Manual for Energy Meter 480VAC ST, the measured value ID and the associated measured variables for the complete performance are reversed. The correct association is shown in the table below:

Measured value ID	Measured variables	Unit
34	Total active power L1L2L3	W
35	Total reactive power L1L2L3	var
36	Total apparent power L1L2L3	VA
65	Max. total active power	W
66	Max. total reactive power	var
67	Max. total apparent power	VA
95	Min. total active power	W
96	Min. total reactive power	var
97	Min. total apparent power	VA

If you use the user-data mapping via data record DS 130, note that the texts for the measured variables are also displayed incorrectly during configuration.
During configuration of the measured variables for the total active, reactive, and apparent power, select the following texts:

Desired measured variable for the user-data mapping	Text to select during configuration
Total active power L1L2L3	Total apparent power L1L2L3 (ID00034)
Total reactive power L1L2L3	Total active power L1L2L3 (ID00035)
Total apparent power L1L2L3	Total reactive power L1L2L3 (ID00036)
Max. total active power	Max. total apparent power (ID00065)
Max. total reactive power	Max. total active power (ID00066)
Max. total apparent power	Max. total reactive power (ID00067)
Min. total active power	Min. total apparent power (ID00095)
Min. total reactive power	Min. total active power (ID00096)
Min. total apparent power	Min. total reactive power (ID00097)

The project configuration modification described above is no longer required if the following tools and GSD files are used:
- STEP 7 (TIA Portal) as of V14
- STEP 7 V5.5 SP4 or higher with HSP 0227
- GSD file GSDML-V2.32-ET200SP-20160706

Section 11.1 Phase-related measured values
Assignment of the user data variants swapped between L1 and L3.
Correct assignment:
- Phase-specific measurement Phase L1 with user data variants 158 ($9E_H$) and 159 ($9F_H$)
- Phase-specific measurement Phase L2 with payload variants 156 ($9C_H$) and 157 ($9D_H$)
- Phase-specific measurement Phase L3 with user data variants 154 ($9A_H$) and 155 ($9B_H$)

Appendix D User data variants
Table D-13 Basic energy counter measurement variables (periodic) Overflow counter (ID 239 or EFH).
Replace measured value IDs:

Table 21 Basic energy-counter-measurement variables (periodic) overflow counter

Byte	Allocation	Data type	Unit	Value range	Measured value ID
0	Payload variant	BYTE	-	239 (EFH)	-
1	Quality information = QQ_1 I_3 U_3 I_2 U_2 I_1 U_1	BYTE	Bit string	qq xx xx xx	-

Byte	Allocation	Data type	Unit	Value range	Measured value ID
2 ... 3	Overflow counter for active energy inflow L1	UINT	-	0 ... 65535	61190

AI 4xI 2/4-wire ST (6ES7134-6GD01-0BA1)	09/2018
AI 4xTC HS (6ES7134-6JD00-0DA1)	03/2019

"Diagnostic messages" section
Diagnostic messages in the measured value of analog input modules
Each analog input module supplies the measured value $7FFF_H$ or 8000_H depending on the parameter assignment when an error is detected.

Equipment Manual AI 4xTC HS (6ES7134-6JD00-0DA1)
New section in Appendix B: "Measured values for wire break and reference channel mode"

Table 23 Measured values for a wire break depending on enabled diagnostics and parameters in TC operating mode

Parameters			Measured value		Explanation
Wire break check	Diagnostics wire break	Diagnostics underflow			
Enable	Enable	*	32767	$7FFF_H$	The "wire break" diagnostics is reported.
Enable	Disable	*	32767	$7FFF_H$	No diagnostics reported. A wire break check is carried out (i.e. test current flows).
Disable	Disable	*	Undefined		No "wire break" diagnostics is reported. No wire break check is carried out (i.e. no test current flows). This is required to calibrate thermocouples, since the test current necessary for a wire break check leads to measurement errors during calibration.

* Parameter assignment not relevant

Table 24 Measured values for a wire break in a TC measurement with enabled reference junction (reference channel) depending on enabled diagnostic information and parameters

Case	Parameters					Measured value			
	Reference channel		TC channel			Reference channel		TC channel	
	Diagnostics Wire break	Diagnostics underflow	Wire break check	Diagnostics wire break	Diagnostics underflow				
1	Enable[3]	*[3]	*	*	*[1]	32767[3]	$7FFF_H$[3]	32767[2]	$7FFF_H$[2]
2	Disable[3]	*[3]	*	*	*[1]	32767[3]	$7FFF_H$[3]	32767[2]	$7FFF_H$[2]
3	*	*	Enable[3]	Enable[3]	*[3]	Valid	Valid	32767[3]	$7FFF_H$[3]
4	*	*	Enable[3]	Disable[3]	*[3]	Valid	Valid	32767[3]	$7FFF_H$[3]
5	*	*	Disable[3]	Disable[3]	*[3]	Valid	Valid	Undefined[3]	

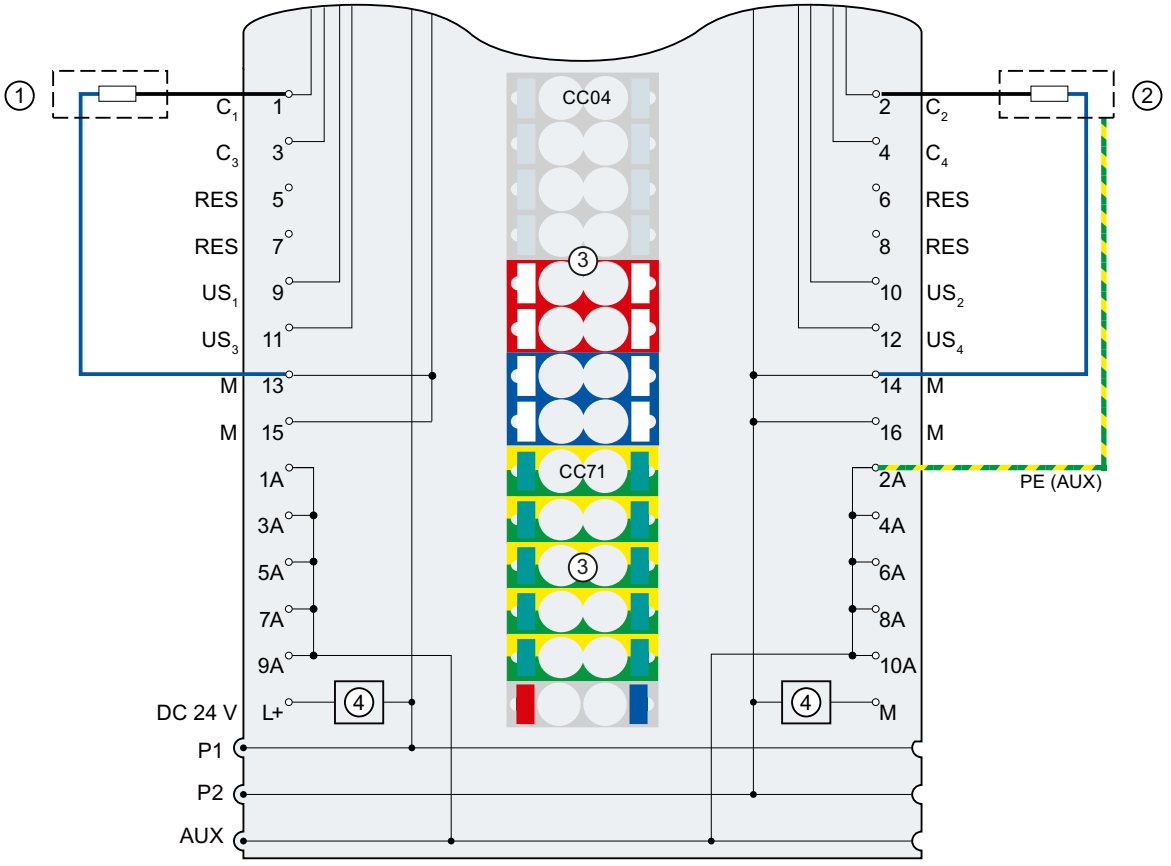
* Parameter assignment not relevant

1 Diagnostics is suppressed in the event of a reference channel error.

2 Measured value taken from the reference channel

3 Channel with line break

Explanations of the cases:



Case	Reference channel	TC channel
1	The "wire break" diagnostics is reported. This has a higher priority than the "Underflow" diagnostics.*	The "Reference channel error" diagnostics is reported if this is enabled. Where own pending diagnostic information ("overflow" or "underflow") is reported as outgoing. Wire break diagnostics is detected independently of the measured value and has the same priority as the "Reference channel error" diagnostics. Both items of diagnostic information can be pending simultaneously. The measured value of the reference channel (RTD channel) is adopted for the TC channel. The validity of the measured value of the TC channel is irrelevant.
2	No diagnostics reported. A wire break check is carried out (i.e. test current flows).*	*Behavior corresponds to case 1*.
3	*(Measured values are in the valid measuring range)*	The "wire break" diagnostics is reported.*
4	*(Measured values are in the valid measuring range)*	No diagnostics reported. A wire break check is carried out (i.e. test current flows).*
5	*(Measured values are in the valid measuring range)*	No "wire break" diagnostics is reported. No wire break check is carried out (i.e. no test current flows). This is required to calibrate thermocouples, since the test current necessary for a wire break check leads to measurement errors during calibration.*

* Channel with wire break

Communications module manuals

Communications module CM DP, Edition 12/2014
The communications module CM DP supports the PROFIsafe protocol V2.
Exception: Fail-safe modules that only support PROFIsafe V1 mode.

Communications module IO-Link Master CM 4xIO-Link, Edition 10/2017
Section "Connecting, Wiring and block diagram"
Connection: 2-wire and 3-wire connection in DQ operating mode:

①	2-wire connection	1 A ... 10 A	AUX terminals
②	3-wire connection	PE (AUX)	Protective conductor connection
③	Color-coded labels with color code CC04 and CC71 (optional)	P1, P2, AUX	Internal self-assembling voltage buses Connection to the left (dark-colored BaseUnit) Connection to the left interrupted (light-colored BaseUnit)
④	Supply voltage filter circuit (only when light-colored BaseUnit is present)	C_n	Communication signal, DI, DQ
24 V DC	Supply voltage L+ (infeed for light-colored BaseUnit only)	RES	Reserved, must not be assigned
M	Ground	US_n	Supply voltage (positive)

Figure 14 Terminal assignment for 2-wire and 3-wire connection in DQ operating mode

Section "Replacement of the IO-Link Master CM 4xIO-Link communication module with an electronic coding element type H"
The "IO_LINK_MASTER" function block is now called "LIOLink_Master".

Using ET 200SP higher than 2 000 m above sea level.

Ambient temperature and installation altitude

Extension of the temperature range and the installation altitude

The previously permissible ambient temperature range of **0 °C** to 60 °C has been extended for a large number of modules to an ambient temperature range of **-30 °C** to 60 °C or **-25 °C** to 60 °C (in each case without condensation or icing). In addition, depending on the module, the permitted installation altitudes has been extended to installation heights of up to 5 000 meters.
The accessory components offered for ET 200SP (labeling strips, shield terminals, mounting rails, front connectors, etc.) can also be used down to -30 °C and for altitudes up to 5 000 m.
The following tables show an overview of the current climatic ambient conditions for ambient temperature and installation altitude of modules of the ET 200SP product family. For modules that are not listed, the current information in the "Technical specifications" section of the corresponding Equipment Manual applies.

Reference
You can find the current status of the respective modules in the technical specifications published online.
In general, the module-dependent extended climatic operating conditions are described in the "Technical specifications" section of the respective modules in the Equipment Manuals.
Constraints on operating ET 200SP at altitudes > 2 000 m are described in SIMATIC ET 200SP Distributed I/O System (https://support.industry.siemens.com/cs/ww/en/view/58649293).

Shipping and storage conditions for modules
ET 200SP meets the requirements of IEC 61131-2 regarding transport and storage conditions. The following information applies to modules that are shipped and/or stored in their original packaging.

Type of condition	Permitted range
Air pressure	1140 to 540 hPa (corresponds to an altitude of -1 000 to 5 000 m above sea level)

Listing of the modules

Information on PFDavg, PFH values for ET 200SP fail-safe I/O modules

The safety parameters specified in the Equipment Manual of the fail-safe I/O module ET 200SP (PFD_{avg}, PFH values) already reflect the influence of higher cosmic radiation (soft error rate) for operation up to 4 000 m above sea level.

[1] Packaging unit: Pack of 5

Restrictions

Restrictions of the max. ambient temperature specified with regard to the installation altitude

Installation altitude	Derating factor for ambient temperature [1]
-1 000 to 2 000 m	1.0
2 000 to 3 000 m	0.9
3 000 to 4 000 m	0.8
4 000 to 5 000 m	0.7

[1] Base value for the application of the derating factor is the maximum permissible ambient temperature in °C for 2 000 m

NOTE

- Linear interpolation between altitudes is permissible.
- The derating factors compensate for the decreasing cooling effect of air at higher altitudes due to lower density.
- Note the mounting position of the respective module in the technical specifications. This is based on the IEC 61131-2 standard.
- Make sure that the power supplies you use are also rated for altitudes > 2 000 m.
- The "Safety-related shutdown of standard modules" function, as described in the Internet (https://support.industry.siemens.com/cs/ww/en/view/39198632), is only approved up to a maximum of 2 000 m.

Effects on availability

The higher cosmic radiation present during operation at altitudes over 2 000 m above sea level also starts to have an effect on the error rate of electronic components (referred to as the soft error rate). In rare cases, this can result in a transition of the module into the safe state, especially for Safety Modules. However, the functional safety of the module is fully retained.

NOTE

Information printed on the ET 200SP automation system components

The markings and approvals printed on the components of the ET 200SP automation system are currently based on operation at an altitude of up to 2 000 m above sea level. The fail-safe modules are certified for operation in safety mode up to the maximum altitudes indicated in the tables (As certified by the German Technical Inspectorate (https://support.industry.siemens.com/cs/us/en/view/109825198)).

SIEMENS

Distributed I/O system ET 200SP

Compact Operating Instructions
Original instructions

1 Notes on Safety and Product Conformity

Function
SIMATIC products control, regulate and monitor applications in automation systems, for example in the field of industrial automation technology and process engineering.

EU and UK Declaration of Conformity

- You can find the EU Declaration of Conformity here on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/14031/cert?ct=444&ci=526).
- You can find the UK Declaration of Conformity here on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/14031/cert?ct=444&ci=5596).
- You can find the EU Declaration of Conformity for SIPLUS and SIPLUS RAIL here on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/18161/cert?ct=444&ci=526).
- You can find the UK Declaration of Conformity for SIPLUS and SIPLUS RAIL here on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/18161/cert?ct=444&ci=5596).

Firmware
You will find the latest firmware versions (for devices that support a firmware update) on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109804718).

Documentation
The complete documentation consists of product information, the system manual, equipment and function manuals. You can find these in the Manual Collection (https://support.industry.siemens.com/cs/ww/en/view/84133942) on the Internet.

Retention of the documentation
Retain this documentation for later use.

1. Download the documentation after receiving your product and before initial installation/commissioning.
2. Retain this version of the documentation.

Updating the documentation
The documentation of the product is updated in digital form. In particular in the case of function extensions, the new performance features are provided in an updated version.

1. Download the current version as described above.
2. Also retain this version of the documentation.

© Siemens AG 2022 - 2024. All rights reserved

Intended use
SIMATIC products are intended for use in industry. If you plan to use the product in a different environment, check the conditions required for such use.
The product may be operated only by personnel qualified for the specific task in accordance with the relevant documentation, in particular its warning notices and safety information. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products.

⚠ WARNING

Intended use
SIMATIC products are intended for automation of machine plants, process control and process engineering. Refer to the associated documentation (https://support.industry.siemens.com/cs/ww/en/view/84133942) to learn about the intended area of application of the respective product (e.g. ambient conditions, possible use in safety-critical systems).
If third-party products and components are used, these have to be recommended or approved by Siemens.
Proper transport, proper storage, setup, assembly/disassembly, installation, commissioning, operation, maintenance and decommissioning are required to ensure that the product and its accessories operate safely and without any problems.
Non-observance may result in death or serious physical injury.
Read the notes in the corresponding documentation (https://support.industry.siemens.com/cs/ww/en/view/84133942)**.**

Observe the ambient conditions for intended operation as described in the "Technical specifications" section of the associated documentation.

⚠ WARNING

Connection of the power supply
The power supply may only be connected by qualified and authorized personnel. In particular, observe the information in the documentation (https://support.industry.siemens.com/cs/ww/en/view/84133942) and on the nameplate of the device.

NOTE
The power supply must be connected by the operator/user in accordance with the national regulations regarding installation.

⚠ WARNING

Danger from voltage/current!
Only perform assembly and disassembly work when the device is de-energized.
Only install products with IP20 degree of protection according to IEC 60529 in enclosures, cabinets, or electrical equipment rooms suitable for the end use that meet at least this degree of protection.

⚠ WARNING

Electric shock due to externally supplied plant units
Even if the main supply to the plant is disconnected, externally supplied plant units can continue to carry voltage. An electric shock on contact with live parts can lead to death or serious injury.
Therefore, ensure that the plant is completely disconnected from the power supply before starting work. This means that all externally supplied plant units must also be disconnected from the power supply.

⚠ WARNING

Electric shock due to permissible electric potential difference

Due to the permissible electric potential difference, a dangerous voltage may be present at the inputs of modules. An electric shock on contact with live parts can lead to death or serious injury.

Therefore, ensure that the plant is completely disconnected from the power supply before starting work. This means that all externally supplied plant units must also be disconnected from the power supply.

⚠ WARNING

Safety functional extra low voltage

The product must be operated with safety functional extra low voltage (SELV, PELV). You can find more information on safety functional extra low voltage in the documentation (https://support.industry.siemens.com/cs/ww/en/view/84133942) of the fail-safe I/O and in the data sheets of the power supplies to be used.

Use a power supply unit with output voltage that does not exceed 36 V DC even in the event of a fault.

Observe the maximum permissible switching conditions specified in the equipment manual for F-RQ modules.

Follow the notes and warnings in the respective equipment manual.

⚠ CAUTION

BusAdapters for fiber-optic cables contain a laser system and are classified as a "CLASS 1 LASER PRODUCT" in accordance with IEC 60825-1.

Can cause personal injury.

Avoid eye contact with the laser beam. Do not open the housing. Read the information in the documentation (https://support.industry.siemens.com/cs/ww/en/view/84133942).

⚠ WARNING

Personal injury due to uncontrolled movement

When using Motion Control, uncontrolled movements can occur which result in personal injury of unknown extent.

Follow the safety instructions described in the Motion Control function manuals (https://support.industry.siemens.com/cs/ww/en/view/84133942).

Electromagnetic Compatibility

The product is intended for operation in the Industrial EMC environment class.

Ensure that your automation system is installed in compliance with EMC requirements, as described in the documentation (https://support.industry.siemens.com/cs/ww/en/view/84133942) for the product.

NOTICE

Interference emission / Interference immunity

Operation of the product can cause radio interference in residential areas.

If higher EMI is expected at the place of use than is intended for the industrial area according to EN61000-6-2, additional measures are required (e.g. ESD, overvoltage protection).

ATEX-/UKEX device intended for use in hazardous area
If the product is intended for use in a potentially explosive atmosphere (gas/air or gas/dust mixture), observe the special information in the documentation (https://support.industry.siemens.com/cs/ww/en/view/84133942). The intended use (e.g. ATEX zone, degree of protection, temperature class) is indicated on the product (in the declaration of conformity and usually also on the nameplate).

NOTE
As a rule, country-specific requirements for the operator also apply when a product is used in a potentially explosive atmosphere (e.g. Directive 1999/92/EC for the EU).

Safety in potentially hazardous atmospheres
SIMATIC systems are suitable for use in zones with occasional presence of hazardous gas atmospheres (equipment group II, Cat. 3, gases, vapors, mists). You can find information, restrictions and special conditions in the respective system manuals. To avoid damage, determine a suitable installation location and select suitable products. It is mandatory to define the following points before planning your automation system:

- Hazardous plant areas
- Potentially existing atmosphere
- Relevant requirements for the products

⚠ WARNING
Explosion hazard
If work in areas with potentially hazardous atmospheres is not carried out correctly, an explosion may occur. Explosions can lead to serious personal injury or damage to the plant.
Only suitably qualified specialists are allowed to plan and perform activities in areas with potentially hazardous atmospheres. In hazardous areas, always de-energize the SIMATIC system before starting activities.

Cleaning
If you need to clean the product, use dry ESD cleaning cloths (observing the protective measures for ESD).
Requirement: All supply voltages present on the device are switched off. Observe the five safety rules for working in and on electrical installations.

Maintenance and repair
The product is maintenance-free. Repairs to the product may only be carried out by the manufacturer.

Recycling and disposal
For environmentally sustainable recycling and disposal of your electronic waste, contact a company certified for the disposal of electronic waste. Dispose of the product in accordance with the applicable regulations in your country.

Accessories
You can find information on the approved accessories in the documentation (https://support.industry.siemens.com/cs/ww/en/view/84133942).

Functional safety

⚠ WARNING
Danger to humans and the environment
To avoid danger to people and the environment, under no circumstances may you bypass safety functions or take measures that amount to or result in bypassing safety functions. The manufacturer is not liable for the consequences of such manipulation or for damages resulting from the failure to heed this warning.

Perform a safety inspection for safety-related functions throughout the entire system, including all safety-related components.

For fail-safe I/O, observe the notes and warnings in the documentation (https://support.industry.siemens.com/cs/ww/en/view/84133942) especially for:

- Connecting/wiring
- Parameter assignment
- Status, fault displays and alarms
- Maintenance (recurring tests, software/firmware updates)
- Checking for proper function
- Technical specifications

You can find use cases for achieving the required safety class (SIL) in the documentation (https://support.industry.siemens.com/cs/ww/en/view/84133942).

⚠ WARNING

Check the firmware version for fail-safe approval
When using a new firmware version, check whether it is approved for the respective device.
The attachments of the certificate (https://support.automation.siemens.com/WW/view/en/49368678/134200) for SIMATIC Safety specify the firmware version that is approved.

Ensure that fail-safe capability is enabled for F-CPUs.
The PROFIsafe address must be set or assigned for fail-safe I/O.
Perform function tests for safety functions according to your automation task. They may only be used in production when the correct operation of the safety-related functions is ensured.

⚠ WARNING

Unexpected malfunctions of machines caused by radio devices/cell phones
Malfunctions are possible when radio devices or cell phones are used in the direct proximity of F-I/O. This can result in death, serious injury or property damage.
If you scan the 2D matrix code/ID Link or use the "SIEMENS Industry Support App" with a powered-on F-I/O, then deactivate all radio connections of the radio device/cell phone beforehand. Alternatively, power off the F-I/O before scanning.
Power off radio devices in the immediate proximity of the F-I/O.

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines, and networks.
In order to protect plants, systems, machines, and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.
Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.
For more information on protective industrial cybersecurity measures for implementation, please visit (https://www.siemens.com/global/en/products/automation/topic-areas/industrial-cybersecurity.html).
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.
To stay informed about product updates at all times, subscribe to the Siemens Industrial Cybersecurity RSS Feed under (https://new.siemens.com/global/en/products/services/cert.html).

Purpose of the documentation

This device manual complements the system manual ET 200SP distributed I/O system. You can find functions that generally relate to the ET 200SP system in the system manual ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293).

The information provided in this device manual and the system manual enables you to commission the ET 200SP distributed I/O system.

Conventions

Note the following identified notes:

NOTE

A note includes important information on the product described in the documentation, on handling the product or on the part of the documentation to which you ought to pay special attention.

Important note for maintaining the operational safety of your plant

NOTE

Plants with safety-related features are subject to special operational safety requirements on the part of the operator. The supplier is also obliged to comply with special product monitoring measures. For this reason, we inform you in personal notifications about product developments and features that are (or could be) relevant to the operation of plants from a safety perspective.

You should subscribe to the corresponding notifications in order to obtain the latest information and to allow you to make any necessary modifications to your system.

1.1 ET 200SP documentation guide

1.1.1 Information classes ET 200SP

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.

This arrangement enables you to access the specific content you require.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Basic information

The System Manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP distributed I/O system.

The STEP 7 online help supports you in the configuration and programming.

Examples:

- ET 200SP System Manual
- System Manual ET 200SP HA/ET 200SP modules for devices used in a hazardous area
- Online help TIA Portal

Device information

Equipment manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

Examples:

- Equipment Manuals CPUs
- Equipment Manuals Interface Modules
- Equipment Manuals Digital Modules
- Equipment Manuals Analog Modules
- Equipment Manuals Motor Starter
- BaseUnits Equipment Manuals
- Equipment Manual Server Module
- Equipment Manuals Communications Modules
- Equipment Manuals Technology Modules

General information

The function manuals contain detailed descriptions on general topics relating to the SIMATIC ET 200SP distributed I/O system.

Examples:

- Function Manual ET 200AL/ET 200SP Mixed Configuration
- Function Manual Diagnostics
- Function Manual Communication
- PROFINET Function Manual
- PROFIBUS Function Manual
- Function Manual Designing Interference-free Controllers
- MultiFieldbus Function Manual

Product Information

Changes and supplements to the manuals are documented in a Product Information. The Product Information takes precedence over the device and system manuals.

You can find the latest Product Information on the ET 200SP distributed I/O system on the Internet. (https://support.industry.siemens.com/cs/de/en/view/73021864)

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet.
(https://support.industry.siemens.com/cs/cn/en/view/84133942)

Manual Collection fail-safe modules

The Manual Collection contains the complete documentation on the fail-safe SIMATIC modules, gathered together in one file.

You can find the Manual Collection on the Internet.
(https://support.industry.siemens.com/cs/ww/en/view/109806400)

1.1.2 Basic tools

Tools

The tools described below support you in all steps: from planning, over commissioning, all the way to analysis of your system.

TIA Selection Tool

The TIA Selection Tool tool supports you in the selection, configuration, and ordering of devices for Totally Integrated Automation (TIA).

As successor of the SIMATIC Selection Tools , the TIA Selection Tool assembles the already known configurators for automation technology into a single tool.

With the TIA Selection Tool , you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet.
(https://support.industry.siemens.com/cs/ww/en/view/109767888)

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities on various SIMATIC S7 stations as bulk operations independent of TIA Portal.

The SIMATIC Automation Tool offers a wide range of functions:

- Scanning of a PROFINET/Ethernet system network and identification of all connected CPUs
- Assignment of addresses (IP, subnet, Gateway) and device name (PROFINET device) to a CPU
- Transfer of the date and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- RUN/STOP mode switchover
- CPU localization through LED flashing
- Reading out of CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Firmware update of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet.
(https://support.industry.siemens.com/cs/ww/en/view/98161300)

PRONETA

SIEMENS PRONETA (PROFINET network analysis) is a commissioning and diagnostic tool for PROFINET networks. PRONETA Basic has two core functions:

- In the network analysis, you get an overview of the PROFINET topology. Compare a real configuration with a reference installation or make simple parameter changes, e.g. to the names and IP addresses of the devices.
- The "IO test" is a simple and rapid test of the wiring and the module configuration of a plant, including documentation of the test results.

You can find SIEMENS PRONETA Basic on the Internet:
(https://support.industry.siemens.com/cs/ww/en/view/67460624)

SIEMENS PRONETA Professional is a licensed product that offers you additional functions. It offers you simple asset management in PROFINET networks and supports operators of automation systems in automatic data collection/acquisition of the components used through various functions:

- The user interface (API) offers an access point to the automation cell to automate the scan functions using MQTT or a command line.
- With PROFIenergy diagnostics, you can quickly detect the current pause mode or the readiness for operation of devices that support PROFIenergy and change these as needed.
- The data record wizard supports PROFINET developers in reading and writing acyclic PROFINET data records quickly and easily without PLC and engineering.

You can find SIEMENS PRONETA Professional on the Internet.
(https://www.siemens.com/proneta-professional)

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and the optimal use of resources

You can find SINETPLAN on the Internet
(https://new.siemens.com/global/en/products/automation/industrial-communication/profinet/sinetplan.html).

1.1.3 S7 Failsafe Configuration Tool (S7-FCT)

SIMATIC S7-FCT

Failsafe Configuration Tool (FCT) enables you to GSD configure the following devices in third-party engineering systems:

- Selected, functionally fail-safe SIMATIC I/O devices
- Functionally fail-safe SIRIUS ACT PROFINET interfaces

The engineering system must meet the following requirements for this:

- Support of the CPD system integration acc. to "PROFIsafe - Profile for Safety Technology on PROFIBUS DP and PROFINET IO"
- TCI implementation to Conformance Class C3

Additional information on S7-FCT can be found on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109762827).

1.1.4 SIMATIC Technical Documentation

Additional SIMATIC documents will complete your information. You can find these documents and their use at the following links and QR codes.

The Industry Online Support gives you the option to get information on all topics. Application examples support you in solving your automation tasks.

Overview of the SIMATIC Technical Documentation

Here you will find an overview of the SIMATIC documentation available in Siemens Industry Online Support:

Industry Online Support International (https://support.industry.siemens.com/cs/ww/en/view/109742705)

Watch this short video to find out where you can find the overview directly in Siemens Industry Online Support and how to use Siemens Industry Online Support on your mobile device:

Quick introduction to the technical documentation of automation products per video (https://support.industry.siemens.com/cs/us/en/view/109780491)

YouTube video: Siemens Automation Products - Technical Documentation at a Glance (https://youtu.be/TwLSxxRQQsA)

Retention of the documentation

Retain the documentation for later use.

For documentation provided in digital form:

1. Download the associated documentation after receiving your product and before initial installation/commissioning. Use the following download options:
   - Industry Online Support International: (https://support.industry.siemens.com)
     The article number is used to assign the documentation to the product. The article number is specified on the product and on the packaging label. Products with new, non-compatible functions are provided with a new article number and documentation.
   - ID link:
     Your product may have an ID link. The ID link is a QR code with a frame and a black frame corner at the bottom right. The ID link takes you to the digital nameplate of your product. Scan the QR code on the product or on the packaging label with a smartphone camera, barcode scanner, or reader app. Call up the ID link.
2. Retain this version of the documentation.

Updating the documentation

The documentation of the product is updated in digital form. In particular in the case of function extensions, the new performance features are provided in an updated version.

1. Download the current version as described above via the Industry Online Support or the ID link.
2. Also retain this version of the documentation.

mySupport

With "mySupport" you can get the most out of your Industry Online Support.

Registration	You must register once to use the full functionality of "mySupport". After registration, you can create filters, favorites and tabs in your personal workspace.
Support requests	Your data is already filled out in support requests, and you can get an overview of your current requests at any time.
Documentation	In the Documentation area you can build your personal library.
Favorites	You can use the "Add to mySupport favorites" to flag especially interesting or frequently needed content. Under "Favorites", you will find a list of your flagged entries.
Recently viewed articles	The most recently viewed pages in mySupport are available under "Recently viewed articles".
CAx data	The CAx data area gives you access to the latest product data for your CAx or CAe system. You configure your own download package with a few clicks: • Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files • Manuals, characteristics, operating manuals, certificates • Product master data

You can find "mySupport" on the Internet. (https://support.industry.siemens.com/My/ww/en)

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You can find the application examples on the Internet.
(https://support.industry.siemens.com/cs/ww/en/ps/ae)

Industrial cybersecurity

2

2.1 Introduction to industrial cybersecurity

Due to the digitalization and increasing networking of machines and industrial plants, the risk of cyber attacks is also growing. Appropriate protective measures are therefore mandatory, particularly in the case of critical infrastructure facilities.

You can find general information and measures relating to industrial cybersecurity in the system manual (https://support.industry.siemens.com/cs/ww/en/view/58649293).

This section provides an overview of security-related information about your SIEMENS device.

NOTE

Security-related changes to software or devices are documented in the "New functions" section.

2.2 Cybersecurity information

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial cybersecurity measures that may be implemented, please visit
https://www.siemens.com/cybersecurity-industry.

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Cybersecurity RSS Feed under
https://new.siemens.com/cert.

Product overview

3.1 Properties

Article number

6ES7136-6BA01-0CA0

View of the module

① Module type and name
② Function class
③ Color coding module type
④ Color code for selecting the color-coded labels
⑤ BU type
⑥ Firmware and function version
⑦ Article number
⑧ LED for supply voltage
⑨ LEDs for channel status
⑩ Wiring diagram
⑪ QR code for identification link
⑫ LED for diagnostics

Figure 1-178 View of the F-DI 8×24VDC HF module

Properties

The module has the following technical properties:

- Fail-safe digital module
- PROFIsafe
- RIOforFA-Safety
- PROFIsafe address type 2
- 8 inputs (SIL3/Cat.3/PLd) or 4 inputs (SIL3/Cat.4/PLe)
- 8 outputs for sensor supply
- Use of various interconnection types (1oo1, 1oo2) is possible
- Suitable for the connection of 3-wire/4-wire sensors according to IEC 61131, Type 1
- Channel-specific assignable input delay 0.4 ms to 20 ms
- Internal short-circuit proof sensor supplies for each input
- External sensor supply possible
- Supply voltage L+
- Sink input (P-reading)
- Safety mat evaluation (firmware version V2.0.0 or higher)
- Suitable for the connection of 4-wire safety mats and pressure-sensitive protective devices (NO contact operating principle) according to ISO 13856-1, -2, -3
- Fail-safe counter (firmware version V3.0.0 or higher)
- Fail-safe standstill and overspeed monitoring (firmware version V3.0.0 or higher)
- Diagnostic display (DIAG red/green LED)
- Status display for each input (green LED)
- Error display for each input (red LED)
- Diagnostics
  - e.g., short-circuit, channel-specific
  - e.g., load voltage missing, module-specific
- Channel-based or module-based passivation

The module supports the following functions:

- Firmware update
- I&M identification data
- Service data

⚠ WARNING

If you have configured the digital input module F-DI 8x24VDC HF (6ES7136-6BA00-0CA0) in a plant, but have inserted the digital input module F-DI 8x24VDC HF (6ES7136-6BA01-0CA0) instead, the information from the manual of the digital input module F-DI 8x24VDC HF (6ES7136-6BA00-0CA0) still applies.

⚠ WARNING

The safety parameters in the technical data apply for a mission time of 20 years and a repair time of 100 hours. If repair is not possible within 100 hours, remove the respective module from the BaseUnit or switch off its supply voltage before the 100 hours have elapsed. Proceed for the repair as described in the section Diagnostic messages.

Accessories

You can order the following accessories separately:

- Labeling strips
- Color identification labels
- Reference identification labels
- Shield connection
- Electronic coding element as replacement part (part number 6ES7193-6EF00-1AA0)

For more information on accessories, refer to the system manual ET 200SP Distributed I/O System (https://support.industry.siemens.com/cs/ww/en/view/58649293).

3.2 Operating modes

The digital input module F-DI 8x24VDC HF can be operated in the following operating modes:

- "Digital inputs (Page 17)"operating mode
- "Counter (Page 53)" operating mode
- "Standstill and overspeed monitoring (Page 82)" operating mode

Digital inputs operating mode

4

4.1 Wiring

4.1.1 Pin assignment for "Digital inputs" operating mode

Pin assignment for "Digital inputs" operating mode

Table 1-436 Pin assignment for "Digital inputs" operating mode

Pin assignment for "Digital inputs" operating mode						
Terminal	**Assignment**	**Terminal**	**Assignment**	**Description**	**BaseUnit**[1]	**Color identification label (terminals 1 to 16)**
1	DI_0	**2**	DI_1	• DI_n: Input signal, channel n • VS_n: Internal sensor supply, channel n	A0	 CC01 6ES7193-6CP01-2MA0
3	DI_2	**4**	DI_3			
5	DI_4	**6**	DI_5			
7	DI_6	**8**	DI_7			
9	VS_0	**10**	VS_1			
11	VS_2	**12**	VS_3			
13	VS_4	**14**	VS_5			
15	VS_6	**16**	VS_7			
L+	DC24V	**M**	M			

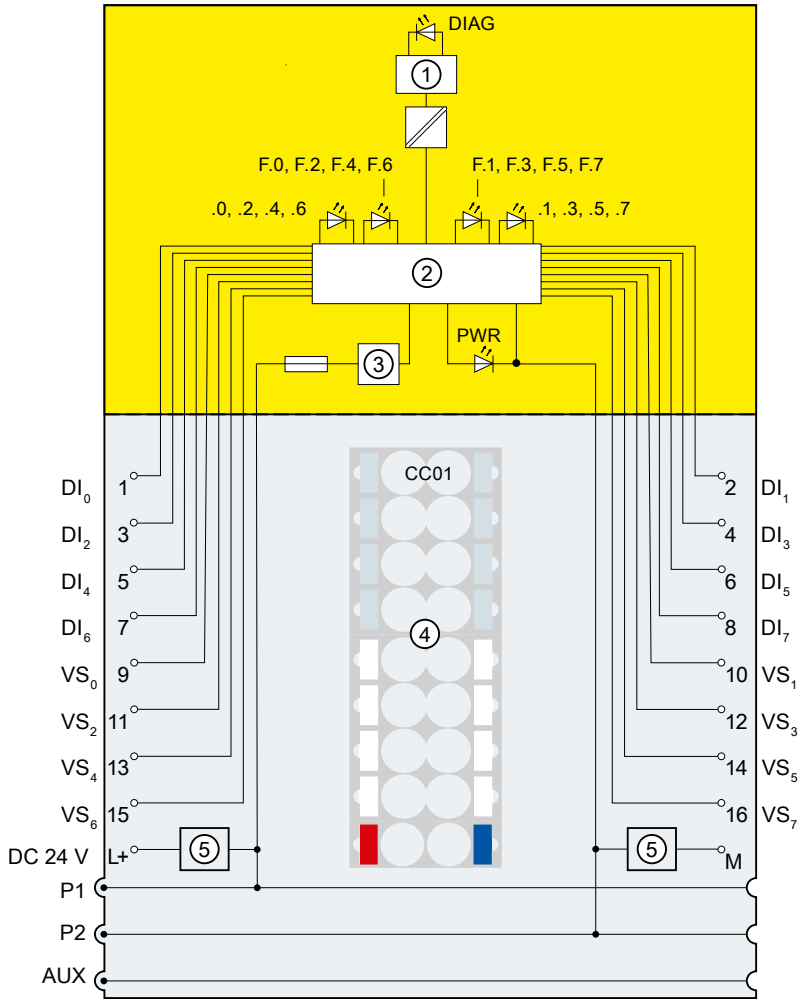
[1] Usable BaseUnit types can be identified by the last two digits of their order number. See also *ET 200SP Distributed I/O System* system manual

NOTE

The first BaseUnit of a potential group must be a light-colored BaseUnit.

NOTE

Make sure that you only use digital modules with BaseUnit type A0 during commissioning.



4.1.2 Wiring and block diagram

This section includes the block diagram of the digital input module F-DI 8×24VDC HF with the pin assignment.

You can find more information about wiring the BaseUnit in the Distributed I/O System ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/58649293) System Manual.

Block diagram

The following figure shows the pin assignment of the F-DI 8×24VDC HF digital input module on BaseUnit BU type A0.

①	Backplane bus interface	VS_n	Internal sensor supply, channel n
②	Input electronics	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
③	Reverse polarity protection	DI_n	Input signal, channel n
④	Color identification label with color code CC01 (optional)	DIAG	Error or diagnostics LED (green, red)

⑤	Filter circuit supply voltage (available in light-colored BaseUnit only)	.0 to .7	Channel status LED (green)
L+	24 V DC (infeed only with light-colored BaseUnit)	F.0 to F.7	Channel fault LED (red)
M	Mass supply voltage	PWR	Power LED (green)

Figure 1-179 Block diagram

4.2 Parameters/address space

"Digital inputs" operating mode is only effective if the operating mode selection is configured as "Digital inputs".

Parameters for the "Digital Inputs" operating mode

⚠ WARNING

You must enable or disable the diagnostic functions in accordance with the application; see section Application cases for inputs (Page 32).

The following parameters are possible:

Table 1-437 Adjustable parameters

Parameter	Value range	Default	Parameter reassignment in RUN	Scope
Module parameters:				
Operating mode	• Digital inputs • Counter • Standstill and Overspeed monitoring	Digital inputs	No	Module
F-parameters:				
Manual assignment of the F-monitoring time	• Disable • Enable	Disable	No	Module
F-monitoring time	1 to 65535 ms	150 ms	No	Module
F-source address	1 to 65534	Depends on the parameter assignment of the F-CPU	No	Module
F-destination address	1 to 65534	Is proposed by the F-system	No	Module
F-parameter signature (without address)	0 to 65535	Is calculated by the F-system	No	Module
Behavior after channel fault	• Passivate the entire module • Passivate channel	Passivate channel	No	Module
Reintegration after channel fault	• Adjustable • All channels automatically • All channels manually	(S7-300/400) Adjustable (S7-1200/1500) All channels manually	No	Module

Parameter	Value range	Default	Parameter reassignment in RUN	Scope
F-I/O DB manual number assignment	• Disable • Enable	Disable	No	Module
F-I/O DB number	—	Is proposed by the F-system	No	Module
F-I/O DB name	—	Is proposed by the F-system	No	Module
DI parameters:				
Sensor supply				
Sensor supply n				
Short-circuit test	• Disable • Enable	Enable	No	Channel
Time for short-circuit test	0.5 ms to 2 s	4.2 ms	No	Channel
Startup time of sensor after short-circuit test	0.5 ms to 2 s	4.2 ms	No	Channel
Channel parameters				
Channel n, n+4				
Sensor evaluation	• 1oo1 evaluation • 1oo2 evaluation, equivalent • 1oo2 evaluation, non-equivalent • Safety mat evaluation	1oo2 evaluation, equivalent	No	Channel pair
Discrepancy behavior	• Supply value 0 • Supply last valid value	Supply value 0	No	Channel pair
Discrepancy time	5 ms to 30 s	5 ms	No	Channel pair
Reintegration after discrepancy error	• Test 0-Signal not necessary • Test 0-Signal necessary	Test 0-Signal not necessary	No	Channel pair
Channel n				
Activated	• Enable • Disable	Enable	No	Channel
Channel failure acknowledge	• Manual • Automatic The value range offered depends on the F-CPU used and the parameter assignment of the F-parameter "Reintegration after channel fault".	(S7-300/400) Parameter is not supported (S7-1200/1500) Manual	No	Channel
Sensor supply	• Sensor supply 0 to 7 • External sensor supply	Sensor supply n	No	Channel

Parameter	Value range	Default	Parameter reassignment in RUN	Scope
Input delay	• 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 6.4 ms • 10.0 ms • 12.8 ms • 20 ms The provided value range depends on the parameter assignment of the employed sensor supply.	3.2 ms	No	Channel
Chatter monitoring	• Disable • Enable	Disable	No	Channel
Number of signal changes	2 to 31	5	No	Channel
Monitoring window	0 to 100 s (If 0 s is configured, the monitoring window is 0.5 s long.)	2 s	No	Channel

4.2.1 Explanation of parameters

4.2.1.1 Module parameters

Operating mode

This parameter is used to specify the desired operating mode.

The digital input module F-DI 8×24VDC HF can be operated in the following operating modes:

- "Digital inputs"
- "Counter"
- "Standstill and Overspeed monitoring"

4.2.1.2 F-parameters

F-parameters

You have to assign the PROFIsafe address (F-destination address together with F-source address) to the F-module before you start operation.

- You specify the F-source address with the "Central F-source address" parameter in the F-CPU.
- The F-destination address is assigned automatically for each F-module CPU-wide. You can change the specified F-destination address in the hardware configuration manually.

Information on the F-parameters for the F-monitoring time, the PROFIsafe addressing (F-source address, F-destination address) and the F-I/O DB can be found in the manual SIMATIC Safety - Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126).

See also

S7 Distributed Safety - Configuring and Programming
(https://support.industry.siemens.com/cs/ww/en/view/22099875)

Behavior after channel fault

This parameter is used to specify whether the entire F-module is passivated or just the faulty channel(s) in the event of channel faults:

- "Passivate the entire module"
- "Passivate channel"

Reintegration after channel fault

Use this parameter to select how the channels of the fail-safe module are reintegrated after a fault.

Use on S7-300/400 F-CPUs
This parameter is always set to "Adjustable" when you use the fail-safe module in S7-300/400 F-CPUs.

You make the required setting in the F-I/O DB of the fail-safe module.

Use on S7-1200/1500 F-CPUs
When using the F-module on F-CPUs S7-1200/1500, set this parameter in the STEP 7 dialog of the F-module:

- "Adjustable"
- "All channels automatically"
- "All channels manually"

If you have set the "Behavior after channel fault" parameter to "Passivate channel", you enable individual setting of the reintegration type per channel with the parameter assignment "Adjustable". The reintegration type of the respective channel is specified with the "Channel failure acknowledge" channel parameter.

If you have set the "Behavior after channel fault" parameter to "Passivate the entire module", you can only select the same reintegration type for all channels.

4.2.1.3 Parameters of the sensor supply

Short-circuit test

Here you activate the short-circuit detection for the channels of the F-module for which an internal sensor supply is set.

The short-circuit test can always be performed when you use simple switches which do not have an own power supply. For switches with an own power supply, e.g. 3-/4-wire proximity switches or optical sensors with OSSD outputs (Output Signal Switching Device), you have to adjust the parameter "Startup time of sensor after short-circuit test" depending on the sensor used.

The short-circuit detection switches off the sensor supply briefly. The length of the deactivation period is equivalent to the configured "Time for short-circuit test".

If a short-circuit is detected, the F-module triggers a diagnostic interrupt and the input is passivated.

The following short-circuits are detected:

- Short-circuit of input to L+
- Short-circuit of the input with another channel, if this has a 1-signal
- Short-circuit between the input and sensor supply of another channel
- Short-circuit between the sensor supply and the sensor supply of another channel

If the short-circuit test is disabled, you must make your wiring short-circuit and cross-circuit proof or select a connection type (discrepancy, non-equivalent) which also detect the cross-circuits using discrepancy.

NOTE

During the execution time (Time for short-circuit test + Startup time of sensor after short-circuit test) of the short-circuit test, the last valid value of the input before the start of the short-circuit test is passed to the F-CPU. The activation of the short-circuit test thus affects the response time of the respective channel or channel pair.

NOTE

Safety mat evaluation
If you have configured "Safety mat evaluation" for a channel pair under "Sensor evaluation", short-circuit tests are performed on the internal sensor supplies that were assigned to this channel pair. These short-circuit tests are performed with a defined test pattern. The parameters "Time for short-circuit test" and "Startup time of sensor after short-circuit test" cannot be changed.

Time for short-circuit test

Function

When the short-circuit test is enabled, the corresponding sensor supply is switched off for the configured time. If the module does not detect a "0" signal at the input within the assigned time, a diagnostic message is generated.

Note the following during parameter assignment:

- If the channel is passivated, this may be due to too high capacitance between sensor supply and input. This consists of the capacitance per unit length of the cable and the capacitance of the employed sensor. If the connected capacitance does not discharge within the assigned time, you need to adjust the "Time for short-circuit test" parameter.
- The values available for the input delay depend on the "Startup time of sensor after short-circuit test" and the "Time for short-circuit test" of the configured sensor supply.

Requirement

The short-circuit test is activated.

NOTE

Safety mat evaluation
If you have configured "Safety mat evaluation" for a channel pair under "Sensor evaluation", short-circuit tests are performed on the internal sensor supplies that were assigned to this channel pair. These short-circuit tests are performed with a defined test pattern. The parameters "Time for short-circuit test" and "Startup time of sensor after short-circuit test" cannot be changed.

Startup time of sensor after short-circuit test

Function

Apart from the switch-off time ("Time for short-circuit test"), a startup time must also be specified for the execution of the short-circuit test. With this parameter you inform the module how long the used sensor requires for the startup after the sensor supply is switched on. This way you avoid an undefined input status due to transient responses in the sensor.

Note the following during parameter assignment:

- This parameter must be larger than the settling time of the sensor used.
- Since the parameterized time affects the response time of the module, we recommend setting this time as short as possible but large enough so that the sensor has stabilized.
- The values available for the input delay depend on the "Startup time of sensor after short-circuit test" and the "Time for short-circuit test" of the configured sensor supply.

Requirement

The short-circuit test is activated.

NOTE

Dependencies between the parameters "Startup time of sensor after short-circuit test" and "Time for short-circuit test"
The startup time of the sensor after the short-circuit test must amount to at least 1 % of the time for the short-circuit test.

NOTE

Safety mat evaluation
If you have configured "Safety mat evaluation" for a channel pair under "Sensor evaluation", short-circuit tests are performed on the internal sensor supplies that were assigned to this channel pair. These short-circuit tests are performed with a defined test pattern. The parameters "Time for short-circuit test" and "Startup time of sensor after short-circuit test" cannot be changed.

4.2.1.4 Parameters of the channel pairs

Sensor evaluation

Overview

Select the type of sensor evaluation with the "Sensor evaluation" parameter:

- 1oo1 evaluation
- 1oo2 evaluation, equivalent
- 1oo2 evaluation, non-equivalent
- Safety mat evaluation

1oo1 evaluation

The sensor uses only one input channel for the 1oo1 evaluation.

1oo2 evaluation, equivalent/non-equivalent

With a 1oo2 evaluation equivalent/non-equivalent, two input channels are occupied by:

- One two-channel sensor
- Two one-channel sensors
- One non-equivalent sensor

The input signals are compared internally for equivalence or non equivalence.

Note that in 1oo2 evaluation, two channels are combined into a channel pair. The number of available process signals of the F-module is reduced accordingly.

Discrepancy analysis

When using a two-channel sensor or two one-channel sensors which measure the same process variable, the sensors interact with a slight time delay due to the limited precision of their arrangement.

The discrepancy analysis for equivalence/non equivalence is used for fail-safe applications to prevent errors from time differences between two signals for the same function. The discrepancy analysis is initiated when different levels are detected in two associated input signals (when testing for non equivalence: the same levels). A check is made to determine whether the difference in levels (when testing for non equivalence: the same levels) has disappeared after an assignable time period, the so-called discrepancy time. If not, this means that a discrepancy error exists.

Safety mat evaluation

With safety mat evaluation, two input channels and two internal sensor supplies are occupied by a 4-wire safety mat (NO contact operating principle). If necessary, you can also connect several 4-wire safety mats connected in series.

Discrepancy behavior

Function

For the "Discrepancy behavior", you assign the value that is supplied to the safety program in the F-CPU during a discrepancy between two relevant input channels, which means while discrepancy time is running. You assign the discrepancy behavior as follows:

- "Supply last valid value"
- "Supply value 0"

Requirements

You have assigned the following:

- "Sensor evaluation": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non-equivalent"

"Supply last valid value"

The most recent valid value (old value) before the discrepancy occurred is made available to the safety program in the F-CPU as soon as a discrepancy is detected between the signals of the two affected input channels. This value is supplied until the discrepancy disappears or the discrepancy time expires and a discrepancy error is detected. The sensor-actuator response time is correspondingly increased by this time.

This means the discrepancy time of connected sensors with 1oo2 evaluation must be adjusted to short response times. It makes no sense, for example, if connected sensors with a discrepancy time of 500 ms trigger a time-critical shutdown. In the worst possible case, the sensor-actuator response time is extended by the discrepancy time:

- For this reason, position the sensors in the process in such a way as to **minimize discrepancy**.
- Then select the **shortest possible** discrepancy time which is also sufficient to compensate for faulty triggering of discrepancy errors.

"Supply value 0"

As soon as a discrepancy between the signals of the two relevant input channels is detected, the value "0" is made available to the safety program in the F-CPU.

If you have set "Supply value 0", the sensor-actuator response time is not affected by the discrepancy time.

Discrepancy time

Function

You can set the discrepancy time for each channel pair.

Requirements

You have assigned the following:

- "Sensor evaluation": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non-equivalent"

In most cases, a discrepancy time is started, but does not fully expire because the signal differences are cleared within a short time.

Set the discrepancy time high enough that in the error-free case the difference between the two signals (when testing for non equivalence: the same levels) has always disappeared before the discrepancy time has expired.

Behavior while discrepancy time is running

While the programmed discrepancy time is running internally on the module, either the **last valid value** or **"0"** is returned to the safety program on the F-CPU by the input channels involved, depending on the parameter settings for the behavior at discrepancy.

Behavior after expiration of the discrepancy time

If no agreement (when checking for non equivalence: inequality) of the input signals exists once the assigned discrepancy time expires, for example, due to a break in a sensor wire, a discrepancy error is detected and the "Discrepancy error" diagnostic message containing information on which channels are faulty is generated.

NOTE

Dependencies between the parameters "Discrepancy time" und "Input delay"
The discrepancy time must be parameterized greater than the input delay.

Reintegration after discrepancy error

Function

This parameter specifies the criteria for when a discrepancy error is regarded as corrected, thus enabling reintegration of the relevant input channels. The following parameter assignment options are available:

- "Test 0-Signal necessary"
- "Test 0-Signal not necessary"

Requirements

You have assigned the following:

- "Sensor evaluation": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non-equivalent"

"Test 0-Signal necessary"

If you have assigned "Test 0-Signal necessary", a discrepancy error is not regarded as corrected until a 0-signal is present at both of the relevant input channels.

If you are using non equivalent sensors, which means you have set "Sensor evaluation" to "1oo2 evaluation, non-equivalent", the result of the channel pair must be "0" again.

"Test 0-Signal not necessary"

If you have assigned "Test 0-Signal not necessary", a discrepancy error is regarded as corrected when a discrepancy no longer exists at both of the relevant input channels.

4.2.1.5 Parameters of the channels

Activated

You hereby enable the corresponding channel for signal processing in the safety program.

Channel failure acknowledge

Use on S7-1200/1500 F-CPUs

The parameter is only relevant if the F-module is operated on an S7-1200/1500 F-CPU.

The parameter can only be set if the F-parameter "Behavior after channel fault" is set to "Passivate channel" and the F-parameter "Reintegration after channel fault" is set to "Adjustable".

The value of this parameter specifies how the channel reacts after a channel fault:

- Manual: A channel failure is reintegrated after manual acknowledgment.
- Automatically: The channel is reintegrated automatically after a channel fault. Manual acknowledgment is not necessary.

Use on S7-300/400 F-CPUs

The value of this parameter is not relevant in the case of operation on S7-300/400 F-CPUs. For S7-300/400 F-CPUs you set the corresponding property at the F-I/O DB by means of the ACK_NEC tag.

For detailed information about the F-I/O DB, refer to the SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual.

Sensor supply

You can select one of the internal sensor supplies VS_0 to VS_7 or an external sensor supply.

The selection of an internal sensor supply is required for using the short-circuit test.

With safety mat evaluation, the internal sensor supplies are assigned to the channel pair. For additional information, see the section Safety mat evaluation application (from firmware version V2.0.0) (Page 49).

⚠ WARNING

Sensor supply with safety mat evaluation
With safety mat evaluation, the internal sensor supply assigned to the respective channel must be used. The internal sensor supply must not be used for any other channel. The use of a different internal sensor supply or an external sensor supply is prohibited.

See also

Time for short-circuit test (Page 23)

Input delay

Function

To suppress injected interference, you can set an input delay for a channel or a channel pair.

Interference pulses whose pulse time is less than the set input delay are suppressed. Suppressed interference pulse are not visible in the safety program.

A high input delay suppresses longer interference pulses, but results in a longer response time.

The set value for the input delay has to be smaller than the configured "Startup time of sensor after short-circuit test" and smaller than the configured "Time for short-circuit test".

With 1oo2 evaluation, the input delay of the lower-order channel (channel n) automatically applies to the higher-order channel (channel n+4).

NOTE

Input delay with Safety mat evaluation
If the Safety mat evaluation is set, you must configure an input delay of 1.6 ms.

NOTE

Due to the physical properties, there is a possibility of crosstalk between signals in the case of long, unshielded signal lines (see section "Electromagnetic compatibility" in the system manual ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293)).
Adapt the input delay or use shielded signal lines in order to prevent possible passivation of the fail-safe digital inputs and switch-off of the sensor supply.

Response times (Page 123)
Technical specifications (Page 119)

Chatter monitoring

Function

Chatter monitoring is a process control function for digital input signals. It detects and reports unusual signal sequences in the process with 1oo1 evaluation, for example, an input signal fluctuating between "0" and "1" too frequently. The occurrence of such signal characteristics is an indication of faulty sensors or process control instability.

Recognizing unusual signal patterns

An assigned monitoring window is available for each input channel. The monitoring window starts with the first signal change of the input signal. If the input signal changes within the monitoring window at least as often as the assigned "Number of signal changes", a chatter error is detected. If no chatter error is detected within the monitoring window, the next signal change restarts the monitoring window.

If a chatter error is detected, a diagnostic is signaled. If the chatter error does not occur for the monitoring window for three times the configured period, the diagnostic is reset.

Principle

The figure below shows the principle of chatter monitoring as a graphic.

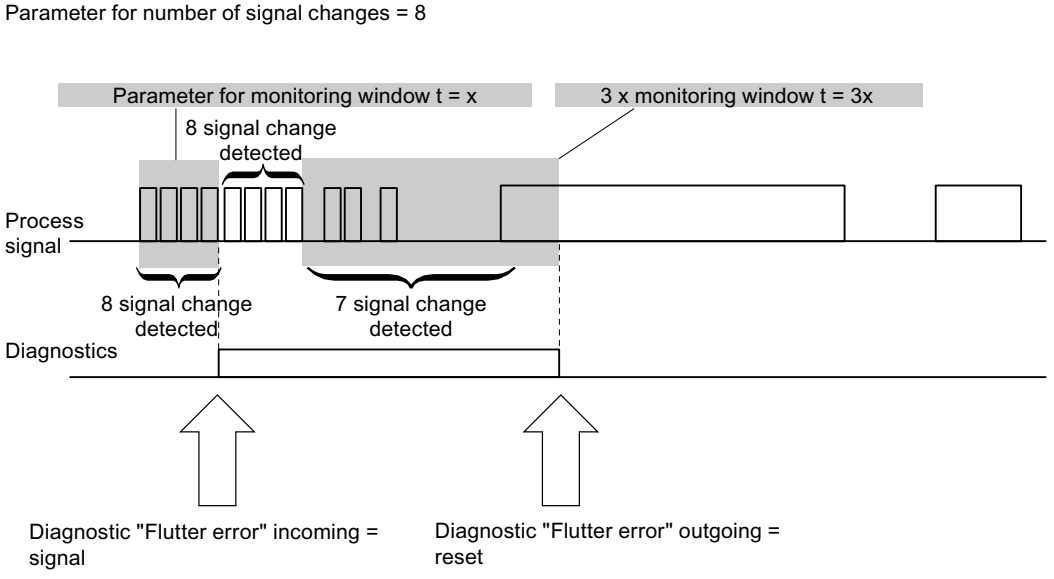

Figure 1-180 Figure chatter monitoring

Number of signal changes

Defines the number of signal changes after whose sequence a chatter error is to be reported.

Monitoring window

Sets the time for the monitoring window of chatter monitoring.
You can set times of 1 s to 100 s in whole seconds for the monitoring window.
If you parameterize 0 s, the monitoring window is 0.5 s long.

4.2.2 Address space

Address assignment of the digital input module F-DI 8×24VDC HF in "Digital inputs" operating mode

The digital input module F-DI 8×24VDC HF occupies the following address areas in the F-CPU:

Table 1-438 Address assignment in the F-CPU

Occupied bytes in the F-CPU:		
F-CPU	**In the input range**	**In the output range**
F-CPUs S7-300/400	IB x + 0 to x + 5	QB x + 0 to x + 3
F-CPUs S7-1200/1500	IB x + 0 to x + 6	QB x + 0 to x + 4

x = Module start address

Address assignment of the user data and the value status of digital input module F-DI 8×24VDC HF in "Digital inputs" operating mode

The user data occupy the following addresses in the F-CPU out of all the assigned addresses of the digital input module F-DI 8×24VDC HF:

Table 1-439 User data address assignment in the input range

Byte in the F-CPU	**Assigned bits in F-CPU per F-module:**							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
IB x + 0	DI_7	DI_6	DI_5	DI_4	DI_3	DI_2	DI_1	DI_0
IB x + 1	Value status for DI_7	Value status for DI_6	Value status for DI_5	Value status for DI_4	Value status for DI_3	Value status for DI_2	Value status for DI_1	Value status for DI_0

x = Module start address

NOTE

You may only access the addresses occupied by user data and value status.
The other address areas occupied by the F-modules are assigned for functions including safety-related communication between the F-modules and F-CPU in accordance with PROFIsafe.
With safety mat evaluation and 1oo2 evaluation of the sensors, the two channels are combined, for example, DI_0 and DI_4. With safety mat evaluation and 1oo2 evaluation of the sensors, you may only access the low order channel in the safety program, for example, DI_0.

More information

For detailed information about F-I/O access, refer to the SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual.

4.3 Applications for inputs

Selecting the application

The diagram below supports you in selecting the application that suits your fail-safe requirements. In the following sections, you will learn how to wire the F-module, the specific parameters you must assign in STEP 7 Safety and the errors that are detected.

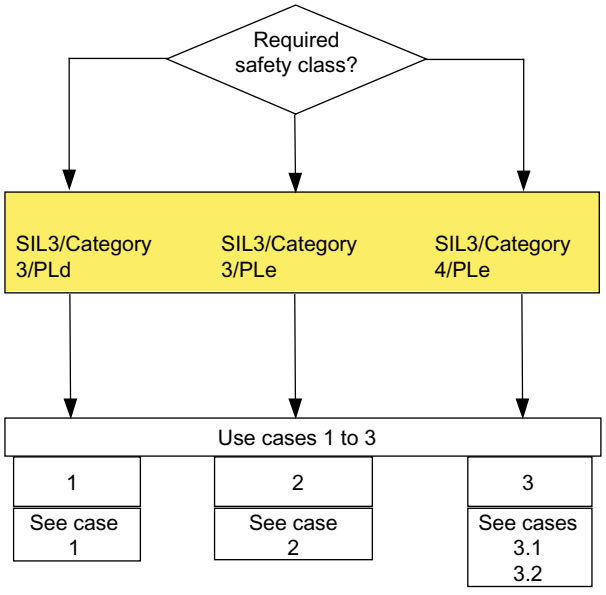

Figure 1-181 Selecting the application – digital input module F-DI 8×24VDC HF

WARNING

The achievable safety class depends on the quality of the sensor and the duration of the proof-test interval in accordance with IEC 61508:2010. If the quality of the sensor is lower than the quality required by the safety class, redundant sensors connected via two channels must be used and evaluated.

Conditions for achieving SIL/Cat./PL

The table below lists the conditions which have to be met for achieving at least the corresponding safety requirements.

Table 1-440 Conditions for achieving SIL/Cat./PL

Application	Sensor evaluation	Sensor supply	Achievable SIL/Cat./PL
1	1oo1	Internal, with short-circuit test	3 / 3 / d
		Internal, without short-circuit test	
		External	
2	1oo2 equivalent	Internal, without short-circuit test	3 / 3 / e
		External	
3.1	1oo2 equivalent	Internal, with short-circuit test	3 / 4 / e
3.2	1oo2 non-equivalent	Internal, with short-circuit test	
		Internal, without short-circuit test	
		External	

NOTE

With a module you can realize the applications listed in Table 5-1 simultaneously on different inputs. You only have to interconnect the inputs and assign parameters as described in the following sections.

Sensor requirements

Information on the safety-oriented use of sensors can be found in the section Requirements for sensors and actuators for fail-safe modules and fail-safe motor starters in the system manual ET 200SP Distributed I/O System (https://support.industry.siemens.com/cs/ww/en/view/58649293).

4.3.1 Application 1: Safety mode SIL3/Cat.3/PLd

Wiring

The wiring is performed on a suitable BaseUnit.

Sensor supply

The sensor supply can be internal or external.

Wiring diagram – connecting one sensor via one channel

Per process signal, one sensor is connected via one channel (1oo1 evaluation).

You can assign any module sensor supply to each input, as well as an external sensor supply, via which the sensor is then supplied.

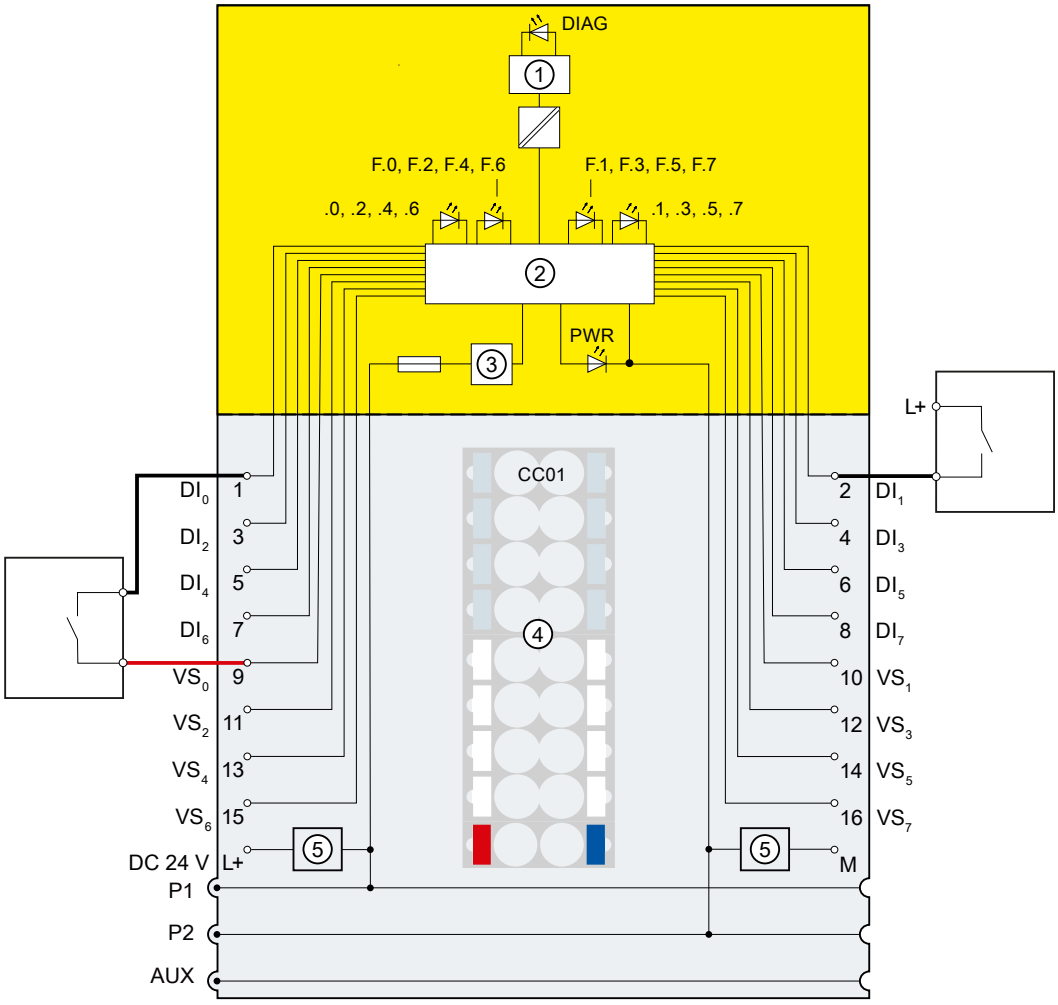

Figure 1-182 One sensor connected via one channel, internal and external sensor supply

WARNING

To achieve SIL3/Cat.3/PLd using this wiring, you must use a qualified sensor.

WARNING

To achieve SIL3/Cat.3/PLd with this wiring, you have to route the cables cross-circuit proof and apply the positive opening operation principle for the sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 1-441 Parameter assignment

Parameter	Channel with internal sensor supply	Channel with external sensor supply
Sensor evaluation	1oo1 evaluation	
Sensor supply	Sensor supply n	External sensor supply*
Short-circuit test	• Disable • Enable	Disable

*) Otherwise a diagnostic message will be generated when short-circuit test is activated.

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short-circuit test:

Table 1-442 Fault detection

Fault	Fault detection		
	Internal sensor supply and short-circuit test activated	Internal sensor supply and short-circuit test deactivated	External sensor supply
Short-circuit of the input with other channels or other sensor supplies (short-circuit with other channels is detected only if they use a different sensor supply)	Yes*	No	No
Short-circuit of the input with the associated sensor supply	No	No	No
Short-circuit with L+ to DI_n	Yes	No	No
Short-circuit with M to DI_n	Yes*	Yes*	No
Discrepancy error	—	—	—
Short-circuit with L+ to VS_n	Yes	No	—
Short-circuit with M to VS_n or defective	Yes	Yes	—

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal. If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

4.3.2 Application 2: Safety mode SIL3/Cat.3/PLe

Assigning inputs to each other

The digital input module F-DI 8×24VDC HF has 8 fail-safe inputs, DI_0 to DI_7 (SIL3). You can combine two of these inputs to one input.

You can combine the following inputs:

- DI_0 and DI_4
- DI_1 and DI_5
- DI_2 and DI_6
- DI_3 and DI_7

The process signals are provided by channels DI_0, DI_1, DI_2 and DI_3.

Wiring

The wiring is performed on a suitable BaseUnit.

Sensor supply

The sensor supply can be internal or external.

Wiring diagram - connecting a two-channel sensor equivalent via two channels

Per process signal, a two-channel sensor is connected equivalent via two channels to two inputs of the F-module (1oo2 evaluation).

You can assign any module sensor supply to each input, as well as an external sensor supply, via which the sensor is then supplied.

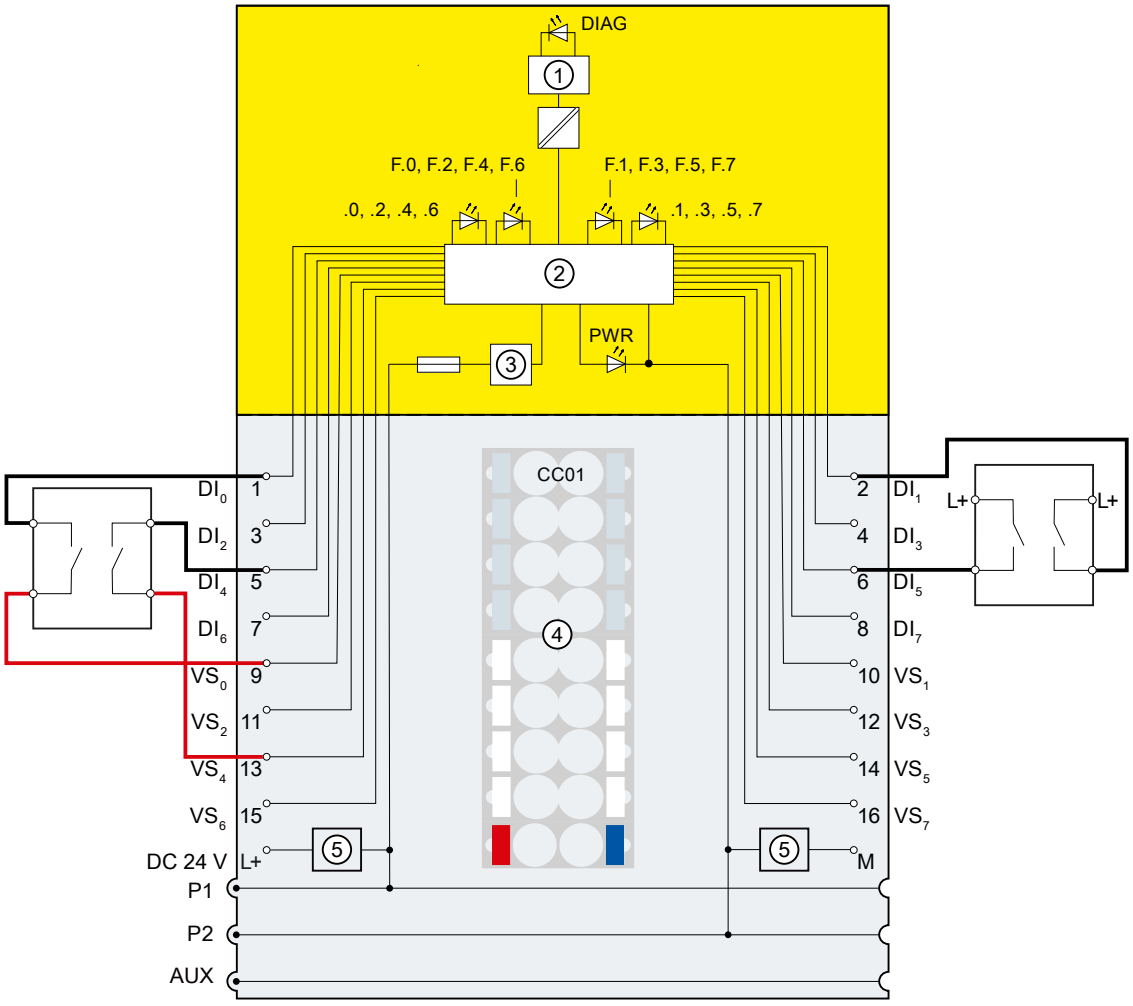

Figure 1-183 A two-channel sensor connected via two channels, internal and external sensor supply

WARNING

To achieve SIL3/Cat.3/PLe using this wiring, you must use a suitably qualified sensor.

Wiring diagram - connecting two one-channel sensors equivalent via two channels

Per process signal, two one-channel sensors, which record the same process value, are connected equivalent via two channels to two inputs of the F-module (1oo2 evaluation).

You can assign any module sensor supply to each input, as well as an external sensor supply, via which the sensors are then supplied.

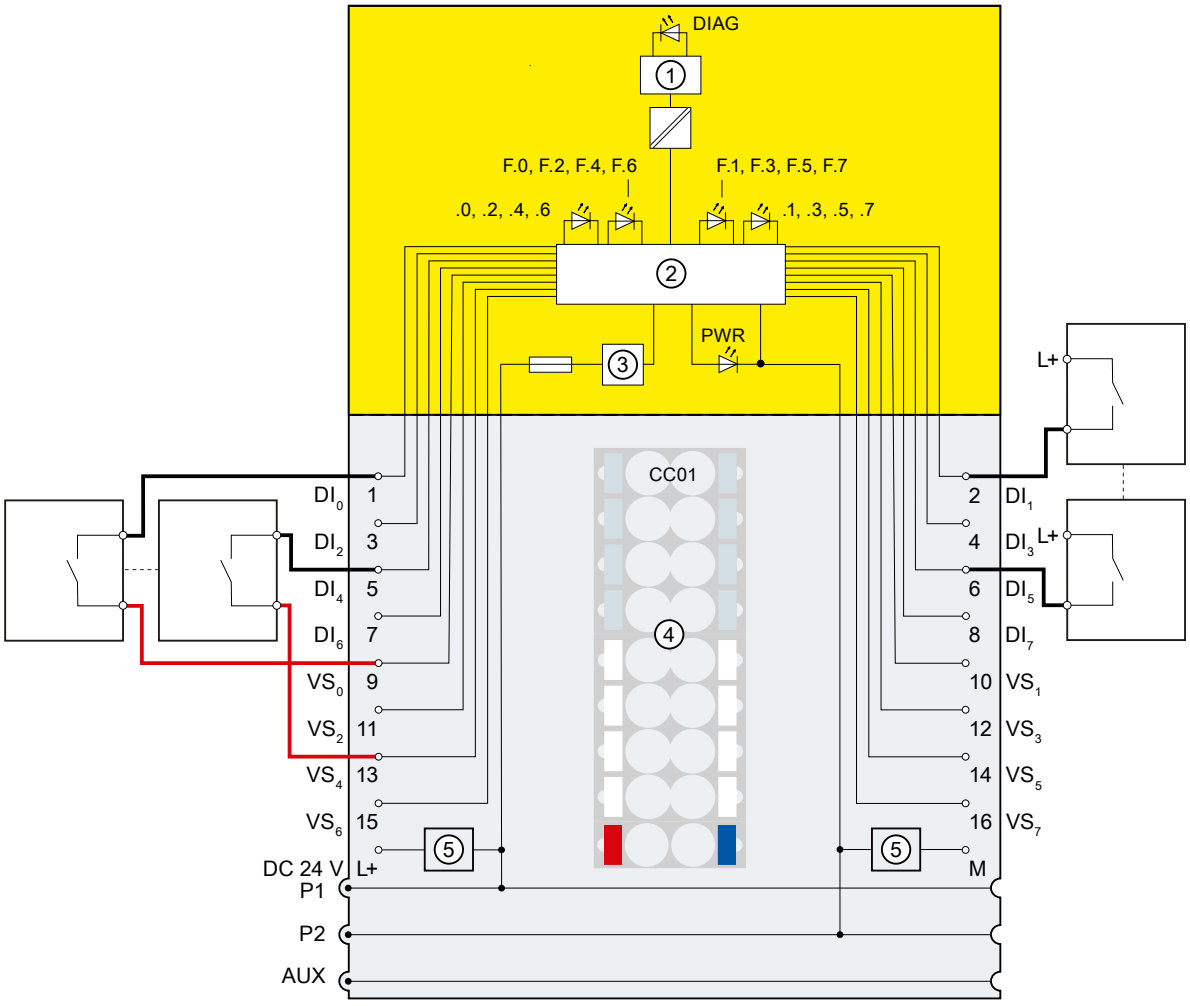

Figure 1-184 Two one-channel sensors connected via two channels, internal and external sensor supply

WARNING

To achieve SIL3/Cat.3/PLe using this wiring, you must use a suitably qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 1-443 Parameter assignment

Parameter	Channel with internal sensor supply	Channel with external sensor supply
Sensor evaluation	1oo2 evaluation, equivalent	
Sensor supply	Sensor supply n	External sensor supply*
Short-circuit test	• Disable • Enable	Disable

*) Otherwise a diagnostic message will be generated when short-circuit test is activated.

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short-circuit test:

Table 1-444 Fault detection

Fault	Fault detection	
	Internal sensor supply and short-circuit test deactivated	External sensor supply
Short-circuit within the channel pair	No	No
Short-circuit with other channels or other sensor supplies	Yes*	Yes*
Short-circuit with L+ to DI_n	Yes*	Yes*
Short-circuit with M to DI_n	Yes*	Yes*
Discrepancy error	Yes	Yes
Short-circuit with L+ to VS_n	No	—
Short-circuit with M to VS_n or defective	Yes	—

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

4.3.3 Application 3: Safety mode SIL3/Cat.4/PLe

Assigning inputs to each other

The digital input module F-DI 8×24VDC HF has 8 fail-safe inputs, DI_0 to DI_7 (SIL3). You can combine two of these inputs to one input.

You can combine the following inputs:

- DI_0 with DI_4
- DI_1 with DI_5
- DI_2 with DI_6
- DI_3 with DI_7

The process signals are provided by channels DI_0,DI_1,DI_2 and DI_3.

Wiring

The wiring is performed on a suitable BaseUnit.

Sensor supply

For application 3.1, the sensor supply must be set up for at least one channel internally with activated short-circuit test.

The sensor can be supplied internally or externally for application 3.2.

Requirements for applications in machinery protection with Cat.4

Both conditions must be met for applications in machine protection with Cat.4:

- The wiring between sensors and automation system and between automation system and actuators must be designed to state-of-the-art engineering and standards to prevent short-circuits.
- The actuators must be wired as seen in sections Application 3.1: Safety mode SIL3/Cat.4/PLe (Page 43) or Application 3.2: Safety mode SIL3/Cat.4/PLe (Page 46). You only need to detect **one** short-circuit because two faults are required to generate it. This means both signal cables in short-circuit have an isolation fault. A multiple short-circuit analysis is not required.

Procedures for locating all short-circuits are also permitted if single short-circuits are not located. One of the two conditions must be met for this purpose:

- Short-circuits may not corrupt the read signals compared to the sensor signals.
- Short-circuits cause a corruption of the read signals compared to sensor signals in the direction that ensures safety.

4.3.3.1 Application 3.1: Safety mode SIL3/Cat.4/PLe

Wiring diagram - connecting a two-channel sensor equivalent via two channels

Per process signal, a two-channel sensor is connected equivalent via two channels to two inputs of the F-module (1oo2 evaluation).

Supply the sensor from two different internal sensor supplies or from an internal and an external sensor supply.

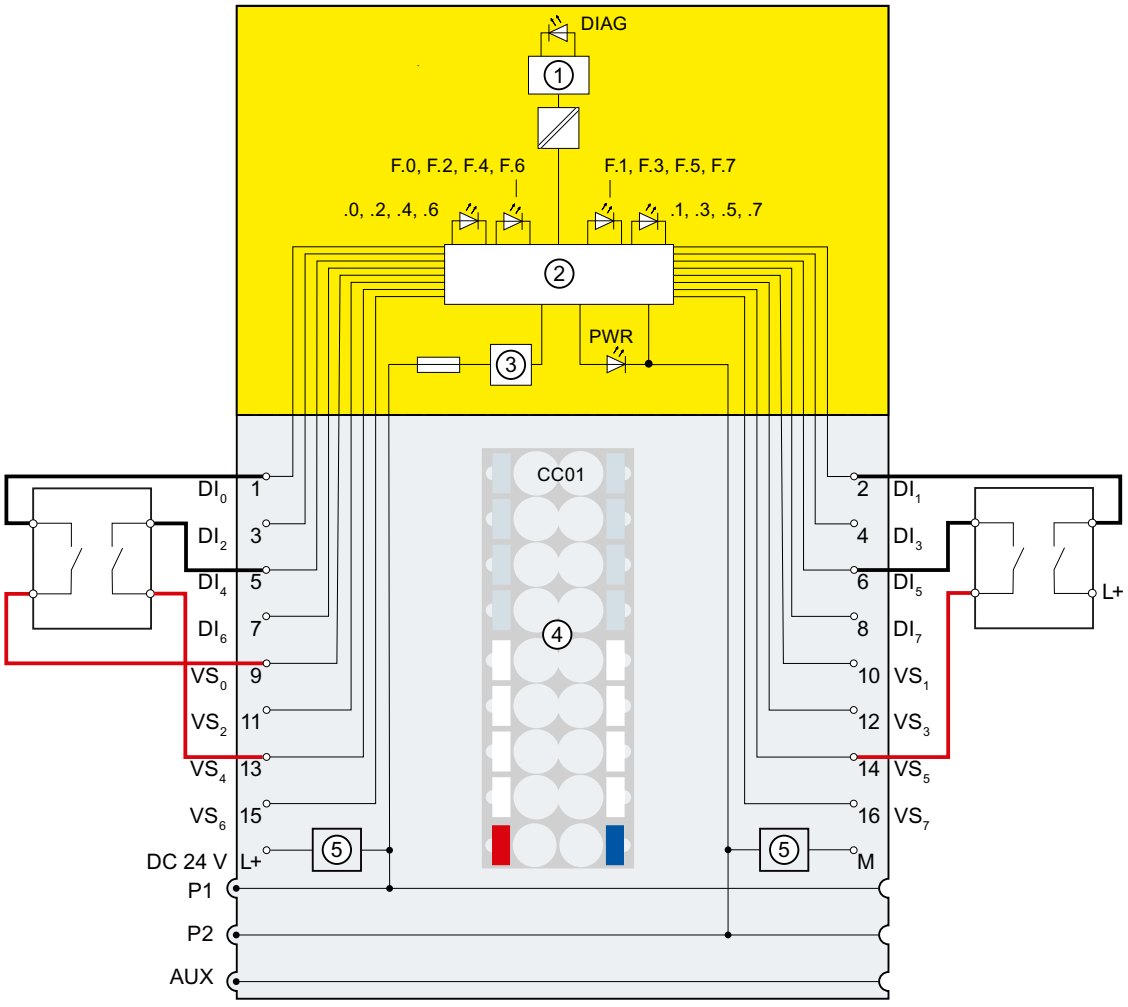

Figure 1-185 A two-channel sensor connected via two channels, internal sensor supply and a two-channel sensor connected via two channels, internal and external sensor supply

WARNING

To achieve SIL3/Cat.4/PLe using this wiring, you must use a qualified sensor.

Wiring diagram - connecting two one-channel sensors equivalent via two channels

Per process signal, two one-channel sensors, which record the same process value, are connected equivalent via two channels to two inputs of the F-module (1oo2 evaluation).

Supply the sensors from two different internal sensor supplies or from an internal and an external sensor supply.

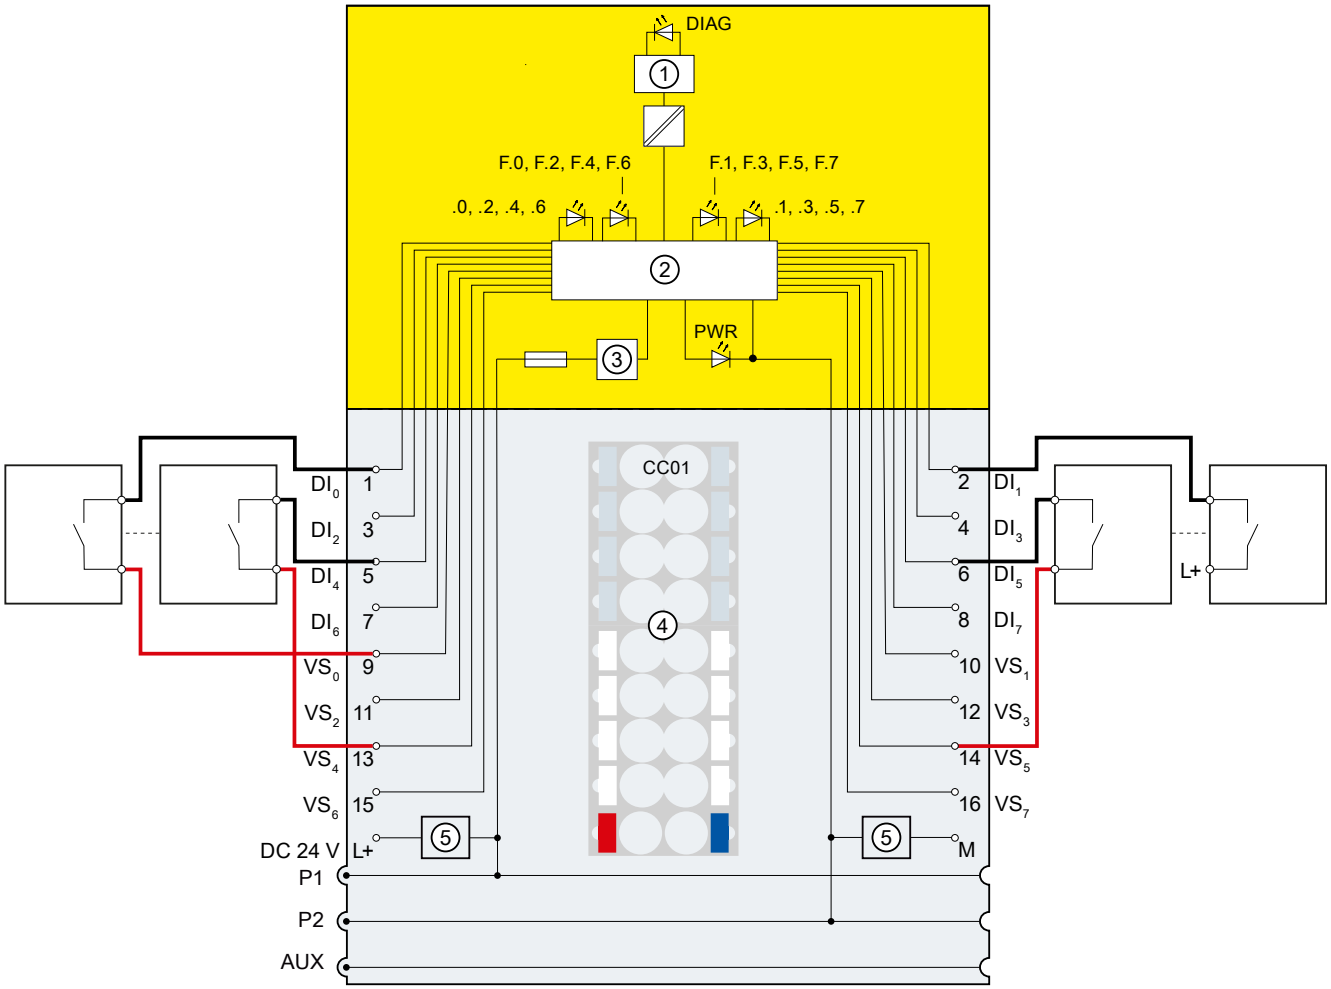

Figure 1-186 Two one-channel sensors connected via two channels, internal sensor supply and two one-channel sensors connected via two channels, internal and external sensor supply.

WARNING

To achieve SIL3/Cat.4/PLe using this wiring, you must use a qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 1-445 Parameter assignment

Parameter	Channel with internal sensor supply*	Channel with external sensor supply
Sensor evaluation	1oo2 evaluation, equivalent	
Sensor supply	Sensor supply n	External sensor supply**
Short-circuit test	Enable*	Disable

*) The sensor supply must be set up for at least one channel internally with activated short-circuit test.

**) Otherwise a diagnostic message is generated for an activated short-circuit test.

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short-circuit test:

Table 1-446 Fault detection

Fault	Fault detection	
	Internal sensor supply and short-circuit test activated	External sensor supply
Short-circuit within the channel pair	Yes*	Yes*
Short-circuit with other channels or other sensor supplies	Yes*	Yes*
Short-circuit with L+ to DI_n	Yes	Yes*
Short-circuit with M to DI_n	Yes*	Yes*
Discrepancy error	Yes	Yes
Short-circuit with L+ to VS_n	Yes	-
Short-circuit with M to VS_n or defective	Yes	-

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

4.3.3.2 Application 3.2: Safety mode SIL3/Cat.4/PLe

Wiring diagram – connecting a non-equivalent sensor

Per process signal, a non-equivalent sensor is connected to two inputs of the F-module (1oo2 evaluation).

You can supply the sensor via an internal or external sensor supply.

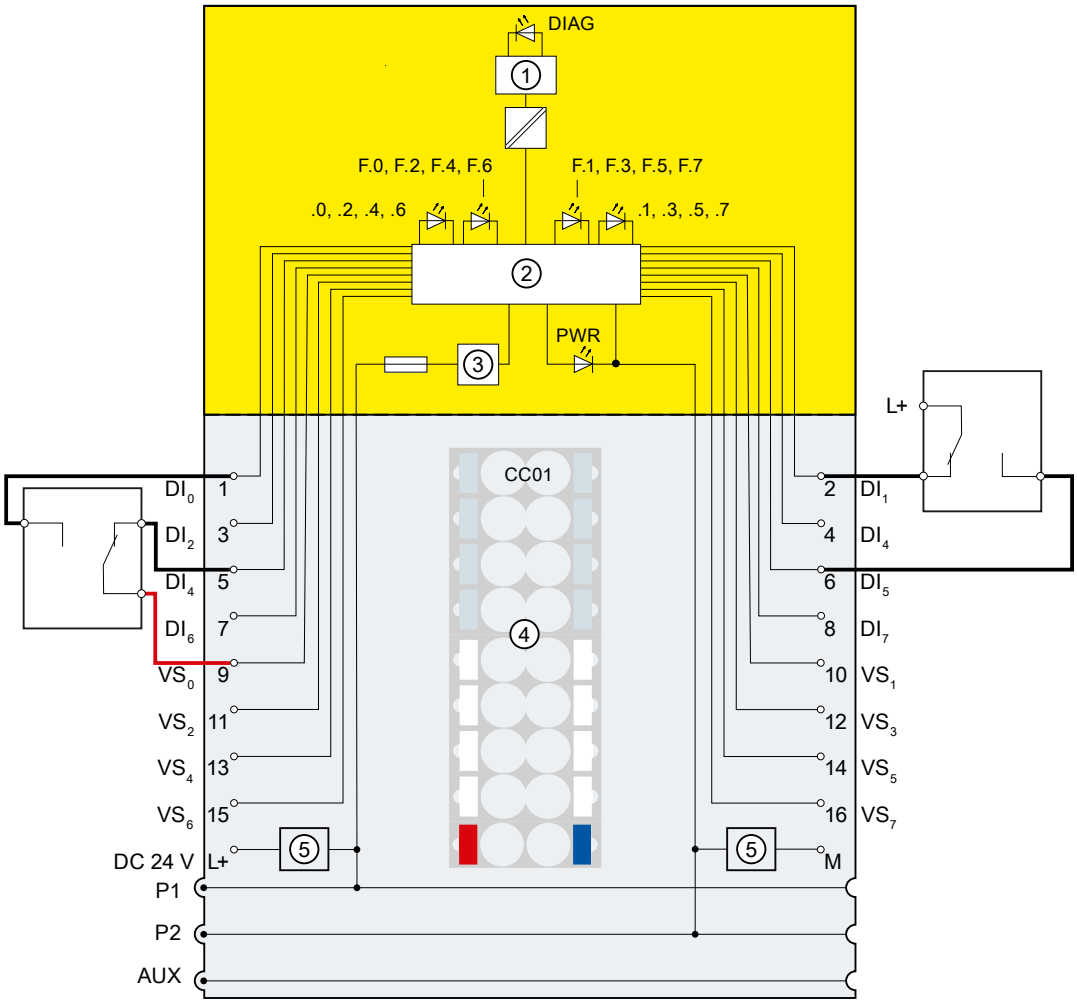

Figure 1-187 One non-equivalent sensor connected, internal sensor supply and one non-equivalent sensor connected, external sensor supply

WARNING

To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Wiring diagram - connecting two one-channel sensors non-equivalent via two channels

Per process signal, two one-channel sensors, which record the same process value, are connected non-equivalent via two channels to two inputs of the F-module (1oo2 evaluation).

You can assign any module sensor supply to each input, as well as an external sensor supply, via which the sensors are then supplied.

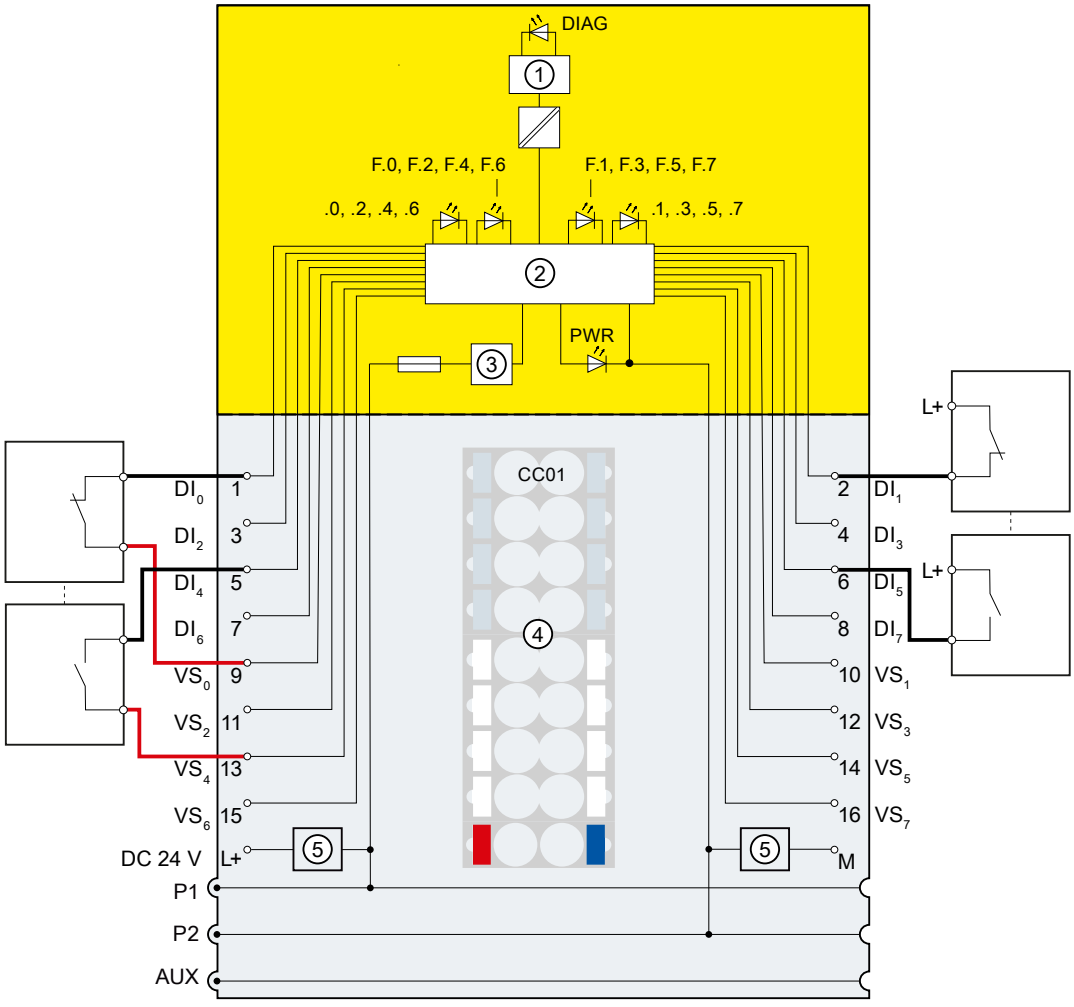

Figure 1-188 Two one-channel sensors connected via two channels non-equivalent, internal sensor supply and two one-channel sensors connected via two channels non-equivalent, external sensor supply.

WARNING

To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 1-447 Parameter assignment

Parameter	Channel with internal sensor supply	Channel with external sensor supply
Sensor evaluation	1oo2 evaluation, non-equivalent	
Sensor supply	Sensor supply n	External sensor supply*
Short-circuit test	• Disable • Enable	Disable

*) Otherwise a diagnostic message will be generated when short-circuit test is activated.

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short-circuit test:

Table 1-448 Fault detection

Fault	Fault detection		
	Internal sensor supply and short-circuit test activated	Internal sensor supply and short-circuit test deactivated	External sensor supply
Short-circuit within the channel pair	Yes	Yes	Yes
Short-circuit with other channels or other sensor supplies	Yes*	Yes*	Yes*
Short-circuit with L+ to DI_n	Yes	Yes*	Yes*
Short-circuit with M to DI_n	Yes*	Yes*	Yes*
Discrepancy error	Yes	Yes	Yes
Short-circuit with L+ to VS_n	Yes	No	-
Short-circuit with M to VS_n or defective	Yes	Yes	-

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

4.3.4 Safety mat evaluation application (from firmware version V2.0.0)

Assigning inputs to each other

The digital input module F-DI 8×24VDC HF has 8 fail-safe inputs, DI_0 to DI_7 (SIL3). You can combine two of these inputs to one input and use for the monitoring of safety mats.

You can combine the following inputs:

- DI_0 and DI_4
- DI_1 and DI_5
- DI_2 and DI_6
- DI_3 and DI_7

The process signals are provided by channels DI_0, DI_1, DI_2 and DI_3.

NOTE

Process signal
When a safety mat is activated, the process signal "0" is provided. When a safety mat is not activated, the process signal is "1".

Wiring

The wiring is performed on a suitable BaseUnit.

Sensor supply

The sensor supplies are operated in the "Safety mat evaluation" mode and must be assigned to the digital inputs as follows:

- VS_0 to DI_0 and VS_4 to DI_4
- VS_1 to DI_1 and VS_5 to DI_5
- VS_2 to DI_2 and VS_6 to DI_6
- VS_3 to DI_3 and VS_7 to DI_7

Wiring diagram – connecting multiple safety mats in series

For each process signal, you can connect multiple 4-wire safety mats in series to two inputs and two internal sensor supplies of the F-module.

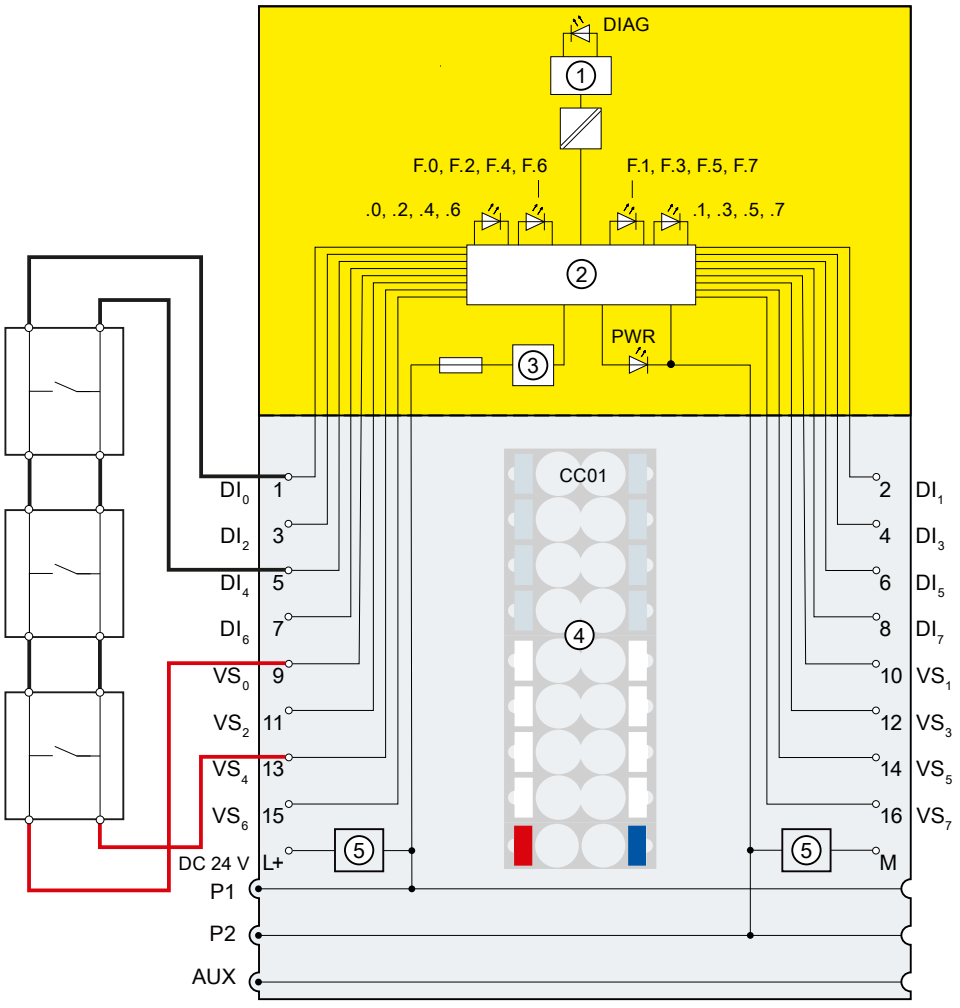

Figure 1-189 Safety mats connected via two channels to two internal sensor supplies

WARNING

To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor. If a regular function test is required, observe the requirements in the application standard or in the manual of the sensor in use.

WARNING

You must ensure short-circuit-proof wiring. Cables intended for the connection of the safety mats must be laid separately from the cables for applications 1 to 3 (Page 32).

⚠ WARNING

You may only use 4-wire safety mats with a current-carrying capacity of at least 100 mA.

⚠ WARNING

If a short-circuit of the sensor supply to ground occurs, you must check after resolving the short-circuit whether the safety mat is functional by activating it. An excessive current load may damage the contact of the safety mat.

⚠ WARNING

When selecting the cables and safety mats, note that the ohmic resistance of the cables including an activated safety mat must not exceed 100 ohms.

Determining the ohmic resistance for connecting a safety mat

If you do not know the resistance of the cables including activated safety mat, you must determine the resistance through measurements.

Proceed as follows:

- Unplug the digital input module from the BaseUnit.
- Measure the resistance of the cables including activated safety mat between VS_n and DI_{n+4}.
- Measure the resistance of the cables including activated safety mat between VS_{n+4} and DI_n.

For the above-mentioned measurements, the resistance must not exceed 100 ohms.

You can use the measuring tap of the BaseUnit for the measurements. For more information, refer to the ET 200SP Distributed I/O System (https://support.industry.siemens.com/cs/ww/en/view/58649293) System Manual.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 1-449 Parameter assignment

Parameter	Channel with internal sensor supply
Sensor evaluation	Safety mat evaluation
Sensor supply	Sensor supply n
Short-circuit test	Enable
Time for short-circuit test	Default value 4.2 ms (not used)

Parameter	Channel with internal sensor supply
Startup time of sensor after short-circuit test	Default value 4.2 ms (not used)
Input delay	1.6 ms
Chatter monitoring	Disable

NOTE

With configured safety mat monitoring, the parameters "Short-circuit test", "Input delay" and "Chatter monitoring" cannot be adjusted since they are fixed with the listed values.

Fault detection

The following table presents fault detection:

Table 1-450 Fault detection

Fault	Fault detection
Short-circuit within the channel pair of the safety mat evaluation	No (activation of the safety mat is detected)
Short-circuit with other channel pairs with configured safety mat evaluation	Yes
Short-circuit with other channels that are used for the applications 1 to 3	No
Short-circuit with L+ to DI_n or DI_{n+4}	Yes*
Short-circuit with M to DI_n or DI_{n+4}	Yes
Wire break	Yes
Short-circuit with L+ to VS_n or VS_{n+4}	Yes*
Short-circuit with M to VS_n or VS_{n+4}	Yes

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal. If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

NOTE

The fault detection diagnostics is not signaled as outgoing until the safety mat function is once again error-free after running self-tests. The safety mat must not be activated in this case.

Counter operating mode

5	DI_4	**6**	DI_5			
7	DI_6	**8**	DI_7			
9	VS_0	**10**	VS_1			
11	VS_2	**12**	VS_3			
13	VS_4	**14**	VS_5			
15	VS_6	**16**	VS_7			
L+	DC24V	**M**	M			

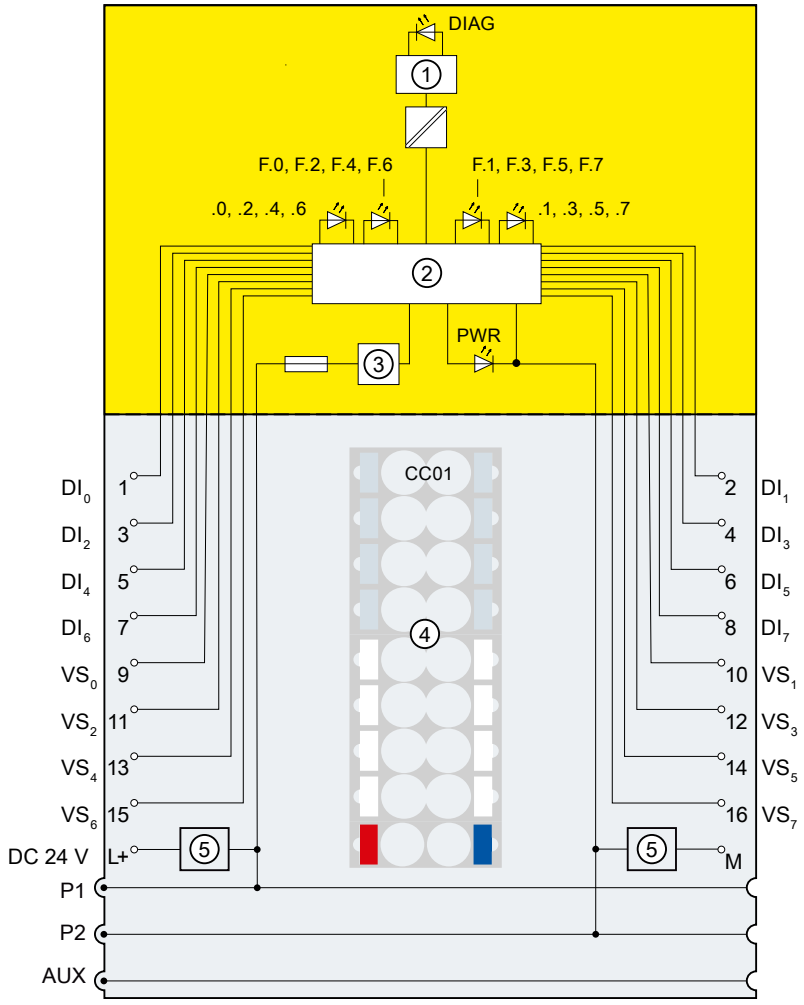
[1] Usable BaseUnit types can be identified by the last two digits of their order number. See also *ET 200SP Distributed I/O System* system manual

NOTE

The first BaseUnit of a potential group must be a light-colored BaseUnit.

NOTE

Make sure that you only use digital modules with BaseUnit type A0 during commissioning.



5.1.2 Wiring and block diagram

This section includes the block diagram of the digital input module F-DI 8×24VDC HF with the pin assignment.

You can find more information about wiring the BaseUnit in the Distributed I/O System ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/58649293) System Manual.

Block diagram

The following figure shows the pin assignment of the F-DI 8×24VDC HF digital input module on BaseUnit BU type A0.

①	Backplane bus interface	VS_n	Internal sensor supply, channel n
②	Input electronics	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
③	Reverse polarity protection	DI_n	Input signal, channel n
④	Color identification label with color code CC01 (optional)	DIAG	Error or diagnostics LED (green, red)

⑤	Filter circuit supply voltage (available in light-colored BaseUnit only)	.0 to .7	Channel status LED (green)
L+	24 V DC (infeed only with light-colored BaseUnit)	F.0 to F.7	Channel fault LED (red)
M	Mass supply voltage	PWR	Power LED (green)

Figure 1-190 Block diagram

5.2 Parameters/address space

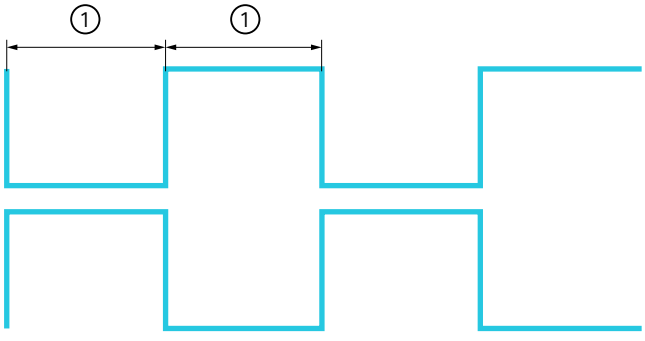
5.2.1 Counter

Function

Counting is the detecting and adding up of events. The counter of the module detects sensor signals and pulses and evaluates them accordingly, e.g.:

- For counting piece goods up to a maximum limit
- For counting of continuous pulses

The counting process is performed by non-equivalent 1oo2 evaluation of the DI_0 and DI_4 inputs. You define the properties of the counter with the functions described below.



The counter matches relevant edges on DI_0 with relevant edges on DI_4.

The relevant edges are:

- Rising edges for DI_0
- Falling edges for DI_4

If a relevant edge is detected, the counter is incremented by the value 1 (when counting up) or decremented (when counting down).

In order for a rising or falling edge to be detected, a constant input signal must be present for the minimum pulse duration. See the figure below.

① Minimum pulse duration

Figure 1-191 Minimum pulse duration

Table 1-452 Numerical values

Input delay	Minimum pulse duration	Maximum frequency
0.4 ms	0.71 ms	500 Hz
0.8 ms	1.10 ms	400 Hz
3.2 ms	3.60 ms	130 Hz

NOTE

Maximum frequency exceeded

If the maximum frequency is exceeded, a diagnostic message (Frequency too high) may occur, even if the gate is closed.

⚠ WARNING

Input signals shorter than the minimum pulse duration may not be detected. This can lead to a falsification of the count value.

Counting limits

The counting limits define the range of the count value. You can only change the counting limits during parameter assignment. It is not possible to change the counting limits during runtime.

The following counting limits can be configured:

- **High counting limit**

The maximum configurable counting limit is 2000000000.

- **Low counting limit**

The minimum configurable counting limit is –2000000000.

You can continue or stop the counting processes when a counting limit is violated (Reaction to violation of a counting limit). In the event of an overflow or underflow of the count value, the respective event bit in the feedback interface is set to "1". See section Assignment of the counter feedback interface (Page 67).

Application examples for counter mode

Information on possible application examples can be found in the section Application examples for counter mode (Page 76).

Reset control

You have two options to reset the counter:

- Using the user program
- Via the digital inputs DI_2 and DI_6 or the user program

You can select one of these two options through parameter assignment. Resetting sets the counter value to the configured start value and clears all counter errors present on counter

input channels DI_0 and DI_4. Counting errors can thus be eliminated and the passivated channel can be reintegrated.

In both cases, a rising edge on a control element (SW or HW) triggers the reset.

A reset is also necessary if errors have occurred on the other HW inputs.

After resetting, the counter starts counting automatically when the gate is at logic 1.

Gate control

The opening and closing of the hardware gate (HW gate) and software gate (SW gate) define the time window in which the counting signals are detected.

You have two options to control the gate:

- Via the user program (SW gate)
- Via the digital inputs DI_1 and DI_5 (HW gate)

You can select one of these two options through parameter assignment. The gate is closed when the control signal is at logic 0 and open when the control signal is at logic 1.

With the gate open, ensure that the two signals adopt unequal (antivalent) states ($DI_0 = 1$, $DI_4 = 0$ or $DI_0 = 0$, $DI_4 = 1$). If the signal on one channel changes, the other channel must change to the opposite state within the adjustable discrepancy time.

The gate control is active as long as no error is present. The gate control remains inactive even after a discrepancy error has been resolved and can only be reactivated by a reset. Only then will the error be reported as resolved and the outgoing error acknowledged.

When the gate is closed, the discrepancy evaluation of the digital inputs DI_0 and DI_4 is not active. However, exceeding the maximum possible frequency will continue to be monitored and will result in an error message even when the gate is closed.

After you have closed the gate, the two digital inputs of the counter must have adopted unequal (antivalent) states within the set "Discrepancy time limit" ($DI_0 = 1$, $DI_4 = 0$ or $DI_0 = 0$, $DI_4 = 1$). Otherwise, a diagnostic interrupt "Discrepancy error" can be triggered.

NOTE

Automatic closing of the gate

The gate is automatically closed in the following situations:

- If the CPU is in STOP mode
- CRC error in PROFIsafe communication
- In the event of a timeout of the PROFIsafe communication
- In the event of errors in the safety program that lead to a CPU STOP

⚠ WARNING

Reinitialization after parameter download
When you download the parameter assignment to the F-CPU, the internal module states are reinitialized. The internal module states thus correspond to the state on startup.
The reinitialization affects the following internal module states:

- Status and event bits in the process image are reset
- The count value is set to the start value

In addition to a user-command-controlled download of parameters from STEP 7 (TIA Portal), parameters are downloaded and the module is reinitialized in the following situations:

- Power cycling the F-CPU
- Pulling/plugging the module
- Power cycling the module supply voltage L+
- Power cycling the interface module in a distributed setup
- Pulling/plugging the PROFINET cable to the interface module in a distributed setup

Direction control

You have two options to control the counting direction:

- Using the user program
- Via the digital inputs DI_3 and DI_7

You can select one of these two options through parameter assignment. Changes in direction are only made when the gate is closed. The counting direction is up if the control signal is at logic 0 and down if the control signal is at logic 1.

Exceeding the counting limit

Exceeding the high or falling below the low counting limit is signaled by setting the corresponding event bit in the feedback interface.

You can acknowledge and clear these events via the user data interface (reset event) in the user program.

If a counting limit is exceeded twice without acknowledgment, the counter is deactivated and the "Channel passivated" diagnostics is generated.

5.2.2 Parameters

The "Counter" operating mode is only effective if the operating mode selection is configured as "Counter".

Parameters for "Counter" operating mode

The following parameters are possible:

Table 1-453 Adjustable parameters

Parameters	Value range	Default	Parameter reassignment in RUN	Scope
Module parameters:				
Operating mode	• Digital inputs • Counter • Standstill and Overspeed monitoring	Digital inputs	No	Module
F-parameters				
Manual assignment of the F-monitoring time	• Disable • Enable	Disable	No	Module
F-monitoring time	1 to 65535 ms	150 ms	No	Module
F-source address	1 to 65534	Depends on the parameter assignment of the F-CPU	No	Module
F-destination address	1 to 65534	Is proposed by the F-system	No	Module
F-parameter signature (without address)	0 to 65535	Is calculated by the F-system	No	Module
Behavior after channel fault	Passivate channel	Passivate channel (unchangeable)	No	Module
Reintegration after channel fault	• Adjustable • All channels automatically	Adjustable	No	Module
F-I/O DB manual number assignment	• Disable • Enable	Disable	No	Module
F-I/O DB number	—	Is proposed by the F-system	No	Module
F-I/O DB name	—	Is proposed by the F-system	No	Module

Table 1-454 Configurable counter parameters

Parameters	Value range	Default	Parameter reassignment in RUN	Scope
Counter - Channel 0, 4				
Input delay	• 0.4 ms • 0.8 ms • 3.2 ms	3.2 ms	No	Channel pair
Reset when counting limit is violated	• Start value • Opposite counting limit value	Start value	No	Channel pair
Reaction to violation of a counting limit	• Stop counting • Continue counting	Continue counting	No	Channel pair

Parameters	Value range	Default	Parameter reassignment in RUN	Scope
Discrepancy limit [number of pulses]	1	1 (unchangeable)	No	Channel pair
Discrepancy time limit	5 ms to 30 s	5 ms	No	Channel pair
High counting limit	-2000000000 to 2000000000	2000000000	No	Channel pair
Low counting limit	-2000000000 to 2000000000	-2000000000	No	Channel pair
Start value	-2000000000 to 2000000000	0	No	Channel pair
Counting value change reported	When present on a single channel	When present on a single channel (unchangeable)	No	Channel pair
Channel failure acknowledge	• Manual • Automatic	Manual	No	Channel pair
Gate, reset, direction control				
Gate controlled by	• Software • Hardware	Software	No	Module
Reset controlled by	• Software • Software or Hardware	Software	No	Module
Direction controlled by	• Software • Hardware	Software	No	Module
Gate, reset, direction hardware control				
Sensor evaluation	1oo2 evaluation, nonequivalent	1oo2 evaluation, nonequivalent (unchangeable)	No	Channel pair
Discrepancy behavior	Supply last valid value	Supply last valid value (unchangeable)	No	Channel pair
Reintegration after discrepancy error	Test 0-Signal not necessary	Test 0-Signal not necessary (unchangeable)	No	Channel pair
Discrepancy time	5 ms to 30 s	5 ms	No	Channel pair
Channel failure acknowledge	Automatic	Automatic (unchangeable)	No	Channel pair
Input delay	• 0.4 ms • 0.8 ms • 3.2 ms	3.2 ms (3.2 ms is fixed and unchangeable for reset hardware control)	No	Channel pair

5.2.3 Explanation of parameters

5.2.3.1 Module parameters

Operating mode

This parameter is used to specify the desired operating mode.
The digital input module F-DI 8×24VDC HF can be operated in the following operating modes:

- "Digital inputs"
- "Counter"
- "Standstill and Overspeed monitoring"

5.2.3.2 F-parameters

F-parameters

You have to assign the PROFIsafe address (F-destination address together with F-source address) to the F-module before you start operation.

- You define the F-source address with the "Central F-source address" parameter in the F-CPU.
- The F-destination address is assigned automatically for each F-module CPU-wide. You can change the specified F-destination address in the hardware configuration manually.

Information on the F-parameters for the F-monitoring time, the PROFIsafe addressing (F-source address, F-destination address) and the F-I/O DB can be found in the manual SIMATIC Safety - Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126).

Behavior after channel fault

This parameter is used to specify whether the entire F-module is passivated or just the faulty channel(s) in the event of channel faults. In "Counter" mode, the parameter must be set to "Passivate channel".

Reintegration after channel fault

Use this parameter to select how the channels of the fail-safe module are reintegrated after a fault.

Use on S7-1200/1500 F-CPUs
When using the F-module on F-CPUs S7-1200/1500, set this parameter in the STEP 7 dialog of the F-module:

- "Adjustable"
- "All channels automatically"

The parameter "Behavior after channel fault" is set to "Passivate the channel". You allow the individual configuration of the reintegration type per channel using the "Adjustable" parameter assignment. The reintegration type of the respective channel is specified with the "Channel failure acknowledge" channel parameter.

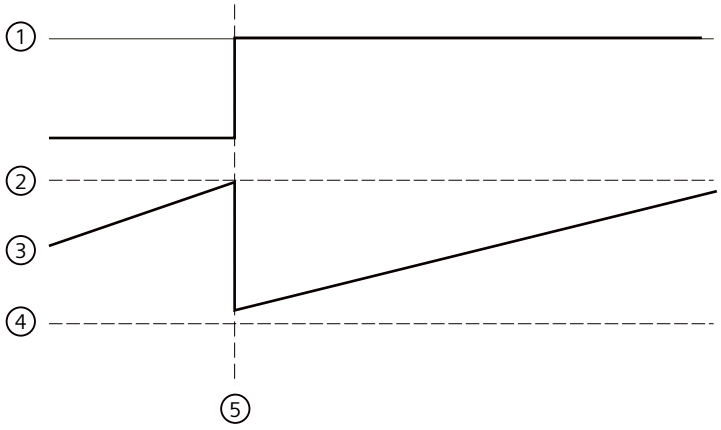
5.2.3.3 Counter parameters

Input delay

Input delay applied to the counting channels. See section Input delay (Page 29).

Reset when counting limit is violated

Determines whether the count value is to be set to the start value or to the opposite counting limit when the high or low counting limit is violated.



After a count overflow, the specified reset value is adjusted by one counting step to take the overflow pulse into account:

- When counting up: Reset value + 1
- When counting down: Reset value - 1

Reaction to violation of a counting limit

Determines the behavior when the high and low counting limit is violated. You can select whether counting continues or is stopped. If counting is to be stopped, you must close and reopen the gate to resume counting.

The following figure shows the reaction when a counting limit is violated and configured with "Continue counting":

① Overflow status
② High counting limit
③ Evaluated count value
④ Start value/opposite counting limit
⑤ Count value exceeds the configured high counting limit, is reset to the initial value/opposite counting limit value +1 and counting continues.
The user program detects that the "Overflow status" bit changes to high, indicating that the upper counting limit has been exceeded. The user program detects an updated count value.

Discrepancy limit [number of pulses]

The discrepancy limit is the difference in the number of pulses between the two counting channels. The permissible discrepancy is fixed to one pulse. Because a pulse consists of two edges, the detection of a third unequal edge triggers a counting discrepancy error and the diagnostic message "Counter discrepancy limit exceeded" is generated for both channels.

Discrepancy time limit

The time limit for discrepancy is the maximum time within which, after a pulse edge is detected on one input signal (DI_0 or DI_4), a corresponding edge must be detected on the opposite input signal (DI_4 or DI_0). The discrepancy time is measured for each individual unequal edge.

If an edge does not match after the set discrepancy time has expired, e.g. due to a wire break in a sensor cable, a discrepancy error is detected and the diagnostic message "Discrepancy error" is generated for both channels.

High counting limit

You limit the counting range by specifying the high counting limit. When the current count value exceeds the high counting limit, an overflow event is triggered in the feedback interface. You can select if counting is stopped or continued after the high counting limit is exceeded. The current count value is then set to the start value +1 or the low counting limit +1, depending on the parameter assignment. The high counting limit must be greater than the start value. The permissible range is between -2000000000 and 2000000000. The default setting is 2000000000.

Low counting limit

You limit the counting range by specifying the low counting limit. If the current count value falls below the low counting limit, an underflow event is triggered in the feedback interface. You can select if counting is stopped or continued after the low counting limit is undershot. The current count value is then set to the start value -1 or the high counting limit -1, depending on the parameter assignment. The low counting limit must be lower than the start value. The permissible range is between -2000000000 and 2000000000. The default setting is -2000000000.

Start value

You determine the count value at the beginning of the counting by configuring the start value. The current count value is reset to the start value in the following situations:

- After startup
- After parameter download
- After reset
- When the counting limit is exceeded, if configured

The start value must be a value between the high and low counting limit. The permissible range is between -2000000000 and 2000000000. The default setting is 0.

Counting value change reported

Determines when the count value is updated. This parameter is always set to "When present on a single channel". This results in an update being triggered as soon as a "single" rising edge on the primary channel DI_0 or a "single" falling edge on the secondary channel DI_4 is detected. In this context, "single" means that it is not a matching edge. A matching edge is an edge that coincides with an opposite edge already detected on the other channel.

Channel failure acknowledge

Determines how faults on channels 0 and 4 are acknowledged.

You can select from the following options:

- Manual
- Automatic

5.2.3.4 Parameters for gate, reset and direction control

Gate, reset and direction control

Specifies the source for gate, reset, and direction control.

You can select the following options for the gate or direction control:

- "Software"
- "Hardware"

You can choose the following options for the reset control:

- "Software"
- "Software or Hardware"

The default setting is "Software".

NOTE

If you select the "Hardware" option, the respective internal sensor supply is automatically enabled. However, their use in the wiring is optional.

5.2.3.5 Parameters for gate, reset and direction hardware control

Sensor evaluation

If the hardware control option is selected, the setting is always "1oo2 evaluation, non-equivalent". For more information, see section Sensor evaluation (Page 25).

Discrepancy behavior

If the hardware control option is selected, the setting is always "Supply last valid value". For more information, see section Discrepancy behavior (Page 26).

Reintegration after discrepancy error

If the hardware control option is selected, the setting is always "Test 0-Signal not necessary". For more information, see section Reintegration after discrepancy error (Page 27).

Discrepancy time

For more information, see section Discrepancy time (Page 27).

Channel failure acknowledge

This setting is always "Automatic". For more information, see section Channel failure acknowledge (Page 28).

Input delay

For more information, see section Input delay (Page 29).

5.2.4 Address space

Address assignment of the digital input module F-DI 8×24VDC HF in "Counter" operating mode

The digital input module F-DI 8×24VDC HF occupies the following address areas in the F-CPU:

Table 1-455 Address assignment in the F-CPU

	Occupied bytes in the F-CPU:	
F-CPU	**In the input range**	**In the output range**
S7-1200/1500 F-CPUs*	IB x + 0 to x + 14	QB x + 0 to x + 5

*) The counter only works with F-CPUs that support PROFIsafe version 2.6.1

x = Module start address

Address assignment of the user data and the value status of digital input module F-DI 8×24VDC HF in "Counter" operating mode

The user data occupy the following addresses in the F-CPU out of all the assigned addresses of the digital input module F-DI 8×24VDC HF:

Table 1-456 User data address assignment in the input range

Byte in the F-CPU	**Assigned bits in F-CPU per F-module:**							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
IB x + 0	Reserved				HW direction signal	HW reset signal	HW gate signal	Reserved
IB x + 1	Reserved		Underflow status	Overflow status	Direction status	Reset status	Gate status	Reserved
IB x + 2	Count value							
IB x + 3								

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	6	5	4	3	2	1	0
IB x + 4	Count value							
IB x + 5								
IB x + 6	Reserved				HW direction value status	HW reset value status	HW gate value status	Reserved
IB x + 7	Reserved		Value status of underflow status	Value status of overflow status	Value status of direction status	Value status of reset status	Value status of gate status	Reserved
IB x + 8	Reserved							Value status of count value
IB x + 9	Reserved			Event reset controlled by SW	Direction controlled by SW	Reset controlled by SW	Gate controlled by SW	Reserved

Table 1-457 User data address assignment in the output range

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	6	5	4	3	2	1	0
QB x + 0	Reserved			Event reset	SW direction control	SW reset control	SW gate control	Reserved

5.2.5 Assignment of the control interface counter

The safety program can influence the behavior of the module in "Counter" operating mode via the control interface.

Assignment of the control interface

The following table shows the assignment of the control interface:

Table 1-458 Address assignment in the F-CPU

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	6	5	4	3	2	1	0
QB x + 0	Reserved			Event reset	SW direction control	SW reset control	SW gate control	Reserved

Explanations

Table 1-459 Explanations

Byte	Bit	Control bit/value	Explanations
QB x + 0	1	SW gate control	Use this bit to control whether the software gate is open, and thus counting is activated. • 0: SW gate closed, counting stopped • 1: SW gate open, counting possible
QB x + 0	2	SW reset control	Use this bit to reset the current value to the configured start value. • 0: No action • 1: Resets the counter to the start value and clears all counter errors present on the channels. The "SW reset" action is always initiated when this bit transitions from 0 to 1. The counter is set to the "Start value" and any error status present on the channels of the counter is cleared.
QB x + 0	3	SW direction control	Use this bit to specify the counting direction. • 0: Counting direction up • 1: Counting direction down Changes in direction are only made when the gate is closed.
QB x + 0	4	Event reset	Use this bit to reset the following status bits in the feedback interface: • Underflow status • Overflow status As long as the "Reset event" bit is set to 1, the "Underflow status" and "Overflow status" bits are continuously reset.

5.2.6 Assignment of the feedback interface counter

In "Counter" operating mode, the safety program can receive actual values and status information via the feedback interface.

Feedback interface

The following table shows the assignment of the feedback interface:

Table 1-460 Assignment of the feedback interface

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
IB x + 0	Reserved				HW direction signal	HW reset signal	HW gate signal	Reserved
IB x + 1	Reserved		Underflow status	Overflow status	Direction status	Reset status	Gate status	Reserved
IB x + 2	Count value							
IB x + 3								
IB x + 4								
IB x + 5								
IB x + 6	Reserved				HW direction value status	HW reset value status	HW gate value status	Reserved

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	6	5	4	3	2	1	0
IB x + 7	Reserved		Value status of under-flow status	Value status of overflow status	Value status of direction status	Value status of reset status	Value status of gate status	Reserved
IB x + 8	Reserved							Value status of count value
IB x + 9	Reserved			Event reset controlled by SW	Direction controlled by SW	Reset con-trolled by SW	Gate con-trolled by SW	Reserved

Explanations

Table 1-461 Explanations

Byte	Bit	Feedback bit/value	Description
IB x + 0	1	HW gate signal	Only valid if the HW control is configured for the gate. The signal value is formed via a 1oo2 evaluation, non-equivalent of the digital inputs DI_1 and DI_5.
IB x + 0	2	HW reset signal	Only valid if the HW control is configured for the reset. The signal value is formed via a 1oo2 evaluation, non-equivalent of the digital inputs DI_2 and DI_6.
IB x + 0	3	HW direction signal	Only valid if the HW control is configured for the direction. The signal value is formed via a 1oo2 evaluation, non-equivalent of the digital inputs DI_3 and DI_7.
IB x + 1	1	Gate status	The "Gate status" bit indicates that the module has received the gate control from either the SW control interface or the HW control and has responded as follows: • If the gate control is set to 1, the "Gate status" bit is also set to 1. The module begins monitoring the counter channel pair. • If the gate control is set to 0, the "Gate status" bit is also set to 0. Changes to the counter channel pair are ignored.
IB x + 1	2	Reset status	The "Reset status" bit indicates that the module has received the "Reset" from the control interface and responded as follows: • If the reset control transitions from 0 to 1, the module sets the count value to the start value and clears the counter error states. The "Reset status" bit is set to 1. • If the reset control is set to 0, the "Reset status" bit is also set to 0. If both HW and SW control are used, both must be set to 0 to clear the status bit.
IB x + 1	3	Direction status	The "Direction status" bit indicates the counting direction. • 0: Counting direction is up • 1: Counting direction is down
IB x + 1	4	Overflow status	The "Overflow status" bit is always set when the current count value exceeds the configured "High counting limit". • 0: High counting limit not violated • 1: High counting limit was violated The overflow status bit remains set to 1 until the "Event reset" bit of the module is set to 1, and remains cleared as long as the “Event reset” bit is set to 1.

Byte	Bit	Feedback bit/value	Description
IB x + 1	5	Underflow status	The "Underflow status" bit is always set when the current count value falls below the configured "Low counting limit". • 0: Low counting limit not violated • 1: Low counting limit was violated The "Underflow status" bit remains set to 1 until the "Event reset" bit of the module is set to 1, and remains cleared as long as the "Event reset" bit is set to 1.
IB x + 2 **IB x + 3** **IB x + 4** **IB x + 5**	0-7	Count value	The count value is a 32-bit signed integer value with a high limit of 2 billion and a low limit of -2 billion.
IB x + 6	1	HW gate value status	Contains the value status of the hardware control inputs in the event that gate is controlled by the hardware.
IB x + 6	2	HW reset value status	Contains the value status of the hardware control inputs in the event that reset is controlled by the hardware.
IB x + 6	3	HW direction value status	Contains the value status of the hardware control inputs in the event that direction is controlled by the hardware.
IB x + 7	1	Value status of gate status	Contains the value status of gate status
IB x + 7	2	Value status of reset status	Contains the value status of reset status
IB x + 7	3	Value status of direction status	Contains the value status of direction status
IB x + 7	4	Value status of overflow status	Contains the value status of overflow status
IB x + 7	5	Value status of underflow status	Contains the value status of underflow status
IB x + 8	0	Value status of count value	Contains the value status of count value
IB x + 9	1	Gate controlled by SW	Contains bit that indicates whether gate is software-controlled.*
IB x + 9	2	Reset controlled by SW	Contains bit that indicates whether reset is software-controlled.*
IB x + 9	3	Direction controlled by SW	Contains bit indicating whether direction is software-controlled.*
IB x + 9	4	Event reset controlled by SW	Contains bit indicating whether reset event is software-controlled.*

*) This can only be changed by parameter assignment.

A detailed bit assignment of the bytes IB x + 6 to IB x + 9 can be found in the table "Address assignment by user data in the input range (Page 65)".

5.3 Use cases for Counter (as of firmware version V3.0.0)

⚠ WARNING

Make sure that the highest frequency occurring in the application does not exceed 500 Hz.

⚠ WARNING

Reinitialization after parameter download
When you download the parameter assignment to the F-CPU, the internal module states are reinitialized. The internal module states thus correspond to the state on startup.
The reinitialization affects the following internal module states:

- Status and event bits in the process image are reset
- The count value is set to the start value

In addition to a user-command-controlled download of parameters from STEP 7 (TIA Portal), parameters are downloaded and the module is reinitialized in the following situations:

- Power cycling the F-CPU
- Pulling/plugging the module
- Power cycling the module supply voltage L+
- Power cycling the interface module in a distributed setup
- Pulling/plugging the PROFINET cable to the interface module in a distributed setup

⚠ WARNING

In the time range $2*T_{cycle}$ before the gate opens, signal changes at the inputs DI_0 and DI_4 can be included in the count value.
In the time range $2*T_{cycle}$ before the gate closes, signal changes at the inputs DI_0 and DI_4 are not necessarily included in the count value.
Ensure that, in these time ranges, either no signal changes occur at DI_0 and DI_4, or the influence of signal changes occurring in these time ranges on the count value is tolerated by the application.
When using the software gate, the times described in the section "Monitoring and response times" in the programming and operating manual "Industrial Software SIMATIC Safety - Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126)" influence the gate control. These times can influence the count value and must be taken into account in the application.
Details on this can be found in the application examples (Page 76).

Inputs for counter

The digital input module F-DI 8x24VDC HF has 8 fail-safe inputs, DI_0 to DI_7.

The inputs are paired in a non-equivalent 1oo2 logic and are used as follows:

- DI_0 and DI_4 are used as counting channels.
- DI_1 and DI_5 are used optionally for HW gate control.
- DI_2 and DI_6 are used optionally for HW reset control.
- DI_3 and DI_7 are used optionally for HW direction control.

The process signals for the HW controls are provided by channels DI_1, DI_2 and DI_3.

The counter counts the number of relevant edges detected on both DI_0 and DI_4. The higher count value on relevant edges of both channels is output as the count value by the module.

Relevant edges are:

- Rising edges for DI_0
- Falling edges for DI_4

Wiring

The wiring is performed on a suitable BaseUnit.

Sensor supply

In "Counter" mode, the internal sensor supplies are permanently assigned to the inputs and cannot be changed.

- VS_0 to DI_0 and VS_4 to DI_4 (always activated)
- VS_1 to DI_1 and VS_5 to DI_5 (activated if the HW gate control is configured)
- VS_2 to DI_2 and VS_6 to DI_6 (activated if the HW reset control is configured)
- VS_3 to DI_3 and VS_7 to DI_7 (activated if the HW direction control is configured)
- The short-circuit tests of the sensor supplies are permanently deactivated.

NOTE

The use of the internal sensor supply in the wiring is optional.

NOTE

Avoidance of interference due to high-energy surge voltages

To avoid interference caused by high-energy surge voltages, you must observe the following restrictions when operating in "Counter" mode:

With parameter assignment of the DI_0 and DI_4 inputs with an input delay of 3.2 ms:

No restrictions

With parameter assignment of the DI_0 and DI_4 inputs with an input delay of 0.8 ms:

For the DI_0 and DI_4 inputs, you need to use either shielded cables with a maximum length according to the technical specifications (Page 119) or unshielded cables with a maximum length of 30 m. When unshielded cables are used, they can only be installed inside a building.

The following applications are not supported:

- Applications according to NAMUR recommendation NE 21
- Applications according to EN 298
- Shipbuilding applications

With parameter assignment of the DI_0 and DI_4 inputs with an input delay of 0.4 ms:

For the DI_0 and DI_4 inputs, you need to use either shielded cables with a maximum length according to the technical specifications (Page 119) or unshielded cables with a maximum length of 30 m. When unshielded cables are used, they can only be installed inside a building.

The following applications are not supported:

- Applications according to NAMUR recommendation NE 21
- Applications according to EN 298
- Shipbuilding applications

The length of the cable between the power supply unit and the F-module cannot be greater than 30 m. The cable can only be installed inside a building.

NOTE

Interruptions of the supply voltage according to IEC 61131-2 are not buffered by the F-module and thus influence the internal sensor supplies. This can lead to the occurrence of diagnostics and passivation of the F-module in "Counter" operating mode. To ensure problem-free functioning of the F-module and the sensors, we recommend the following:

With parameter assignment of the DI_0 and DI_4 inputs with an input delay of 3.2 ms:

No additional measures necessary.

With parameter assignment of the DI_0 and DI_4 inputs with an input delay of 0.8 ms or 0.4 ms:

For the power supply, use a separate power supply unit that only supplies voltage to digital input modules F-DI 8x24VDC HF in "Counter" operating mode and the associated sensors.

WARNING

When selecting the sensors, take into account that test pulses at the output of the sensor may influence the counter value.

Wiring diagram - Use case with external sensor supply

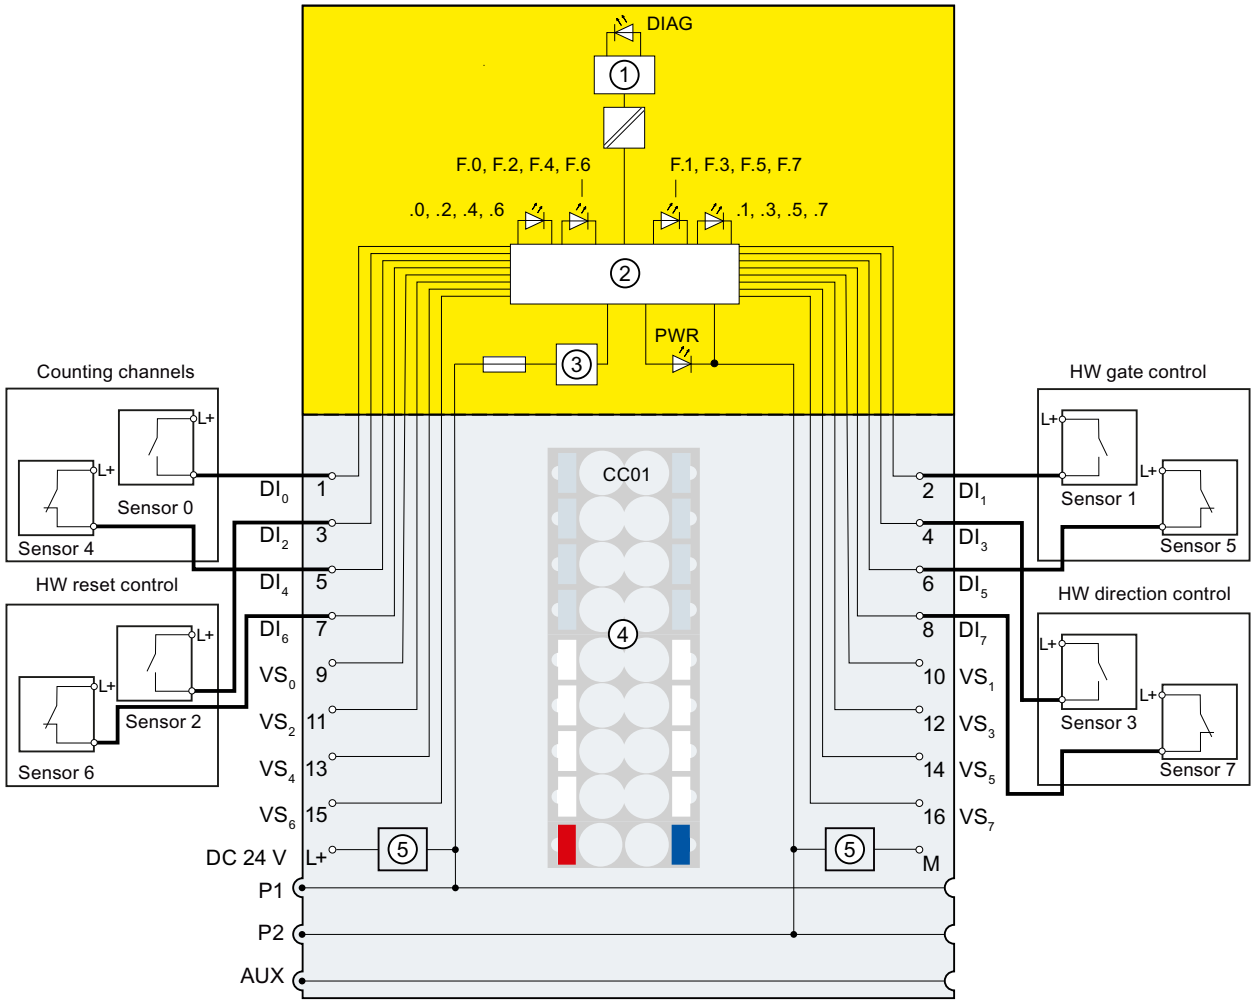


Figure 1-192 Use case with external sensor supply

WARNING

To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Wiring diagram - Use case with internal sensor supply

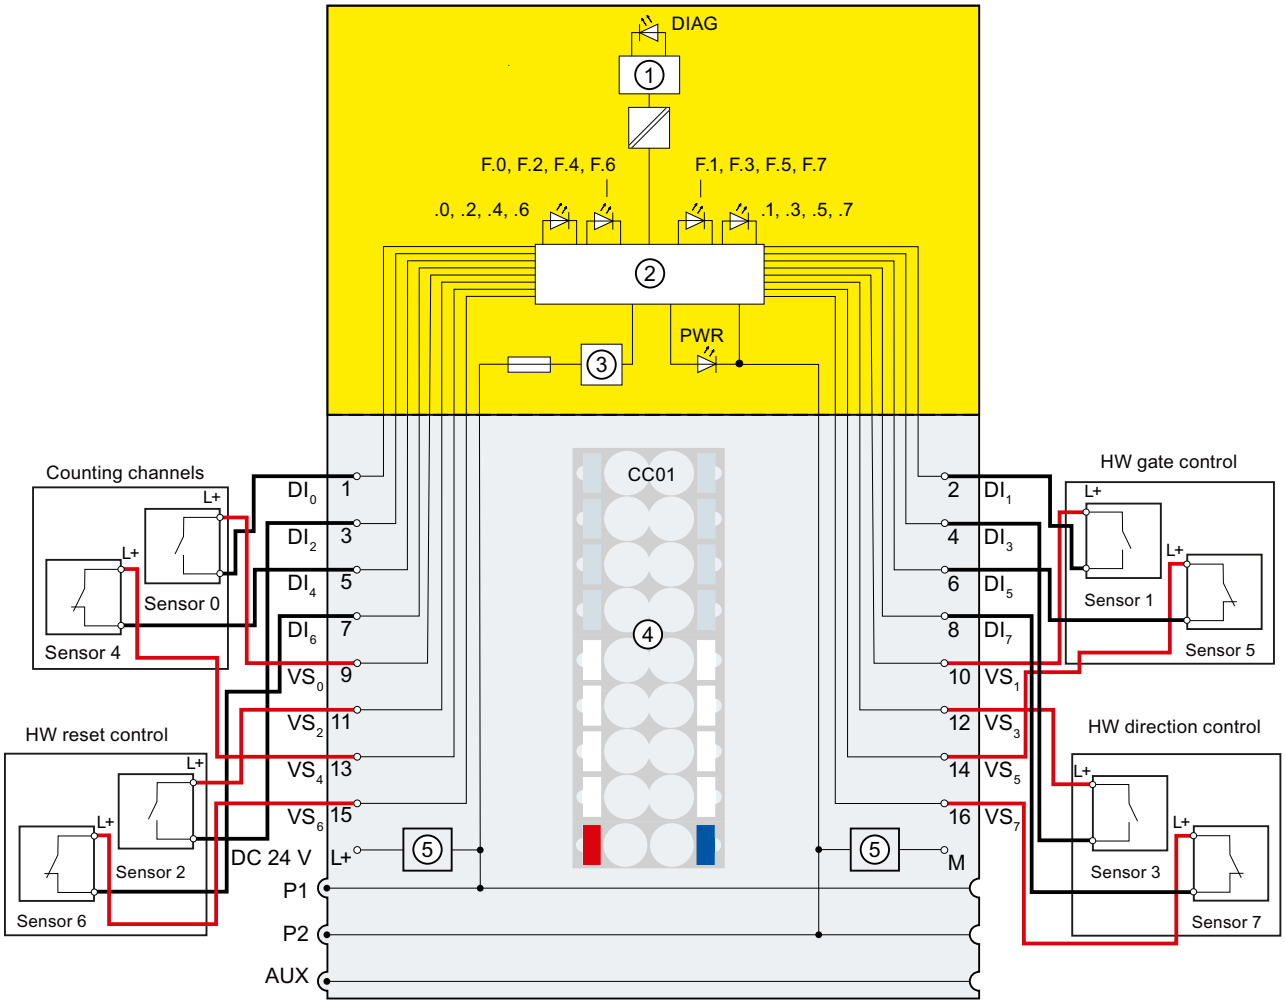

Figure 1-193 Use case with internal sensor supply

WARNING

To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Fault detection

The following tables show the fault detection depending on the sensor supply:

Table 1-462 Error detection at counter inputs (DI_0 and DI_4)

Faults	Fault detection at counter inputs	
	Internal sensor supply	**External sensor supply**
Short-circuit within the channel pair	Yes	Yes
Short-circuit with other channel pairs or with other sensor supplies	Yes*	Yes*
Short-circuit with L+ to DI_0 or DI_4	Yes*	Yes*
Short-circuit with M to DI_0 or DI_4	Yes*	Yes*
Short-circuit with L+ to SV_n	No	-
Short-circuit with M to SV_n or defective	Yes	-
Discrepancy error	Yes	Yes
Counter discrepancy limit exceeded	Yes	Yes
Wire break	Yes*	Yes*

*) All these errors are detected based on the discrepancy. A discrepancy error is reported after the discrepancy time. Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal. If there is no signal corruption compared to the sensor signal, error detection is neither possible nor required from a safety standpoint.

Table 1-463 Fault detection at HW inputs (DI_1, DI_2, DI_3, DI_5, DI_6 and DI_7)

Faults	Fault detection at HW control inputs	
	Internal sensor supply	**External sensor supply**
Short-circuit within the channel pair	Yes	Yes
Short-circuit with other channel pairs or with other sensor supplies	Yes*	Yes*
Short-circuit with L+ to DI_n	Yes*	Yes*
Short-circuit with M to DI_n	Yes*	Yes*
Discrepancy error	Yes	Yes
Short-circuit with L+ to SV_n	No	-
Short-circuit with M to SV_n or defective	Yes	-

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal. If there is no signal corruption compared to the sensor signal, error detection is neither possible nor required from a safety standpoint.

5.4 Application examples for counter mode

The following are two possible application examples for counter mode:

- Piece count
- Counting of continuous pulses

Piece count

In the illustrated example, the number of items transported on a conveyor belt is counted. The counting is performed via two sensors connected to DI_0 and DI_4.

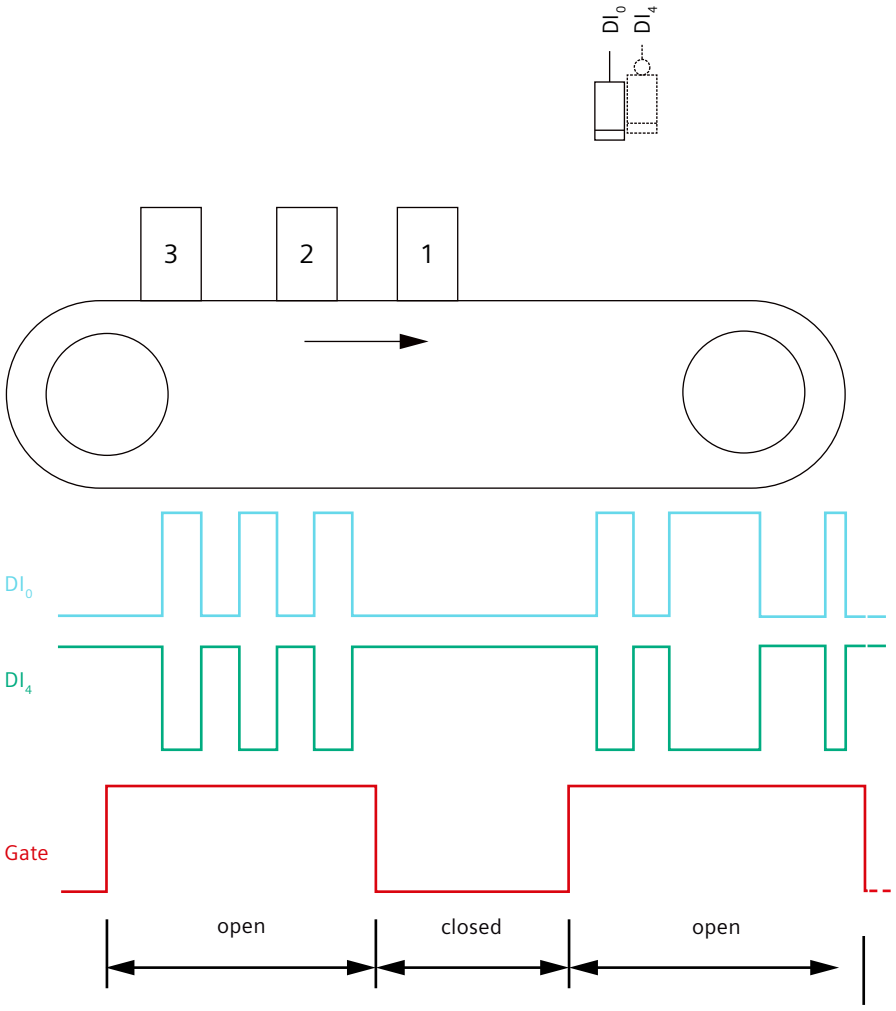

Figure 1-194 Piece count

The piece count refers to cases where an exact number of events is to be counted.

The piece count is defined by the following main characteristics:

- The signal change at the inputs occurs at an unpredictable time.
- The cycle duration and width of the pulses are variable.
- If the gate of the counter is open, the signal changes at the inputs can be stopped, paused, or resumed.
- This application example allows for an exact count value. (For details, see Rules and restrictions)

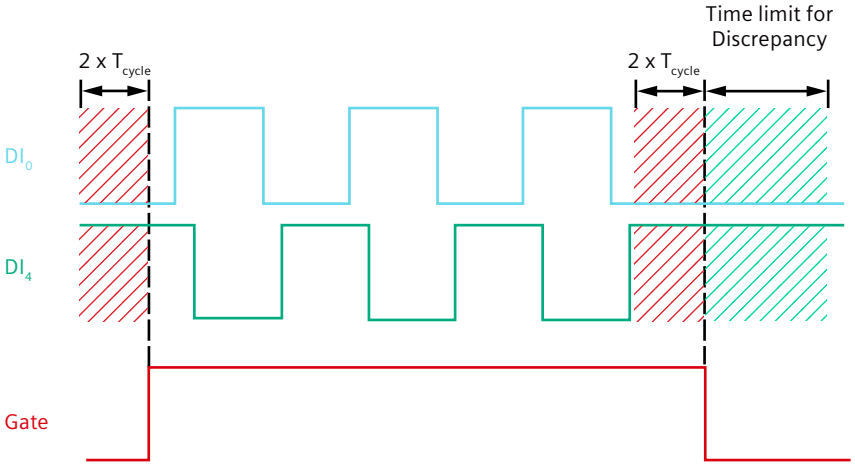
Rules and restrictions:

WARNING

In the time range 2*T_{cycle} before the gate opens, signal changes at the inputs DI_0 and DI_4 can be included in the count value.
In the time range 2*T_{cycle} before the gate closes, signal changes at the inputs DI_0 and DI_4 are not necessarily included in the count value.
Ensure that, in these time ranges, either no signal changes occur at DI_0 and DI_4, or the influence of signal changes occurring in these time ranges on the count value is tolerated by the application.
When using the software gate, the times described in the section "Monitoring and response times" in the programming and operating manual "Industrial Software SIMATIC Safety - Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126)" influence the gate control. These times can influence the count value and must be taken into account in the application.

NOTE

After you have closed the gate, the two digital inputs of the counter must have adopted unequal (antivalent) states within the set "Discrepancy time limit" (DI_0 = 1, DI_4 = 0 or DI_0 = 0, DI_4 = 1). Otherwise, a diagnostic interrupt "Discrepancy error" can be triggered.



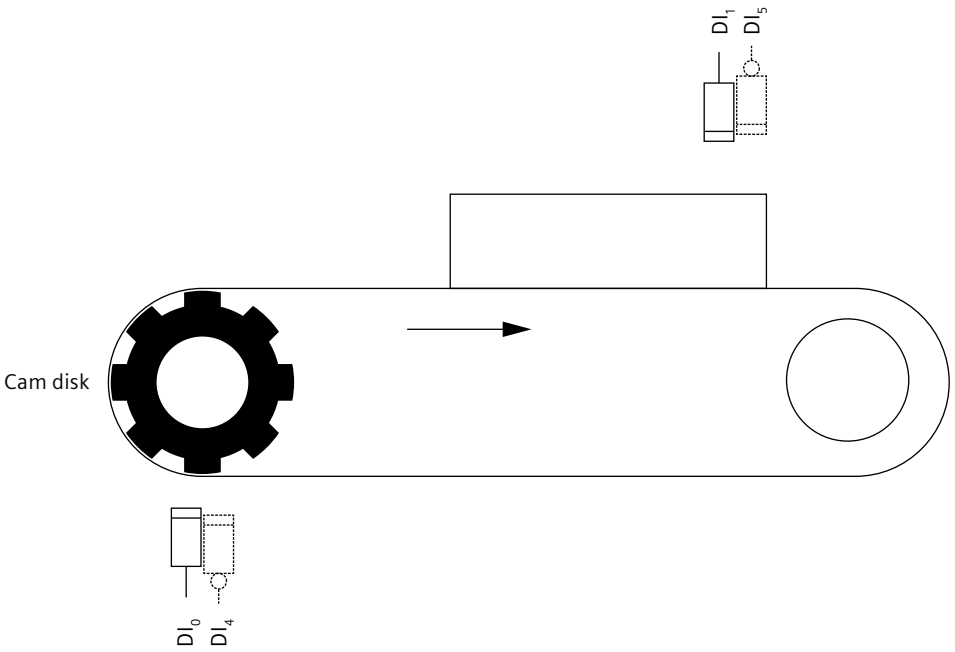


Figure 1-195 Leader and trailer

Counting of continuous pulses

In the illustrated example, the length of the item transported on a conveyor belt is determined.

The object is detected and the gate is controlled via sensors at digital inputs DI_1 and DI_5.

A cam disk is placed on the drive shaft of the conveyor belt. This is detected by sensors connected to DI_0 and DI_4. The length of the object can be inferred from the pulses counted by the sensors.

Counting continuous pulses refers to cases where recurring events are to be counted.

The counting of continuous pulses is defined by the following main characteristics:

- The signal change at the inputs occurs periodically.
- The maximum cycle duration of the pulses applied to the inputs depends on the "Discrepancy time limit" parameter.
- If the counter gate is open, the signal changes at the inputs **cannot** be stopped, paused, or resumed.
- This application example is suitable for applications that allow a tolerance-based count value. (For details, see Rules and restrictions)

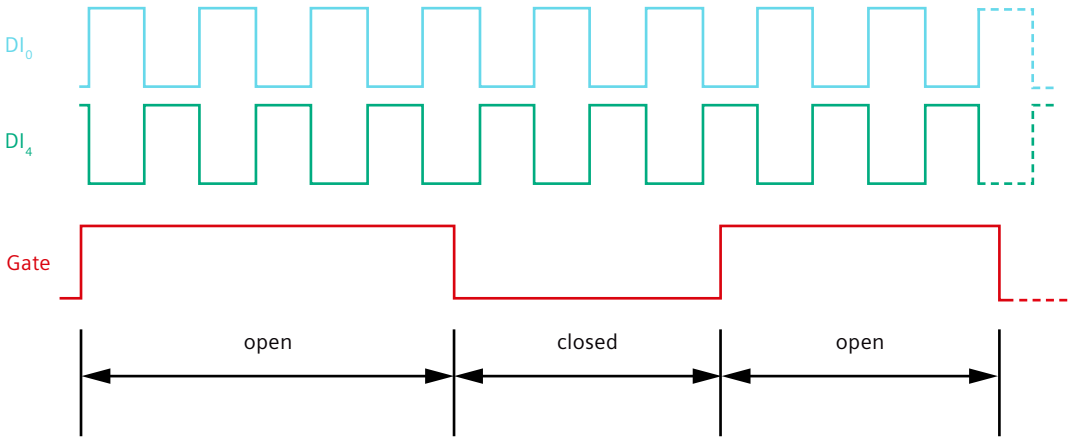

Figure 1-196 Counting of continuous pulses

Rules and restrictions:

- Ensure that the time assigned in the "Discrepancy time limit" parameter is longer than the longest time that the counter inputs are expected to remain unchanged (the longest gap between 2 edges). The figure below shows a continuous pulse pattern that alternates between three cycle durations: P1, P2, P3. The time assigned in the "Discrepancy time limit" parameter must be greater than T1. T1 is the largest distance between 2 edges.

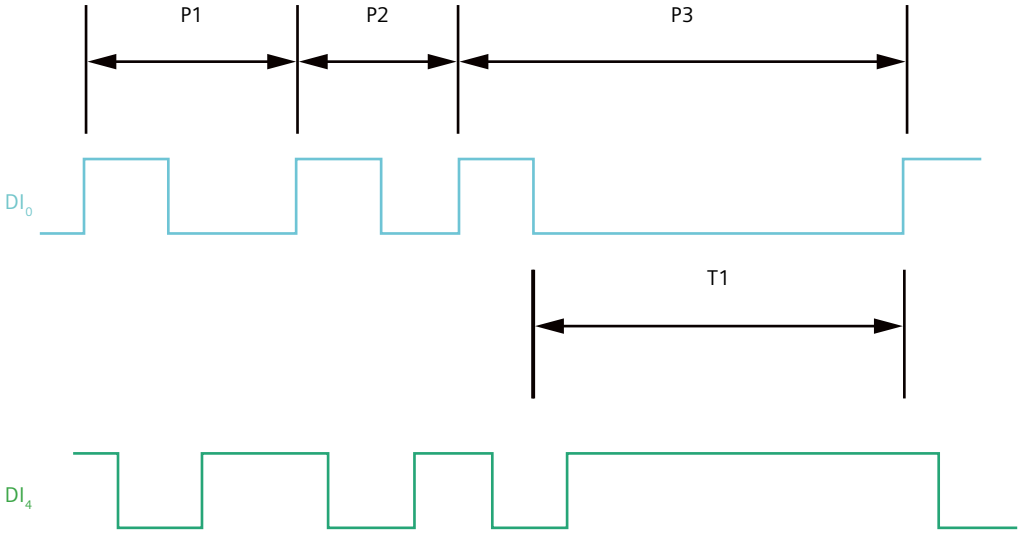

Figure 1-197 Pulse pattern

WARNING

In the time range $2*T_{cycle}$ before the gate opens, signal changes at the inputs DI_0 and DI_4 can be included in the count value.
In the time range $2*T_{cycle}$ before the gate closes, signal changes at the inputs DI_0 and DI_4 are not necessarily included in the count value.
Ensure that, in these time ranges, either no signal changes occur at DI_0 and DI_4, or the influence of signal changes occurring in these time ranges on the count value is tolerated by the application.
When using the software gate, the times described in the section "Monitoring and response times" in the programming and operating manual "Industrial Software SIMATIC Safety - Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126)" influence the gate control. These times can influence the count value and must be taken into account in the application.

NOTE

Ensure that the continuous pulse pattern shown in the "Leader and trailer" figure is detected by inputs DI_0 and DI_4 for at least $2*T_{cycle}$ before the gate is opened. Otherwise, a diagnostic interrupt "Discrepancy error" can be triggered.
Ensure that, after the gate is closed, the continuous pulse pattern is detected by inputs DI_0 and DI_4 for at least the configured "Discrepancy time limit". Otherwise, a diagnostic interrupt "Discrepancy error" can be triggered.

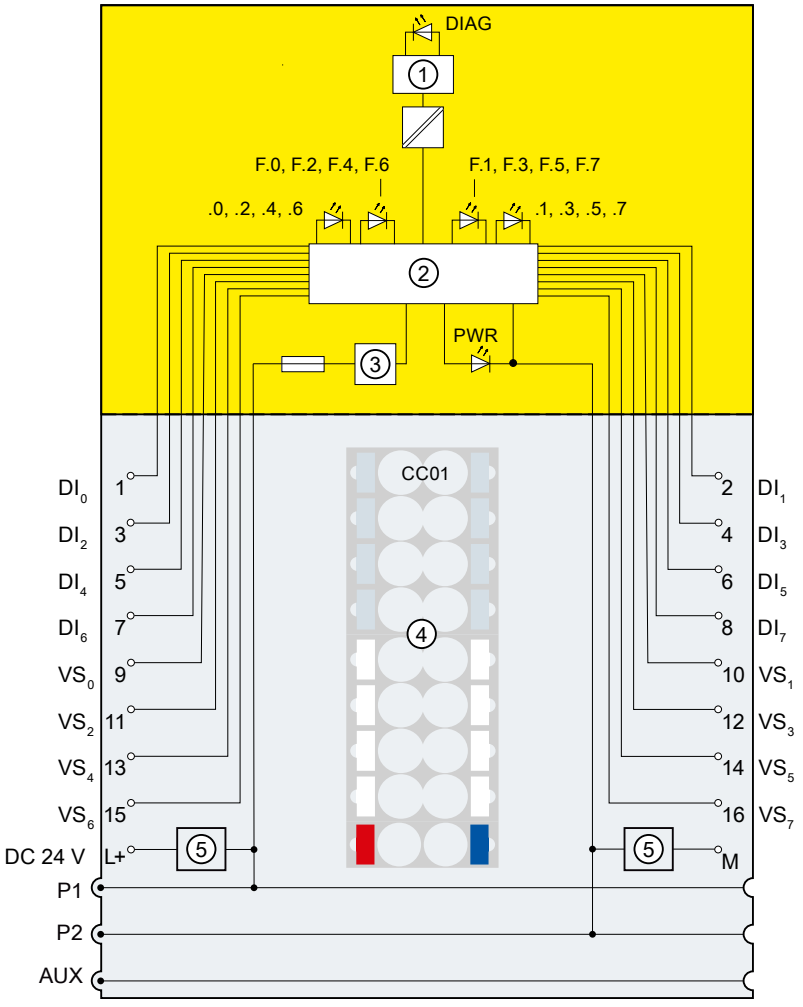
[1] Usable BaseUnit types can be identified by the last two digits of their order number. See also *ET 200SP Distributed I/O System* system manual

NOTE
The first BaseUnit of a potential group must be a light-colored BaseUnit.

NOTE
Make sure that you only use digital modules with BaseUnit type A0 during commissioning.



6.1.2 Wiring and block diagram

This section includes the block diagram of the digital input module F-DI 8×24VDC HF with the pin assignment.

You can find more information about wiring the BaseUnit in the Distributed I/O System ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/58649293) System Manual.

Block diagram

The following figure shows the pin assignment of the F-DI 8×24VDC HF digital input module on BaseUnit BU type A0.

①	Backplane bus interface	VS_n	Internal sensor supply, channel n
②	Input electronics	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
③	Reverse polarity protection	DI_n	Input signal, channel n
④	Color identification label with color code CC01 (optional)	DIAG	Error or diagnostics LED (green, red)

⑤	Filter circuit supply voltage (available in light-colored BaseUnit only)	.0 to .7	Channel status LED (green)
L+	24 V DC (infeed only with light-colored BaseUnit)	F.0 to F.7	Channel fault LED (red)
M	Mass supply voltage	PWR	Power LED (green)

6.2 Parameters/address space

6.2.1 Standstill and overspeed monitoring

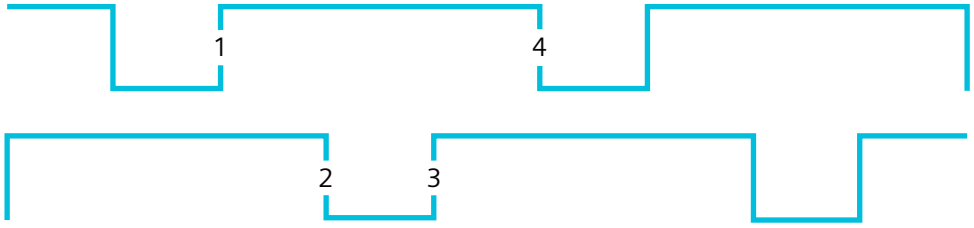
Function

Standstill and overspeed monitoring means the detection of periodically occurring pulse events. The module determines the number of pulses occurring in a defined time window and evaluates them.

Possible applications include:

- Monitoring for excessively high speed during rotation
- Monitoring of the standstill or runout of a rotational movement to its maximum residual speed

The standstill and overspeed monitoring is carried out by means of 1oo2 evaluation of the inputs DI_0 and DI_4. The following figure shows the required pulse pattern.



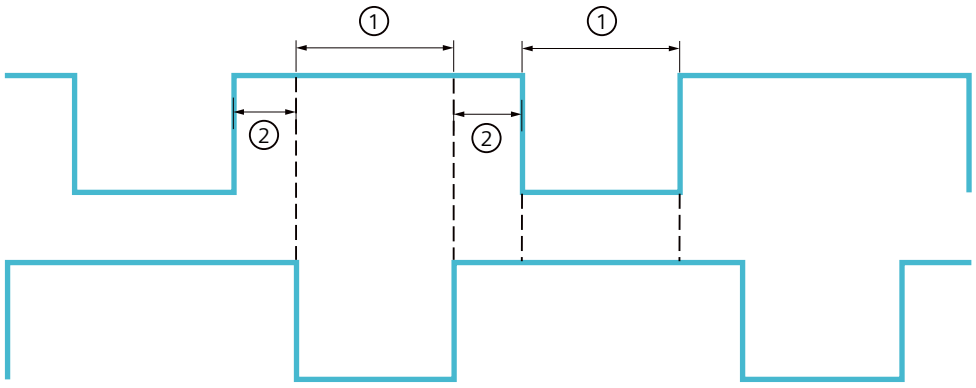


Figure 1-200 Pulse pattern

Between a rising edge (1) and falling edge (4) on the first channel, there must always be a falling edge (2) and a rising edge (3) on the second channel.

In order for a rising or falling edge to be detected, a constant input signal must be present for the minimum pulse duration. See the figure below.

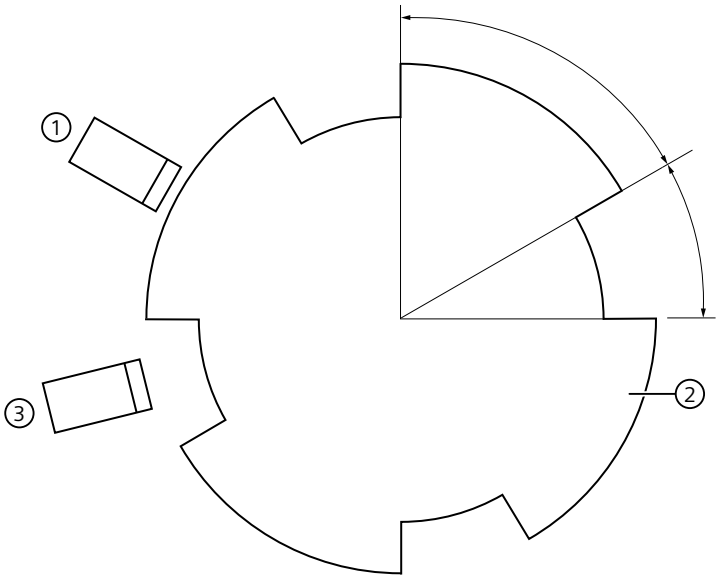
① Minimum pulse duration of the "0" signal
② Minimum duration between edge changes = 330 µs

Figure 1-201 Minimum pulse length

Table 1-465 Numerical values

Input delay	Minimum pulse duration of the "0" signal	Maximum frequency
0.4 ms	0.71 ms	480 Hz
0.8 ms	1.10 ms	350 Hz
3.2 ms	3.60 ms	120 Hz

NOTE



Maximum frequency exceeded

If the maximum frequency is exceeded, a diagnostic message (Frequency too high) may occur, even if the gate is closed.

⚠ WARNING

Input signals shorter than the minimum pulse duration may not be detected. This can lead to a falsification of the standstill and speed detection.

The pulse pattern requirements can be met with applications using a cam disk mounted on a motor shaft. For example, in the following figure in which the sensors are designed as normally open contacts:

① Sensor 1
② Cam disk
③ Sensor 2

Figure 1-202 Example of a pulse detection

With pulse detection, note the following:

- The segment that provides the "1" signal state is larger than the segment that represents the "0" signal state.
- You must position the sensors so that the signals on both sensors do not change at the same time and do not deliver the signal state "0" at the same time.
- After the logic of a sensor switches from 1 to 0, a minimum pulse duration of the "0" signal must be observed. During this entire duration, both sensors must constantly maintain their logic.

  Furthermore, a minimum duration of at least 330 µs must be between the edge changes. This period defines a phase in which both sensors must consistently keep logical 1 at the same time.
- After each logic change on either of the two sensors, a minimum pulse duration should elapse during which the logic on both sensors remains unchanged. See figure "Minimum pulse length" at the beginning of this section.

You define the properties of the standstill and overspeed monitoring with the functions described below.

Standstill monitoring counts the number of relevant edges.

Relevant edges are:

- Rising edges for DI_0
- Rising edges for DI_4 (valid only for tolerant discrepancy evaluation method during standstill)

The standstill monitoring reports the counted number of relevant edges in each monitoring window (at the end of the monitoring window):

- If the tolerant discrepancy evaluation method during standstill is configured, the highest counter reading of DI_0 and DI_4 is reported.
- If the tolerant discrepancy evaluation method during standstill is not configured, the counter reading of DI_0 is reported.

You can find additional information in the section "Use case standstill and overspeed monitoring (Page 100)".

Standstill monitoring

You set the standstill monitoring by selecting a standstill threshold and the duration of a monitoring window. The pulses per monitoring window are counted and compared to the standstill threshold at the end of each monitoring window. A standstill is reported if the number of pulses per monitoring window is less than or equal to the "Standstill threshold" parameter and remains less than or equal for the number of subsequent monitoring windows of "Standstill on-delay" + 1. The standstill is reported by the feedback interface by means of the "Standstill event status" bit. You can find more information under Feedback interface (Page 97).

If the number of input pulses per monitoring window exceeds the "Standstill threshold" parameter, the "Standstill event state" bit is set to "0".

Overspeed monitoring

You set the overspeed monitoring by selecting an overspeed threshold. The pulses per monitoring window are counted and compared to the overspeed threshold at the end of each monitoring window. Overspeed is detected as soon as the number of counted pulses is equal to or greater than the "Overspeed threshold". The overspeed is reported by the feedback interface using the "Overspeed event status" bit. You can find more information under Feedback interface (Page 97).

Reset control

The reset is triggered on the transition from logic 0 to logic 1. A reset clears all standstill and overspeed monitoring faults that are present on the channels. A reset is also necessary if a fault has occurred in the gate input channels. The reset function can only be executed if the standstill and overspeed monitoring is in fault status. If the reset is triggered with the gate open, counting begins immediately after the first monitoring window.

Gate control

Opening the hardware or software gate activates the standstill and overspeed monitoring.

You have two options to control the gate:

- Using the user program
- Via the digital inputs DI_1 and DI_5

You can select one of these two options through parameter assignment. The gate is closed when the control signal is at logic 0 and open when the control signal is at logic 1.

Make sure that a valid pulse pattern is present at digital inputs DI_0 and DI_4 when the gate is opened. See the "Pulse pattern" figure at the beginning of this section.

When the gate is closed, the signal evaluation of the digital inputs DI_0 and DI_4 is not active.

If the reset is triggered with the gate open, counting begins immediately after the first monitoring window. You can find more information under Feedback interface.

NOTE

Automatic closing of the gate

The gate is automatically closed in the following situations:

- If the CPU is in STOP mode
- CRC error in PROFIsafe communication
- In the event of a timeout of the PROFIsafe communication
- In the event of errors in the safety program that lead to a CPU STOP

Discrepancy evaluation method

Standstill and overspeed monitoring allows you to choose by parameter assignment between a strict discrepancy evaluation method and a tolerant discrepancy evaluation method during standstill.

The differences in the discrepancy evaluation method are only applied if the standstill and overspeed monitoring is in the standstill state. This occurs when the number of pulses per monitoring window is lower than the configured "Standstill threshold".

- **Strict discrepancy evaluation method during standstill**

Each detected edge that deviates from the pulse pattern results in a discrepancy error. Use this discrepancy evaluation method to achieve maximum SIL3/Cat.4/PLe.

The parameter "Tolerant discrepancy evaluation method during standstill" is not activated.

- **Tolerant discrepancy evaluation method during standstill**

During standstill, a discrepancy error is only detected if the input signals DI_0 and DI_4 are at logical 0 at the same time. This can help when filtering jitter. To achieve SIL3/Cat.4/PLe, you must use cross-circuit proof wiring. Without cross-circuit proof wiring, you will achieve a maximum of SIL2/ Cat.3/Pld.

The parameter "Tolerant discrepancy evaluation method during standstill" is activated.

6.2.2 Parameters

The "Standstill and Overspeed monitoring" operating mode is only effective if the operating mode selection is configured as "Standstill and Overspeed monitoring".

Parameters for the "Standstill and Overspeed monitoring" operating mode

The following parameters are possible:

Table 1-466 Adjustable parameters

Parameters	Value range	Default	Parameter reassignment in RUN	Scope
Module parameters:				
Operating mode	• Digital inputs • Counter • Standstill and Overspeed monitoring	Digital inputs	No	Module
F-parameters				
Manual assignment of the F-monitoring time	• Disable • Enable	Disable	No	Module
F-monitoring time	1 to 65535 ms	150 ms	No	Module
F-source address	1 to 65534	Depends on the parameter assignment of the F-CPU	No	Module
F-destination address	1 to 65534	Is proposed by the F-system	No	Module
F-parameter signature (without address)	0 to 65535	Is calculated by the F-system	No	Module
Behavior after channel fault	Passivate channel	Passivate channel (unchangeable)	No	Module
Reintegration after channel fault	• Adjustable • All channels automatically	Adjustable	No	Module
F-I/O DB manual number assignment	• Disable • Enable	Disable	No	Module
F-I/O DB number	—	Is proposed by the F-system	No	Module
F-I/O DB name	—	Is proposed by the F-system	No	Module

Table 1-467 Configurable standstill and overspeed monitoring parameters

Parameters	Value range	Default	Parameter reassignment in RUN	Scope
Standstill and Overspeed monitoring - Channel 0, 4				
Input delay	• 0.4 ms • 0.8 ms • 3.2 ms	3.2 ms	No	Channel pair
Channel failure acknowledge	• Manual • Automatic	Manual	No	Channel pair
Monitoring window duration	0.1 to 30 s	6 s	No	Channel pair
Overspeed threshold	2 to 14,400	7	No	Channel pair
Overspeed off-delay [number of monitoring windows]	1 to 127	1	No	Channel pair

Parameters	Value range	Default	Parameter reassignment in RUN	Scope
Standstill threshold	0 to 14,398	2	No	Channel pair
Standstill on-delay [number of monitoring windows]	1 to 127	1	No	Channel pair
Tolerant discrepancy evaluation method during standstill	• Not activated • Activated	Not activated	No	Channel pair
Gate control				
Gate controlled by	• Software • Hardware	Software	No	Module
Gate hardware control - Channel 1, 5				
Sensor evaluation	1oo2 evaluation, non-equivalent	1oo2 evaluation, non-equivalent (unchangeable)	No	Channel pair
Discrepancy behavior	Supply last valid value	Supply last valid value (unchangeable)	No	Channel pair
Reintegration after discrepancy error	Test 0-Signal not necessary	Test 0-Signal not necessary (unchangeable)	No	Channel pair
Discrepancy time	5 ms to 30 s	5 ms	No	Channel pair
Channel failure acknowledge	Automatic	Automatic (unchangeable)	No	Channel pair
Input delay	• 0.4 ms • 0.8 ms • 3.2 ms	3.2 ms	No	Channel pair
Reset control				
Reset controlled by	Software	Software (unchangeable)	No	Module

Standstill and overspeed monitoring use cases (as of firmware version V3.0.0) (Page 100)

6.2.3 Explanation of parameters

6.2.3.1 Module parameters

Operating mode

This parameter is used to specify the desired operating mode.
The digital input module F-DI 8×24VDC HF can be operated in the following operating modes:

- "Digital inputs"
- “Counter"
- "Standstill and Overspeed monitoring"

6.2.3.2 F-parameters

F-parameters

You have to assign the PROFIsafe address (F-destination address together with F-source address) to the F-module before you start operation.

- You specify the F-source address with the "Central F-source address" parameter in the F-CPU.
- The F-destination address is assigned automatically for each F-module CPU-wide. You can change the specified F-destination address in the hardware configuration manually.

Information on the F-parameters for the F-monitoring time, the PROFIsafe addressing (F-source address, F-destination address) and the F-I/O DB can be found in the manual SIMATIC Safety - Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126).

Behavior after channel fault

This parameter is used to specify whether the entire F-module is passivated or just the faulty channel(s) in the event of channel faults. In "Standstill and Overspeed monitoring" mode, the parameter must be set to "Passivate the channel".

Reintegration after channel fault

Use this parameter to select how the channels of the fail-safe module are reintegrated after a fault.

Use on S7-1200/1500 F-CPUs
When using the F-module on F-CPUs S7-1200/1500, set this parameter in the STEP 7 dialog of the F-module:

- "Adjustable"
- "All channels automatically"

The parameter "Behavior after channel fault" is set to "Passivate the channel". You allow the individual configuration of the reintegration type per channel using the "Adjustable" parameter assignment. The reintegration type of the respective channel is specified with the "Channel failure acknowledge" channel parameter.

6.2.3.3 Standstill and overspeed monitoring parameters

Input delay

Input delay applied to the channels. See section Input delay (Page 29).

Channel failure acknowledge

Determines how faults on channels 0 and 4 are acknowledged.

You can select from the following options:

- "Manual"
- "Automatic"

Monitoring window duration

Specifies the monitoring window duration in 0.1 s increments. You can set a range of 0.1 to 30 s. The default setting is 6 s.

Overspeed threshold

Determines the limit for overspeed detection in pulses per monitoring window. You can set a range from 2 to 14,400 pulses. To take the limit into account for normal operation, the set value must be at least 2 greater than the standstill threshold. The default setting is 7.

⚠ WARNING

When configuring the overspeed threshold, you need to consider the monitoring window duration and the input delay.
If the overspeed threshold cannot be reached, speed monitoring will not be performed correctly.
With the following formula, you must determine the maximum reachable value for the overspeed threshold:

*Maximum overspeed threshold = maximum frequency * monitoring window duration*

The value for the maximum frequency can be found in the following "Numerical values" table.

Table 1-468 Numerical values

Input delay	Minimum pulse duration of the "0" signal	Maximum frequency
0.4 ms	0.71 ms	480 Hz
0.8 ms	1.10 ms	350 Hz
3.2 ms	3.60 ms	120 Hz

Overspeed off-delay [number of monitoring windows]

Determines how many consecutive monitoring windows without overspeed must be registered before the "Overspeed event status" bit is reset from 0 to 1. You can set a range from 1 to 127. The default setting is 1. The delay corresponds to the parameterized value + 1 monitoring window.

Standstill threshold

Determines the limit for the standstill detection in pulses per monitoring window. You can set a range from 0 to 14,398 pulses. To take the limit into account for normal operation, the set value must be at least 2 lower than the overspeed limit. The default setting is 2.

⚠ WARNING

When configuring the standstill threshold, you need to consider the monitoring window duration and the input delay.
If the standstill threshold cannot be reached, standstill monitoring will not be performed correctly.
With the following formula, you must determine the maximum reachable value for the standstill threshold:

*Maximum standstill threshold = maximum frequency * monitoring window duration -2*

You must always set the value of the standstill threshold lower than the value of the overspeed threshold.
The value for the maximum frequency can be found in the following "Numerical values" table.

Table 1-469 Numerical values

Input delay	Minimum pulse duration of the "0" signal	Maximum frequency
0.4 ms	0.71 ms	480 Hz
0.8 ms	1.10 ms	350 Hz
3.2 ms	3.60 ms	120 Hz

Standstill on-delay [number of monitoring windows]

Determines how many consecutive monitoring windows must detect a standstill before the standstill event status bit is set. You can set a range from 1 to 127. The default setting is 1. The delay corresponds to the parameterized value + 1 monitoring window.

Tolerant discrepancy evaluation method during standstill

If you select this option, a tolerant discrepancy evaluation method is applied during the standstill. This can help when filtering jitter.

To achieve SIL3/Cat.4/PLe, you must use cross-circuit proof wiring.

6.2.3.4 Parameters for gate and reset control

Gate and reset control

Specifies the source for gate and reset control.

You can choose the following options for the gate control:

- "Software"
- "Hardware"

NOTE

If you select the "Hardware" option, the respective internal sensor supply is automatically enabled. However, their use in the wiring is optional.

You can choose the following options for the reset control:

- "Software"

6.2.3.5 Parameters for gate hardware control

Sensor evaluation

If the hardware control option is selected, the setting is always "1oo2 evaluation, non-equivalent". For more information, see section Sensor evaluation (Page 25).

Discrepancy behavior

If the hardware control option is selected, the setting is always "Supply last valid value". For more information, see section Discrepancy behavior (Page 26).

Reintegration after discrepancy error

If the hardware control option is selected, the setting is always "Test 0-Signal not necessary". For more information, see section Reintegration after discrepancy error (Page 27).

Discrepancy time

For more information, see section Discrepancy time (Page 27).

Channel failure acknowledge

This setting is always "Automatic". For more information, see section Channel failure acknowledge (Page 28).

Input delay

For more information, see section Input delay (Page 29).

6.2.4 Address space

Address assignment of the digital input module F-DI 8×24VDC HF in "Standstill and Overspeed monitoring" operating mode

The digital input module F-DI 8×24VDC HF occupies the following address ranges in the F-CPU:

Table 1-470 Address assignment in the F-CPU

Occupied bytes in the F-CPU:		
F-CPU	**In the input range**	**In the output range**
S7-1200/1500 F-CPUs*	IB x + 0 to x + 14	QB x + 0 to x + 5

*) The standstill and overspeed monitoring only works with F-CPUs that support PROFIsafe version 2.6.1

x = Module start address

Address assignment of the user data and the value status of digital input module F-DI 8×24VDC HF in "Standstill and Overspeed monitoring" operating mode

The user data occupy the following addresses in the F-CPU out of all the assigned addresses of the digital input module F-DI 8×24VDC HF:

Table 1-471 User data address assignment in the input range

Byte in the F-CPU	**Assigned bits in F-CPU per F-module:**							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
IB x + 0	Reserved						HW gate signal	Reserved
IB x + 1	Standstill event status	Over-speed event status	Reserved			Reset status	Gate status	First mon-itoring window
IB x + 2	Number of pulses per monitoring window							
IB x + 3								
IB x + 4								
IB x + 5								
IB x + 6	Reserved						Value status of HW gate signal	Reserved

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	6	5	4	3	2	1	0
IB x + 7	Value status of standstill event status	Value status of overspeed event status	Reserved			Value status of reset status	Value status of gate status	Value status of first monitoring window
IB x + 8	Reserved							Value status of the number of pulses per monitoring window
IB x + 9	Reserved					Reset controlled by SW	Gate controlled by SW	Reserved

Table 1-472 User data address assignment in the output range

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	6	5	4	3	2	1	0
QB x + 0	Reserved					SW reset control	SW gate control	Reserved

6.2.5 Assignment of the standstill and overspeed monitoring control interface

The safety program can influence the behavior of the module in "Standstill and Overspeed monitoring" operating mode via the control interface.

Assignment of the control interface

The following table shows the assignment of the control interface:

Table 1-473 Address assignment in the F-CPU

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	6	5	4	3	2	1	0
QB x + 0	Reserved					SW reset control	SW gate control	Reserved

Explanations

Table 1-474 Explanations

Byte	Bit	Control bit/value	Explanations
QB x + 0	1	SW gate control	Use this bit to control when the software gate is opened and the standstill and overspeed monitoring is activated. • 0: The SW gate is closed and the standstill and overspeed monitoring is stopped. • 1: The SW gate is open and standstill and overspeed monitoring is enabled.
QB x + 0	2	SW reset control	Use this bit to clear all error statuses in the standstill and overspeed monitoring. • 0: No action • 1: Sets the number of pulses per monitoring window to 0 and clears all error states in the standstill monitoring that are present on the channels. The "SW reset" action is always initiated when this bit transitions from 0 to 1. The current number of pulses per monitoring window is set to 0 and any error status that is present on the channels of the standstill and overspeed monitoring is cleared.

6.2.6 Assignment of the standstill and overspeed monitoring feedback interface

The safety program can receive actual values and status information in "Standstill and Overspeed monitoring" operating mode via the feedback interface.

Feedback interface

The following table shows the assignment of the feedback interface:

Table 1-475 Assignment of the feedback interface

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
IB x + 0	Reserved						HW gate signal	Reserved
IB x + 1	Standstill event status	Overspeed event status	Reserved			Reset status	Gate status	First monitoring window
IB x + 2	Number of pulses per monitoring window							
IB x + 3								
IB x + 4								
IB x + 5								
IB x + 6	Reserved						Value status of HW gate signal	Reserved

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	6	5	4	3	2	1	0
IB x + 7	Value status of standstill event status	Value status of over-speed event status	Reserved			Value status of reset status	Value status of gate status	Value status of first monitoring window
IB x + 8	Reserved							Value status of the number of pulses per monitoring window
IB x + 9	Reserved					Reset controlled by SW	Gate controlled by SW	Reserved

Explanations

Table 1-476 Explanations

Byte	Bit	Feedback bit/value	Description
IB x + 0	1	HW gate signal	Only valid if the HW control is configured for the gate. The signal value is formed via a 1oo2 evaluation, non-equivalent of the digital inputs DI_1 and DI_5.
IB x + 1	0	First monitoring window	The "First monitoring window" bit indicates whether the current monitoring window is the first after a new gate open command was received. • 0: The current monitoring window is not the first after a gate open command. Therefore, normal measured data can be expected. This bit enables the control system to identify the first monitoring window after gate opening. In this first window, the data may not be valid yet. In this way, the control system can distinguish the first window with an error from the subsequent regular monitoring windows. This allows you to distinguish between an actual error and the expected initial state during the first monitoring window. The first monitoring window should be handled by the user program accordingly before the actual measured values can be received. • 1: The current monitoring window is the first after a new gate open command. In the sampling phase, the standstill value status during the first monitoring window is 0 because there is no valid measurement data available to report.
IB x + 1	1	Gate status	The "Gate status" bit indicates that the module has received and responded to the gate control from either the SW control interface or the HW control: • 1: Gate opened. Standstill and overspeed monitoring active. • 0: Gate closed Changes to the counting channel pair for standstill and overspeed monitoring are ignored.
IB x + 1	2	Reset status	The "Reset status" bit indicates that the module has received the "Reset" from the control interface and responded as follows: • If the reset control transitions from 0 to 1, the "Reset status" bit is set to 1 and the module deletes the error states for standstill and overspeed monitoring. • If the reset control is set to 0, the "Reset status" bit is also set to 0.

Byte	Bit	Feedback bit/value	Description
IB x + 1	6	Overspeed event status	The "Overspeed event status" bit indicates the status of an overspeed detection. • 0: Overspeed detected • 1: No overspeed The bit is set to "0" if the pulse count within a monitoring window is greater than or equal to the configured "Overspeed threshold". The bit is automatically reset to "1" when both of the following conditions are met: • The number of pulses is below the "Overspeed threshold". • This state is detected in the number of consecutive monitoring windows defined by the "Overspeed off-delay".
IB x + 1	7	Standstill event status	The "Standstill event status" bit indicates the status of a detected standstill. • 0: No standstill detected • 1: Standstill detected The bit is set to "1" if both of the following conditions are met: • The pulse count within a monitoring window is less than or equal to the configured "Standstill threshold". • This state is detected in the number of consecutive monitoring windows defined by the "Standstill on-delay". The bit is automatically reset to "0" as soon as the pulse count exceeds the defined "Standstill threshold".
IB x + 2 **IB x + 3** **IB x + 4** **IB x + 5**	0-7	Number of pulses per monitoring window	Contains the value status of the number of pulses per monitoring window
IB x + 6	1	Value status of HW gate signal	Contains the value status of the hardware control channel pair in the event that the gate is controlled by the hardware.
IB x + 7	0	Value status of first monitoring window	Contains the value status of first monitoring window
IB x + 7	1	Value status of gate status	Contains the value status of gate status
IB x + 7	2	Value status of reset status	Contains the value status of reset status
IB x + 7	6	Value status of overspeed event status	Contains the value status of overspeed event status
IB x + 7	7	Value status of standstill event status	Contains the value status of standstill event status
IB x + 8	0	Value status of the number of pulses per monitoring window	Contains the value status of the number of pulses per monitoring window
IB x + 9	1	Gate controlled by SW	Contains bit that indicates whether gate is software-controlled.*
IB x + 9	2	Reset controlled by SW	Contains bit that indicates whether reset is software-controlled.*

*) This can only be changed by parameter assignment.

A detailed bit assignment of the bytes IB x + 6 to IB x + 9 can be found in the above table "Assignment of the feedback interface".

6.3 Standstill and overspeed monitoring use cases (as of firmware version V3.0.0)

⚠ WARNING

When the "Tolerant discrepancy evaluation method during standstill" parameter is activated
To achieve SIL3/Cat.4/PLe when the parameter is activated, the cables used for standstill and overspeed monitoring must be installed in a cross-circuit proof manner.

⚠ WARNING

Make sure that the highest possible frequency does not exceed 480 Hz in the application.

Conditions for achieving SIL/Cat./PL

The table below lists the conditions which have to be met for achieving at least the corresponding safety requirements.

Table 1-477 Conditions for achieving SIL/Cat./PL

Discrepancy evaluation	Wiring requirements	Achievable SIL/Cat./PL
Standstill and overspeed monitoring (tolerant discrepancy evaluation method during standstill deactivated)	None	3 / 4 / e
	Cross-circuit proof wiring	3 / 4 / e
Standstill and overspeed monitoring (tolerant discrepancy evaluation method during standstill activated)	None	2 / 3 / d
	Cross-circuit proof wiring	3 / 4 / e

Inputs for standstill and overspeed monitoring

The digital input module F-DI 8x24VDC HF has 8 fail-safe inputs, DI_0 to DI_7.

The inputs are paired in 1oo2 equivalent logic for the standstill and overspeed monitoring counter channels and in 1oo2 non-equivalent logic for the hardware gate control channels:

- DI_0 and DI_4 are used as channels for the standstill and overspeed monitoring.
- DI_1 and DI_5 are used optionally for HW gate control.

The process signal for the hardware control is provided via channel DI_1.

Strict discrepancy evaluation method during standstill
If the strict discrepancy evaluation method is used during standstill, only input DI_0 counts.

If the speed or overspeed is detected, only input DI_0 counts.

Tolerant discrepancy evaluation method during standstill
If the tolerant discrepancy evaluation method during standstill is used, both DI_0 and DI_4 count, and the highest value of both (DI_0, DI_4) is used.

The tolerant discrepancy evaluation method for normal speed and overspeed is identical to the strict discrepancy evaluation method, which means that only DI_0 is counted.

Relevant edges are:

- Rising edges for DI_0
- Rising edges for DI_4 (valid only for tolerant discrepancy evaluation method during standstill)

The standstill monitoring reports the counted number of pulses in each monitoring window (at the end of the monitoring window).

Wiring

The wiring is performed on a suitable BaseUnit.

Sensor supply

In "Standstill and Overspeed monitoring" mode, the internal sensor supplies are permanently switched on, permanently assigned to the inputs, and cannot be changed.

- VS_0 to DI_0 and VS_4 to DI_4 (always activated)
- VS_1 to DI_1 and VS_5 to DI_5 (activated if the HW gate control is configured)
- The short-circuit tests of the sensor supplies are permanently deactivated.

NOTE

The use of the internal sensor supply in the wiring is optional.

NOTE

Avoidance of interference due to high-energy surge voltages
To avoid interference due to high-energy surge voltages, you need to consider the following restrictions in "Standstill and Overspeed monitoring" operating mode:

With parameter assignment of the DI_0 and DI_4 inputs with an input delay of 3.2 ms:
No additional restrictions apply.

With parameter assignment of the DI_0 and DI_4 inputs with an input delay of 0.8 ms:
For the DI_0 and DI_4 inputs, you need to use either shielded cables with a maximum length according to the technical specifications (Page 119) or unshielded cables with a maximum length of 30 m. When unshielded cables are used, they can only be installed inside a building.
The following applications are not supported:

- Applications according to NAMUR recommendation NE 21
- Applications according to EN 298
- Shipbuilding applications

With parameter assignment of the DI_0 and DI_4 inputs with an input delay of 0.4 ms:
For the DI_0 and DI_4 inputs, you need to use either shielded cables with a maximum length according to the technical specifications (Page 119) or unshielded cables with a maximum length of 30 m. When unshielded cables are used, they can only be installed inside a building.
The following applications are not supported:

- Applications according to NAMUR recommendation NE 21
- Applications according to EN 298
- Shipbuilding applications

The length of the cable between the power supply unit and the F-module cannot be greater than 30 m. The cable can only be installed inside a building.

NOTE

Interruptions of the supply voltage according to IEC 61131-2 are not buffered by the F-module and thus influence the internal sensor supplies. This can lead to the occurrence of diagnostics and passivation of the F-module in "Standstill and Overspeed monitoring" operating mode. To ensure problem-free functioning of the F-module and the sensors, we recommend the following:

With parameter assignment of the DI_0 and DI_4 inputs with an input delay of 3.2 ms:
No additional measures necessary.

With parameter assignment of the DI_0 and DI_4 inputs with an input delay of 0.8 ms or 0.4 ms:
For the power supply, use a separate power supply unit that only supplies voltage in "Standstill and Overspeed monitoring" operating mode to F-DI 8x24VDC HF digital input modules and their associated sensors.

⚠ WARNING

When selecting the sensors, take into account that test pulses at the output of the sensor may influence the number of pulses per monitoring window.

Wiring diagram - Use case with external sensor supply

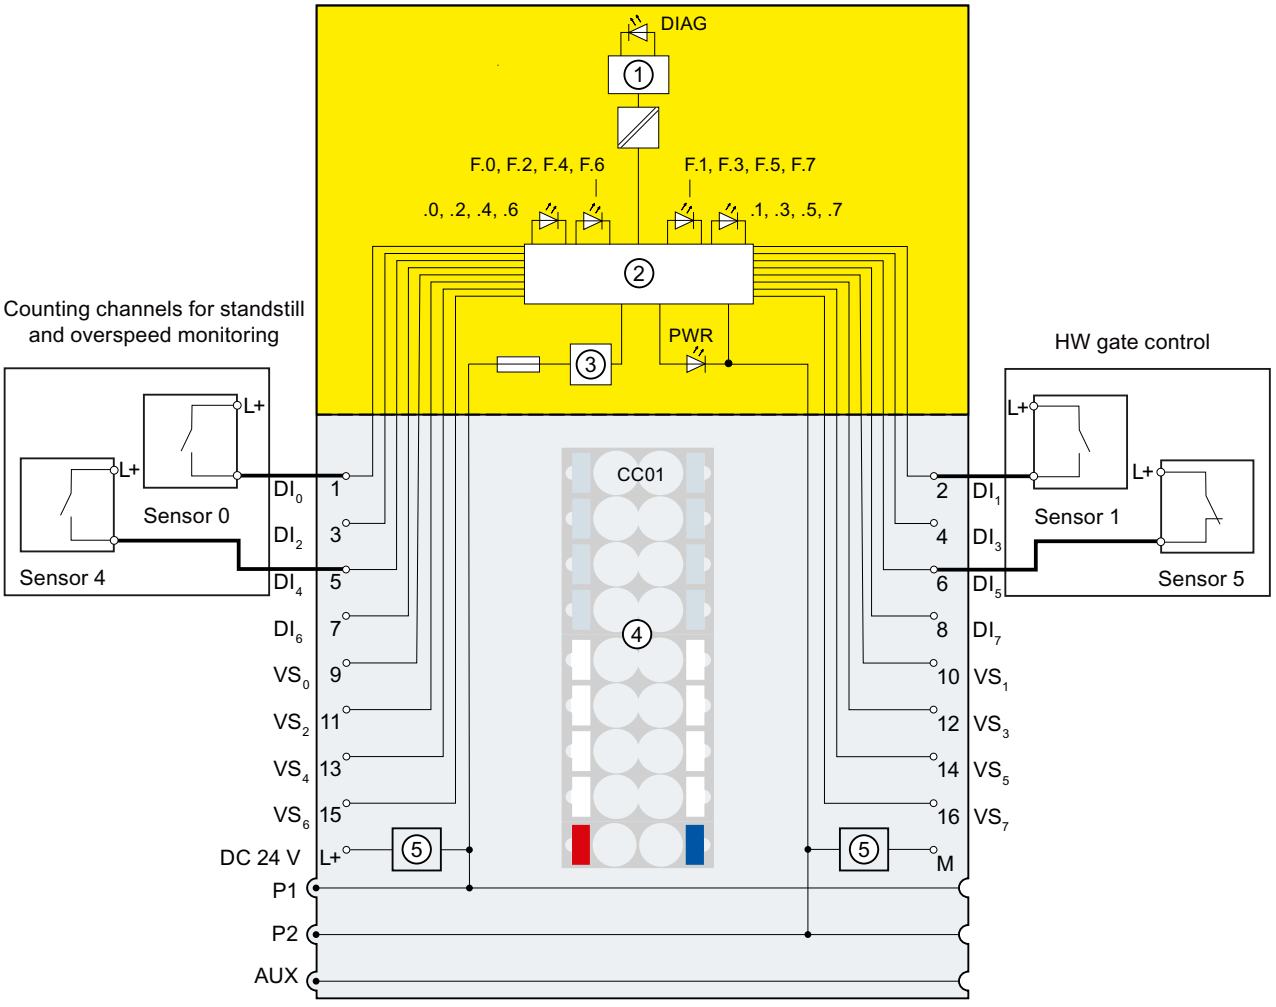

Figure 1-203 Use case with external sensor supply

⚠ WARNING

To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

WARNING

When the "Tolerant discrepancy evaluation method during standstill" parameter is activated
To achieve SIL3/Cat.4/PLe when the parameter is activated, the cables used for standstill and overspeed monitoring must be installed in a cross-circuit proof manner.

Wiring diagram - Use case with internal sensor supply

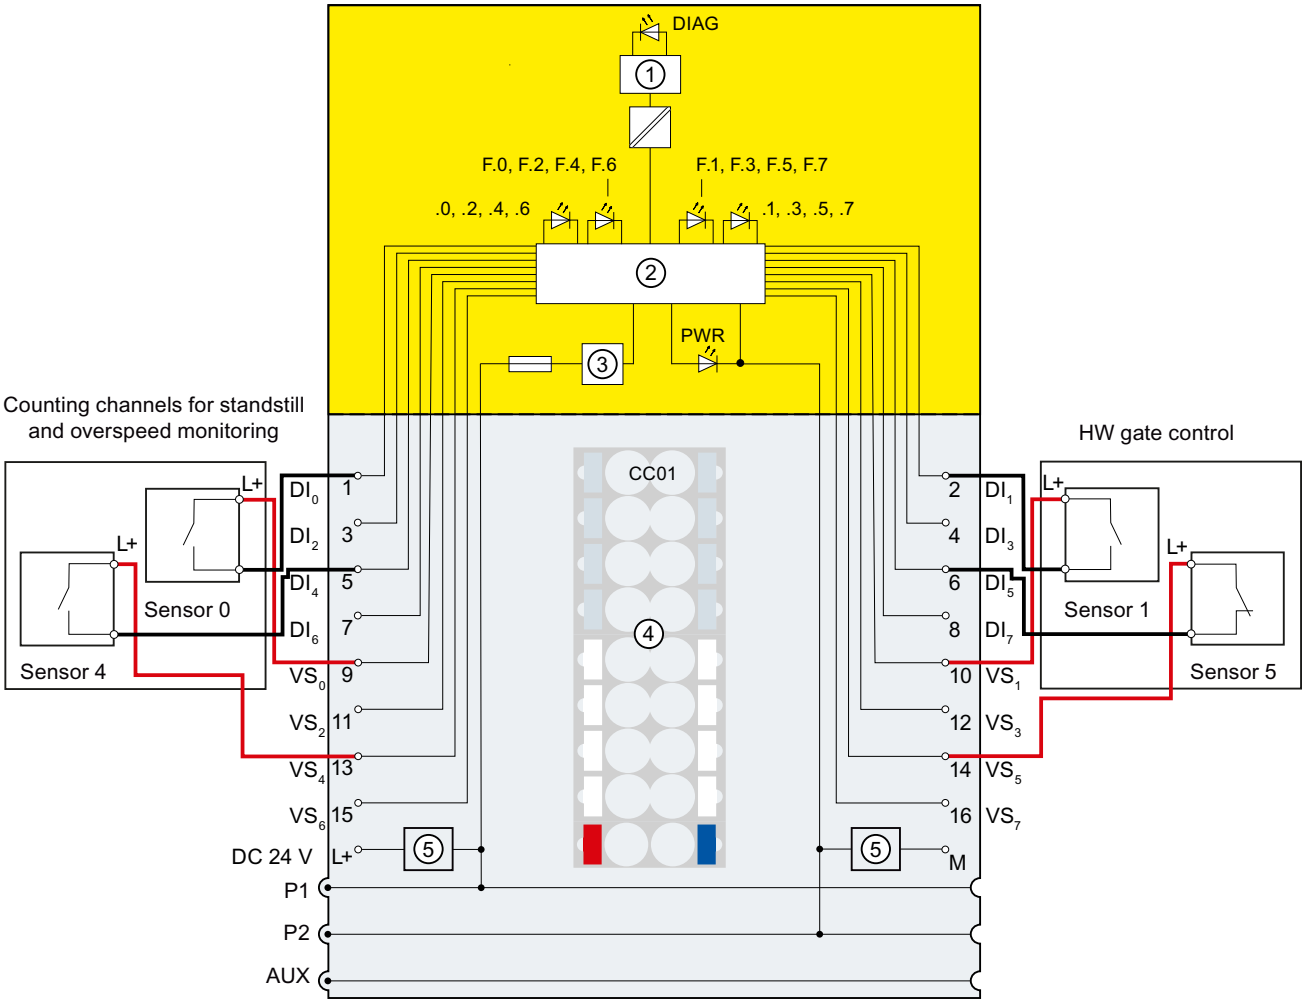

Figure 1-204 Use case with internal sensor supply

WARNING

To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

⚠ WARNING

When the "Tolerant discrepancy evaluation method during standstill" parameter is activated
To achieve SIL3/Cat.4/PLe when the parameter is activated, the cables used for standstill and overspeed monitoring must be installed in a cross-circuit proof manner.

Fault detection

The following tables show the fault detection depending on the sensor supply:

Table 1-478 Fault detection at standstill and overspeed monitoring inputs (DI_0 and DI_4)

Tolerant discrepancy evaluation method during standstill disabled		
Faults	**Fault detection at standstill and overspeed monitoring inputs**	
	Internal sensor supply	**External sensor supply**
Short-circuit within the channel pair	Yes	Yes
Short-circuit with other channel pairs or with other sensor supplies	Yes*	Yes*
Short-circuit with L+ to DI_0 or DI_4	Yes*	Yes*
Short-circuit with M to DI_0 or DI_4	Yes*	Yes*
Short-circuit with L+ to SV_n	No	-
Short-circuit with M to SV_n or defective	Yes	-
Discrepancy error	Yes	Yes
Wire break	Yes**	Yes**

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal. If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

**) A single fault (wire break on one channel) may not be detected immediately, but only when the next pulse signals are generated during rotation. A double fault (wire break on both channels DI

Table 1-479 Fault detection at HW control inputs (DI_1 and DI_5)

Tolerant discrepancy evaluation method during standstill disabled		
Faults	**Fault detection at HW control inputs**	
	Internal sensor supply	**External sensor supply**
Short-circuit within the channel pair	Yes	Yes
Short-circuit with other channel pairs or with other sensor supplies	Yes*	Yes*

Interrupts/diagnostic messages

7

7.1 Status and error display

LED display

The following figure shows you the LED display of the F-DI 8x24VDC HF.

① DIAG (green/red)
② Channel status (green)
③ Channel error (red)
④ PWR (green)

Figure 1-205 LED display

Meaning of the LED displays

The following tables explain the meaning of the status and error displays. Remedies for diagnostic messages can be found in section Diagnostic messages (Page 112).

WARNING

The DIAG LED and the channel status and channel fault LEDs of the inputs are not designed as safety-related LEDs and therefore may not be evaluated for safety-related activities.

DIAG LED

Table 1-482 DIAG LED fault display

DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not okay
Flashing	Module parameters not configured
On	Module parameters configured and no module diagnostics
Flashing	• Module parameters configured and module diagnostics • Operation at F-CPUs S7-1200/1500: At least one channel waits for a user acknowledgement.
Flashing	• Operation at F-CPUs S7-1200/1500: After a module fault, the F-module waits for a user acknowledgement. • Operation at F-CPUs S7-300/400: The F-module waits for a user acknowledgement.

Channel status/channel fault LED

Table 1-483 Status display of the LED channel status/channel fault

Channel status	Channel fault	Meaning
Off	Off	Process signal = 0 and no channel diagnostics
On	Off	Process signal = 1 and no channel diagnostics
Off	On	Process signal = 0 and channel diagnostics
Alternately flashing		At least one channel waits for a user acknowledgement.

Channel status/DIAG/channel fault LED

Table 1-484 Status display of the LED channel status/DIAG/channel fault

Channel status	DIAG	Channel fault	Meaning
Off	Flashing	All On	The PROFIsafe address does not match the PROFIsafe address of the configuration or there is a module-wide error. See section Interrupts (Page 110)
Flashing	Flashing	Off	Identification of the F-module when assigning the PROFIsafe address

PWR LED

Table 1-485 Status display of the PWR LED

PWR	Meaning
□ Off	Supply voltage L+ not present
■ On	Supply voltage L+ present

7.2 Interrupts

Introduction

The fail-safe digital input module F-DI 8×24VDC HF supports diagnostic interrupts.

Diagnostic interrupt

The F-module generates a diagnostic interrupt for each diagnostic message described in section Diagnostic messages (Page 112).

The following list provides you with an overview of the diagnostic interrupts of the F-module. The diagnostic interrupts are assigned either to one channel or the entire F-module.

⚠ WARNING

Before acknowledgment of a diagnostic message, eliminate the respective error and validate your safety function. Proceed as described in section Diagnostic messages (Page 112) to eliminate the error.

Module-wide diagnostic interrupts:

- Overtemperature
- Parameter error
- Supply voltage missing
- Communication fault
- Mismatch of safety destination address (F_Dest_Add)
- Safety destination address not valid (F_Dest_Add)
- Safety source address not valid (F_Source_Add)
- Safety watchdog time value is 0 ms (F_WD_Time)
- Parameter F_SIL exceeds SIL from specific device application
- Parameter F_CRC_Length does not match the generated values
- Version of F parameter set incorrect
- CRC1 fault
- Device-specific diagnostics information, see manual
- Inconsistent iParameter (iParCRC error)
- F_Block_ID not supported

- Transmission error: Inconsistent data (CRC error)
- Transmission error: Timeout (watchdog time 1 or 2 expired)
- Acknowledge required to enable channel(s) - as channel error(s) are remedied.
- Watchdog tripped
- Invalid/inconsistent firmware present
- Diagnostic queue overflow
- F-address memory not accessible
- No valid F-address available
- Undertemperature
- Supply voltage too high
- Supply voltage too low
- F-module error (0x032F)

Channel-wide diagnostic interrupts

- Wire break
- Discrepancy failure, channel status 0/0
- Discrepancy failure, channel status 0/1
- Discrepancy failure, channel status 1/0
- Discrepancy failure, channel status 1/1
- Input signal not recorded unique
- Internal sensor supply short-circuit to P
- Overload or internal sensor supply short-circuit to ground
- Sensor signal flutters
- Frequency too high
- Discrepancy error
- Input shorted to P
- Channel passivated
- Counter discrepancy limit exceeded

7.3 Diagnostic messages

Diagnostic messages

Module faults are indicated as diagnostics (module status).

Once the fault is eliminated, the F-module must be reintegrated in the safety program. For additional information on passivation and reintegration of F-I/O, refer to the SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual.

NOTE

If you are using a GSDML file for configuring the F-module, other error codes will be supplied. In this case you must multiply the listed error numbers by 0x40 (e.g. 0x05 * 0x40 = 0x140). However, the text in the CPU diagnostic buffer corresponds to the text of the diagnostic interrupt as listed in the table below.

Table 1-486 Diagnostic messages of the F-DI 8x24VDC HF

Diagnostic message	Fault code	Meaning	Remedy
Overtemperature	5_H	An excessively high temperature was measured in the F-module.	Operate the F-module within the specified temperature range. (See Technical specifications (Page 119)) Once the fault has been eliminated, the F-module must be removed and inserted or the power switched OFF and ON
Wire break	6_H	Possible causes: • There is an interrupted cable between the module and sensor. • The channel is not connected (open).	Establish a cable connection.
Parameter error	10_H	Parameter assignment errors include: • The F-module cannot use the parameters (unknown, invalid combination, etc.). • The F-module parameters have not been configured.	• Correct the parameter assignment. • Check whether a coding element is available.
Supply voltage missing	11_H	Missing or insufficient supply voltage L+	• Check supply voltage L+ at the BaseUnit • Check BaseUnit type
Communication fault	13_H	Possible causes: • An impermissibly high electromagnetic interference is present. • The F-module has detected an internal error and reacted to it in a safety-oriented manner.	• Correct the fault. The module must then be pulled and plugged, or the power switched OFF and ON. • If the F-module cannot be put into operation anymore, consider a replacement.
Mismatch of safety destination address (F_Dest_Add)	40_H	The PROFIsafe driver has detected a different F-destination address.	Check the parameter assignment of the PROFIsafe driver and the address setting of the F-module.
Safety destination address not valid (F_Dest_Add)	41_H	The PROFIsafe driver has detected an invalid F-destination address.	Check the parameter assignment of the PROFIsafe driver.
Safety source address not valid (F_Source_Add)	42_H	The PROFIsafe driver has detected an invalid F-source address.	

Diagnostic message	Fault code	Meaning	Remedy
Safety watchdog time value is 0 ms (F_WD_Time)	43_H	The PROFIsafe driver has detected an invalid watchdog time.	Check the parameter assignment of the PROFIsafe driver.
Parameter F_SIL exceeds SIL from specific device application	44_H	The PROFIsafe driver has detected a discrepancy between the SIL setting of the communication and the application.	
Parameter F_CRC_Length does not match the generated values	45_H	The PROFIsafe driver has detected a discrepancy in the CRC length.	
Version of F parameter set incorrect	46_H	The PROFIsafe driver has detected an incorrect version of the F-parameters or an invalid F_Block_ID.	
CRC1 fault	47_H	The PROFIsafe driver has detected inconsistent F-parameters.	
Device-specific diagnostics information, see manual	48_H	The PROFIsafe driver has received inconsistent fail-safe parameters.	
Inconsistent iParameter (iParCRC error)	$4B_H$	The PROFIsafe driver has detected inconsistent iParameters.	Check the parameter assignment of the PROFIsafe driver.
F_Block_ID not supported	$4C_H$	The PROFIsafe driver has detected an incorrect Block ID.	Check the parameter assignment of the PROFIsafe driver.
Transmission error: Inconsistent data (CRC error)	$4D_H$	The PROFIsafe driver has detected a CRC error. Possible causes: • The communication between F-CPU and F-module is interrupted. • Impermissibly high electromagnetic interference is present. • An error has occurred during the sign-of-life monitoring.	• Check the communication link between the F-module and the F-CPU. • Eliminate the cause of the electromagnetic interference.
Transmission error: Timeout (watchdog time 1 or 2 expired)	$4E_H$	The PROFIsafe driver has detected a timeout. Possible causes: • The F-monitoring time is set incorrectly. • A bus fault is present.	• Check the parameter assignment. • Make sure that your communication is operating correctly.
Acknowledge required to enable channel(s) - as channel error(s) are remedied.	$4F_H$	A channel fault was detected. A confirmation is required to enable the channel.	Confirm the channel fault.
Watchdog tripped	103_H	Possible causes: • An impermissibly high electromagnetic interference is present. • The F-module has detected an internal error and reacted to it in a safety-oriented manner.	• Correct the fault. The module must then be pulled and plugged, or the power switched OFF and ON. • If the F-module cannot be put into operation anymore, consider a replacement.
Invalid/inconsistent firmware present	$11B_H$	The firmware is incomplete and/or firmware added to the F-module is incompatible. This leads to errors or functional limitations when operating the F-module.	• Perform a firmware update for all parts of the F-module and note any error messages. • Use only firmware versions released for this F-module.
Diagnostic queue overflow	$13E_H$	Overflow of the diagnostic memory. Not all pending diagnostics could be sent. This error can result in deactivation of the module up to switching on/off of the power supply.	Eliminate the previously reported error.

Diagnostic message	Fault code	Meaning	Remedy
Discrepancy failure, channel status 0/0	300_H	The discrepancy time set for 1oo2 evaluation was exceeded. Possible causes: • The process signal is faulty. • The sensor is defective. • The configured discrepancy time is too low. • There is a short-circuit between an unconnected sensor cable and the sensor supply cable. • Wire break in connected sensor cable or the sensor supply cable • An error occurred during the discrepancy check.	• Check the process signal. • Replace the sensor. • Check the parameter assignment of the discrepancy time. • Check the process wiring. You must eliminate the occurred error within 100 hours if no short-circuit test has been configured for the corresponding sensor supply.
Discrepancy failure, channel status 0/1	301_H		
Discrepancy failure, channel status 1/0	302_H		
Discrepancy failure, channel status 1/1	303_H		
Input signal not recorded unique	305_H	An error occurred during the plausibility check of the input signal between the processors. Possible causes: • The input signal is faulty. For example, through an impermissibly high electromagnetic interference. • There is a high-frequency input signal. For example, through reciprocal interference of the sensors, or the signal lies above the sampling frequency of the input signal. • A momentary interruption/short-circuit of the sensor cable (loose contact) is present. • The sensor/switch bounces.	• Use shielded cables to reduce the EMC effects. • Reduce the input frequency. • Check the wiring of the sensor.
Internal sensor supply short-circuit to P	306_H	Possible causes: • There is a short-circuit of the internal sensor supply with L+. • There is a short-circuit of two sensor supplies. • The capacitance of the connected sensor for the configured test time is too high. • The sensor is defective.	• Eliminate the short-circuit in the process wiring. • Check the configured test time and the process wiring. • Replace the sensor.
Overload or internal sensor supply short-circuit to ground	307_H	Possible causes: • The internal sensor supply is short-circuited to ground. • Impermissibly high electromagnetic interference is present.	• Eliminate the overload. • Eliminate the short-circuit in the process wiring. • Check the "Sensor supply" parameter. • Eliminate/reduce the electromagnetic interference.
F-address memory not accessible	$30D_H$	F-source address placed in the electronic coding element and F-destination address cannot be accessed.	Check whether the coding element is available. Replace the coding element, if necessary.
No valid F-address available	$30E_H$	No valid PROFIsafe address is stored in the retentive memory. Possible causes: • Initial commissioning • Deliberate parameter change of the PROFIsafe address • Deviation between setpoint and actual configuration of the plant	• Perform the assignment of the PROFIsafe address during initial commissioning or deliberate parameter changes. • Check the consistency between the setpoint and actual configuration.

Diagnostic message	Fault code	Meaning	Remedy
Sensor signal flutters	310_H	Too many signal changes have occurred within the time configured with the "Monitoring window" parameter. • The "Monitoring window" parameter setting is too high. • The "Number of signal changes" parameter setting is too low. • A momentary interruption/short-circuit of the sensor cable (loose contact) is present. • Impermissibly high electromagnetic interference is present. • The sensor/switch is bouncing. • The sensor is defective.	• Check the "Monitoring window" parameter. • Check the "Number of signal changes" parameter. • Check the process wiring. • Eliminate/reduce the electromagnetic interference. • Replace the sensor.
Frequency too high	311_H	The switching frequency of the sensor is too high. For counter as well as standstill and overspeed monitoring: This error can be detected even when the gate signal is closed.	Reduce the switching frequency of the sensor.
Undertemperature	312_H	The minimum permissible temperature limit has been violated.	Operate the F-module within the specified temperature range. (See Technical specifications (Page 119))
Discrepancy error	314_H	The discrepancy time set for 1oo2 evaluation was exceeded. The error message is output for channel n+4. Additional information: see error codes 300_H ... 303_H. For counter as well as standstill and overspeed monitoring: This error indicates that the edges on the two channels do not match: • For counter, the edges were not matched within the configured discrepancy time. • For counter, a gate start was triggered while an unmatched edge was unresolved. • During standstill and overspeed monitoring, an out-of-sequence edge was detected using the strict discrepancy evaluation method during standstill. • During standstill and overspeed monitoring with either of the two discrepancy evaluation methods, both signals are logical 0 at the same time.	Additional information: see error codes 300_H ... 303_H. For counter as well as standstill and overspeed monitoring: Determine and resolve the cause for the discrepancy error and then reset the counter or standstill and overspeed monitoring with the reset control.
Input shorted to P	$31C_H$	The input signal is short-circuited to L+.	Eliminate the short-circuit.
Supply voltage too high	321_H	The supply voltage is too high.	Check the supply voltage.
Supply voltage too low	322_H	Possible causes: • The supply voltage is too low. • Wrong BaseUnit	• Check the supply voltage. • Use a BaseUnit of the type A0.

Diagnostic message	Fault code	Meaning	Remedy
Channel passivated	$32B_H$	Possible causes: • The high or low counting limit of the counter was violated twice without acknowledgment. • An error occurred on a hardware control channel pair.	Check the diagnostic buffer for errors that may have occurred in the hardware control channels. Resolve all existing errors and then reset the counter or the standstill monitoring with the reset control.
F-module error (0x032F)	$32F_H$	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• The internal diagnostics has detected an error. Removing and inserting the module or POWER OFF – POWER ON necessary. • If the F-module cannot be put into operation anymore, consider a replacement.
Counter discrepancy limit exceeded	334_H	The counter discrepancy limit between the two channels of the counter has exceeded the permissible limit of 1.	Determine and resolve the cause for the discrepancy error and then reset the counter with the reset control.

Supply voltage outside the nominal range

If the supply voltage L+ is outside the specified value range, the DIAG LED flashes and the module is passivated.

With subsequent voltage recovery (level must be within the specified value range for at least 1 minute (see Technical specifications (Page 119): Voltages, Currents, Potentials)), the DIAG LED stops flashing. The module remains passivated.

Behavior in case of cross circuit/short-circuit to the sensor supply

When internal sensor supply is configured and short-circuit test is deactivated, short-circuits to ground at the sensor supplies are detected. Channels for which the relevant sensor supply is configured will be passivated.

When internal sensor supply is configured and short-circuit test is enabled, short-circuits to ground and potential at the sensor supply are detected. Channels for which the relevant sensor supply is configured will be passivated.

Behavior of the safety mat evaluation in case of cross circuit/short-circuit to the sensor supply or the digital input

With configured safety mat evaluation, short-circuits with L+, short-circuits with M and cross circuits to another channel are detected with configured safety mat evaluation. Both channels assigned to the affected safety mat evaluation are passivated.

To make it easier to determine the cause of the error, the red channel LED of the input affected by the short-circuit/cross circuit lights up.

Behavior of the safety mat evaluation after wire break of the sensor supply cable or the cable of the digital input

With configured safety mat evaluation, the wire break is detected on all cables used for the connection of the safety mat evaluation. Both channels assigned to the affected safety mat evaluation are passivated.

To make it easier to determine the cause of the error, the red channel LED of the input affected by the wire break lights up.

Special features for fault detection

The detection of certain faults (short-circuits or discrepancy errors, for example) depends on the application, the wiring, and the parameter assignment of the short-circuit test and the sensor power supply. For this reason, tables on fault detection for the applications are presented under:

Applications for inputs (Page 32)
Use cases for Counter (as of firmware version V3.0.0) (Page 70)
Standstill and overspeed monitoring use cases (as of firmware version V3.0.0) (Page 100)

Detection of a cross circuit is not ensured in mixed operation between a channel with safety mat and a channel with 1oo1 or 1oo2 configuration.

Generally applicable information on diagnostics

For information on diagnostics which apply to all F-modules (e.g. reading out the diagnostic functions, passivation of channels), refer to the SIMATIC Safety - Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual.

(https://support.industry.siemens.com/cs/ww/en/view/22099875)

7.4 Value status

Properties

In addition to the diagnostic messages and the status and error display, the F-module makes available information about the validity of each input and output signal – the value status. The value status is entered in the process image along with the input signal.

Value status for digital input and output modules

The value status is additional binary information of a digital input or output signal. It is entered in the process image of the inputs (PII) at the same time as the process signal. It provides information about the validity of the input or output signal.

The value status is influenced by all errors.

- 1_B: A valid process value is output for the channel.
- 0_B: A fail-safe value is output for the channel, or the channel is deactivated.

Assignment of inputs and outputs for the value status in the PII

Each channel of the F-module is assigned a value status in the process image of the inputs. You can find the assignment in the following sections:

Address space (Page 31) of the "Digital inputs" operating mode

Address space (Page 65) of the "Counter" operating mode

Address space (Page 95) of the "Standstill and Overspeed monitoring" operating mode

Reference

A detailed description of the evaluation and processing of the value status can be found in the SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual.

Technical specifications

8

Technical specifications of F-DI 8×24VDC HF

The following table lists the technical specifications as of the issue date. You can find a data sheet including updated technical specifications on the Internet (https://support.industry.siemens.com/cs/ww/en/pv/6ES7136-6BA01-0CA0/td?dl=en).

Article number	6ES7136-6BA01-0CA0
General information	
Product type designation	F-DI 8x24VDC HF
Firmware version	V3.0
• FW update possible	Yes
usable BaseUnits	BU type A0
Color code for module-specific color identification plate	CC01
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated from version	SIMATIC Safety V20 or higher with HSP 0484
• STEP 7 configurable/integrated from version	as 6ES7136-6BA00-0CA0
• PROFINET from GSD version/GSD revision	GSDML V2.45
Operating mode	
• DI	Yes
• Counter	Yes; pulse counting, standstill and speed monitoring
CiR - Configuration in RUN	
Reparameterization possible in RUN	No
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes
power supply according to NEC Class 2 required	No
Input current	
Current consumption, max.	40 mA; without load
Encoder supply	
Number of outputs	8
24 V encoder supply	
• 24 V	Yes; min. L+ (-1.5 V)
• Short-circuit protection	Yes; Electronic (response threshold 0.7 A to 1.8 A)
• Output current per channel, max.	300 mA

Article number	6ES7136-6BA01-0CA0
• Output current per module, max.	800 mA; Total current of all encoders
Power loss	
Power loss, typ.	2 W
Address area	
Address space per module	
• Inputs	7 byte; S7-300/400F CPU, 6 byte
• Outputs	5 byte; S7-300/400F CPU, 4 byte
Hardware configuration	
Automatic encoding	Yes
• Electronic coding element type F	Yes
Digital inputs	
Number of digital inputs	8
Digital inputs, parameterizable	Yes
Source/sink input	Yes; P-reading
Input characteristic curve in accordance with IEC 61131, type 1	Yes
Digital input functions, parameterizable	
• Counter	Yes
– Number, max.	1
– Counting frequency, max.	500 Hz
– Counting direction up/down	Yes
Input voltage	
• Rated value (DC)	24 V
• for signal "0"	-30 to +5 V
• for signal "1"	+15 to +30 V
Input current	
• for signal "1", typ.	3.7 mA
Input delay (for rated value of input voltage)	
for standard inputs	
– parameterizable	Yes
– at "0" to "1", min.	0.4 ms
– at "0" to "1", max.	20 ms
– at "1" to "0", min.	0.4 ms
– at "1" to "0", max.	20 ms
for technological functions	
– parameterizable	No
Cable length	
• shielded, max.	1 000 m
• unshielded, max.	500 m
Interrupts/diagnostics/status information	
Diagnostics function	Yes
Alarms	
• Diagnostic alarm	Yes
• Hardware interrupt	No

Article number	6ES7136-6BA01-0CA0
Diagnostics indication LED	
• RUN LED	Yes; green LED
• ERROR LED	Yes; red LED
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; green LED
• for channel diagnostics	Yes; red LED
• for module diagnostics	Yes; green/red DIAG LED
Potential separation	
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes
• between the channels and the power supply of the electronics	No
Isolation	
Isolation tested with	707 V DC (type test)
Standards, approvals, certificates	
Suitable for safety functions	Yes
Highest safety class achievable in safety mode	
• Performance level according to ISO 13849-1	PLe
• Category according to ISO 13849-1	Cat. 4
• SIL acc. to IEC 61508	SIL 3
Probability of failure (for service life of 20 years and repair time of 100 hours)	
– Low demand mode: PFDavg in accordance with SIL3	< 2.00E-05
– High demand/continuous mode: PFH in accordance with SIL3	< 1.00E-09 1/h
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	0 °C
• horizontal installation, max.	60 °C
• vertical installation, min.	0 °C
• vertical installation, max.	50 °C
Altitude during operation relating to sea level	
• Installation altitude above sea level, max.	4 000 m; restrictions for installation altitudes > 2 000 m, see ET 200SP system manual
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	29 g

Dimension drawing

See the Equipment Manual ET 200SP BaseUnits (https://support.industry.siemens.com/cs/ww/en/view/59753521).

Response times

A

Introduction

The next section shows the response times of the digital input module F-DI 8×24VDC HF. The response times of the digital input module F-DI 8×24VDC HF are included in the calculation of the response time of the F-system. To do this, use the SIMATIC STEP7 response time table (https://support.industry.siemens.com/cs/ww/en/view/93839056).

WARNING

If you have configured the digital input module F-DI 8x24VDC HF (6ES7136-6BA00-0CA0) in a plant, but have inserted the digital input module F-DI 8x24VDC HF (6ES7136-6BA01-0CA0) instead, the information from the manual of the digital input module F-DI 8x24VDC HF (6ES7136-6BA00-0CA0) still applies.

Definition of response time for fail-safe digital inputs

The response time represents the interval between a signal change at the digital input and reliable availability of the safety frame on the backplane bus.

Times required for the calculation

- Maximum cycle time: T_{cycle} = 8.0 ms
- Max. acknowledgement time (device acknowledgement time): T_{DAT} = 16 ms

Maximum response time in an error-free scenario (worst case delay time, WCDT) for 1oo1 evaluation.

The following formula applies to a sensor supply without short-circuit test:

Maximum response time (T_{WCDT}) = 2 * T_{cycle} + Input delay

The following formula applies to a sensor supply with short-circuit test:

Maximum response time (T_{WCDT}) = 2 * T_{cycle} + Input delay + T1 + T2

T1 = Time for short-circuit test

T2 = Startup time of sensor after short-circuit test

Maximum response time in an error-free scenario (worst case delay time, WCDT) for 1oo2 evaluation.

The following formula applies to a sensor supply without short-circuit test:

Maximum response time (T_{WCDT}) = 2 * T_{cycle} + Input delay+ Discrepancy time*

The following formula applies to a sensor supply with short-circuit test:

Maximum response time (T_{WCDT}) = 2 * T_{cycle} + Input delay + max (T1p + T2p, T1s + T2s) + Discrepancy time*

*) Is omitted for discrepancy behavior "Supply value 0"

T1p = Time for short-circuit test (sensor 1)

T2p = Startup time of sensor after short-circuit test (sensor 1)

T1s = Time for short-circuit test (sensor 2)

T2s = Startup time of sensor after short-circuit test (sensor 2)

The discrepancy time is included in the calculation of the maximum response time (T_{WCDT}) and can therefore be set to 0 in the SIMATIC STEP7 response time table.

Maximum response time to external short-circuits (one fault delay time, OFDT)

Maximum response time (T_{OFDT}) = Input delay + T_{cycle} + (n * T_{cycle}) + Sum[x=0...7](Tsx)

Tsx summation term:

(T1x + T2x) < T_{cycle} → Tsx = T_{cycle}

(T1x + T2x) >= T_{cycle} → Tsx = max (T1x, T_{cycle}) + T2x

For deactivated sensor supplies or sensor supplies with deactivated short-circuit test, the value 0 has to be used in the formula for Tsx.

x = Sensor supply

T1x = Time for short-circuit test

T2x = Startup time of sensor after short-circuit test

n = Number of sensor supplies with activated short-circuit test

Below you will find two examples for calculating the maximum response time to external short-circuits on a F-DI 8×24VDC HF depending on the parameter assignment.

Channel	Input delay (ms)	Short-circuit test	T1 (ms)	T2 (ms)	T_{cycle} (ms)	T1 + T2 < T_{cycle}	Ts (ms)	Max. response time to external short-circuits (ms)
0	3.2	Enable	4.2	4.2	8.0	NO	12.2	172.8
1	3.2	Enable	4.2	4.2	8.0	NO	12.2	172.8
2	3.2	Enable	4.2	4.2	8.0	NO	12.2	172.8
3	3.2	Enable	4.2	4.2	8.0	NO	12.2	172.8
4	3.2	Enable	4.2	4.2	8.0	NO	12.2	172.8

Channel	Input delay (ms)	Short-circuit test	T1 (ms)	T2 (ms)	T_{cycle} (ms)	T1 + T2 < T_{cycle}	Ts (ms)	Max. response time to external short-circuits (ms)
5	3.2	Enable	4.2	4.2	8.0	NO	12.2	172.8
6	3.2	Enable	4.2	4.2	8.0	NO	12.2	172.8
7	3.2	Enable	4.2	4.2	8.0	NO	12.2	172.8

Example calculation: (4.2 ms + 4.2 ms) >= 8.0 ms→ Ts = max (4.2 ms, 8.0 ms) + 4.2 ms = 12.2 ms

Channel	Input delay (ms)	Short-circuit test	T1 (ms)	T2 (ms)	T_{cycle} (ms)	T1 + T2 < T_{cycle}	Ts (ms)	Max. response time to external short-circuits (ms)
0	0.4	Enable	0.5	0.5	8.0	YES	8.0	5334.8
1	0.8	Enable	4.2	10	8.0	NO	18.0	5335.2
2	1.6	Enable	20	4.2	8.0	NO	24.2	5336.0
3	3.2	Enable	100	100	8.0	NO	200	5337.6
4	0.4	Disable	-	-	8.0	-	-	- *)
5	0.8	Enable	4.2	4.2	8.0	NO	12.2	5335.2
6	1.6	Enable	500	500	8.0	NO	1000	5336.0
7	3.2	Enable	2000	2000	8.0	NO	4000	5337.6

*) External short-circuits are not detected with a deactivated short-circuit test.

Example calculation channel 1: (4.2 ms +10 ms) >= 8.0 ms → Ts = max(4.2 ms, 8.0 ms) + 10 ms = 18.0 ms

Maximum response time for discrepancy error for 1oo2 evaluation (one fault delay time, OFDT)

Maximum response time (T_{OFDT}) = 2 * T_{cycle} + Input delay + 2 * max (T1p + T2p, T1s + T2s) + Discrepancy time

T1p = Time for short-circuit test (sensor 1)

T2p = Startup time of sensor after short-circuit test (sensor 1)

T1s = Time for short-circuit test (sensor 2)

T2s = Startup time of sensor after short-circuit test (sensor 2)

Maximum response time with no faults (Worst Case Delay Time, WCDT) for safety mat evaluation

When the safety mat is activated (the contact is closed), the maximum response time is 17.6 ms.

Maximum response time in the case of fault (One Fault Delay Time, OFDT) for safety mat evaluation

If a safety mat evaluation is only configured on one channel pair, the maximum response time in case of a fault is 25.6 ms.

If a safety mat evaluation is configured on 2 to 4 channel pairs, the maximum response time in case of a fault is 33.6 ms.

Maximum response time with no faults (Worst Case Delay Time, WCDT) for counter

Maximum response time (T_{WCDT}) = 2 * T_{cycle} + Input delay

Maximum response time to discrepancy error for counter (One Fault Delay Time, OFDT)

Maximum response time (T_{OFDT}) = 3 * T_{cycle} + Input delay + T1w

T1w = Discrepancy time limit (maximum permissible value is 30,000 ms).

Maximum response time with no faults (Worst Case Delay Time, WCDT) for standstill and overspeed monitoring

Maximum response time (T_{WCDT}) = 2 * T_{cycle} + Input delay + T2w * 1.002

T2w = Monitoring window duration (maximum permissible value is 30,000 ms).

Maximum response time to discrepancy error for standstill and overspeed monitoring (One Fault Delay Time, OFDT)

To define the worst case failure response time for standstill and overspeed monitoring, the following assumptions need to be made:

- An event must occur that makes the failure noticeable. This implies a deviation from the expected pulse sequence. This event is defined as failure event.
- A type of motion must activate the sensor to trigger an event.

The failure reaction indicates the time between the occurrence of the failure event and the occurrence of a discrepancy on the backplane bus. To detect the discrepancy and pass it on to the backplane bus, 2 * T_{cycle} + Input delay are required.

Preface

Purpose of the documentation

This manual supplements the system manual Distributed I/O System ET 200SP (http://support.automation.siemens.com/WW/view/en/58649293).

Functions that affect the system in general are described in the system manual.

The information in this manual and the system/function manuals provide support when you commission the system.

A description of the F-system SIMATIC Safety can be found in the programming and operating manual SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126).

Conventions

CPU: When the term "CPU" is used hereafter, it refers to both the CPUs of the S7-1200/1500 automation system and CPUs of the ET 200SP distributed I/O system.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software " (STEP 7 TIA Portal)".

Note the following identified notes:

NOTE

A note includes important information on the product described in the documentation, on handling the product or on the part of the documentation to which you ought to pay special attention.

Standards

You can find a dated reference to the respective standards in the certificate (https://support.industry.siemens.com/cs/ww/en/view/57141281) or in the EC Declaration of Conformity (https://support.industry.siemens.com/cs/ww/en/view/71764057) for the F-module.

Certified versions

You can find the certified product and firmware versions in annex 1 of the report on the TÜV certificate (https://support.industry.siemens.com/cs/ww/en/view/57141289).

Recycling and disposal

For environmentally friendly recycling and disposal of your old equipment, contact a certified electronic waste disposal company and dispose of the equipment according to the applicable regulations in your country.

Important note for maintaining the operational safety of your system

⚠ WARNING

The operators of systems with safety-related characteristics must adhere to specific operational safety requirements. The supplier is also obliged to comply with special product monitoring measures. Siemens informs system operators in the form of personal notifications about product developments and properties which may be or become important issues in terms of operational safety.
You should subscribe to the corresponding notifications in order to obtain the latest information and to allow you to make any necessary modifications to your system.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary

and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Documentation guide

1

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.

Basic information
The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP. distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information
Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information
The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" in the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual.
You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation in the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can have access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data in the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (http://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

2.1 Properties

Article number

6ES7136-6AA00-0CA1

View of the module

①	Module type and name	⑦	Function class
②	LED for diagnostics	⑧	Color coding module type
③	2D matrix code	⑨	Function and firmware version
④	Wiring diagram	⑩	Color code for selecting the color identification labels
⑤	LEDs for channel status	⑪	BU type
⑥	LED for supply voltage	⑫	Article number

Figure 1-206 View of the F-AI 4xI 0(4)..20mA 2-/4-wire HF module

Properties

The module has the following technical properties:

- Fail-safe module
- PROFIsafe
- Supports the "RIOforFA-Safety" profile on F-CPUs S7-1200/1500.
- PROFIsafe address type 2
- 4 analog inputs with electrical isolation between channels and the backplane bus (up to SIL3/Cat.4/PLd)
- Measuring ranges: 0..20 mA and 4..20 mA
- Resolution: 16 bits including sign
- Short circuit-proof power supply for 2-wire or 4-wire transmitter
- Supply voltage L+
- External sensor supply possible
- Assignable diagnostics
- Diagnostics display (DIAG, red/green LED)
- Status display for each input (green LED)
- Error display for each input (red LED)
- Diagnostics
  - e.g., short-circuit, channel-specific
  - e.g. supply voltage missing, module-specific
- Channel- and module-wide passivation

The module supports the following functions:

- Firmware update
- I&M identification data
- Value status

⚠ WARNING

The fail-safe performance characteristics in the technical specifications apply for a mission time life of 20 years and a repair time of 100 hours. If a repair within 100 hours is not possible, remove the respective module from the BaseUnit or switch off its supply voltage before 100 hours expires.
The module switches off independently after the 100 hours have expired.
Follow the repair procedure described in section Diagnostic messages (Page 48).

NOTE

Cyclic reading of I&M data
Cyclic reading of I&M data can affect the timing of the F-modules. You should therefore avoid short read cycles of less than 500 ms.

Accessories

You can order the following accessories separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector
- Electronic coding element as spare part (article number 6ES7193-6EF00-1AA0)

You can find additional information about accessories in the Distributed I/O System ET 200SP (http://support.automation.siemens.com/WW/view/en/58649293) System Manual.

Connecting

Figure 1-207 Block diagram

Sensor supply

⚠ WARNING

Voltage dips and voltage fluctuations of the voltage supply are not buffered by the F-module and, thus, affect the sensor supply.
This can cause the measured value to be false and must be taken into account when determining the safety function.
To ensure that the sensor functions problem-free, we recommend one of the following options:

- You can avoid voltage dips by using a voltage supply according to the NAMUR recommendation NE 21.

or

- Use a transducer with an appropriate battery backup or diagnostics.

Recommendation: Internal sensor supply

You are strongly advised to use the short circuit-proof internal sensor supply of the F-module. This internal sensor supply is monitored and its status is indicated by the Fn LED. The input is also protected in the event of short-circuits in the wiring or at the sensor.

NOTE

The internal sensor supply is switched off in case of a short circuit to ground or during power-up in the event of short circuit to L+.
The sensor supply is also switched off at input currents > 35 mA.
A check is made approximately 1 minute later to determine if the error has gone.

NOTE

Behavior of process values and diagnostics evaluation
Sensor startup during module startup:
After the internal sensor supply is activated, the evaluation of wire break and underflow diagnostics is suppressed for 3 seconds. During this time, the module makes the secure process data 0 available at all channels. This suppresses a possible wire break or underflow diagnostics caused by the sensor startup. If the sensor startup is not yet complete after the 3 seconds have elapsed, it is possible that the module might detect wire break or underflow and passivate the affected channel. In this case, the channel fault must be acknowledged during startup.
Sensor startup during operation:
If a sensor startup takes place during operation, e.g. the sensor supply is reactivated after a short-circuit, all analog values are invalid and wire break or underflow diagnostics can occur on the sensors connected to the internal sensor supply.

External/internal sensor supply

The figures in section "Applications of the F-I/O module (Page 34)" show how you can supply power to the sensors via an external sensor supply (for example, from another module).

⚠ WARNING

If there is a short-circuit from L+ to Mn+, the input resistors could be destroyed, depending on the selected interconnection type.
You can avoid this problem through proper wiring and use of the internal sensor supply.
When an external sensor supply is used, other suitable measures are necessary to protect the input resistors (e.g. external fast 50 mA fuse in the input circuit of the F-module).

⚠ WARNING

External sensor supply
If you use an external sensor supply, you need to take into consideration the voltage dips and voltage fluctuations when determining the safety function.
To ensure that the sensor functions problem-free, we recommend one of the following options:

- Use a transducer with an appropriate battery backup or diagnostics.
  or
- Use a **redundant** external sensor supply
  or
- **Monitor** the external sensor supply for undervoltage/overvoltage, including shutdown of the sensor supply in the event of a fault (single channel for SIL2; two-channel for SIL3).

Parameters/address space

4

4.1 Measurement types and measuring ranges

The following table shows the measurement types and the respective measuring range.

Table 1-487 Measurement types and measuring ranges

Measurement type	Measuring range	Resolution
Current	0 to 20 mA (2-wire and 4-wire transducer) 4 to 20 mA (2-wire and 4-wire transducer)	16 bits including sign 16 bits including sign

You can find the tables of the measuring ranges as well as overflow, overrange, etc. in the Appendix Representation of analog values (Page 60).

4.2 Parameters

Parameters for F-AI 4xI 0(4)..20mA 2-/4-wire HF

WARNING

Diagnostics functions should be activated or deactivated in accordance with the application, see section Applications of the F-I/O module (Page 34).

The following parameters are possible:

Table 1-488 Configurable parameters

Parameters	Value range	Default	Parameter reassignment in RUN	Scope
F-parameters:				
Manual assignment of the F-monitoring time	• Disable • Enable	Disable	No	Module
F-monitoring time	1 to 65535 ms	150 ms	No	Module
F-source address	1 to 65534	depends on parameter assignment of F-CPU	No	Module
F-destination address	1 to 65534	suggested by F-system	No	Module
F-parameter signature (without address)	0 to 65535	calculated by F-system	No	Module
Behavior after channel faults	• Passivate entire module • Passivate channel	Passivate channel	No	Module
Reintegration after channel fault	• Adjustable • All channels automatically • All channels manually	(S7-300/400) Adjustable (S7-1200/1500) All channels manually	No	Module

Parameters	Value range	Default	Parameter reassignment in RUN	Scope
F-I/O DB manual number assignment	• Disable • Enable	Disable	No	Module
F-I/O DB number	—	suggested by F-system	No	Module
F-I/O DB name	—	suggested by F-system	No	Module
AI parameters				
Interference frequency suppression	• 50 Hz • 60 Hz	50 Hz	No	Module
Channel parameters:				
Channel n				
Sensor evaluation	• 1oo1 evaluation (max. SIL3/Cat.3/PLd) • 1oo2 evaluation (max. SIL3/Cat.4/PLe)	1oo1 evaluation (max. SIL3/Cat.3/PLd)	No	Channel
Standard value	• MIN • MAX	MIN	No	Channel
Discrepancy time *	100 to 30000 ms	100 ms	No	Channel
Tolerance window %, absolute	2.0 to 20.0%	5.0%	No	Channel
Tolerance window %, relative	2.0 to 20.0%	5.0%	No	Channel
Activated	• Disable • Enable	Enable	No	Channel
Channel fault acknowledgment	• Manual • Automatic The value range offered depends on the F-CPU in use and on the configuration of the F-parameter "Reintegration after channel fault".	(S7-300/400) Parameter is not supported (S7-1200/1500) Manual	No	Channel
Measuring range	• 0 to 20 mA • 4 to 20 mA	4 to 20 mA	No	Channel
Diagnostics: Wire break **	• Disable • Enable	Enable	No	Channel
Smoothing	• 1 • 2 • 4 • 8 • 16 • 32 • 64	1	No	Channel

* See formula under Parameter assignment of discrepancy analysis for 1oo2 evaluation (Page 23)

* Can only be set with 4 to 20 mA measuring range

4.3 Explanation of parameters

4.3.1 F-parameters

You must assign the PROFIsafe address (F-destination address together with F-source address) to the F-module before you put it into operation.

- You define the F-source address using the "Base for PROFIsafe addresses" parameter in the F-CPU.
- An F-destination address unique throughout the CPU is automatically assigned for each F-module. You can manually change the F-destination addresses set in the hardware configuration.

You can find information on F-parameters for the F-monitoring time, the PROFIsafe addressing (F-source address, F-destination address) and the F-I/O DB in the manual SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126).

4.3.2 Parameters of the channels

4.3.2.1 Interference frequency suppression

Here you set the interference frequency suppression for the line frequency:

- 50 Hz
- 60 Hz

You can find additional information on this in the Analog value processing function manual (https://support.industry.siemens.com/cs/ww/en/view/67989094).

4.3.2.2 Evaluation of the sensors

Overview

Here you select the type of sensor evaluation:

- "1oo1 evaluation (max. SIL3/Cat.3/PLd)"
- "1oo2 evaluation (max. SIL3/Cat.4/PLe)"

If you do not want to measure with a channel or channel pair, disable the channel or the channel pair.

1oo1 evaluation (max. SIL3/Cat.3/PLd)

With the 1oo1 evaluation, there is one sensor, and it is connected to the F-module via a single channel.

1oo2 evaluation (max. SIL3/Cat.4/PLe)

With the 1oo2 evaluation, two input channels are occupied by:

- Two single-channel sensors
- One two-channel sensor

Note that in 1oo2 evaluation, two channels are combined into a channel pair.

Achievable safety class

Depending on the selected sensor evaluation, you achieve the following safety classes with a sensor that is qualified accordingly:

- SIL3/Cat.3/PLd for "1oo1 evaluation" or
- SIL3/Cat.4/PLe for "1oo2 evaluation"

See also

Parameter assignment of discrepancy analysis for 1oo2 evaluation (Page 23)

4.3.2.3 Standard value

Function

If you have selected "1oo2 evaluation (max. SIL3/Cat.4/PLe)", you can choose for each input channel pair which of the two F-CPU values is provided.

- "MIN": the lesser of the two values.
- "MAX": the greater of the two values.

During a discrepancy between the two input channels, the last valid standard value prior to the occurrence of the discrepancy is made available to the F-CPU.

4.3.2.4 Discrepancy time

Function

If you have selected "1oo2 evaluation (max. SIL3/Cat.4/PLe)", you can enter the discrepancy time for each channel pair here in milliseconds.

The discrepancy time does not start until the standard value is outside the assigned tolerance window (relative or absolute). If the two redundant input channels of the channel pair differ by more than the specified tolerance and for longer than the specified discrepancy time but no longer than the duration of the maximum response time, the F-module detects a discrepancy error and triggers a diagnostic interrupt. If the input channels fall below the specified tolerance prior to expiration of the discrepancy time (input channels are no longer discrepant), the discrepancy time is cleared and is restarted only when a new discrepancy is detected.

You can find additional information about configuring the discrepancy analysis under Parameter assignment of discrepancy analysis for 1oo2 evaluation (Page 23).

A discrepancy error is handled by the safety program in the same way as a channel fault. Additional information is available in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

4.3.2.5 Tolerance window %, absolute

Function

If you have selected "1oo2 evaluation (max. SIL3/Cat.4/PLe)", you can enter the size of a tolerance window for the discrepancy here for the channel pair. You specify the tolerance window as a percentage of the full-scale value. The reference value is the full-scale value, i.e. 20 mA. The entered value is rounded to one decimal place.

If two redundant input channels of the channel pair differ by more than the tolerance specified here and for longer than the specified discrepancy time, the F-module detects a discrepancy error and triggers a diagnostic interrupt.

For more information regarding setting the tolerance window, refer to Parameter assignment of discrepancy analysis for 1oo2 evaluation (Page 23).

Example

You have assigned the following:

- The "Tolerance window % absolute" 10%
- The measuring range 0..20 mA
- A discrepancy time of 100 ms

The input channels may differ from the configured discrepancy time (100 ms) up to the max. reaction time for a time window with a difference of more than 2 mA.

See also

Discrepancy time (Page 21)

4.3.2.6 Tolerance window %, relative

Function

If you have selected "1oo2 evaluation (max. SIL3/Cat.4/PLe)", you can enter the size of a tolerance window for the discrepancy here for each channel pair. You specify the tolerance window as a percentage of the assigned standard value. The entered value is rounded to one decimal place.

If two redundant input channels of the channel pair differ by more than the tolerance specified here and for longer than the specified discrepancy time, the F-module detects a discrepancy error and triggers a diagnostic interrupt.

The two parameters "Tolerance window % absolute" and "Tolerance window % relative" are combined. The "Tolerance window % absolute" parameter is decisive in case of low process values.

For more information regarding setting the tolerance window, refer to Parameter assignment of discrepancy analysis for 1oo2 evaluation (Page 23).

Example

You have assigned the following:

- The "tolerance window % relative" is set at 10%
- A measuring range of 0 to 20 mA
- A discrepancy time of 200 ms
- A unit value of 20 mA

The input channels may differ from the configured discrepancy time (200 ms) up to the max. reaction time for a time window with a difference of more than 2 mA.

See also

Discrepancy time (Page 21)

4.3.2.7 Parameter assignment of discrepancy analysis for 1oo2 evaluation

Operating principle of discrepancy analysis

A discrepancy analysis is performed with a configured 1oo2 evaluation. **Smoothed** process values are used for the discrepancy analysis.

An assignable tolerance window is formed around the process value that represents the instantaneous standard value (value that is signaled to the F-CPU).

The tolerance window is formed relative to the process value or as an absolute value relative to the measuring range end value. Relative and absolute tolerance windows are combined.

If the process value does not represent the standard value at an instant and is within the tolerance window, **no** discrepancy exists.

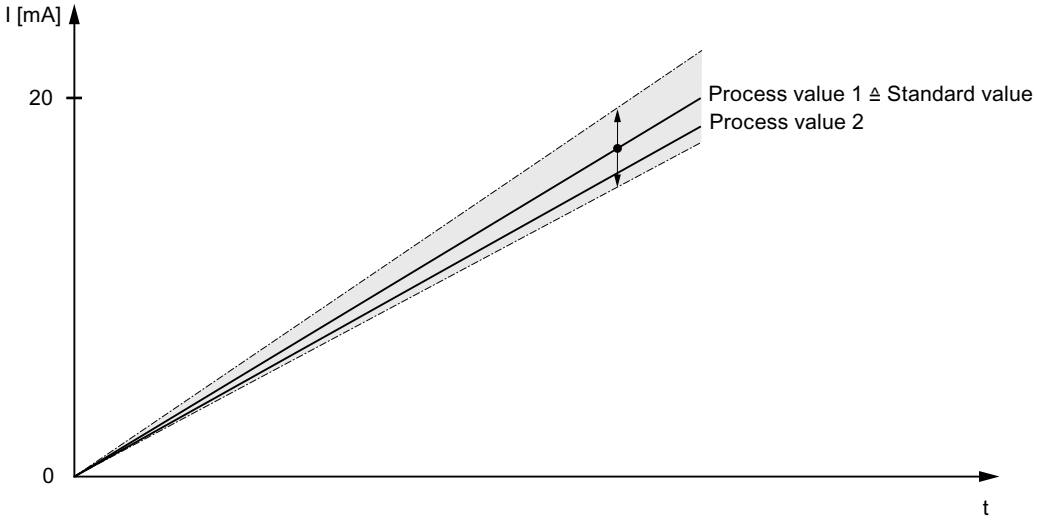

Figure 1-208 Example of a relative tolerance window *without* discrepancy (parameter assignment: standard value = MAX)

If the process value does not represent the standard value at an instant but is outside the tolerance window, a discrepancy exists.

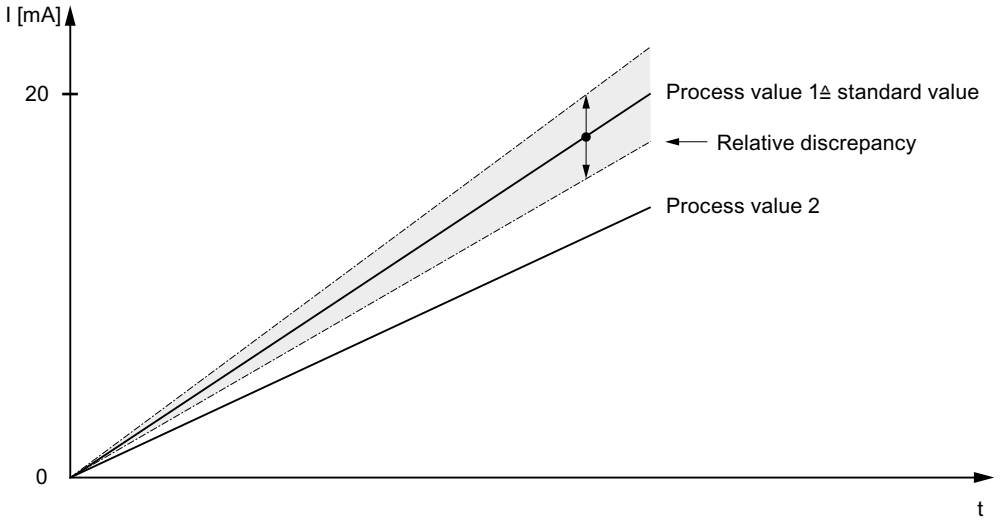

Figure 1-209 Example of a relative tolerance window *with* discrepancy (parameter assignment: standard value = MAX)

The assigned discrepancy time starts as soon as a discrepancy is detected. The discrepancy time runs as long as the discrepancy exists.

- During a discrepancy between the two input channels, the last valid standard value prior to occurrence of the discrepancy is signaled to the F-CPU.

  If the input channels fall below the specified tolerance prior to expiration of the discrepancy time (input channels are no longer discrepant), the discrepancy time is cleared and is restarted only when a new discrepancy is detected.
- There is no valid old value after startup. If the discrepancy is detected during this time, $7FFF_H$ is output for S7-300/400 F-CPUs or 0 is output for S7-1200/1500 F-CPUs and the discrepancy time is started.

  If there is no longer a discrepancy between the input channels when the discrepancy time expires, the standard value is output.

If the discrepancy time has expired, an error is signaled and the process value is set to $7FFF_H$ for S7-300/400 F-CPUs or 0 for S7-1200/1500 F-CPUs. In the PII, the substitute value 0 is set for the safety program.

A discrepancy error is handled by the safety program in the same way as a channel fault. Additional information is available in the STEP 7 Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Configuring the discrepancy analysis parameters

The following four parameters for the discrepancy analysis are assigned for each channel pair:

- Discrepancy time
- Standard value
- Tolerance window %, absolute
- Tolerance window %, relative

"Discrepancy time" parameter

If the following is true, the F-module detects a discrepancy error:

- The process value that does not represent the standard value is outside the configured tolerance window.
- Lasts longer than the configured discrepancy time.
- Lasts at maximum the duration of the maximum response time.

In the case of a discrepancy error, the F-module triggers a diagnostic interrupt and sets the process value to $7FFF_H$ for S7-300/400 F-CPUs or 0 for S7-1200/1500 F-CPUs. The discrepancy time is reset if the standard value lies within the tolerance window again.

In the PII, the substitute value 0 is set for the safety program.

You calculate the maximum discrepancy time that is permitted in the respective application using the following formula:

Discrepancy time = Maximum response time (in case of discrepancy error) – 2 × Conversion cycle time × Smoothing – 2 × Conversion cycle time

NOTE

You calculate the discrepancy time by using the values from section Discrepancy time (Page 58) in the above equation.

You can assign the discrepancy time for each channel pair.

"Standard value" parameter

You can select which of the two values is to be signaled to the F-CPU for each input channel pair. During a discrepancy between the two input channels, the last valid standard value prior to occurrence of the discrepancy is signaled to the F-CPU.

- "MIN": The lower of the two values is signaled to the F-CPU as the standard value.
- "MAX": The higher of the two values is signaled to the F-CPU as the standard value.

"Tolerance window %, absolute" parameter

You can calculate the absolute tolerance window using the following formula:

$$T_{abs} = \frac{|\Delta I_{abs}|}{I_{ME} - I_{MA}} \times 100 \ [\%]$$

Calculate the maximum deviation of the current using the following formula:

$$\Delta I_{abs} = \pm \frac{(I_{ME} - I_{MA}) \times T_{abs}}{100} \ [mA]$$

With

- I_{ME} = 20 mA (full-scale value)
- I_{MA} = 0 mA for measuring range 0 ... 20 mA (start-of-scale value)
- I_{MA} = 4 mA for measuring range 4 ... 20 mA (start-of-scale value)
- T_{abs} = Tolerance in %
- ΔI_{abs} = Maximum deviation of current (+/-)

You can assign a value of 2.0 to 20.0% for the "Tolerance window %, absolute" parameter for each channel pair.

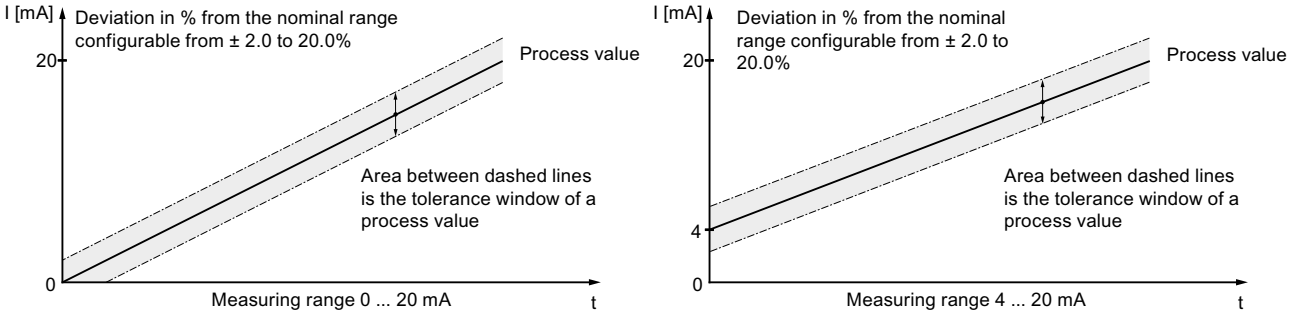

Figure 1-210 Absolute deviation in % of the nominal range for measuring range 0 to 20 mA or 4 to 20 mA

"Tolerance window %, relative" parameter

The tolerance window is calculated as a percentage of the **smoothed** process value that represents the MIN or MAX value (depending on the parameter assignment of the standard value) in this instant.

You can calculate the relative tolerance window using the following formula:

$$T_{rel} = \frac{\left| \Delta I_{rel} \right|}{\left| I_{EW} - I_{MA} \right|} \times 100 \ [\%]$$

Calculate the maximum deviation of the current using the following formula:

$$\Delta I_{rel} = \pm \frac{\left| I_{EW} - I_{MA} \right| \times T_{rel}}{100} \ [mA]$$

With

- I_{EW} = Process standard value (min./max.)
- I_{MA} = 0 mA for measuring range 0 ... 20 mA
- I_{MA} = 4 mA for measuring range 4 ... 20 mA
- T_{rel} = Tolerance in %
- ΔI_{rel} = Maximum deviation of current (+/-)

You can assign a value of 2.0 to 20.0% for the "Tolerance window %, relative" parameter for each channel pair.

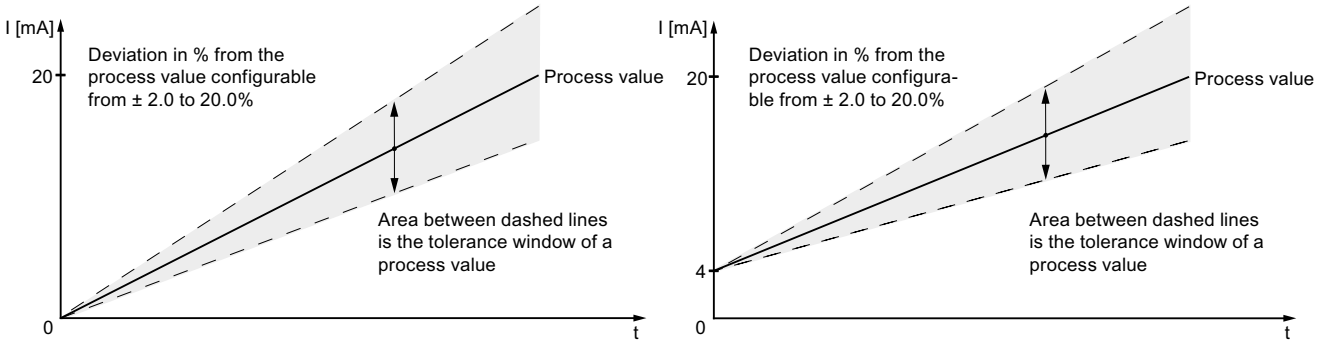

Figure 1-211 Relative deviation in % of the nominal range for measuring range 0 to 20 mA or 4 to 20 mA

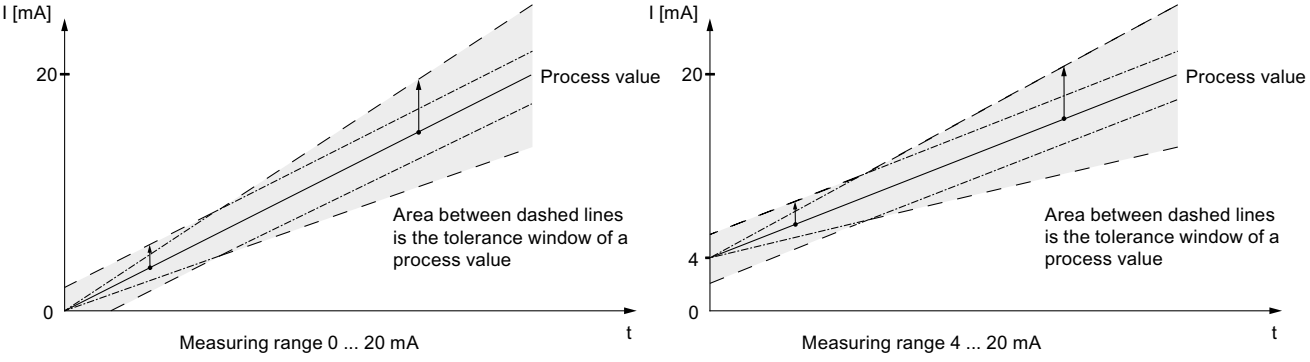
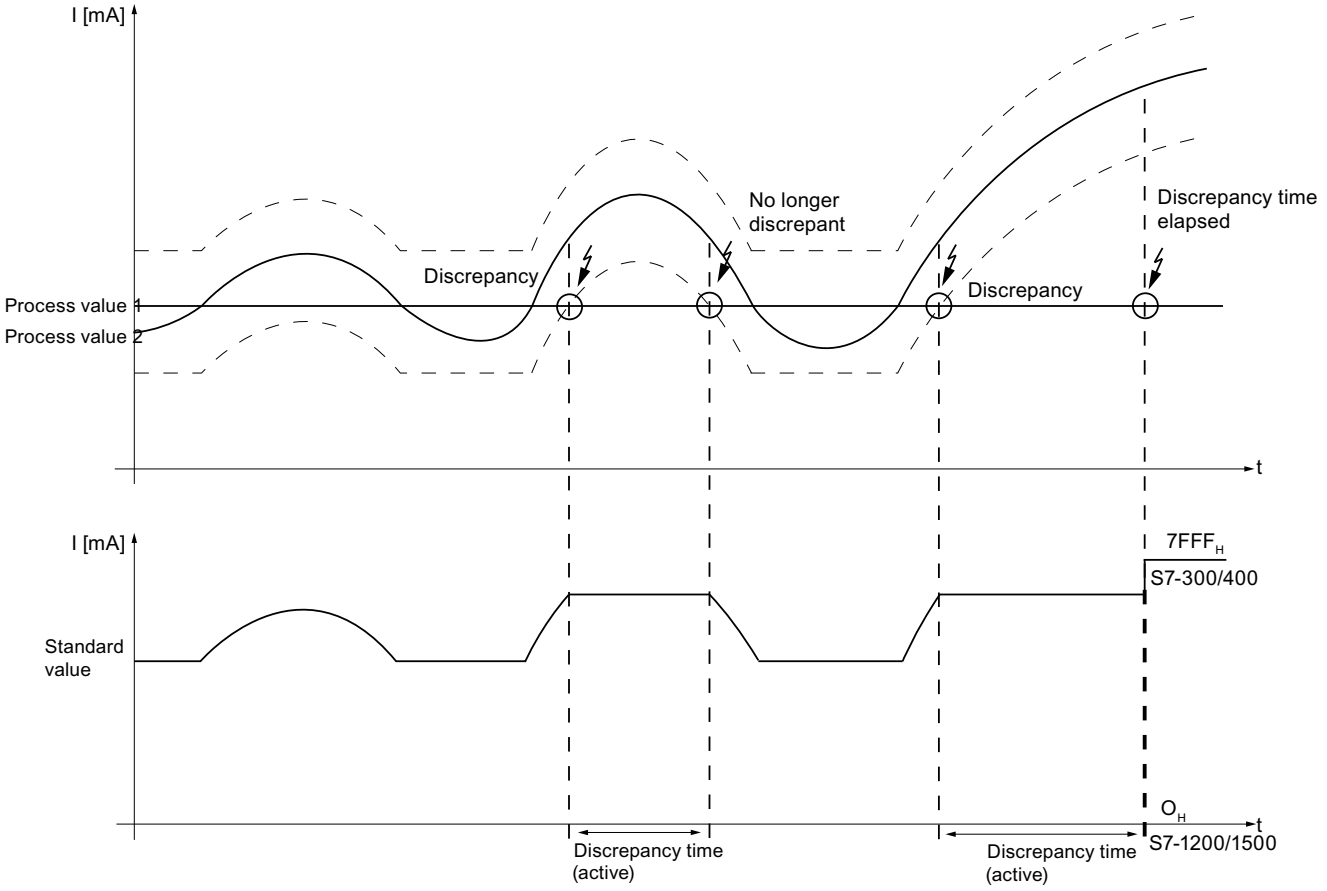
Combination of the "Tolerance window %, absolute" and "Tolerance window %, relative" parameters



You can combine the "Tolerance window %, absolute" and "Tolerance window %, relative" parameters as needed. The combined tolerance window (shown in gray in the figure below) is the maximum of T_{rel} and T_{abs}.

$T = MAX \{ T_{rel}, T_{abs} \}$

$\Delta I = MAX \{ \Delta I_{rel}, \Delta I_{abs} \}$



With

- T = Tolerance, in %
- ΔI = Maximum deviation of current (+/-)

Example

The following diagrams show you the behavior of the discrepancy evaluation when standard value = MAX.

The upper of the two diagrams shows you the characteristic curve of the two process values. The dashed line represents the absolute tolerance range configured in this example.

The lower of the two diagrams shows you the standard value signaled to the F-CPU.

In this example, on the first occurrence of a discrepancy, process value 1 is **within** the tolerance range again **before** expiration of the discrepancy time. This means the discrepancy error is not signaled.

In this example, on the second occurrence of a discrepancy, process value 1 is **outside** the tolerance range when the discrepancy time expires. As a result, a discrepancy error is signaled with 7FFF$_H$ for S7-300/400 F-CPUs or 0 for S7-1200/1500 F-CPUs after expiration of the discrepancy time. In the PII, the substitute value 0 is set for the safety program.

See also

Discrepancy time (Page 21)
Tolerance window %, absolute (Page 22)
Tolerance window %, relative (Page 22)

4.3.2.8 Activated

If you select this check box, the corresponding channel is enabled for signal processing.

You can deactivate an unused channel with this parameter.

If you deactivate unused channels, the response time of the F-module is reduced.

4.3.2.9 Channel failure acknowledge

Use on S7-1200/1500 F-CPUs

The parameter is only relevant if the F-module can be operated on an S7-1200/1500 F-CPU.

The parameter can only be set if the F-parameter "Behavior after channel fault" is set to "Passivate channel" and the F-parameter "Reintegration after channel fault" is set to "Adjustable".

The value of this parameter specifies how the channel reacts after a channel fault:

- Manual: A channel failure is reintegrated after manual acknowledgment.
- Automatically: The channel is reintegrated automatically after a channel fault. Manual acknowledgment is not necessary.

Use in S7-300/400 F-CPUs

The value of this parameter is not relevant in the case of operation on S7-300/400 F-CPUs. For S7-300/400 F-CPUs you set the corresponding property at the F-I/O DB by means of the ACK_NEC tag.

For detailed information about the F-I/O DB, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

4.3.2.10 Measuring range

You select the measuring range for the channel with this parameter:

- 0 to 20 mA
- 4 to 20 mA

4.3.2.11 Diagnostics: Wire break

Function

Here you activate wire break detection for a configured measuring range of 4 to 20 mA.

With an assigned measuring range of 4 to 20 mA:

- With assigned wire break diagnostics and currents < 3.6 mA, a wire break is detected and a diagnostic interrupt is triggered in the F-CPU.
- Without configured wire break and currents diagnostics < 0.4444 mA detects "underflow" and triggers a diagnostic interrupt in the F-CPU.

With an assigned measuring range of 0 to 20 mA, the wire break diagnostics is permanently set by default. With currents < 0.4442 mA, a wire break is detected and a diagnostic interrupt is triggered in the F-CPU.

If you do not need a channel, deactivate the channel. Then, a wire break is not detected.

4.3.2.12 Smoothing

Using smoothing

Smoothing of analog values provides a stabilized analog signal for further processing. Smoothed values are always used for discrepancy analysis.

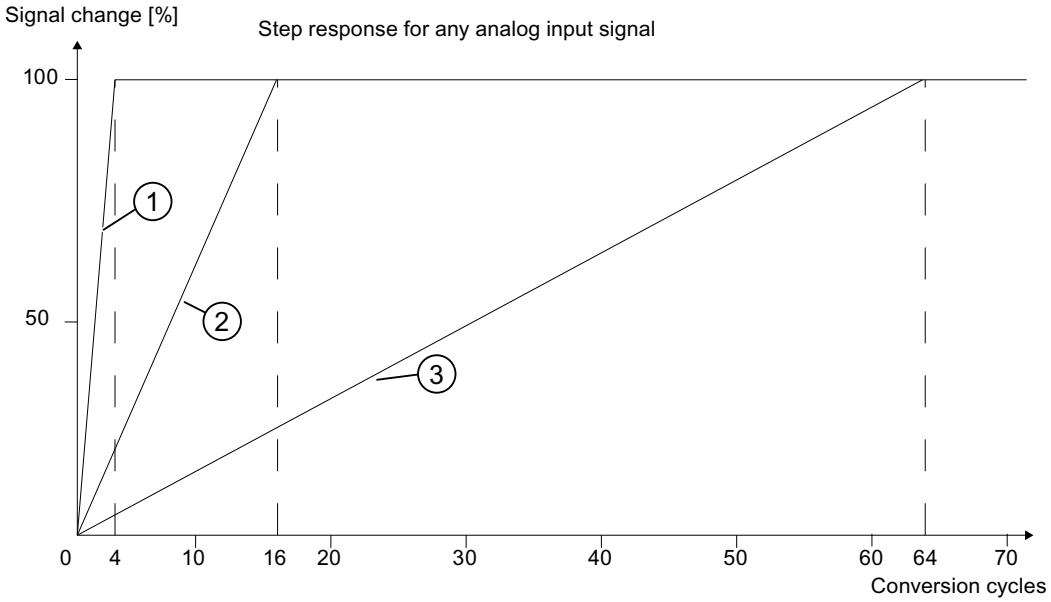
⚠ WARNING

The smoothing takes place as a result of averaging over the selected number of most recently converted analog values of a channel, e.g. 64.
The mean value generation causes a discrepancy to be delayed with a configured "1oo2 evaluation (max. SIL3/Cat.4/PLe)". You can find an example below.

Smoothing principle

The measured values are smoothed by a digital filter. Smoothing is achieved by the F-module forming the mean of a number of converted (digitized) analog values determined by the "Smoothing" parameter.

You assign smoothing in 7 levels (1, 2, 4, 8, 16, 32, 64 conversion cycles). The level determines the number of analog signals that are averaged. If smoothing = 1 is configured, the smoothing is deactivated.



A higher smoothing provides a more stable analog value, and prolongs the time it takes to apply a smoothed analog signal following a unit step. You can find an example below.

NOTE

Smoothing is reset after startup, short circuit, wire break or another channel fault. If, for example, smoothing with 16 conversion cycles is assigned and all channels are active, it takes up to 2000 ms until the process value is signaled with a configured interference frequency suppression of 50 Hz.
Until the first valid process value, the F-module signals for the channel $7FFF_H$ for S7-300/400 F-CPUs or 0 for S7-1200/1500 F-CPUs.
If a discrepancy occurs, measuring and smoothing continues and is not restarted.

Example

The figure below shows the number of conversion cycles, depending on the smoothing setting, after which the analog value is completely smoothed and available in the case of a unit step. The figure applies to all signal changes at the analog input.

① Smoothing - 4 conversion cycles
② Smoothing - 16 conversion cycles
③ Smoothing - 64 conversion cycles

Example: Effect of smoothing on the maximum response time for a configured "1oo2 evaluation (max. SIL3/Cat.4/PLe)" in case of error

If an error (One Fault Delay Time, OFDT) occurred with a configured "1oo2 evaluation (max. SIL3/Cat.4/PLe)", you calculate the maximum response time according to the following formula:

Maximum response time (in case of discrepancy error) = 2 × Conversion cycle time × Smoothing + Discrepancy time + 2 × Conversion cycle time

Example: One channel pair connected and configured (activated), interference frequency 50 Hz, smoothing = 16 conversion cycles, discrepancy time = 2000 ms, conversion cycle time calculated with the formula from section Response times (Page 58):

Max. response time (in case of discrepancy error) = 2 × 70 ms × 16 + 2000 ms + 2 × 70 ms = 4380 ms

If a discrepancy exists between the two input channels, it can take 4380 ms until the F-module signals a discrepancy error to the F-CPU.

If the discrepancy time expires, an error is signaled and the process value is set to $7FFF_H$ for S7-300/400 F-CPUs or 0 for S7-1200/1500 F-CPUs. In the PII, the substitute value 0 is set for the safety program.

4.4 Address space

Address assignment for the analog input module F-AI 4xI 0(4)..20mA 2-/4-wire HF

The analog input module F-AI 4xI 0(4)..20mA 2-/4-wire HF occupies the following address areas in the F-CPU:

Table 1-489 Address assignment in the F-CPU

Occupied bytes in the F-CPU:		
F-CPU	**In input range**	**In output range**
S7-300/400 F-CPUs	IB x + 0 to x + 12	QB x + 0 to x + 3
S7-1200/1500 F-CPUs	IB x + 0 to x + 13	QB x + 0 to x + 4

x = Module start address

Address assignment of the user data and the value status of the analog input module F-AI 4xI 0(4)..20mA 2-/4-wire HF

The user data occupy the following addresses in the analog input module F-AI 4xI 0(4)..20mA 2-/4-wire HF out of all the assigned addresses in the F-CPU:

Table 1-490 User data address assignment in the input range

Byte in the F-CPU	**Assigned bits in F-CPU per F-module:**							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
IB x + 0	Input value at channel 0 (Result of the 1oo2 evaluation channel 0/2)							
IB x + 1								
IB x + 2	Input value at channel 1 (Result of the 1oo2 evaluation channel 1/3)							
IB x + 3								
IB x + 4	Input value at channel 2							
IB x + 5								
IB x + 6	Input value at channel 3							
IB x + 7								
IB x + 8	—	—	—	—	Value status* for AI_3	Value status* for AI_2	Value status* for AI_1	Value status* for AI_0

* Only S7-1200/1500 F-CPUs

x = Module start address

NOTE

You may only access the addresses occupied by user data and value status.
The other address areas occupied by the F-modules are assigned for functions including safety-related communication between the F-modules and F-CPU in accordance with PROFIsafe.

Additional information

For detailed information about F-I/O access, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Applications of the F-I/O module

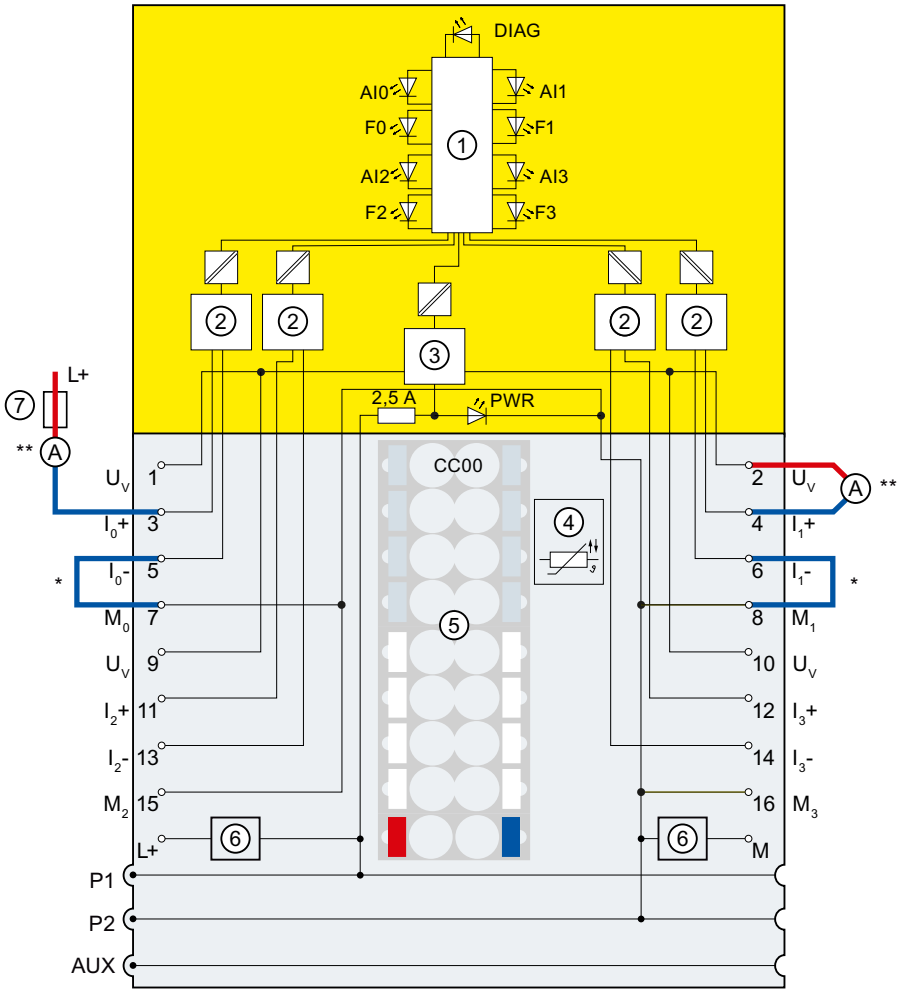
5

You achieve SIL3/Cat.4/PLe with the following applications.

The wiring is performed on the suitable BaseUnit. Additional information is available in the Connecting section in the Distributed I/O System ET 200SP (http://support.automation.siemens.com/WW/view/en/58649293) System Manual.

5.1 Application 1: Safety mode SIL3/Cat.3/PLd with 2-wire transducer

Introduction



Below you will find the wiring scheme and the parameter assignment of the F-AI 4xI 0(4)..20mA 2-/4-wire HF for

- Application 1: Safety mode SIL3/Cat.3/PLd, 1oo1 (1v1) evaluation.

Possible diagnostic messages, the error causes and possible corrective measures are given in section "Diagnostic messages (Page 48)".

Current measurement 0/4 to 20 mA, 2-wire transducer

Four process signals can be connected to the F-module in this interconnection variant. Sensor supply U_V is provided by the F-module for 4 channels. You can also supply the sensors by means of an external sensor supply.

①	Backplane bus interface	U_V	Sensor supply
②	Analog-to-digital converter (ADC)	M	Supply voltage ground
③	Sensor supply/reverse polarity protection	M_n	Ground reference to U_V, channel n
④	Temperature measurement for BU type A1 only (the function cannot be used for this module.)	L+	24 V DC (infeed only with light-colored BaseUnit)
⑤	Color-coded label with color code CC00 (optional)	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
⑥	Filter connection supply voltage (available with light-colored BaseUnit only)	DIAG	Diagnostics LED (green, red)
⑦	External fuse	AI0, AI1, AI2, AI3	Channel status LED (green)

I_n+	Current input positive, channel n	F0, F1, F2, F3	LED channel fault (red)
I_n-	Current input negative, channel n	PWR	Power LED (green)
*	Create the bridge directly at the terminal connection.	**	Measuring transducer

Figure 1-212 1oo1 evaluation

WARNING

To achieve SIL3/Cat.3/PLd using this wiring, you must use a suitably qualified sensor.

WARNING

All cables need to be laid in such a way that they are resistant to interference voltage. Use shielded cables.

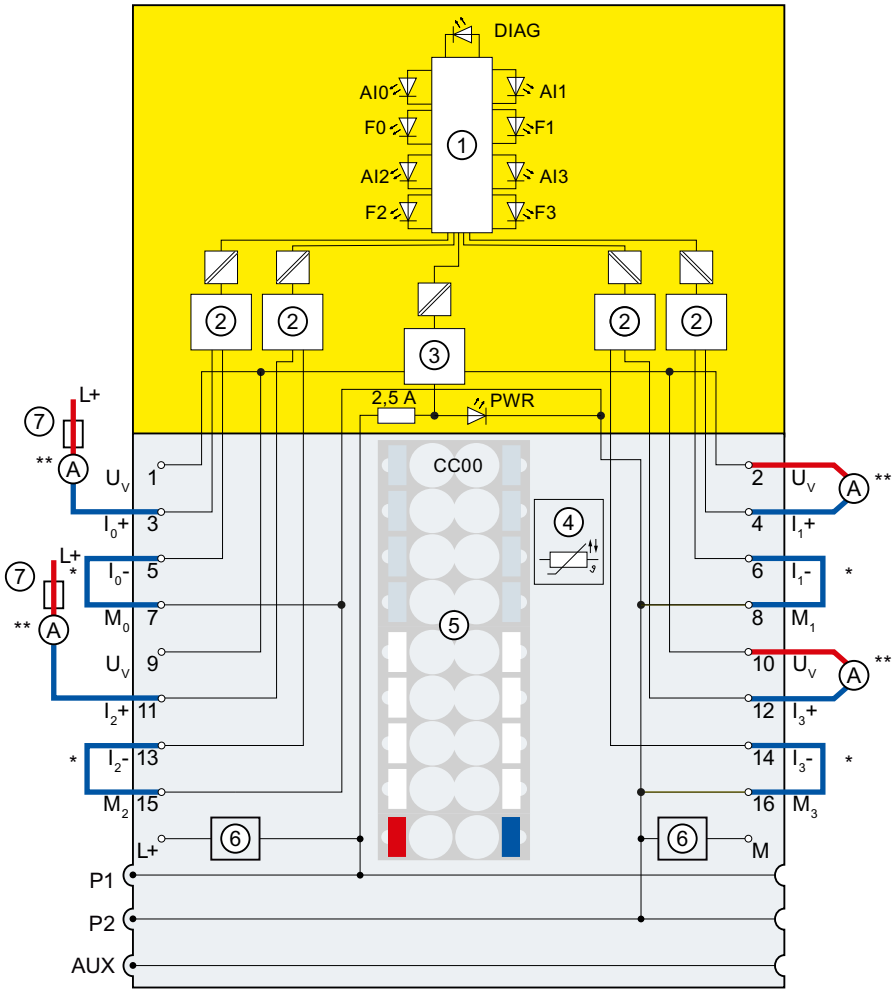
Assignable parameters for application 1

Table 1-491 Parameters for application 1 of F-AI 4xI 0(4)..20mA 2-/4-wire HF

Parameters	Range of values in safety mode
Behavior after channel faults	• Passivate the entire F-module • Passivate channel
Interference frequency suppression	• 50 Hz • 60 Hz
Sensor evaluation	1oo1 evaluation (max. SIL3/Cat.3/PLd)
Measuring range	• 0 ... 20 mA • 4 ... 20 mA
Diagnostics: Wire break	(in the measuring range 4 to 20 mA) • Disable • Enable
Smoothing	1 / 2 / 4 / 8 / 16 / 32 / 64 conversion cycles

5.2 Application 2: Safety mode SIL3/Cat.4/PLe with 2-wire transducer

Introduction



Below you will find the wiring scheme and the parameter assignment of the F-AI 4xI 0(4)..20mA 2-/4-wire HF for

- application 2: Safety mode SIL3/Cat.4/PLe, 1oo2 (2v2) evaluation.

Possible diagnostic messages, the error causes and possible corrective measures are given in section "Diagnostic messages (Page 48)".

Current measurement 0/4 to 20 mA, 2-wire transducer

Two process signals can be connected to the F-module in this interconnection variant. Sensor supply U_V is provided by the F-module for 4 channels. You can also supply the sensors by means of an external sensor supply.

①	Backplane bus interface	U_V	Sensor supply
②	Analog-to-digital converter (ADC)	M	Supply voltage ground
③	Sensor supply/reverse polarity protection	M_n	Ground reference to U_V, channel n
④	Temperature measurement for BU type A1 only (the function cannot be used for this module.)	L+	24 V DC (infeed only with light-colored BaseUnit)
⑤	Color-coded label with color code CC00 (optional)	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
⑥	Filter connection supply voltage (available with light-colored BaseUnit only)	DIAG	Diagnostics LED (green, red)
⑦	External fuse	AI0, AI1, AI2, AI3	Channel status LED (green)

I_n+	Current input positive, channel n	F0, F1, F2, F3	LED channel fault (red)
I_n-	Current input negative, channel n	PWR	Power LED (green)
*	Create the bridge directly at the terminal connection.	**	Measuring transducer

Figure 1-213 1oo2 evaluation

⚠ WARNING

To achieve SIL3/Cat.4/PLe using this wiring, you must use a qualified, two-channel sensor or two qualified single-channel sensors.

⚠ WARNING

All cables need to be laid in such a way that they are resistant to interference voltage. Use shielded cables.

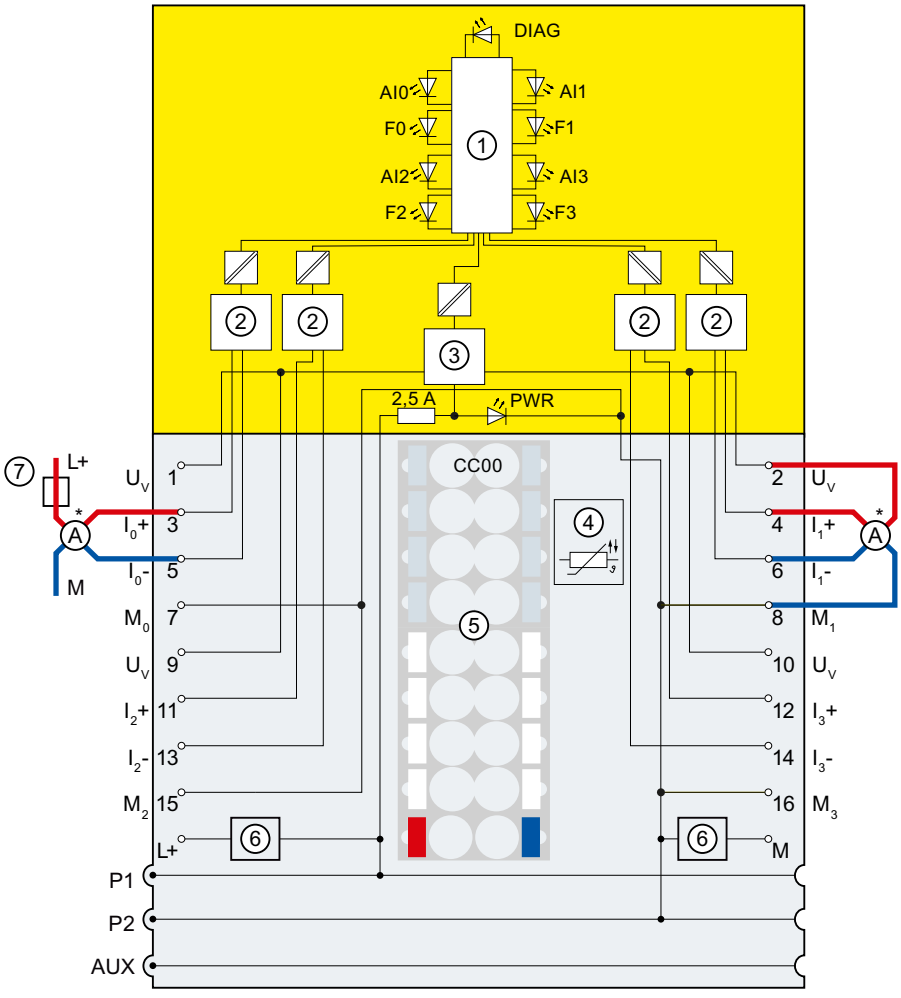
Assignable parameters for application 2

Table 1-492 Parameters for application 2 of F-AI 4xI 0(4)..20mA 2-/4-wire HF

Parameters	Range of values in safety mode
Standard value	• MIN • MAX
Discrepancy time	100 to 30000 ms
Tolerance window %, absolute	2.0 to 20.0%
Tolerance window %, relative	2.0 to 20.0%
Behavior after channel faults	• Passivate the entire F-module • Passivate channel
Interference frequency suppression	• 50 Hz • 60 Hz
Sensor evaluation	1oo2 evaluation (max. SIL3/Cat.4/PLe)
Measuring range	• 0 to 20 mA • 4 to 20 mA
Diagnostics: Wire break	(in the measuring range 4 to 20 mA) • Disable • Enable
Smoothing	1 / 2 / 4 / 8 / 16 / 32 / 64 conversion cycles

5.3 Application 3: Safety mode SIL3/Cat.3/PLd with 4-wire transducer

Introduction



Below you will find the wiring scheme and the parameter assignment of the F-AI 4xI 0(4)..20mA 2-/4-wire HF for

- Application 3: Safety mode SIL3/Cat.3/PLd, 1oo1 (1v1) evaluation.

Possible diagnostic messages, the error causes and possible corrective measures are given in section "Diagnostic messages (Page 48)".

Current measurement 0/4 to 20 mA, 4-wire transducer

Four process signals can be connected to the F-module in this interconnection variant. Sensor supply U_V is provided by the F-module for 4 channels. You can also supply the sensors by means of an external sensor supply.

①	Backplane bus interface	U_V	Sensor supply
②	Analog-to-digital converter (ADC)	M	Supply voltage ground
③	Sensor supply/reverse polarity protection	M_n	Ground reference to U_V, channel n

④	Temperature measurement for BU type A1 only (the function cannot be used for this module.)	L+	24 V DC (infeed only with light-colored BaseUnit)
⑤	Color-coded label with color code CC00 (optional)	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
⑥	Filter connection supply voltage (available with light-colored BaseUnit only)	DIAG	Diagnostics LED (green, red)
⑦	External fuse	AI0, AI1, AI2, AI3	Channel status LED (green)
I_n+	Current input positive, channel n	F0, F1, F2, F3	LED channel fault (red)
I_n-	Current input negative, channel n	PWR	Power LED (green)
*	Measuring transducer		

Figure 1-214 1oo1 evaluation

⚠ WARNING

To achieve SIL3/Cat.3/PLd using this wiring, you must use a suitably qualified sensor.

⚠ WARNING

All cables need to be laid in such a way that they are resistant to interference voltage. Use shielded cables.

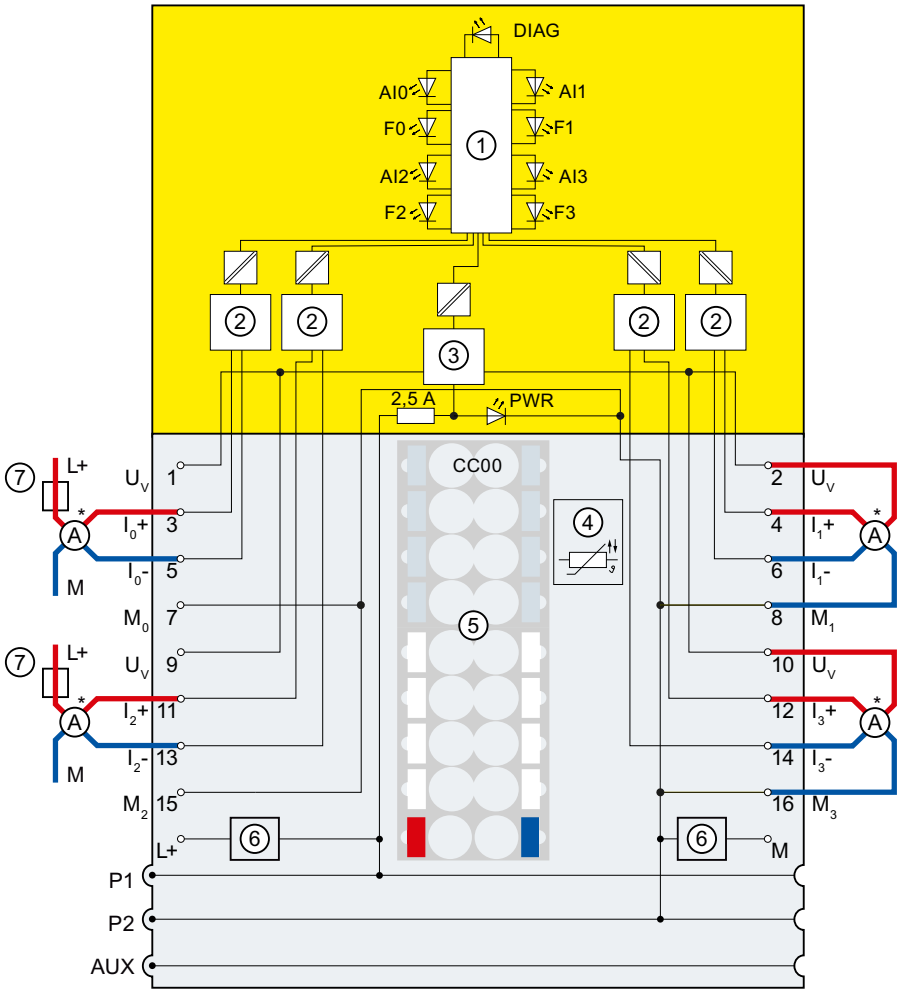
Assignable parameters for application 3

Table 1-493 Parameters for application 3 of F-AI 4xI 0(4)..20mA 2-/4-wire HF

Parameters	Range of values in safety mode
Behavior after channel faults	• Passivate the entire F-module • Passivate channel
Interference frequency suppression	• 50 Hz • 60 Hz
Sensor evaluation	1oo1 evaluation (max. SIL3/Cat.3/PLd)
Measuring range	• 0 to 20 mA • 4 to 20 mA
Diagnostics: Wire break	(in the measuring range 4 to 20 mA) • Disable • Enable
Smoothing	1 / 2 / 4 / 8 / 16 / 32 / 64 conversion cycles

5.4 Application 4: Safety mode SIL3/Cat.4/PLe with 4-wire transducer

Introduction



Below you will find the wiring scheme and the parameter assignment of the F-AI 4xI 0(4)..20mA 2-/4-wire for

- application 4: Safety mode SIL3/Cat.4/PLe, 1oo2 (2v2) evaluation.

Possible diagnostic messages, the error causes and possible corrective measures are given in section "Diagnostic messages (Page 48)".

Current measurement 0/4 to 20 mA, 4-wire transducer

Two process signals can be connected to the F-module in this interconnection variant. Sensor supply U_V is provided by the F-module for 4 channels. You can also supply the sensors by means of an external sensor supply.

①	Backplane bus interface	U_V	Sensor supply
②	Analog-to-digital converter (ADC)	M	Supply voltage ground
③	Sensor supply/reverse polarity protection	M_n	Ground reference to U_V, channel n

④	Temperature measurement for BU type A1 only (the function cannot be used for this module.)	L+	24 V DC (infeed only with light-colored BaseUnit)

6.1 Status and error display

LED display

The following figure shows the LED display of the F-AI 4xI 0(4)..20mA 2-/4-wire HF.

① DIAG (green/red)
② Channel status (green)
③ Channel fault (red)
④ PWR (green)

Figure 1-216 LED display

Meaning of the LED displays

The following tables show the meaning of the status and error displays. Remedies for diagnostics alarms can be found in section Diagnostic messages (Page 48).

WARNING

The DIAG LED and the channel status and channel fault LEDs of the outputs are not designed as safety-related LEDs and therefore may not be evaluated for safety-related activities.

DIAG LED

Table 1-495 Error display of the LED DIAG

DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not okay
Flashing	Module parameters not configured
On	Module parameters configured and no module diagnostics
Flashing	• Module parameters configured and module diagnostics • Operation in S7-1200/1500 F-CPUs: At least one channel is waiting for a user acknowledgment.
Flashing	• Operation in S7-1200/1500 F-CPUs: The F-module is waiting for a user acknowledgment after a module fault. • Operation in S7-300/400 F-CPUs: The F-module is waiting for a user acknowledgment.

Channel status/channel fault LED

Table 1-496 Status display of the LEDs channel status / channel error

Channel status	Channel fault	Meaning
Off	Off	Channel deactivated or supply voltage L+ missing.
On	Off	Channel activated and no channel diagnostics
Off	On	Channel activated and channel diagnostics
Alternately flashing		At least one channel is waiting for a user acknowledgment.

Channel status/DIAG/channel fault LED

Table 1-497 Status display of the LEDs channel status / DIAG / channel error

Channel status	DIAG	Channel fault	Meaning
Off	Flashing	All On	The PROFIsafe address does not match the configured PROFIsafe address.
Flashing	Flashing	Off	Identification of the F-module when assigning the PROFIsafe address.

PWR LED

Table 1-498 Status display of LED PWR

PWR	Meaning
□ Off	Supply voltage L+ missing
■ On	Supply voltage L+ available

6.2 Interrupts

Introduction

The fail-safe analog input module F-AI 4xI 0(4)..20mA 2-/4-wire HF supports diagnostic interrupts.

Diagnostic interrupt

The F-module generates a diagnostic interrupt for each diagnostic message described in section Diagnostic messages (Page 48).

The list below provides an overview of the diagnostic interrupts of the F-module. The diagnostic interrupts are assigned either to one channel or the entire F-module.

⚠ WARNING

Before acknowledging the short circuit diagnostic message, remedy the respective fault and validate your safety function. Follow the fault remedying procedure described in section Diagnostic messages (Page 48)

Scope of diagnostic interrupt: F-module

- Overtemperature
- Parameter error
- Supply voltage missing
- Channel/component temporarily not available
- Mismatch of safety destination address (F_Dest_Add)
- Safety destination address not valid (F_Dest_Add)
- Safety source address not valid (F_Source_Add)
- Safety watchdog timer value is 0 ms (F_WD_Time)
- Parameter F_SIL exceeds SIL from specific device application
- Parameter F_CRC_Length does not match the generated values
- Version of F-parameter set incorrectly
- CRC1 fault
- Inconsistent iParameters (iParCRC error)
- F_Block_ID not supported

- Transmission error: Inconsistent data (CRC error)
- Transmission error: Timeout (monitoring time 1 or 2 expired)
- Module is defective
- Watchdog tripped
- Invalid/inconsistent firmware present
- Diagnostics memory overflow
- Channel failure acknowledgment
- F-address memory not accessible
- No valid F-address available
- Diagnostics memory overflow
- Undertemperature
- Supply voltage too high
- Supply voltage too low
- Channel/component not available

Scope of diagnostic interrupt: Channel

- Diagnostics: Wire break (can only be configured for measuring range 4..20mA)
- High limit exceeded
- Low limit violated
- Safety-related switch off
- Internal supply voltage of the module failed
- Common mode error
- Analog input signal not recorded unique
- Internal sensor supply short-circuit to P
- Overload or internal sensor supply short-circuit to M
- Discrepancy error
- Analog input signal not recorded unique
- Internal sensor supply short-circuit to P
- Overload or internal sensor supply short-circuit to M
- Read back failure
- ADC error
- Fault in test circuit

6.3 Diagnostic messages

Diagnostic messages

Module faults are indicated as diagnostics (module status).

Once the fault is eliminated, the F-module must be reintegrated in the safety program. For additional information on passivation and reintegration of F-I/O, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Table 1-499 Diagnostic messages of the F-AI 4xI 0(4)..20mA 2-/4-wire HF

Diagnostic message	Fault code	Meaning	Remedy
Overtemperature	5_H	The F-module measured an excessively high temperature.	Operate the F-module within the specified temperature range (see Technical specifications (Page 53)) Once the temperature has been reduced and returns to the specified range, the F-module must be removed and inserted or the power switched OFF and ON.
Wire break	6_H	Possible causes: • A cable to the sensor is broken. • Fault at the external circuit • Defective sensor • Wrong sensor type set in the parameters • Input channel not used • Measurement resistance too high	Check the possible causes and eliminate the fault.
High limit exceeded	7_H	The measured value exceeds the measuring range.	Check the interaction between the module and the sensor.
Low limit violated	8_H	The measured input value is below a measuring range.	Check the interaction between the module and the sensor.
Parameter error	10_H	Parameter assignment errors include: • The F-module cannot use the parameters (unknown, invalid combination, etc.). • The F-module parameters have not been configured.	Correct the parameter assignment.
Supply voltage missing	11_H	Missing or insufficient supply voltage L+	• Check the supply voltage L+ on the BaseUnit. • Check the BaseUnit.
Safety-related switch off	19_H	For safety purposes, channel was switched off due to an error on another channel. Possible causes: • Short circuit is present.	• Correct the process wiring.
Channel/component temporarily not available	$1F_H$	Possible causes: • Internal fault in the F-module • Firmware update error	• Replace the F-module. • Repeat the firmware update.

Diagnostic message	Fault code	Meaning	Remedy
Mismatch of safety destination address (F_Dest_Add)	40_H	The F-module detected a different F-destination address.	• Check the parameter assignment of the PROFIsafe driver and the PROFIsafe address assigned to the F-module. • Assign the PROFIsafe address to the F-module (again).
Safety destination address not valid (F_Dest_Add)	41_H	The F-module detected an invalid F-destination address.	
Safety source address not valid (F_Source_Add)	42_H	The F-module detected a different F-source address.	
Safety watchdog timer value is 0 ms (F_WD_Time)	43_H	The F-module detected an invalid safety watchdog time.	
Parameter F_SIL exceeds SIL from specific device application	44_H	The F-module detected a discrepancy between the SIL setting of the communication and the application.	
Parameter F_CRC_Length does not match the generated values	45_H	The F-module detected a discrepancy in the CRC length.	
Version of F-parameter set incorrectly	46_H	The F-module detected an incorrect F_Par_Version or an invalid F_Block_ID.	
CRC1 fault	47_H	The F-module detected inconsistent F-parameters.	
Transmission error: Inconsistent data (CRC error)	$4D_H$	The F-module detected a CRC error. Possible causes: • The communication between the F-CPU and F-module is disturbed. • Electromagnetic interference has exceeded limits. • An error occurred in the sign-of-life monitoring.	• Check the communication connection between the F-module and F-CPU. • Eliminate the electromagnetic interference.
Inconsistent iParameters (iParCRC error)	51_H	The firmware of the F-module has detected inconsistent iParameters.	Check the parameter assignment.
F_Block_ID not supported	52_H	The F-module detected an incorrect block ID.	Check the parameter assignment of the PROFIsafe driver.
Transmission error: Timeout (monitoring time 1 or 2 expired)	54_H	The F-module detected a timeout. Possible causes: • The F-monitoring time is set incorrectly. • A bus fault is present.	• Check the parameter assignment. • Ensure that communication is functioning correctly.
Module is defective	100_H	Possible causes: • Electromagnetic interference has exceeded limits. • The F-module has detected an internal error and has reacted in a safety-related manner.	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON. • If the F-module cannot be put back into operation, consider replacing it.
Watchdog tripped	103_H	Possible causes: • Electromagnetic interference has exceeded limits. • The F-module has detected an internal error and has reacted in a safety-related manner.	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON. • If the F-module cannot be put back into operation, consider replacing it.
Internal supply voltage of the module failed	104_H	Internal voltage is too low.	Replace the F-module.

Diagnostic message	Fault code	Meaning	Remedy
Common mode error	118_H	Voltage between two input channels is too high.	Correct the input wiring.
Invalid/inconsistent firmware present	$11B_H$	The firmware is incomplete and/or firmware added to the F-module is incompatible. This leads to errors or functional limitations when operating the F-module.	• Perform a firmware update for the F-module. Note any error messages. • Use only firmware versions released for this F-module.
Diagnostics memory overflow	$13E_H$	Overflow of the diagnostics memory. It was not possible to send all pending diagnostics. This error can lead to deactivation of the F-module and even to switch off/on of the supply voltage.	Remedy the cause of the diagnostics surge.
Analog input signal not recorded unique	304_H	Measured values from the sensor are not plausible. Possible causes: • Increased EMC • F-module defective	Check the interaction between the F-module and the sensor.
Internal sensor supply short-circuit to P	306_H	Possible causes: • Short-circuit of internal sensor supply to P	Check the process wiring.
Overload or internal sensor supply short-circuit to M	307_H	• The internal sensor supply is overloaded. • Missing or insufficient supply voltage L+.	• Eliminate the short-circuit in the process wiring. • Check the supply voltage L+ on the BaseUnit. • Check the BaseUnit.
Channel failure acknowledgment	$30B_H$	A channel fault was detected. Confirmation is required to enable the channel.	Confirm the channel fault.
No valid F-address available	$30D_H$	The F-source address and F-destination address stored in the electronic coding element cannot be accessed.	Verify that the coding element is present. Replace the coding element, if necessary.
F-address memory not accessible	$30E_H$	No valid PROFIsafe address is saved in the retentive memory. Possible causes: • Initial commissioning • Deliberate parameter change of the PROFIsafe address • Deviation between target and actual configuration of the plant.	• In the case of initial commissioning or deliberate parameter change, assign the PROFIsafe address. • Check the consistency of the target and actual configuration.
Undertemperature	312_H	The minimum permissible temperature limit has been violated.	Operate the F-module within the specified temperature range (see Technical specifications (Page 53))
Discrepancy error	314_H	The discrepancy time set for 1oo2 operation has been exceeded. Possible causes of the discrepancy error: • Incorrect parameter assignment • Wire break in the sensor's supply cable	Check the discrepancy time, the sensors and the cabling.
Read back failure	$31E_H$	The F-module detected an internal error in the test connection. Possible causes: • Increased EMC • F-module defective	If the error persists, replace the F-module.
Auxiliary voltage too high	321_H	The supply voltage is too high.	Check the supply voltage and then test the safety application.

Diagnostic message	Fault code	Meaning	Remedy
Auxiliary voltage too low	322_H	The supply voltage is too low.	Check the supply voltage and then test the safety application.
ADC error	331_H	Internal error during analog-digital conversion. Possible causes: • Increased EMC • F-module defective	If the error persists, replace the F-module.
Fault in test connection	332_H	The F-module detected an internal error in the test connection. Possible causes: • Increased EMC • F-module defective	If the error persists, replace the F-module.

Supply voltage outside the nominal range

If the supply voltage L+ is outside the specified value range, the DIAG LED flashes and the module is passivated.

When the voltage is then recovered (level must remain within the specified value for at least 1 minute (see Technical specifications (Page 53): Voltages, Currents, Potentials)), the DIAG LED stops flashing. The module remains passivated.

Generally applicable information on diagnostics

Information on diagnostics that pertains to all fail-safe modules (for example, readout of diagnostics functions or passivation of channels) is available in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

6.4 Value status

Properties

In addition to the diagnostic messages and the status and fault display, the F-module provides information about the validity of each analog input signal – the value status. The value status is entered in the process image along with the input signal.

Value status for digital input and output modules

The value status is the binary additional information of an analog input signal. The value status is entered in the process image of the inputs (PII) at the same time as the process signal. It provides information about the validity of the analog input signal.

The value status is affected by all faults.

- 1_B: A valid process value is output for the channel.
- 0_B: A fail-safe value is output for the channel, or the channel is deactivated.

NOTE

You may only access the addresses occupied by user data and value status.

The other address areas occupied by the F-modules are assigned for functions including safety-related communication between the F-modules and F-CPU in accordance with PROFIsafe.

1oo2 evaluation of the sensors combines the two channels. With 1oo2 evaluation of the sensors, you can only access the low order channel in the safety program, e.g. channel 0.

Assignment of the inputs and value status in the PII

Each channel of the F-module is assigned a value status in the process image of the inputs. You can find the assignment in section Address space (Page 32).

Reference

A detailed description of the evaluation and processing of the respective input signals can be found in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Technical specifications

7

7.1 Technical specifications

Technical specifications of the F-AI 4xI 0(4)..20mA 2-/4-wire HF

Article number	6ES7136-6AA00-0CA1
General information	
Product type designation	F-AI 4xI 0(4) ... 20 mA 2/4-wire HF
Firmware version	
• FW update possible	Yes
usable BaseUnits	BU type A0, A1
Color code for module-specific color identification plate	CC00
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V15 with HSP 203
CiR – Configuration in RUN	
Reparameterization possible in RUN	No
Calibration possible in RUN	No
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption (rated value)	0.38 A
Current consumption, max.	0.4 A
24 V encoder supply	
• 24 V	Yes; min. L+ (-1.5 V)
• Short-circuit protection	Yes
• Output current, max.	300 mA; total current of all encoders/channels
Power	
Power available from the backplane bus	70 mW
Power loss	
Power loss, typ.	2 W
Address area	
Address space per module	
• Inputs	14 byte; S7-300/400F CPU, 13 byte
• Outputs	5 byte; S7-300/400F CPU, 4 byte

Article number	**6ES7136-6AA00-0CA1**
Hardware configuration	
Automatic encoding	
• Electronic coding element type F	Yes
Analog inputs	
Number of analog inputs	4
• For current measurement	4
permissible input current for current input (destruction limit), max.	35 mA
Input ranges (rated values), currents	
• 0 to 20 mA	Yes
• Input resistance (0 to 20 mA)	125 Ω
• 4 mA to 20 mA	Yes
• Input resistance (4 mA to 20 mA)	125 Ω
Cable length	
• shielded, max.	1 000 m
Analog value generation for the inputs	
Measurement principle	Sigma Delta
Integration and conversion time/resolution per channel	
• Resolution with overrange (bit including sign), max.	16 bit
• Integration time, parameterizable	Yes
• Integration time (ms)	20 / 16,667
• Interference voltage suppression for interference frequency f1 in Hz	50 / 60 Hz
Smoothing of measured values	
• Number of smoothing levels	7
• parameterizable	Yes
• Step: None	Yes; 1x conversion cycle time
• Step: low	Yes; 2x / 4x conversion cycle time
• Step: Medium	Yes; 8x / 16x conversion cycle time
• Step: High	Yes; 32x / 64x conversion cycle time
Encoder	
Connection of signal encoders	
• for current measurement as 2-wire transducer	Yes
– Burden of 2-wire transmitter, max.	650 Ω
• for current measurement as 4-wire transducer	Yes
Errors/accuracies	
Linearity error (relative to input range), (+/-)	0.1 %
Temperature error (relative to input range), (+/-)	0.023 %/K
Repeat accuracy in steady state at 25 °C (relative to input range), (+/-)	0.1 %

Article number	6ES7136-6AA00-0CA1
Operational error limit in overall temperature range	
• Current, relative to input range, (+/-)	2 %
Basic error limit (operational limit at 25 °C)	
• Current, relative to input range, (+/-)	0.1 %
Interference voltage suppression for f = n x (f1 +/- 1 %), f1 = interference frequency	
• Series mode interference (peak value of interference < rated value of input range), min.	40 dB
• Common mode interference, min.	70 dB
Interrupts/diagnostics/status information	
Diagnostics function	Yes, "Alarms/diagnostic messages" section in the manual
Alarms	
• Diagnostic alarm	Yes
• Limit value alarm	Yes
Diagnostic messages	
• Monitoring the supply voltage	Yes
• Wire-break	Yes; Measuring range 4 to 20 mA only
• Short-circuit	Yes
Diagnostics indication LED	
• RUN LED	Yes; Green LED
• ERROR LED	Yes; Red LED
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; Green LED
• for channel diagnostics	Yes; Red LED
• for module diagnostics	Yes; Green/red LED
Potential separation	
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes
• between the channels and the power supply of the electronics	Yes
Permissible potential difference	
between the inputs (UCM)	10 Vpp
Isolation	
Isolation tested with	707 V DC (type test)
Standards, approvals, certificates	
Highest safety class achievable in safety mode	
• Performance level according to ISO 13849-1	PLe
• Category according to ISO 13849-1	Cat. 4
• SIL acc. to IEC 61508	SIL 3

Article number	6ES7136-6AA00-0CA1
Probability of failure (for service life of 20 years and repair time of 100 hours)	
– Low demand mode: PFDavg in accordance with SIL3	< 5.00E-05
– High demand/continuous mode: PFH in accordance with SIL3	< 1.00E-09 1/h
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	0 °C
• horizontal installation, max.	60 °C
• vertical installation, min.	0 °C
• vertical installation, max.	50 °C
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	48 g

Operational limit in complete temperature range

⚠ WARNING

When designing the safety function, you must take into account the information "Operational limit in complete temperature range" for the entire mission time.

Temperature characteristic values

NOTE

When the ambient temperature exceeds 55 °C, you must only apply a maximum total current of 3 A to an adjacent F-DQ 4x24VDC/2A PM HF.

Dimension drawing

See ET 200SP BaseUnits manual

Response times

A

Introduction

You will find the response times of the F-AI 4xI 0(4)..20mA 2-/4-wire HF below. The response times are included in the calculation of the F-system response time.

Definition of response time for fail-safe analog inputs

The response time results from the number of channels/channel pairs, the response time per channel/channel pair, the basic response time and the configured smoothing.

Times required for the calculation

- Max. acknowledgment time (Device Acknowledgment Time): T_{DAT} = 20 ms
- Basic response time: 20 ms
- Response time per channel
  - At 50 Hz: 25 ms
  - At 60 Hz: 22 ms

Conversion cycle time = basic response time + (N × response time per channel)

(N = number of active channels)

The conversion cycle time is the time in which all activated channels are processed/converted once.

Typical response time

You can calculate the typical response time of F-AI 4xI 0(4)..20mA 2-/4-wire HF using the following formula:

Typical response time = Conversion cycle time × Smoothing

Max. response time (worst case delay time, WCDT)

You can calculate the maximum response time of F-AI 4xI 0(4)..20mA 2-/4-wire HF (worst case delay time, WCDT) using the following formula:

Max. response time = 2 × Conversion cycle time × Smoothing

Response time in the case of a fault (one fault delay time, OFDT)

You can calculate the response time of F-AI 4xI 0(4)..20mA 2-/4-wire HF (one fault delay time, OFDT) as follows:

- According to the following formula if a discrepancy error is present:

  Typical response time = Conversion cycle time × Smoothing + Discrepancy time + Conversion cycle time

  Maximum response time = 2 × Conversion cycle time × Smoothing + Discrepancy time + 2 × Conversion cycle time
- According to the following formula if a channel fault is present:

  Typical response time = Conversion cycle time

  Max. response time = 2 × Conversion cycle time

This means that, for OFDT, the time on occurrence of a discrepancy error should be taken with parameter assignment "1oo2 evaluation (max. SIL3/Kat.4/PLe)" and the time on occurrence of a channel fault should be taken with parameter assignment "1oo1 evaluation (max. SIL3/Kat.3/PLd)".

Representation of analog values

B

In this section we are presenting the analog values for all measuring ranges that you can use with the F-AI 4xI 0(4)..20mA 2-/4-wire HF analog input module.

Measured value resolution

The analog values are shown as fixed-point number in two's complement.

The resolutions shown here are 16 bits including sign.

Table 1-500 Resolution of the analog values

Resolution in bits	Values		Analog value	
	Decimal	Hexadecimal	High byte	Low byte
16	1	1_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 0 1

B.1 Representation of analog values

The following tables list the decimal and hexadecimal values (codes) of the possible current measuring ranges.

Table 1-501 Current measuring range 0 to 20 mA

Values		Current measuring range	Range
Dec.	Hex.	0 to 20 mA	
32512	$7F00_H$	> 23.518 mA	Overflow[2]
32511 . . 27649	$7EFF_H$ . . $6C01_H$	23.518 mA . . 20.0007 mA	Overrange
27648 . . 614	$6C00_H$ . . 266_H	20 mA . . 0.4442 mA	Nominal range
613 . . 1 0	265_H . . 1_H 0_H	< 0.4442 mA . . 723.4 nA 0 mA	Wire break[1]

1 The F-module signals a wire break, $7FFF_H$ for S7-300/400 F-CPUs or 0 for S7-1200/1500 F-CPUs.

2 In *STEP 7 Safety*, the fail-safe value 0 is provided in place of $7FFF_H$ (for overflow) in the PII for the safety program.

Table 1-502 Current measuring range 4 to 20 mA

Values		Current measuring range	Range	
Dec.	**Hex.**		**Diagnostics wire break: No**	**Diagnostics wire break: Yes**
32512	$7F00_H$	> 22.814 mA	Overflow[2]	Overflow[2]
32511 . . 27649	$7EFF_H$ . . $6C01_H$	22.814 mA . . 20.0006 mA	Overrange	Overrange
27648 . . 1 0	$6C00_H$ . . 1_H 0_H	20 mA . . 4 mA + 578.7 nA 4 mA	Nominal range	Nominal range
-1 . . -691	$FFFF_H$ . . $FD4D_H$	3.9994 mA . . 3.6 mA	Underrange	Underrange
-692 . . -6144	$FD4C_H$ . . $E800_H$	< 3.6 mA . . 0.4444 mA		Wire break[1]
-6145	$E7FF_H$	< 0.4444 mA	Underflow[2]	

1 The F-module signals a wire break, $7FFF_H$ for S7-300/400 F-CPUs or 0 for S7-1200/1500 F-CPUs.

2 In *STEP 7 Safety*, the substitute value 0 is provided in place of $7FFF_H$ (for overflow) or 8000_H (for underflow) in the PII for the safety program.

Preface

Purpose of the documentation

This manual supplements the system manual Distributed I/O System ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/58649293).

Functions that affect the system in general are described in the system manual.

The information in this manual and the system/function manuals provide support when you commission the system.

A description of the F-system SIMATIC Safety can be found in the programming and operating manual SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126).

Conventions

CPU: When the term "CPU" is used hereafter, it refers to both the CPUs of the S7-1200/1500 automation system and CPUs of the ET 200SP distributed I/O system.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software " (STEP 7 TIA Portal)".

PII: Process image inputs (analog value).

Analog value: Process value available to the customer in the user program (PII).

Analog signal: Sensor signal at the input terminal.

Measured value: Digital analog signal for internal processing / evaluation.

Note the following identified notes:

NOTE

A note includes important information on the product described in the documentation, on handling the product or on the part of the documentation to which you ought to pay special attention.

Standards

You can find a dated reference to the respective standards in the certificate (https://support.industry.siemens.com/cs/ww/en/view/57141281) or in the EC Declaration of Conformity (https://support.industry.siemens.com/cs/ww/en/view/71764057) for the F-module.

Certified versions

You can find the certified product and firmware versions in annex 1 of the report on the TÜV certificate (https://support.industry.siemens.com/cs/ww/en/view/57141289).

Recycling and disposal

For environmentally friendly recycling and disposal of your old equipment, contact a certified electronic waste disposal company and dispose of the equipment according to the applicable regulations in your country.

Important note for maintaining the operational safety of your system

⚠ WARNING

The operators of systems with safety-related characteristics must adhere to specific operational safety requirements. The supplier is also obliged to comply with special product monitoring measures. Siemens informs system operators in the form of personal notifications about product developments and properties which may be or become important issues in terms of operational safety.
You should subscribe to the corresponding notifications in order to obtain the latest information and to allow you to make any necessary modifications to your system.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that can be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (https://www.siemens.com/industrialsecurity).

Documentation guide

1

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.

Basic information
The System Manual and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information
Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information
The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (https://support.industry.siemens.com/cs/ww/en/view/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (https://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx data

In the CAx data area of "mySupport", you can access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (https://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (https://w3.siemens.com/mcms/topics/en/simatic/tia-selection-tool).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independent of TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet system network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- RUN/STOP mode switchover
- CPU localization by means of LED flashing
- Reading out of CPU error information
- Reading of the CPU diagnostics buffer
- Reset to factory settings
- Firmware update of the CPU and connected modules
- Support for the following processes of the fail-safe CPUs:
  - Program update
  - Restore from a backup file
  - Reset to factory settings
  - Memory reset

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

SIEMENS PRONETA (PROFINET network analysis) allows you to analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview automatically scans the PROFINET and all connected components.
- The IO check is a quick test of the wiring and the module configuration of a plant, including fail-safe digital inputs and outputs.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and the optimal use of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

Figure 1-217 View of the F-AI 4xU 0..10V HF module

Properties

The module has the following technical properties:

- Fail-safe analog input module
- PROFIsafe
- Supports the "RIOforFA-Safety" profile on F-CPUs S7-1200/1500.
- PROFIsafe address type 2
- 4 analog inputs with electrical isolation between channels and the backplane bus (up to SIL3/Cat.4/PLd)
- 1oo2 evaluation with configurable tolerance window and discrepancy
- Measuring range: 0 ... 10 V
- Resolution: 16 bits including sign
- Short-circuit-proof power supply
- Supply voltage L+
- External sensor supply possible
- Internal sensor supply U_V
- Configurable wire break diagnostics
- Diagnostics display (DIAG, red/green LED)
- Status display for each input (green LED)
- Error display for each input (red LED)
- Diagnostics
  - e.g. high limit exceeded, channel-specific
  - e.g. supply voltage missing, module-specific
- Channel- and module-wide passivation

The module supports the following functions:

- Firmware update
- I&M identification data
- Value status

⚠ WARNING

The fail-safe performance characteristics in the technical specifications apply for a mission time life of 20 years and a repair time of 100 hours. If a repair within 100 hours is not possible, remove the respective module from the BaseUnit or switch off its supply voltage before 100 hours expires.
The module switches off independently after the 100 hours have expired.
Follow the repair procedure described in section Diagnostic messages (Page 46).

NOTE

Cyclic reading of I&M data
Cyclic reading of I&M data can affect the timing of the F-modules. You should therefore avoid short read cycles of less than 500 ms.

Accessories

You can order the following accessories separately:

- Labeling strips
- Color identification labels
- Reference identification label
- Shield connector
- Electronic coding element type H as spare part (article number 6ES7193-6EH00-1AA0)

You can find additional information about accessories in the Distributed I/O System ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/58649293) System Manual.

NOTE

The following fail-safe modules need an electronic coding element type F (white):

- F-AI 4xI (0)4..20mA HF (6ES7136-6AA00-0CA1)
- F-DQ 8x24VDC/0.5A PP HF (6ES7136-6DC00-0CA0)
- F-DQ 4x24VDC/2A PM HF (6ES7136-6DB00-0CA0)
- F-DI 8x24VDC HF (6ES7136-6BA00-0CA0)
- F-PM-E 24VDC/8A PPM ST (6ES7136-6PA00-0BC0)

The following fail-safe modules need an electronic coding element type H (gray):

- F-AI 4xU 0..10V HF (6ES7136-6AB00-0CA1)

Connecting

3.1 Wiring and block diagram

This section provides the block diagram of the F-AI 4xU 0..10V HF analog input module with the terminal assignment.

You can find additional information about wiring the BaseUnit in the Distributed I/O System ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/58649293) System Manual.

Block diagram

The following figure shows the block diagram of the F-AI 4xU 0..10V HF analog input module on the BaseUnit BU type A0/A1.

①	Backplane bus interface	U_V	Sensor supply
②	Analog-to-digital converter (ADC)	M	Chassis ground
③	Sensor supply/reverse polarity protection	L+	24 V DC (infeed only with light-colored BaseUnit)
④	Temperature measurement for BU type A1 only (the function cannot be used for this module.)	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
⑤	Color-coded label with color code CC00 (optional)	DIAG	Diagnostics LED (green, red)
⑥	Filter connection supply voltage (available with light-colored BaseUnit only)	AI0, AI1, AI2, AI3	Channel status LED (green)
U_n+	Voltage input positive, channel n	F0, F1, F2, F3	LED channel fault (red)
U_n-	Voltage input negative, channel n	PWR	Power LED (green)

Figure 1-218 Block diagram

Sensor supply

⚠ WARNING

Voltage dips and voltage fluctuations of the voltage supply are not buffered by the F-module and, thus, affect the sensor supply.
This can cause the measured value to be falsified and must be taken into account when determining the safety function.
To ensure that the sensor functions without problems, we recommend one of the following options:

- You can avoid voltage dips by using a voltage supply according to the NAMUR recommendation NE 21.

or

- Use a transducer with an appropriate battery backup or diagnostics.

Recommendation: Internal sensor supply

You are strongly advised to use the short-circuit-proof internal sensor supply of the F-module. This internal sensor supply is monitored and its status is indicated by the respective error LED. The input is also protected in the event of short-circuits in the wiring or at the sensor.

NOTE

The internal sensor supply is switched off in case of a short circuit to ground or during power-up in the event of short circuit to L+.
A check is made approximately 1 minute later to determine if the error has gone.

NOTE

Behavior of process values and diagnostics evaluation

Sensor startup during module startup:

After the internal sensor supply is activated, the "Wire break" and "Low limit violated" diagnostics is suppressed for 3 seconds to prevent passivation of the respective channel by the sensor startup. During this time, the module makes the secure process data 0 available at all channels. If the sensor startup is not completed in time, passivation will occur that must subsequently be acknowledged.

Sensor startup during operation:

If a sensor startup takes place during operation, e.g. the sensor supply is reactivated after a short-circuit, all analog values are invalid and wire break or underflow diagnostics can occur on the sensors connected to the internal sensor supply.

External/internal sensor supply

The figures in section "Applications of the F-I/O module (Page 33)" show how you can supply power to the sensors via an external sensor supply (for example, from another module).

⚠ WARNING

External sensor supply

If you use an external sensor supply, you need to take voltage dips and voltage fluctuations into consideration for the safety function.

To ensure that the sensor functions without problems, we recommend one of the following options:

- Use a transducer with an appropriate battery backup or diagnostics.
  or
- Use a **redundant** external sensor supply
  or
- **Monitor** the external sensor supply for undervoltage/overvoltage, including shutdown of the sensor supply in the event of a fault (single channel for SIL2; two-channel for SIL3).

Parameters/address space

4.1 Measurement types and measuring ranges

The following table shows the measurement types and the respective measuring range.

Table 1-503 Measurement types and measuring ranges

Measurement type	Measuring range	Resolution
Voltage	0 ... 10 V	16 bits including sign

You can find the table of the measuring ranges as well as overflow, overrange, etc. in the Appendix Representation of analog values (Page 57).

4.2 Parameters

Parameters for F-AI 4xU 0..10V HF

⚠ WARNING

Diagnostics functions should be activated or deactivated in accordance with the application, see section Applications of the F-I/O module (Page 33).

The following parameters are possible:

Table 1-504 Configurable parameters

Parameters	Value range	Default	Parameter reassignment in RUN	Scope
F-parameters:				
Manual assignment of F-monitoring time	• Disable • Enable	Disable	No	Module
F-monitoring time	1 ... 65535 ms	150 ms	No	Module
F-source address	1 ... 65534	Depends on parameter assignment of F-CPU	No	Module
F-destination address	1 ... 65534	Suggested by F-system	No	Module
F-parameter signature (without addresses)	0 ... 65535	Calculated by F-system	No	Module
Behavior after channel faults	• Passivate entire module • Passivate channel	Passivate channel	No	Module
Reintegration after channel fault	• Adjustable • All channels automatically • All channels manually	(S7-300/400) Adjustable (S7-1200/1500) All channels manually	No	Module

Parameters	Value range	Default	Parameter reassignment in RUN	Scope
F-I/O DB manual number assignment	• Disable • Enable	Disable	No	Module
F-I/O DB number	—	Suggested by F-system	No	Module
F-I/O DB name	—	Suggested by F-system	No	Module
AI parameters				
Interference frequency suppression	• 50 Hz • 60 Hz	50 Hz	No	Module
Channel parameters:				
Channel n				
Sensor evaluation	• 1oo1 evaluation (max. SIL2/Cat.3/PLd) • 1oo2 evaluation (max. SIL3/Cat.4/PLe)	1oo1 evaluation (max. SIL2/Cat.3/PLd)	No	Channel
Standard value	• MIN • MAX	MIN	No	Channel
Discrepancy time *	100 ... 30000 ms	100 ms	No	Channel
Tolerance window %, absolute	2.0 ... 20.0%	5.0%	No	Channel
Tolerance window %, relative	2.0 ... 20.0%	5.0%	No	Channel
Activated	• Disable • Enable	Enable	No	Channel
Channel failure acknowledge	• Manual • Automatic The value range offered depends on the F-CPU in use and on the configuration of the F-parameter "Reintegration after channel fault".	(S7-300/400) Parameter is not supported (S7-1200/1500) Manual	No	Channel
Measuring range	0 ... 10 V	0 ... 10 V	No	Channel
Diagnostics: Wire break	• Disable • Enable	Enable	No	Channel
Smoothing	• 1 • 2 • 4 • 8 • 16 • 32 • 64	1	No	Channel

* See formula under Discrepancy analysis with 1oo2 evaluation (Page 22)

4.3 Explanation of parameters

4.3.1 F-parameters

You must assign the PROFIsafe address (F-destination address together with F-source address) to the F-module before you put it into operation.

- You define the F-source address using the "Central F-source address" parameter in the F-CPU.
- An F-destination address unique throughout the CPU is automatically assigned for each F-module. You can manually change the F-destination addresses set in the hardware configuration.

You can find information on F-parameters for the F-monitoring time, the PROFIsafe addressing (F-source address, F-destination address) and the F-I/O DB in the manual SIMATIC Safety - Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126).

4.3.2 Parameters of the channels

4.3.2.1 Interference frequency suppression

Here you set the interference frequency suppression for the line frequency:

- 50 Hz
- 60 Hz

For more information, refer to the Analog value processing Function Manual (https://support.industry.siemens.com/cs/ww/en/view/67989094).

4.3.2.2 Sensor evaluation

Overview

Here you select the type of sensor evaluation:

- "1oo1 evaluation (max. SIL2/Cat.3/PLd)"
- "1oo2 evaluation (max. SIL3/Cat.4/PLe)"

If you do not want to measure with a channel or channel pair, disable the channel or the channel pair. If you deactivate unused channels, the response time of the F-module is reduced.

1oo1 evaluation (max. SIL2/Cat.3/PLd)

With the 1oo1 evaluation, there is one sensor, and it is connected to the F-module via a single channel.

1oo2 evaluation (max. SIL3/Cat.4/PLe)

With the 1oo2 evaluation, two input channels are occupied by:

- Two single-channel sensors
- One two-channel sensor

Note that in 1oo2 evaluation, two channels are combined into a channel pair.

Achievable safety level

Depending on the selected sensor evaluation, you achieve the following safety classes with a sensor that is qualified accordingly:

- SIL2/Cat.3/PLd for "1oo1 evaluation"
- SIL3/Cat.4/PLe for "1oo2 evaluation"

See also

Discrepancy analysis with 1oo2 evaluation (Page 22)

4.3.2.3 Standard value

Function

If you have selected "1oo2 evaluation (max. SIL3/Cat.4/PLe)", two channels are considered to be a channel pair. You can select from two measured values in this case, which is provided by the F-CPU as analog value:

- "MIN": the lesser of the two values.
- "MAX": the greater of the two values.

During a discrepancy between the two input channels, the last valid standard value prior to the occurrence of the discrepancy is made available to the F-CPU.

4.3.2.4 Discrepancy time

Function

If you have selected "1oo2 evaluation (max. SIL3/Cat.4/PLe)", you can enter the discrepancy time for each channel pair here in milliseconds.

The discrepancy time does not start until the standard value is outside the assigned tolerance window (relative or absolute). If the two redundant input channels of the channel pair differ by more than the specified tolerance and for longer than the specified discrepancy time but no longer than the duration of the maximum response time, the F-module detects a discrepancy error and triggers a diagnostic interrupt. If the input channels fall below the specified tolerance prior to expiration of the discrepancy time (input channels are no longer discrepant), the discrepancy time is restarted when a new discrepancy is detected.

You can find additional information about configuring the discrepancy analysis under Discrepancy analysis with 1oo2 evaluation (Page 22).

A discrepancy error is handled by the safety program in the same way as a channel fault. Additional information is available in the SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual.

4.3.2.5 Tolerance window %, absolute

Function

If you have selected "1oo2 evaluation (max. SIL3/Cat.4/PLe)", you can enter the size of a tolerance window for the discrepancy here for the channel pair. You specify the tolerance window as a percentage of the full-scale value. The reference value is the maximum full-scale value, i.e. 10 V. The entered value is rounded to one decimal place.

If the two redundant input channels of the channel pair differ by more than the tolerance specified here and for longer than the specified discrepancy time, the F-module detects a discrepancy error and triggers a diagnostic interrupt.

For more information regarding setting the tolerance window, refer to Discrepancy analysis with 1oo2 evaluation (Page 22).

Example

You have assigned the following:

- The "Tolerance window % absolute" at 10%
- The measuring range 0 V ... 10 V
- A discrepancy time of 100 ms

The input channels may differ from the configured discrepancy time (100 ms) up to the max. response time for a time window with a difference of more than 1 V.

See also

Discrepancy time (Page 20)

4.3.2.6 Tolerance window %, relative

Function

If you have selected "1oo2 evaluation (max. SIL3/Cat.4/PLe)", you can enter the size of a tolerance window for the discrepancy here for each channel pair. You specify the tolerance window as a percentage of the assigned standard value. The entered value is rounded to one decimal place.

If the two redundant input channels of the channel pair differ by more than the tolerance specified here and for longer than the specified discrepancy time, the F-module detects a discrepancy error and triggers a diagnostic interrupt.

The two parameters "Tolerance window % absolute" and "Tolerance window % relative" are combined. The "Tolerance window % absolute" parameter is decisive in case of low process values.

For more information regarding setting the tolerance window, refer to Discrepancy analysis with 1oo2 evaluation (Page 22).

Example

You have assigned the following:

- The "tolerance window % relative" at 10%
- The measuring range 0 V ... 10 V
- A discrepancy time of 200 ms

The analog signals may differ for a time window of set discrepancy time (200 ms) up to the maximum reaction time. If your measured values are 9 V and 10 V, a difference in the measured values up to 1 V is tolerated for the MAX standard value. If you configure the MIN standard value, only a difference of up to 0.9 V is tolerated. If the tolerated difference is exceeded, the module signals a diagnostics.

Discrepancy time (Page 20)

4.3.2.7 Discrepancy analysis with 1oo2 evaluation

Operating principle of discrepancy analysis

A discrepancy analysis is performed with a configured 1oo2 evaluation. **Smoothed** process values are used for the discrepancy analysis.

An assignable tolerance window is formed around the process value that represents the instantaneous standard value (value that is signaled to the F-CPU).

The tolerance window is formed relative to the process value as well as an absolute value relative to the full-scale value.

If the process value does not represent the standard value at an instant and is within the tolerance window, **no** discrepancy exists.

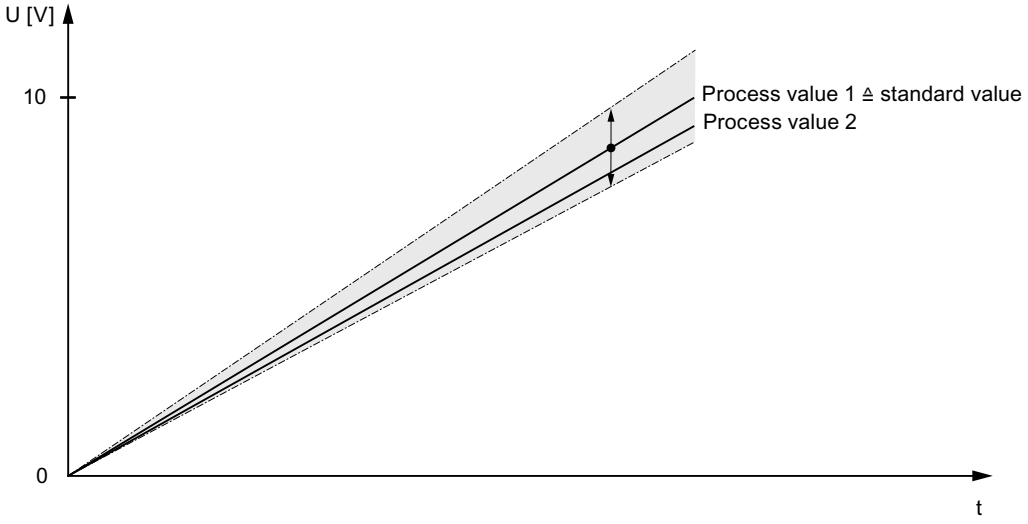

Figure 1-219 Example of a relative tolerance window *without* discrepancy (parameter assignment: standard value = MAX)

If the process value does not represent the standard value at an instant but is outside the tolerance window, a discrepancy exists.

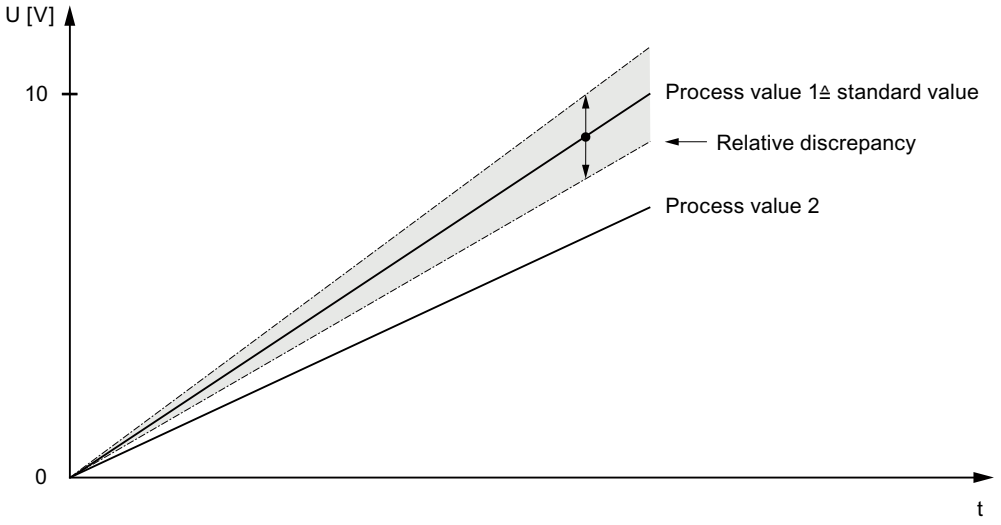

Figure 1-220 Example of a relative tolerance window *with* discrepancy (parameter assignment: standard value = MAX)

The assigned discrepancy time starts as soon as a discrepancy is detected.

- During a discrepancy between the two input channels, the last valid standard value prior to occurrence of the discrepancy is signaled to the F-CPU.
- There is no valid old value after startup from an error or after Off/On of the power supply. During this time, the process value $7FFF_H$ is output for the S7-300/400 F-CPUs and the process value 0 for S7-1200/1500 F-CPUs until a smoothed process value is available once again (see section Smoothing (Page 20)). If a discrepancy of the smoothed process value is now determined, the configured discrepancy time starts running.
- If the input channels fall below the specified tolerance prior to expiration of the discrepancy time (input channels are no longer discrepant), the standard value is output. With a new discrepancy, the discrepancy time measurement starts again.

If the discrepancy time has expired with an existing discrepancy, a discrepancy error is signaled and the process value is set to $7FFF_H$ for S7-300/400 F-CPUs or 0 for S7-1200/1500 F-CPUs. In the PII, the substitute value 0 is set for the safety program.

A discrepancy error is handled by the safety program in the same way as a channel fault. Additional information is available in the STEP 7 Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual.

Configuring the discrepancy analysis parameters

The following four parameters for the discrepancy analysis are assigned for each channel pair:

- Discrepancy time
- Standard value
- Tolerance window %, absolute
- Tolerance window %, relative

"Discrepancy time" parameter

When all criteria are met, the F-module triggers a discrepancy error:

- The process value that does not represent the standard value is outside the configured tolerance window.
- Lasts longer than the configured discrepancy time.
- Lasts at maximum the duration of the maximum response time.

In the case of a discrepancy error, the F-module triggers a diagnostic interrupt and sets the process value to $7FFF_H$ for S7-300/400 F-CPUs or 0 for S7-1200/1500 F-CPUs. The discrepancy time is reset if the standard value lies within the tolerance window again.

In the PII, the substitute value 0 is set for the safety program.

You calculate the maximum discrepancy time that is permitted in the respective application using the following formula:

Discrepancy time = Maximum response time (in case of discrepancy error) – 2 × Conversion cycle time × Smoothing – 2 × Conversion cycle time

NOTE

You calculate the discrepancy time by using the values from section Response times (Page 55) in the above equation.

You can assign the discrepancy time for each channel pair.

"Standard value" parameter

If you have selected "1oo2 evaluation (max. SIL3/Cat.4/PLe)", two channels are considered to be a channel pair. You can select from two measured values in this case, which is provided by the F-CPU as analog value:

- "MIN": The lower of the two values is signaled to the F-CPU as the standard value.
- "MAX": The higher of the two values is signaled to the F-CPU as the standard value.

"Tolerance window %, absolute" parameter

You can calculate the absolute tolerance window using the following formula:

$$T_{abs} = \frac{|\Delta U_{abs}|}{U_{ME} - U_{MA}} \times 100 \ [\%]$$

You can calculate the maximum absolute deviation of the voltage of the full-scale value using the following formula:

$$\Delta U_{abs} = \pm \frac{(U_{ME} - U_{MA}) \times T_{abs}}{100} \ [V]$$

With the following parameters:

- U_{ME} = 10 V (full-scale value)
- U_{MA} = 0 V for measuring range 0 V ... 10 V (start-of-scale value)
- T_{abs} = absolute tolerance in %
- ΔU_{abs} = Maximum absolute deviation of the voltage from the full-scale value (+/-)

You can assign a value of 2.0 to 20.0% for the "Tolerance window %, absolute" parameter for each channel pair.

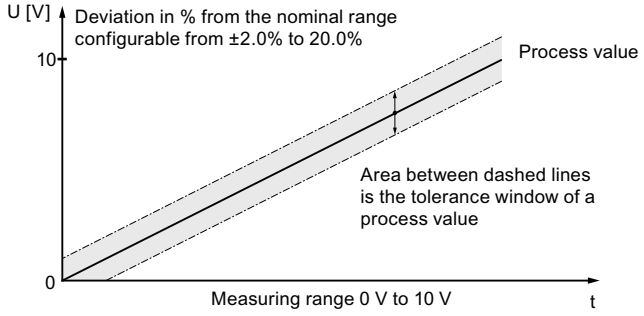

Figure 1-221 Absolute deviation in % from the nominal range for measuring range of 0 V to 10 V

"Tolerance window %, relative" parameter

The tolerance window is calculated as a percentage of the **smoothed** process value that represents the MIN or MAX value (depending on the parameter assignment of the standard value).

You can calculate the relative tolerance window using the following formula:

$$T_{rel} = \frac{|\Delta U_{rel}|}{|U_{EW} - U_{MA}|} \times 100 \ [\%]$$

You can calculate the maximum relative deviation of the voltage of the measured value using the following formula:

$$\Delta U_{rel} = \pm \frac{|U_{EW} - U_{MA}| \times T_{rel}}{100} [V]$$

With the following parameters:

- U_{EW} = Process standard value (min./max.)
- U_{MA} = 0 V for measuring range 0 V ... 10 V (start-of-scale value)
- T_{rel} = Relative tolerance in %
- ΔU_{rel} = Maximum relative deviation of the voltage from the measured value (+/-)

You can assign a value of 2.0 to 20.0% for the "Tolerance window %, relative" parameter for each channel pair.

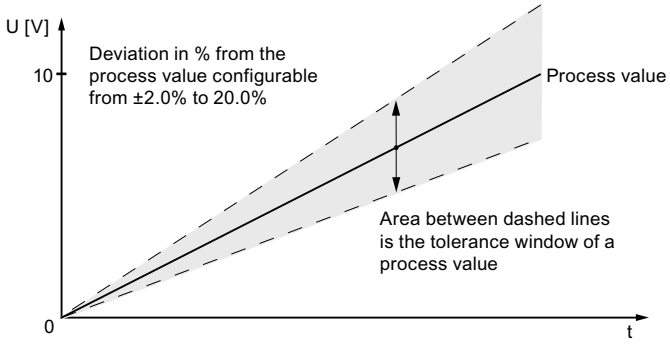

Figure 1-222 Relative deviation in % from the nominal range for measuring range of 0 V to 10 V

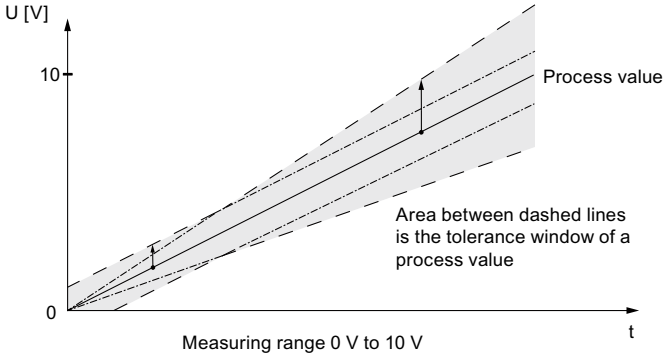
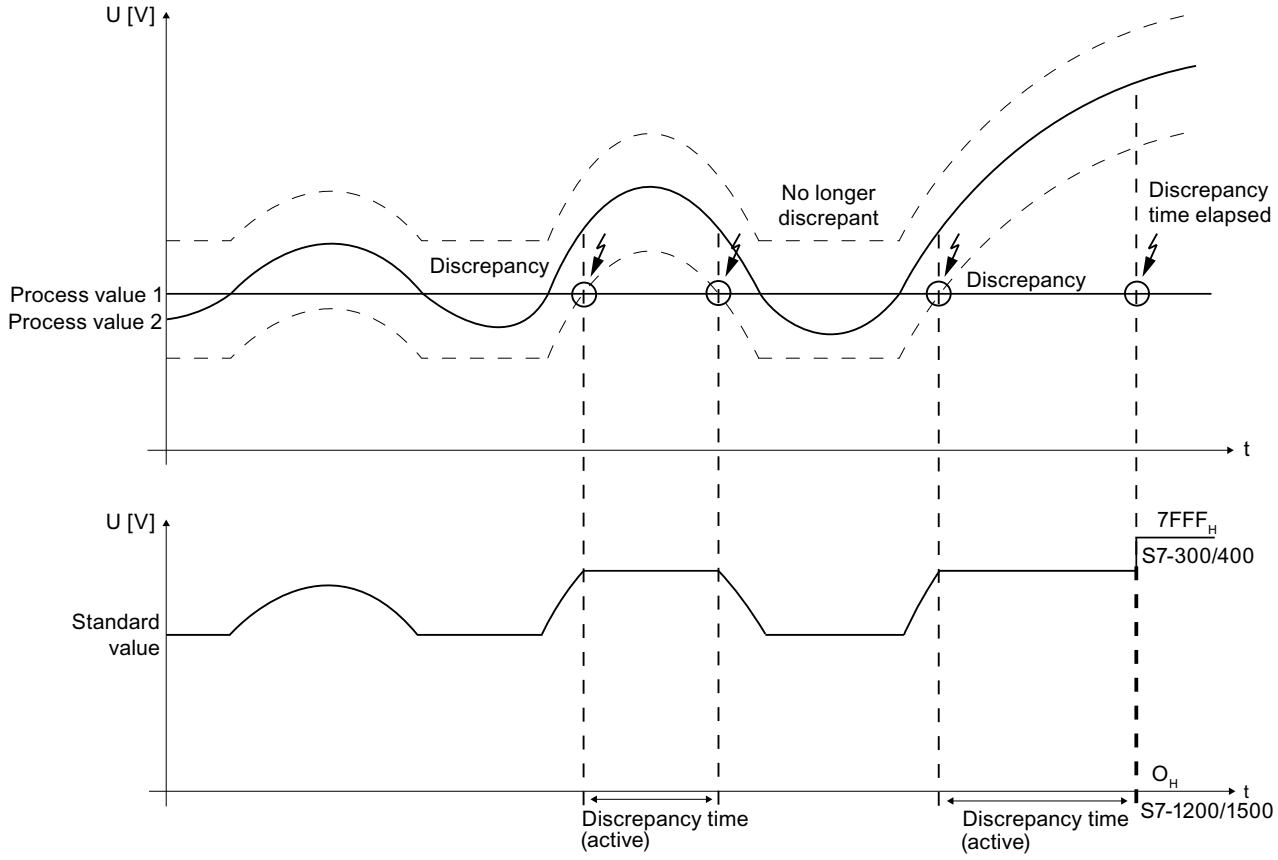
Combination of the "Tolerance window %, absolute" and "Tolerance window %, relative" parameters



You can combine the "Tolerance window %, absolute" and "Tolerance window %, relative" parameters as needed. The combined tolerance window (shown in gray in the figure below) is the maximum of T_{rel} and T_{abs}.

$T = MAX \{ T_{rel}, T_{abs} \}$

$\Delta U = MAX \{ \Delta U_{rel}, \Delta U_{abs} \}$



With:

- T = Tolerance, in %
- ΔU = maximum deviation of the voltage (+/-)

Example

The following diagrams show you the behavior of the discrepancy evaluation when standard value = MAX.

The upper of the two diagrams shows the characteristic curve of the two process values. The dashed line represents the absolute tolerance range configured in this example.

The lower of the two diagrams shows the standard value signaled to the F-CPU.

In this example, on the first occurrence of a discrepancy, process value 1 is **within** the tolerance range again **before** expiration of the discrepancy time. This means the discrepancy error is not signaled.

In this example, on the second occurrence of a discrepancy, process value 1 is **outside** the tolerance range when the discrepancy time expires. As a result, a discrepancy error is signaled with $7FFF_H$ for S7-300/400 F-CPUs or 0 for S7-1200/1500 F-CPUs after expiration of the discrepancy time. In the PII, the substitute value 0 is set for the safety program.

Tolerance window %, absolute (Page 21)
Tolerance window %, relative (Page 21)
Smoothing (Page 29)

4.3.2.8 Activated

If you select this check box, the corresponding channel is enabled for signal processing.
You can deactivate an unused channel with this parameter.
If you deactivate unused channels, the response time of the F-module is reduced.

4.3.2.9 Channel failure acknowledge

Use on S7-1200/1500 F-CPUs
The parameter is only relevant if the F-module can be operated on an S7-1200/1500 F-CPU.
The parameter can only be set if the F-parameter "Behavior after channel fault" is set to "Passivate channel" and the F-parameter "Reintegration after channel fault" is set to "Adjustable".
The value of this parameter specifies how the channel reacts after a channel fault:

- Manual: A channel failure is reintegrated after manual acknowledgment.
- Automatically: The channel is reintegrated automatically after a channel fault. Manual acknowledgment is not necessary.

Use on S7-300/400 F-CPUs
The value of this parameter is not relevant in the case of operation on S7-300/400 F-CPUs. For S7-300/400 F-CPUs you set the corresponding property at the F-I/O DB by means of the ACK_NEC tag.
For detailed information about the F-I/O DB, refer to the SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual.

4.3.2.10 Measuring range

The parameter shows the measuring range for the channel:

- 0 ... 10 V

4.3.2.11 Diagnostics: Wire break

Function

Here you activate the wire break detection. No smoothed measured values are used for the wire break diagnostics.
With a measuring range of 0 V to 10 V:

- With configured wire break diagnostics and voltages < 1 V, a wire break is detected and a diagnostic interrupt is triggered in the F-CPU.
- Without configured wire break diagnostics and voltages < 0.2962 V, an "underflow" is detected and a diagnostic interrupt is triggered in the F-CPU.

For performance reasons, an unused channel should be disabled. There is no wire break detection for a disabled channel.

4.3.2.12 Smoothing

Smoothing principle

The measured values are smoothed by a digital filter. Smoothing is achieved by the F-module forming the sliding mean of a number of converted (digitized) analog values determined by the "Smoothing" parameter.

You assign smoothing in 7 levels (1, 2, 4, 8, 16, 32, 64 conversion cycles). The level determines the number of analog signals converted last that are averaged. If smoothing = 1 is configured, the smoothing is deactivated.

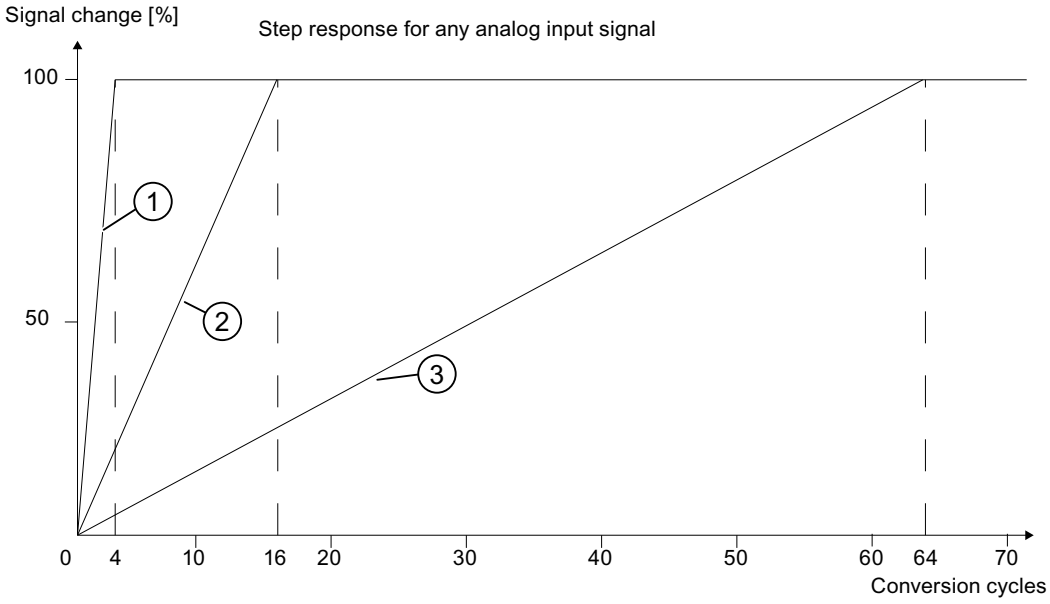
The higher the smoothing you select, the more stable the smoothed analog value of the converted analog signal, and the longer the time it takes until the smoothed analog signal is available as analog value following a unit step. You can find an example below.

For more information on the analog value, refer to the Analog value processing Function Manual (https://support.industry.siemens.com/cs/ww/en/view/67989094).

NOTE

Smoothing is recalculated after startup, short circuit, wire break or any other channel fault. If, for example, smoothing is configured with 16 conversion cycles, all channels are activated and the configured frequency suppression is 50 Hz, it can take up to 2000 ms until the valid process value is signaled.
Until the first valid process value, the F-module signals $7FFF_H$ for the channel on S7-300/400 F-CPUs or 0 on S7-1200/1500 F-CPUs.
The calculation of the smoothing is not interrupted in case of a discrepancy.

Using smoothing



Smoothing of analog values provides a stabilized analog signal for further processing. Smoothed values are always used for discrepancy analysis.

⚠ WARNING

The smoothing takes place as a result of mean value generation over the selected number of most recently converted analog values of a channel, e.g. 64.
The mean value generation causes a discrepancy to be delayed with a configured "1oo2 evaluation (max. SIL3/Cat.4/PLe)". You can find an example below.

Example

The figure below shows the number of conversion cycles, depending on the set smoothing, after which the analog value is completely available following a unit step. The figure applies to all signal changes at the analog input.

① Smoothing - 4 conversion cycles
② Smoothing - 16 conversion cycles
③ Smoothing - 64 conversion cycles

Example: Effect of smoothing on the maximum response time for a configured "1oo2 evaluation (max. SIL3/Cat.4/PLe)" in case of error

If an error (One Fault Delay Time, OFDT) occurred with a configured "1oo2 evaluation (max. SIL3/Cat.4/PLe)", you calculate the maximum response time according to the following formula:

Maximum response time (in case of discrepancy error) = 2 × Conversion cycle time × Smoothing + Discrepancy time + 2 × Conversion cycle time

In this example, one channel pair is connected and configured (activated), interference frequency 50 Hz, smoothing = 16 conversion cycles, discrepancy time = 2000 ms, conversion cycle time calculated with the formula from section Response times (Page 55):

Max. response time (in case of discrepancy error) = 2 × 70 ms × 16 + 2000 ms + 2 × 70 ms = 4380 ms

If a discrepancy exists between the two input channels, it can take 4380 ms until the F-module detects a discrepancy error. This error is then signaled to the F-CPU.

If the discrepancy time has expired, a discrepancy error is signaled and the process value is set to $7FFF_H$ for S7-300/400 F-CPUs or 0 for S7-1200/1500 F-CPUs. In the PII, the substitute value 0 is set for the safety program.

4.4 Address space

Address assignment of the F-AI 4xU 0..10V HF analog input module

The analog input module F-AI 4xU 0..10V HF occupies the following address ranges in the F-CPU:

Table 1-505 Address assignment in the F-CPU

Occupied bytes in the F-CPU:		
F-CPU	**In input range**	**In output range**
S7-300/400 F-CPUs	IB x + 0 to x + 12	QB x + 0 to x + 3
S7-1200/1500 F-CPUs	IB x + 0 to x + 13	QB x + 0 to x + 4

x = Module start address

Address assignment of the user data and the value status of the F-AI 4xU 0..10V HF analog input module

The user data occupy the following addresses in the F-CPU out of all the assigned addresses of the F-AI 4xU 0..10V HF analog input module:

Table 1-506 User data address assignment in the input range

Byte in the F-CPU	Occupied bits in F-CPU per F-module:							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
IB x + 0	Input value at channel 0 (Result of the 1oo2 evaluation channel 0/2)							
IB x + 1								
IB x + 2	Input value at channel 1 (Result of the 1oo2 evaluation channel 1/3)							
IB x + 3								
IB x + 4	Input value at channel 2							
IB x + 5								
IB x + 6	Input value at channel 3							
IB x + 7								
IB x + 8	—	—	—	—	Value status* for AI_3	Value status* for AI_2	Value status* for AI_1	Value status* for AI_0

* Only S7-1200/1500 F-CPUs

x = Module start address

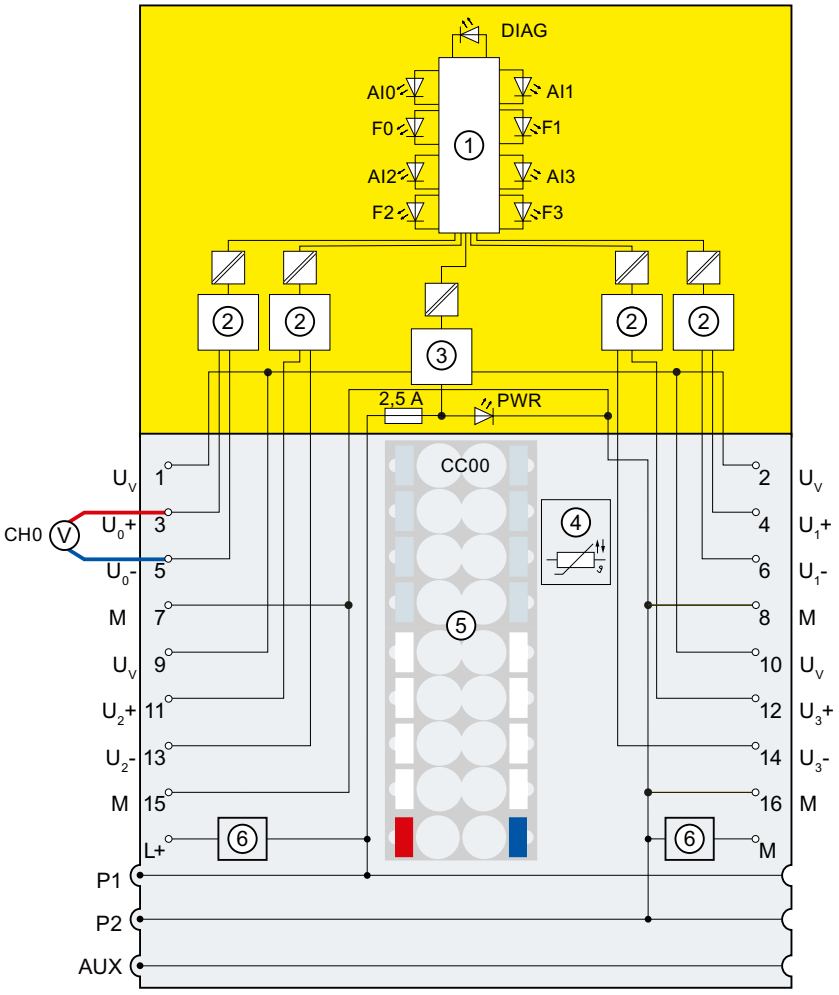
NOTE

You may only access the addresses occupied by user data and value status.
The other address areas occupied by the F-modules are assigned for functions including safety-related communication between the F-modules and F-CPU in accordance with PROFIsafe.

Additional information

For detailed information about F-I/O access, refer to the SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual.

Applications of the F-I/O module



5

The wiring is performed on a suitable BaseUnit. Additional information is available in the Connecting section in the Distributed I/O System ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/58649293) System Manual.

5.1 Application 1: Safety mode SIL2/Cat.3/PLd with two-wire connection, 1oo1 evaluation

Voltage measurement from 0 V to 10 V

Four process signals can be connected to the F-module in this interconnection variant. Sensor supply U_V is provided by the F-module for 4 channels. You can also supply the sensors by means of an external sensor supply.

①	Backplane bus interface	U_V	Sensor supply
②	Analog-to-digital converter (ADC)	M	Chassis ground
③	Sensor supply/reverse polarity protection	L+	24 V DC (infeed only with light-colored BaseUnit)

⚠ WARNING

To achieve SIL2/Cat.3/PLd using this wiring, you must use a suitably qualified sensor.

⚠ WARNING

All cables need to be laid in such a way that they are resistant to interference voltage. Use shielded cables.

⚠ WARNING

For voltage inputs, changes in resistance along the transmission path (from sensor to module) can result in the measured value being falsified.
For correct measured value acquisition during the entire service life, you must take these changes in resistance into account when designing the safety functions and take appropriate measures.

Assignable parameters for application 1

Table 1-507 Parameters for application 1 of the F-AI 4xU 0..10V HF

Parameters	Range of values in safety mode
Behavior after channel faults	• Passivate the entire F-module • Passivate channel
Interference frequency suppression	• 50 Hz • 60 Hz
Sensor evaluation	1oo1 evaluation (max. SIL2/Cat.3/PLd)

Parameters	Range of values in safety mode
Measuring range	0 ... 10 V
Diagnostics: Wire break	• Disable • Enable
Smoothing	1 / 2 / 4 / 8 / 16 / 32 / 64 conversion cycles

U_n-	Voltage input negative, channel n	PWR	Power LED (green)

Figure 1-224 1oo2 evaluation

⚠ WARNING

To achieve SIL3/Cat.4/PLe using this wiring, you must use a qualified, two-channel sensor or two qualified single-channel sensors.

⚠ WARNING

All cables need to be laid in such a way that they are resistant to interference voltage. Use shielded cables.

Assignable parameters for application 2

Table 1-508 Parameters for application 2 of the F-AI 4xU 0..10V HF

Parameters	Range of values in safety mode
Standard value	• MIN • MAX
Discrepancy time	100 ... 30000 ms
Tolerance window %, absolute	2.0 ... 20.0%
Tolerance window %, relative	2.0 ... 20.0%
Behavior after channel faults	• Passivate the entire F-module • Passivate channel
Interference frequency suppression	• 50 Hz • 60 Hz
Sensor evaluation	1oo2 evaluation (max. SIL3/Cat.4/PLe)
Measuring range	0 ... 10 V
Diagnostics: Wire break	• Disable • Enable
Smoothing	1 / 2 / 4 / 8 / 16 / 32 / 64 conversion cycles

6.1 Status and error display

LED display

The following figure shows the LED display of the F-AI 4xU 0..10V HF.

① DIAG (green/red)
② Channel status (green)
③ Channel fault (red)
④ PWR (green)

Figure 1-227 LED display

Meaning of the LED displays

The following tables show the meaning of the status and error displays. Remedies for diagnostics alarms can be found in section Diagnostic messages (Page 46).

WARNING

The DIAG LED and the channel status and channel fault LEDs are not designed as safety-related LEDs and therefore may not be evaluated for safety-related activities.

DIAG LED

Table 1-511 Error display of the LED DIAG

DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not okay
Flashing	Module parameters not configured
On	Module parameters configured and no module diagnostics
Flashing	• Module parameters configured and module diagnostics • Operation with S7-1200/1500 F-CPUs: At least one channel is waiting for a user acknowledgment.
Flashing	• Operation with S7-1200/1500 F-CPUs: The F-module is waiting for a user acknowledgment after a module fault. • Operation with S7-300/400 F-CPUs: The F-module is waiting for a user acknowledgment.

Channel status/channel fault LED

Table 1-512 Status display of the LEDs channel status / channel error

Channel status	Channel fault	Meaning
Off	Off	Channel deactivated or supply voltage L+ missing.
On	Off	Channel activated and no channel diagnostics
Off	On	Channel activated and channel diagnostics
Alternately flashing		At least one channel is waiting for a user acknowledgment.

Channel status/DIAG/channel fault LED

Table 1-513 Status display of the LEDs channel status / DIAG / channel error

Channel status	DIAG	Channel fault	Meaning
Off	Flashing	All On	The PROFIsafe address does not match the configured PROFIsafe address or there is a module-wide error. See section Alarms (Page 44).
Flashing	Flashing	Off	Identification of the F-module when assigning the PROFIsafe address.

PWR LED

Table 1-514 Status display of LED PWR

PWR	Meaning
□ Off	Supply voltage L+ missing
■ On	Supply voltage L+ available

6.2 Interrupts

Introduction

The fail-safe analog input module F-AI 4xU 0..10V HF supports diagnostic interrupts.

Diagnostic interrupt

The F-module generates a diagnostic interrupt for each diagnostic message described in section Diagnostic messages (Page 46).

The list below provides an overview of the diagnostic interrupts of the F-module. The diagnostic interrupts are assigned either to one channel or the entire F-module.

⚠ WARNING

Before acknowledging a diagnostic message, remedy the respective fault and check your safety function. Follow the fault remedying procedure described in section Diagnostic messages (Page 46)

Module-wide diagnostic interrupts:

- Overtemperature
- Undertemperature
- Parameter error
- Supply voltage missing
- Channel/component temporarily not available
- Mismatch of safety destination address (F_Dest_Add)
- Safety destination address not valid (F_Dest_Add)
- Safety source address not valid (F_Source_Add)
- Safety watchdog timer value is 0 ms (F_WD_Time)
- Parameter F_CRC_Length does not match the generated values
- Version of F-parameter set incorrectly
- CRC1 fault
- Inconsistent iParameters (iParCRC error)
- F_Block_ID not supported
- Transmission error: Inconsistent data (CRC error)

- Transmission error: Timeout (monitoring time 1 or 2 expired)
- Module is defective
- Watchdog tripped
- Invalid/inconsistent firmware present
- Diagnostics memory overflow
- Acknowledgement required to activate the channel as soon as the channel faults are remedied.
- F-address memory not accessible
- No valid F-address available
- Supply voltage too high
- Supply voltage too low
- Channel/component not available

Channel-wide diagnostic alarms

- Wire break
- High limit exceeded
- Low limit violated
- Safety-related switch off
- Internal supply voltage of the module failed
- Common mode error
- Analog input signal not recorded unique
- Internal sensor supply short-circuit to P
- Overload or internal sensor supply short-circuit to M
- Discrepancy error
- Read back failure
- ADC error
- Fault in test circuit

6.3 Diagnostic messages

Diagnostic messages

Module faults are indicated as diagnostics (module information).

Once the fault is eliminated, the F-module must be reintegrated in the safety program with manual acknowledgment. For additional information on passivation and reintegration of F-I/O, refer to the SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual.

Table 1-515 Diagnostic alarms of the F-AI 4xU 0..10V HF

Diagnostic message	Fault code	Meaning	Remedy
Overtemperature	5_H	An excessively high temperature was measured in the F-module.	Operate the F-module within the specified temperature range (see Technical specifications (Page 51)) Once the temperature has been reduced and returns to the specified range, the F-module must be removed and inserted or the power switched OFF and ON.
Wire break	6_H	Possible causes: • A cable to the sensor is broken. • Fault at the external circuit • Defective sensor • Wrong sensor type set in the parameters • Input channel not used	Check the possible causes and eliminate the fault.
High limit exceeded	7_H	The measured value exceeds the measuring range.	Check the interaction between the module and the sensor.
Low limit violated	8_H	The measured value is below the measuring range.	Check the interaction between the module and the sensor.
Parameter error	10_H	The parameter error can be: • The F-module cannot use the parameters (unknown, invalid combination, etc.).	Correct the parameter assignment.
Supply voltage missing	11_H	Missing or insufficient supply voltage L+	• Check the supply voltage L+ on the BaseUnit. • Check the BaseUnit.
Safety-related switchoff	19_H	For safety purposes, the channel was switched off due to an error on another channel. Possible causes: • A short-circuit of the sensor supply to ground is present.	• Correct the process wiring.
Channel/component temporarily not available	$1F_H$	Possible causes: • Internal fault in the F-module • The firmware version of the F-module is inconsistent.	• Replace the F-module. • Repeat the firmware update.

Diagnostic message	Fault code	Meaning	Remedy
Mismatch of safety destination address (F_Dest_Add)	40_H	The F-module detected a different F-destination address.	• Check the parameter assignment of the F-parameters and the assigned PROFIsafe address of the F-module. • Assign the PROFIsafe address to the F-module (again).
Safety destination address not valid (F_Dest_Add)	41_H	The F-module detected an invalid F-destination address.	
Safety source address not valid (F_Source_Add)	42_H	The F-module detected a different F-source address.	
Safety watchdog time value is 0 ms (F_WD_Time)	43_H	The F-module detected an invalid safety watchdog time.	
Parameter F_CRC_Length does not match the generated values	45_H	The F-module detected a discrepancy in the CRC length.	
Version of F parameter set incorrect	46_H	The F-module detected an incorrect F_Par_Version or an invalid F_Block_ID.	
CRC1 fault	47_H	The F-module detected inconsistent F-parameters.	
Inconsistent iParameters (iParCRC error)	$4B_H$	The firmware of the F-module has detected inconsistent iParameters.	Check the parameter assignment.
F_Block_ID not supported	$4C_H$	The F-module detected an incorrect block ID.	Check the parameter assignment of the PROFIsafe driver.
Transfer error: Inconsistent data (CRC error)	$4D_H$	The F-module detected a CRC error. Possible causes: • The communication between the F-CPU and F-module is disturbed. • Electromagnetic interference has exceeded limits. • An error occurred in the sign-of-life monitoring.	• Check the communication connection between the F-module and F-CPU. • Eliminate the electromagnetic interference.
Transfer error: Timeout (monitoring time 1 or 2 expired)	$4E_H$	The F-module detected a timeout. Possible causes: • The F-monitoring time is set incorrectly. • A bus fault is present.	• Check the parameter assignment. • Check the components that are involved in the communication.
Acknowledgement required to activate the channel as soon as the channel faults are remedied.	$4F_H$	A channel fault was detected. Confirmation is required to enable the channel.	Confirm the channel fault.
Module is defective	100_H	Possible causes: • Electromagnetic interference has exceeded limits. • The F-module has detected an internal error and has reacted in a safety-related manner.	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON. • If the F-module cannot be put back into operation, consider replacing it.
Watchdog tripped	103_H	Possible causes: • Electromagnetic interference has exceeded limits. • The F-module has detected an internal error and has reacted in a safety-related manner.	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON. • If the F-module cannot be put back into operation, consider replacing it.
Internal supply voltage fault	104_H	Internal power supply of the module failed.	Replace the F-module.

Diagnostic message	Fault code	Meaning	Remedy
Common mode error	118_H	Voltage between two input channels is too high.	Correct the input wiring.
Invalid/inconsistent firmware present	$11B_H$	The firmware is incomplete and/or firmware added to the F-module is incompatible. This results in the F-module not being ready for operation.	• Perform a firmware update for the F-module. Note any error messages. • Use only firmware versions released for this F-module.
Analog input signal not recorded unique	304_H	Measured values from the sensor are not plausible. Possible causes: • Increased EMC • F-module defective	Check the interaction between the F-module and the sensor.
Internal sensor supply short-circuit to P	306_H	Possible causes: • Short-circuit of internal sensor supply to P	Check the process wiring.
Overload or internal sensor supply short-circuit to M	307_H	• The internal sensor supply is overloaded. • Missing or insufficient supply voltage L+.	• Eliminate the short-circuit in the process wiring. • Check the supply voltage L+ on the BaseUnit. • Check the BaseUnit.
F-address memory not accessible	$30D_H$	The F-source address and F-destination address stored in the electronic coding element cannot be accessed.	Verify that the coding element is present. Replace the coding element, if necessary.
No valid F-address available	$30E_H$	No valid PROFIsafe address is saved in the retentive memory. Possible causes: • Initial commissioning • Deliberate parameter change of the PROFIsafe address • Deviation between target and actual configuration of the plant.	• In the case of initial commissioning or deliberate parameter change, assign the PROFIsafe address. • Check the consistency of the target and actual configuration.
Undertemperature	312_H	The F-module has fallen below its specified temperature range.	Operate the F-module within the specified temperature range (see Technical specifications (Page 51))
Discrepancy error	314_H	The discrepancy time set for 1oo2 operation has been exceeded. Possible causes of the discrepancy error: • Unsuitable parameter assignment • One of the two sensors is defective	Check the discrepancy time, the sensors and their cabling.
Read back failure	$31E_H$	The F-module has detected an internal error through the test connection. Possible causes: • Increased EMC • F-module defective	If the error persists, replace the F-module.
Supply voltage too high	321_H	The supply voltage L+ is too high.	Check the supply voltage L+ and then test the safety application.
Supply voltage too low	322_H	The supply voltage L+ is too low.	Check the supply voltage L+ and then test the safety application.
ADC error	331_H	Internal error during analog-digital conversion. Possible causes: • Increased EMC • F-module defective	If the error persists, replace the F-module.

Diagnostic message	Fault code	Meaning	Remedy
Fault in test connection	332_H	The F-module detected an internal error in the test connection. Possible causes: • Increased EMC • F-module defective	If the error persists, replace the F-module.

Supply voltage outside the nominal range

If the supply voltage L+ is outside the specified value range, the DIAG LED flashes and the module is passivated.

When the voltage is then recovered (level must remain within the specified value range for at least 1 minute (see Technical specifications (Page 51): Voltages, Currents, Potentials)), the DIAG LED stops flashing. The module remains passivated.

Generally applicable information on diagnostics

Information on diagnostics that pertains to all fail-safe modules (for example, readout of diagnostics functions or passivation of channels) is available in the SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual.

6.4 Value status

Properties

In addition to the diagnostic messages and the status and fault display, the F-module provides information about the validity of each analog input signal – the value status. The value status is entered in the process image along with the input signal.

Value status for F-modules

The value status is a binary additional information of an input signal. The value status is entered in the process image inputs (PII) at the same time as the process signal. It provides information about the validity of the input signal.

The value status is affected by all faults.

- 1_B: A valid process value is output for the channel.
- 0_B: A fail-safe value is output for the channel, or the channel is deactivated.

NOTE

You may only access the addresses occupied by user data and value status.

The other address areas occupied by the F-modules are assigned for functions including safety-related communication between the F-modules and F-CPU in accordance with PROFIsafe.

1oo2 evaluation of the sensors combines the two channels. With 1oo2 evaluation of the sensors, you can only access the low order channel in the safety program, e.g. channel 0, channel pair 0/2.

Assignment of the inputs and value status in the PII

Each channel of the F-module is assigned a value status in the process image inputs. You can find the assignment in section Address space (Page 31).

Reference

A detailed description of the evaluation and processing of the respective input signals can be found in the SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual.

Technical specifications

7

7.1 Technical specifications

Technical specifications of the F-AI 4xU 0..10V HF

Article number	6ES7136-6AB00-0CA1
General information	
Product type designation	F-AI 4XU 0..10V HF
Firmware version	
• FW update possible	Yes
usable BaseUnits	BU type A0, A1
Color code for module-specific color identification plate	CC00
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated as of version	V16 with HSP 308
Operating mode	
• cyclic measurement	Yes
• Oversampling	No
• MSI	No
CiR – Configuration in RUN	
Reparameterization possible in RUN	No
Calibration possible in RUN	No
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption (rated value)	0.38 A
Current consumption, max.	0.4 A
24 V encoder supply	
• 24 V	Yes; min. L+ (-1.5 V)
• Short-circuit protection	Yes
• Output current, max.	300 mA; total current of all encoders/channels
Power	
Power available from the backplane bus	70 mW
Power loss	
Power loss, typ.	2 W

Article number	6ES7136-6AB00-0CA1
Address area	
Address space per module	
• Inputs	14 byte; S7-300/400F CPU, 13 byte
• Outputs	5 byte; S7-300/400F CPU, 4 byte
Hardware configuration	
Automatic encoding	Yes
• Electronic coding element type H	Yes
Analog inputs	
Number of analog inputs	4
• For voltage measurement	4
permissible input voltage for voltage input (destruction limit), max.	35 V
Input ranges (rated values), voltages	
• 0 to +10 V	Yes
– Input resistance (0 to 10 V)	16 kΩ
Cable length	
• shielded, max.	200 m
Analog value generation for the inputs	
Measurement principle	Sigma Delta
Integration and conversion time/resolution per channel	
• Resolution with overrange (bit including sign), max.	16 bit
• Integration time, parameterizable	Yes
• Integration time (ms)	20 / 16,667
• Interference voltage suppression for interference frequency f1 in Hz	50 / 60 Hz
Smoothing of measured values	
• Number of smoothing levels	7
• parameterizable	Yes
• Step: None	Yes; 1x conversion cycle time
• Step: low	Yes; 2x / 4x conversion cycle time
• Step: Medium	Yes; 8x / 16x conversion cycle time
• Step: High	Yes; 32x / 64x conversion cycle time
• Average value filter	Yes
Encoder	
Connection of signal encoders	
• for voltage measurement	Yes
Errors/accuracies	
Linearity error (relative to input range), (+/-)	0.1 %
Temperature error (relative to input range), (+/-)	0.023 %/K
Repeat accuracy in steady state at 25 °C (relative to input range), (+/-)	0.1 %
Operational error limit in overall temperature range	
• Voltage, relative to input range, (+/-)	2 %

Article number	6ES7136-6AB00-0CA1
Basic error limit (operational limit at 25 °C)	
• Voltage, relative to input range, (+/-)	0.1 %
Interference voltage suppression for f = n x (f1 +/- 1 %), f1 = interference frequency	
• Series mode interference (peak value of interference < rated value of input range), min.	40 dB
• Common mode voltage, max.	10 V
• Common mode interference, min.	70 dB
Interrupts/diagnostics/status information	
Diagnostics function	Yes
Alarms	
• Diagnostic alarm	Yes
• Limit value alarm	No
Diagnostic messages	
• Monitoring the supply voltage	Yes
• Wire-break	Yes
Diagnostics indication LED	
• RUN LED	Yes; Green LED
• ERROR LED	Yes; red LED
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; Green LED
• for channel diagnostics	Yes; red LED
• for module diagnostics	Yes; Green/red LED
Potential separation	
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes
• between the channels and the power supply of the electronics	Yes
Permissible potential difference	
between the inputs (UCM)	10 Vpp
Isolation	
Isolation tested with	707 V DC (type test)
Standards, approvals, certificates	
Highest safety class achievable in safety mode	
• Performance level according to ISO 13849-1	PLe
• Category according to ISO 13849-1	Cat. 4
• SIL acc. to IEC 61508	SIL 3
Probability of failure (for service life of 20 years and repair time of 100 hours)	
– Low demand mode: PFDavg in accordance with SIL3	< 5.00E-05
– High demand/continuous mode: PFH in accordance with SIL3	< 1.00E-09 1/h

Article number	6ES7136-6AB00-0CA1
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	0 °C
• horizontal installation, max.	60 °C
• vertical installation, min.	0 °C
• vertical installation, max.	50 °C
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	48 g

Operational limit in complete temperature range

WARNING

When designing the safety function, you must take into account the information "Operational limit in complete temperature range" for the entire mission time.

Temperature characteristic values

NOTE

When the ambient temperature exceeds 55 °C, you must only apply a maximum total current of 3 A to an adjacent F-DQ 4x24VDC/2A PM HF.

Dimension drawing

See ET 200SP BaseUnits (https://support.industry.siemens.com/cs/ww/en/view/59753521) manual

Response times

A

Introduction

You will find the response times of the F-AI 4xU 0..10V HF below. The response times are included in the calculation of the F-system response time.

Definition of response time for fail-safe analog inputs

The response time results from the number of channels/channel pairs, the response time per channel/channel pair, the basic response time and the configured smoothing.

Times required for the calculation

- Max. acknowledgment time (Device Acknowledgment Time): T_{DAT} = 20 ms
- Basic response time: 20 ms
- Response time per channel
  - At 50 Hz: 25 ms
  - At 60 Hz: 22 ms

Conversion cycle time = basic response time + (N × response time per channel)

(N = number of active channels)

The conversion cycle time is the time in which all activated channels are processed/converted once.

Typical response time

You can calculate the typical response time of the F-AI 4xU 0..10V HF using the following formula:

Typical response time = Conversion cycle time × Smoothing

Maximum response time (worst case delay time, WCDT)

You can calculate the maximum response time of F-AI 4xU 0..10V HF (worst case delay time, WCDT) using the following formula:

Maximum response time = 2 × Conversion cycle time × Smoothing

Response time in the case of a fault (one fault delay time, OFDT)

You can calculate the response time of the F-AI 4xU 0..10V HF (one fault delay time, OFDT) as follows:

- According to the following formula if a discrepancy error is present:

  Typical response time = Conversion cycle time × Smoothing + Discrepancy time + Conversion cycle time

  Maximum response time = 2 × Conversion cycle time × Smoothing + Discrepancy time + 2 × Conversion cycle time
- According to the following formula if a channel fault is present:

  Typical response time = Conversion cycle time

  Max. response time = 2 × Conversion cycle time

This means that, for OFDT, the time on occurrence of a discrepancy error should be taken with parameter assignment "1oo2 evaluation (max. SIL3/Cat.4/PLe)" and the time on occurrence of a channel fault should be taken with parameter assignment "1oo1 evaluation (max. SIL2/Cat.3/PLd)".

Representation of analog values

B

In this section we are presenting the analog values for all measuring ranges that you can use with the F-AI 4xU 0..10V HF analog input module.

Measured value resolution

The analog values are shown as fixed-point number in two's complement.

The resolutions shown here are 16 bits including sign.

Table 1-516 Resolution of the analog values

Resolution in bits	Values		Analog value	
	Decimal	Hexadecimal	High byte	Low byte
16	1	1_H	Sign 0 0 0 0 0 0 0	0 0 0 0 0 0 0 1

B.1 Representation of analog values

The following tables list the decimal and hexadecimal values (codes) of the voltage measuring range 0 V to 10 V.

Table 1-517 Voltage measuring range 0 V to 10 V

Values		Voltage measuring range	Range	
Dec.	Hex.		Diagnostics wire break: No	Diagnostics wire break: Yes
32512	$7F00_H$	> 11.759 V	Overflow[1]	Overflow[1]
32511 . . 27649	$7EFF_H$ . . $6C01_H$	11.759 V . . 10 V + 361.69 µV	Overrange	Overrange
27648 . . 2765	$6C00_H$ . . 0ACD	10 V . . 1 V (1.0000723 V)	Nominal range	Nominal range
2764 . . 819	0ACC . . 0333	< 1 V (1.0000723 V) . . 0.2962240 V		Wire break[1]
818 . . 1 0	0332 . . 1 0	< 0.2962240 V . . 361.69 µV 0 V	Underflow[2]	

1 The F-module signals a "Wire break" or "High limit violated", $7FFF_H$ for S7-300/400 F-CPUs or 0 for S7-1200/1500 F-CPUs.

2 The F-module signals a "Low limit violated", 8000_H for S7-300/400 F-CPUs or 0 for S7-1200/1500 F-CPUs.

Introduction

1

Purpose of the documentation

This device manual complements the system manual ET 200SP distributed I/O system. You can find functions that generally relate to the ET 200SP system in the system manual ET 200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293).

The information provided in this device manual and the system manual enables you to commission the ET 200SP distributed I/O system.

Conventions

Note the following identified notes:

NOTE

A note includes important information on the product described in the documentation, on handling the product or on the part of the documentation to which you ought to pay special attention.

Important note for maintaining the operational safety of your plant

NOTE

Plants with safety-related features are subject to special operational safety requirements on the part of the operator. The supplier is also obliged to comply with special product monitoring measures. For this reason, we inform you in personal notifications about product developments and features that are (or could be) relevant to the operation of plants from a safety perspective.

You should subscribe to the corresponding notifications in order to obtain the latest information and to allow you to make any necessary modifications to your system.

1.1 ET 200SP Documentation Guide

1.1.1 Information classes ET 200SP

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.

This arrangement enables you to access the specific content you require.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Basic information

The System Manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP distributed I/O system.

The STEP 7 online help supports you in the configuration and programming.

Examples:

- ET 200SP System Manual
- System Manual ET 200SP HA/ET 200SP modules for devices used in a hazardous area
- Online help TIA Portal

Device information

Equipment manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

Examples:

- Equipment Manuals CPUs
- Equipment Manuals Interface Modules
- Equipment Manuals Digital Modules
- Equipment Manuals Analog Modules
- Equipment Manuals Motor Starter
- BaseUnits Equipment Manuals
- Equipment Manual Server Module
- Equipment Manuals Communications Modules
- Equipment Manuals Technology Modules

General information

The function manuals contain detailed descriptions on general topics relating to the SIMATIC ET 200SP distributed I/O system.

Examples:

- Function Manual ET 200AL/ET 200SP Mixed Configuration
- Function Manual Diagnostics
- Function Manual Communication
- PROFINET Function Manual
- PROFIBUS Function Manual
- Function Manual Designing Interference-free Controllers
- MultiFieldbus Function Manual

Product Information

Changes and supplements to the manuals are documented in a Product Information. The Product Information takes precedence over the device and system manuals.

You can find the latest Product Information on the ET 200SP distributed I/O system on the Internet. (https://support.industry.siemens.com/cs/de/en/view/73021864)

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet. (https://support.industry.siemens.com/cs/cn/en/view/84133942)

Manual Collection fail-safe modules

The Manual Collection contains the complete documentation on the fail-safe SIMATIC modules, gathered together in one file.

You can find the Manual Collection on the Internet.
(https://support.industry.siemens.com/cs/ww/en/view/109806400)

1.1.2 Basic tools

Tools

The tools described below support you in all steps: from planning, over commissioning, all the way to analysis of your system.

TIA Selection Tool

The TIA Selection Tool tool supports you in the selection, configuration, and ordering of devices for Totally Integrated Automation (TIA).

As successor of the SIMATIC Selection Tools , the TIA Selection Tool assembles the already known configurators for automation technology into a single tool.

With the TIA Selection Tool , you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet.
(https://support.industry.siemens.com/cs/ww/en/view/109767888)

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities on various SIMATIC S7 stations as bulk operations independent of TIA Portal.

The SIMATIC Automation Tool offers a wide range of functions:

- Scanning of a PROFINET/Ethernet system network and identification of all connected CPUs
- Assignment of addresses (IP, subnet, Gateway) and device name (PROFINET device) to a CPU
- Transfer of the date and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- RUN/STOP mode switchover
- CPU localization through LED flashing
- Reading out of CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Firmware update of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet.
(https://support.industry.siemens.com/cs/ww/en/view/98161300)

PRONETA

SIEMENS PRONETA (PROFINET network analysis) is a commissioning and diagnostic tool for PROFINET networks. PRONETA Basic has two core functions:

- In the network analysis, you get an overview of the PROFINET topology. Compare a real configuration with a reference installation or make simple parameter changes, e.g. to the names and IP addresses of the devices.
- The "IO test" is a simple and rapid test of the wiring and the module configuration of a plant, including documentation of the test results.

You can find SIEMENS PRONETA Basic on the Internet:
(https://support.industry.siemens.com/cs/ww/en/view/67460624)

SIEMENS PRONETA Professional is a licensed product that offers you additional functions. It offers you simple asset management in PROFINET networks and supports operators of automation systems in automatic data collection/acquisition of the components used through various functions:

- The user interface (API) offers an access point to the automation cell to automate the scan functions using MQTT or a command line.
- With PROFIenergy diagnostics, you can quickly detect the current pause mode or the readiness for operation of devices that support PROFIenergy and change these as needed.
- The data record wizard supports PROFINET developers in reading and writing acyclic PROFINET data records quickly and easily without PLC and engineering.

You can find SIEMENS PRONETA Professional on the Internet.
(https://www.siemens.com/proneta-professional)

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and the optimal use of resources

You can find SINETPLAN on the Internet
(https://new.siemens.com/global/en/products/automation/industrial-communication/profinet/sinetplan.html).

1.1.3 S7 Failsafe Configuration Tool (S7-FCT)

SIMATIC S7-FCT

Failsafe Configuration Tool (FCT) enables you to GSD configure the following devices in third-party engineering systems:

- Selected, functionally fail-safe SIMATIC I/O devices
- Functionally fail-safe SIRIUS ACT PROFINET interfaces

The engineering system must meet the following requirements for this:

- Support of the CPD system integration acc. to "PROFIsafe - Profile for Safety Technology on PROFIBUS DP and PROFINET IO"
- TCI implementation to Conformance Class C3

Additional information on S7-FCT can be found on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109762827).

1.1.4 SIMATIC Technical Documentation

Additional SIMATIC documents will complete your information. You can find these documents and their use at the following links and QR codes.

The Industry Online Support gives you the option to get information on all topics. Application examples support you in solving your automation tasks.

Overview of the SIMATIC Technical Documentation

Here you will find an overview of the SIMATIC documentation available in Siemens Industry Online Support:

Industry Online Support International (https://support.industry.siemens.com/cs/ww/en/view/109742705)

Watch this short video to find out where you can find the overview directly in Siemens Industry Online Support and how to use Siemens Industry Online Support on your mobile device:

Quick introduction to the technical documentation of automation products per video (https://support.industry.siemens.com/cs/us/en/view/109780491)

YouTube video: Siemens Automation Products - Technical Documentation at a Glance (https://youtu.be/TwLSxxRQQsA)

Retention of the documentation

Retain the documentation for later use.

For documentation provided in digital form:

1. Download the associated documentation after receiving your product and before initial installation/commissioning. Use the following download options:
   - Industry Online Support International: (https://support.industry.siemens.com)
     The article number is used to assign the documentation to the product. The article number is specified on the product and on the packaging label. Products with new, non-compatible functions are provided with a new article number and documentation.
   - ID link:
     Your product may have an ID link. The ID link is a QR code with a frame and a black frame corner at the bottom right. The ID link takes you to the digital nameplate of your product. Scan the QR code on the product or on the packaging label with a smartphone camera, barcode scanner, or reader app. Call up the ID link.
2. Retain this version of the documentation.

Updating the documentation

The documentation of the product is updated in digital form. In particular in the case of function extensions, the new performance features are provided in an updated version.

1. Download the current version as described above via the Industry Online Support or the ID link.
2. Also retain this version of the documentation.

mySupport

With "mySupport" you can get the most out of your Industry Online Support.

Registration	You must register once to use the full functionality of "mySupport". After registration, you can create filters, favorites and tabs in your personal workspace.
Support requests	Your data is already filled out in support requests, and you can get an overview of your current requests at any time.
Documentation	In the Documentation area you can build your personal library.
Favorites	You can use the "Add to mySupport favorites" to flag especially interesting or frequently needed content. Under "Favorites", you will find a list of your flagged entries.
Recently viewed articles	The most recently viewed pages in mySupport are available under "Recently viewed articles".
CAx data	The CAx data area gives you access to the latest product data for your CAx or CAe system. You configure your own download package with a few clicks: • Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files • Manuals, characteristics, operating manuals, certificates • Product master data

You can find "mySupport" on the Internet. (https://support.industry.siemens.com/My/ww/en)

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You can find the application examples on the Internet.
(https://support.industry.siemens.com/cs/ww/en/ps/ae)

Industrial cybersecurity 2

2.1 Introduction to industrial cybersecurity

Due to the digitalization and increasing networking of machines and industrial plants, the risk of cyber attacks is also growing. Appropriate protective measures are therefore mandatory, particularly in the case of critical infrastructure facilities.

You can find general information and measures relating to industrial cybersecurity in the system manual (https://support.industry.siemens.com/cs/ww/en/view/58649293).

This section provides an overview of security-related information about your SIEMENS device.

NOTE

Security-related changes to software or devices are documented in the "New functions" section.

2.2 Cybersecurity information

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial cybersecurity measures that may be implemented, please visit
https://www.siemens.com/cybersecurity-industry.

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Cybersecurity RSS Feed under
https://new.siemens.com/cert.

3.1 Properties

Article number

6ES7136-6DB01-0CA0

View of the module

①	Module type and name	⑦	Article number
②	Function class	⑧	LED for supply voltage
③	Color coding module type	⑨	LEDs for channel status
④	Color code for selecting the color-coded labels	⑩	Wiring diagram
⑤	BU type	⑪	QR code for identification link
⑥	Firmware and function version	⑫	LED for diagnostics

Figure 1-228 View of the F-DQ 4×24VDC/2A PM HF module

Properties

The module has the following technical properties:

- Fail-safe digital module
- PROFIsafe
- PROFIsafe address type 2
- 4 outputs, PM switching (SIL3/Cat.4/PLe)
- Supply voltage L+
- Output current per output 2 A
- Source output (PM switching)
- Suitable for solenoid valves, DC contactors, and indicator lights
- Diagnostic display (DIAG red/green LED)
- Status display for each output (green LED)
- Fault display for each output (red LED)
- Diagnostics e.g. short-circuit/wire break, channel by channel
- Channel-based or module-based passivation

The module supports the following functions:

- Firmware update
- I&M identification data
- Service data
- "Keep last valid value" parameter

⚠ WARNING

If you have configured the digital output module F-DQ 4×24VDC/2A PM HF (6ES7136-6DB00-0CA0) in a plant, but have inserted the digital output module F-DQ 4×24VDC/2A PM HF (6ES7136-6DB01-0CA0) instead, the information from the equipment manual of the digital output module F-DQ 4×24VDC/2A PM HF (6ES7136-6DB00-0CA0) continues to apply.

⚠ WARNING

The safety parameters in the technical specifications apply for a service life of 20 years and a repair time of 100 hours. If repair is not possible within 100 hours, remove the respective module from the BaseUnit or switch off its supply voltage before the 100 hours have elapsed. The module switches off independently after the 100 hours have expired.
Follow the repair procedure described in section Diagnostic messages (Page 46).

Accessories

The following accessories, which are not included in the product package of the F-module, can be used with the F-module:

- Labeling strips
- Color identification labels
- Reference identification labels
- Shield connection
- Electronic coding element as replacement part (article number 6ES7193-6EF00-1AA0)

You can find more information on accessories in the ET 200SP Distributed I/O System (https://support.industry.siemens.com/cs/ww/en/view/58649293) System Manual.

Passivation of fail-safe outputs over a long period of time

⚠ WARNING

Unintentional activation of F-I/O with fail-safe outputs
If an F-I/O with fail-safe outputs is passivated for a period longer than that specified in the safety parameters (> 100 hours) and the fault remains uncorrected, you need to exclude the possibility that the F-I/O can be activated unintentionally by a second fault, and thus place the F-system in a dangerous state.
Even though it is highly unlikely that such hardware faults occur, you must prevent the unintentional activation of F-I/O with fail-safe outputs by using circuit measures or organizational measures.
One possibility is the shutdown of the power supply of the passivated F-I/O within a time period of 100 hours, for example.
The required measures are standardized for plants with product standards.
For all other plants, the plant operator must create a concept for the required measures and have it approved by the inspector.

Property of the individual shutdown of F-modules with fail-safe outputs:

A channel-specific shutdown occurs when a fault is detected. It is also possible to react to critical process states staggered over time or to perform safety-related shutdown of individual outputs.

Use in safety mode with the "Keep last valid value" setting

With the "Keep last valid value" setting for the "Behavior at loss of communication" parameter, you can only use the F-DQ 4×24VDC/2A PM HF I/O module in compliance with the EN 54-2 standard.

NOTE

If the "Behavior at loss of communication" parameter is set to "Keep last valid value", it cannot be used in accordance with the standards for machine safety (IEC 61508, ISO 13849-1).

Connecting

4

4.1 Wiring and schematic circuit diagram

This section includes the schematic circuit diagram of the digital output module F-DQ 4×24VDC/2A PM HF with the terminal assignment.

You can find information on wiring the BaseUnit in the ET 200SP Distributed I/O System (https://support.industry.siemens.com/cs/ww/en/view/58649293) System Manual.

General terminal assignment

Table 1-518 Terminal assignment for F-DQ 4×24VDC/2A PM HF

Pin assignment for F-DQ 4×24VDC/2A PM HF (6ES7136-6DB01-0CA0)						
Terminal	**Assign-ment**	**Terminal**	**Assign-ment**	**Description**	**BaseUnit**[1]	**Color identification label (terminals 1 to 16)**
1	DQ-P_0	**2**	DQ-P_1	• DQ-P_n: Output signal, channel n, P-switching • DQ-M_n: Chassis ground for output signal, channel n, M-switching	A0	 CC02 6ES7193-6CP02-2MA0
3	DQ-P_2	**4**	DQ-P_3			
5	DQ-P_0	**6**	DQ-P_1			
7	DQ-P_2	**8**	DQ-P_3			
9	DQ-M_0	**10**	DQ-M_1			
11	DQ-M_2	**12**	DQ-M_3			
13	DQ-M_0	**14**	DQ-M_1			
15	DQ-M_2	**16**	DQ-M_3			
L+	DC24V	**M**	M			

[1] Usable BaseUnit types, can be identified by the last two digits of the article number. See also *ET 200SP Distributed I/O System* system manual

NOTE

The first BaseUnit of a potential group must be a light-colored BaseUnit.

NOTE

The fuse integrated in the BaseUnit type A1 can be triggered for the digital output module, rendering the terminals unusable.

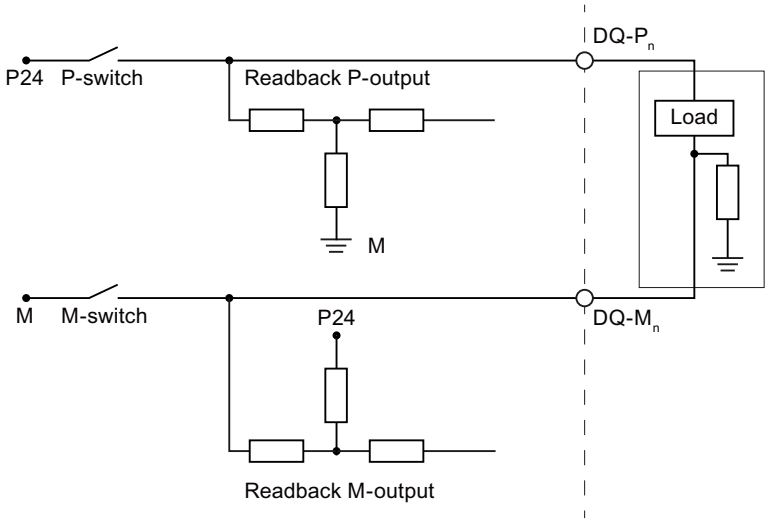
Make sure that you only use digital modules with the BaseUnit type A0 during commissioning.

Switching non-floating loads

If the following two conditions are met, a short-circuit is detected by the F-DQ 4×24VDC/2A PM HF:

- When loads are switched from the F-DQ 4×24VDC/2A PM HF that have a connection between chassis ground and ground. For example to improve the EMC properties.
- When chassis ground and ground are connected on the supplying power supply unit.

From the perspective of the F-module, the M-switch is bridged by the chassis-ground connection.



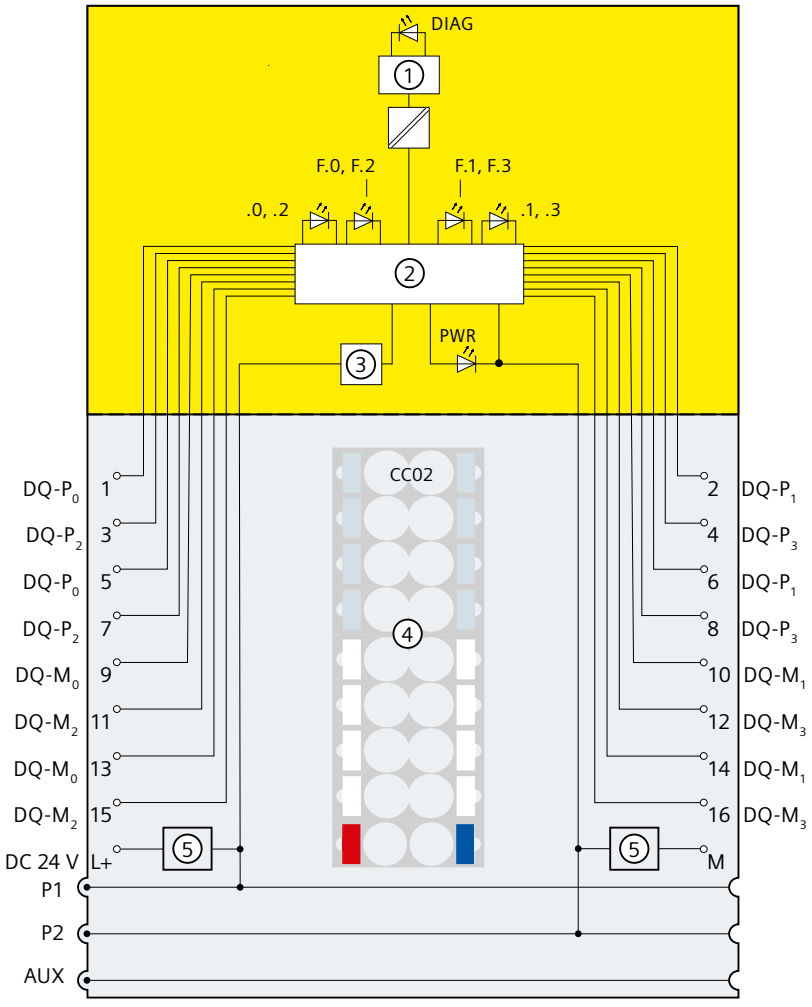


Figure 1-229 Switching of grounded loads (resistance between chassis and ground)

Alternatively, you can use the following modules:

- F-DQ 8x24VDC/0.5A PP HF
- The F-PM-E 24VDC/8A PPM ST power module for which the output is configured as PP switching

Schematic circuit diagram

The following figure shows the pin assignment of the digital output module F-DQ 4×24VDC/2A PM HF on the BaseUnit BU type A0.

①	Backplane bus interface	DQ-P_n	Output signal, channel n, P-switching
②	Input electronics	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
③	Reverse polarity protection	DQ-M_n	Chassis ground for output signal, channel n, M-switching
④	Color-coded label with color code CC02 (optional)	DIAG	Error or diagnostics LED (green, red)
⑤	Filter connection supply voltage (only when light-colored BaseUnit is present)	0.0 to 0.3	Channel status LED (green)
L+	24 V DC (infeed only with light-colored BaseUnit)	F.0 to F.3	Channel fault LED (red)
M	Chassis ground supply voltage	PWR	Power LED (green)

Figure 1-230 Schematic circuit diagram of the F-DQ 4×24VDC/2A PM HF

Parameters/address space

5

5.1 Parameters

Parameters for F-DQ 4×24VDC/2A PM HF

WARNING

Diagnostics functions should be activated or deactivated in accordance with the application, see section Applications of the F-I/O module (Page 36).

The following parameters are possible:

Table 1-519 Adjustable parameters

Parameter	Value range	Default	Parameter reassignment in RUN	Scope
F-parameters:				
Manual assignment of F-monitoring time	• Disable • Enable	Disable	No	Module
F-monitoring time	1 to 65535 ms	150 ms	No	Module
F-source address	1 to 65534	Depends on the parameter assignment of the F-CPU	No	Module
F-destination address	1 to 65534	Is proposed by the F-system	No	Module
F-parameter signature (with addresses)	0 to 65535	Is calculated by the F-system	No	Module
F-parameter signature (without address)	0 to 65535	Is calculated by the F-system	No	Module
Behavior after channel fault	• Passivate entire module • Passivate channel	Passivate channel	No	Module
Reintegration after channel fault	• Adjustable • All channels automatically • All channels manually	Adjustable	No	Module
F-I/O DB manual number assignment	• Disable • Enable	Disable	No	Module
F-I/O DB-number	—	Is proposed by the F-system	No	Module
F-I/O DB-name	—	Is proposed by the F-system	No	Module
DQ parameters:				
Maximum test period	• 100 s • 1000 s	1000 s	No	Module

*) When the "Enable Dynamic Read Back" parameter is enabled.

Parameter	Value range	Default	Parameter reassignment in RUN	Scope
Behavior at loss of communication	• Apply substitute value "0" • Keep last valid value	Apply substitute value "0"	No	Module
Disable Dark Test (max. SIL2, CAT3, PLd)	• Disable • Enable	Disable	No	Module
Disable Dark Test for 48 hours	• Disable • Enable	Disable	No	Module
Enable Dynamic Read Back	• Disable • Enable	Disable	No	Module
Channel parameters:

Max. readback time switch-on test	0.6 to 5.0 ms	0.6 ms	No	Channel
Channel failure acknowledge	• Manual • Automatic The value range offered depends on the F-CPU used and the parameter assignment of the F-parameter "Reintegration after channel fault".	Manual	No	Channel
Activated light test	• Disable • Enable	Disable	No	Channel
Diagnosis: Wire break	• Disable • Enable	Disable	No	Channel

*) When the "Enable Dynamic Read Back" parameter is enabled.

5.2 Explanation of parameters

5.2.1 F-parameters

5.2.1.1 PROFIsafe address

You have to assign the PROFIsafe address (F-destination address together with F-source address) to the F-module before you start operation.

- You specify the F-source address with the "Central F-source address" parameter in the F-CPU.
- The F-destination address is assigned automatically for each F-module CPU-wide. You can change the specified F-destination address in the hardware configuration manually.

Information on the F-parameters for the F-monitoring time, the PROFIsafe addressing (F-source address, F-destination address) and the F-I/O DB can be found in the manual SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126).

See also

S7 Distributed Safety - Configuring and Programming
(https://support.industry.siemens.com/cs/ww/en/view/22099875)

5.2.1.2 Behavior after channel fault

This parameter is used to specify whether the entire F-module is passivated or just the faulty channel(s) in the event of channel faults:

- "Passivate the entire module"
- "Passivate channel"

5.2.1.3 Reintegration after channel fault

Use this parameter to select how the channels of the fail-safe module are reintegrated after a fault.

Use on S7-300/400 F-CPUs
This parameter is always set to "Adjustable" when you use the fail-safe module in S7-300/400 F-CPUs.

You make the required setting in the F-I/O DB of the fail-safe module.

Use on S7-1200/1500 F-CPUs
When using the F-module on F-CPUs S7-1200/1500, set this parameter in the STEP 7 dialog of the F-module:

- "Adjustable"
- "All channels automatically"
- "All channels manually"

If you have set the "Behavior after channel fault" parameter to "Passivate channel", you enable individual setting of the reintegration type per channel with the parameter assignment "Adjustable". The reintegration type of the respective channel is specified with the "Channel failure acknowledge" channel parameter.

If you have set the "Behavior after channel fault" parameter to "Passivate the entire module", you can only select the same reintegration type for all channels.

5.2.2 DQ parameters

5.2.2.1 Maximal test period

With this parameter, you specify the time within which the light, dark and switch on tests (complete bit pattern test) should be performed throughout the module. When this time expires, the tests are repeated. In case of a fault, the test time is reduced to 60 seconds.

- Use "1000 s", for example, to conserve your actuators.
- Use "100 s" to detect faults more quickly.

5.2.2.2 Behavior at loss of communication

Defines the reaction of the digital output in the event of CPU STOP or communication failure between the F-module and CPU.

- Apply substitute value "0"
- Keep last valid value

Behavior of the I/O module depending on the "Behavior at loss of communication" parameter.

With the "Keep last valid value" setting of the "Behavior at loss of communication" parameter, the I/O module is only compliant with EN 54-2.

Options:

- Safety mode (SIL3)
- Safety mode (EN 54)

You can find more information on the behavior of the I/O module depending on the "Behavior at loss of communication" parameter in the section "Reaction of the output module with the "Keep last valid value" setting (Page 23)".

5.2.2.3 Reaction of the output module with the "Keep last valid value" setting

Behavior of I/O module

Depending on the "Behavior at loss of communication" parameter, the digital output module complies with the following standards:

Table 1-520 Conformity to standards

Setting of the "Behavior at loss of communication" parameter	
"Apply substitute value "0""	**"Keep last valid value"**
In conformance with all standards mentioned in the certificates. You will find the certificates on the Internet at: • Certificate for S7 F/FH Systems (https://support.industry.siemens.com/cs/ww/en/ps/14362/cert)	Only compliant with EN 54-2

NOTE

To provide the substitute value, it is necessary to supply the interface module with voltage.

Applications

Typical applications for safety mode with the "Keep last valid value" setting are:

- Ventilation systems
- Smoke flaps

Reactions to faults

NOTE
Observe the appropriate standards for the installation.

NOTE
With the "Keep last valid value" setting of the "Behavior at loss of communication" parameter, only the EN 54-2 standards are met.
The last valid value is supplied when the following communication failures/interruptions occur:

- STOP of the F-CPU (interruption of the PROFIsafe communication)
- Breakdown of PROFIsafe communication
  - Following CRC errors
  - Disconnection of the PROFINET connection
  - Monitoring time of data frames exceeded
- Error in the safety program of the F-CPU
- Error in the PROFIsafe protocol

After resumption of the PROFIsafe communication, the current process value is output again.
The safe state "0" is assumed at the output of the digital output module when the following faults occur:

- Channel fault
- Module fault

If a channel fault occurs in connection with S7 F/FH systems, the last valid value of all error-free channels is held after a STOP-RUN transition of the F-CPU until the channels are re-integrated in the safety program. If the parameter "Behavior after channel fault" is set to "Passivate entire module", you need to eliminate the channel fault before you can reintegrate the channels in the safety program.

5.2.2.4 Disable Dark Test (max. SIL2, CAT3, PLd)

To prevent an unwanted reaction of the actuator to a dark test, you can deactivate the dark test at the F-module output. An unwanted reaction can be for example, the brief de-energizing of a magnetic drive or a process value change of a digital input with very short input delay.

A capacitive load that does not correspond to the load curves (see section Switching capacitive loads (Page 56)) can lead to passivation of the output during a process value change, switch-on test or light test despite the dark test being disabled.

The "Enable Dynamic Read Back" and "Disable Dark Test for 48 hours" parameters must be disabled in conjunction with the "Disable Dark Test (max. SIL2, CAT3, PLd)" parameter.

They achieve max. SIL2/Cat.3/PLd with disabled dark test.

For disabled dark test:

⚠ WARNING

SIL2/Cat.3/PLd requires that there is a signal change from "1" to "0" at the corresponding output at least once a year. The "0" signal must have a duration of at least 2 seconds. It is not enough to simply turn off the supply voltage of the F-module and turn it on again.

⚠ WARNING

When you use the function "Disable Dark Test", cross-circuits between channels with "1" signal are not detected. If an error caused by short-circuits (cross-circuits) is detected when you request the safety function (shutdown of the output), not only is this output passivated, but all outputs are shut down and the F-module is passivated. Also take into consideration the respective requirements of your product standards regarding error detection time.

5.2.2.5 Disable Dark Test for 48 hours

This option allows you to suppress the dark test.

To suppress dark test pulses, you must ensure that all channels together carry the 0-signal once within the 48 hours. This suspends the dark test for a further 48 hours.

If this condition is not fulfilled, all dark test pulses will be applied anyway on all channels after expiration of this time. With 0-signal channels, the test pulses of light test continue to occur.

The "Enable Dynamic Read Back" and "Disable Dark Test for 48 hours" parameters must be disabled in conjunction with the "Disable Dark Test (max. SIL2, CAT3, PLd)" parameter.

If the following condition is met, the dark test is permanently suppressed:

- Before the 48 hours have elapsed, all channels together have a 0 signal.

⚠ WARNING

If a fault caused by short-circuits (cross-circuits) is detected when the safety function is requested (switching off of the output), not only is this output passivated but all outputs are switched off and the module is passivated. This is necessary because no complete bit pattern test is performed within 48 hours and therefore an undetected accumulation of errors cannot be ruled out.
Observe the respective requirements of your product standards with regard to the error discovery time.

If you enable the "Disable Dark Test for 48 hours" parameter, all channels use the values set for channel 0 for the "Max. readback time switch-on test/dark test" parameter.

5.2.2.6 Enable Dynamic Read Back

To avoid an undesired reaction of the actuator to a dark test, you have the option of dynamizing the dark test of the output of the F-module.

The dynamic readback function ends the dark test as soon as the readback signal of the dark test has been validly detected.

- The "Disable Dark Test (max. SIL2, CAT3, PLd)" and "Disable Dark Test for 48 hours" parameters must be disabled in conjunction with the "Enable Dynamic Read Back" parameter.
- The value range of the "Max. readback time, dark test and switch-off test" parameter is limited to a range between 0.6 and 20 ms.

⚠ WARNING

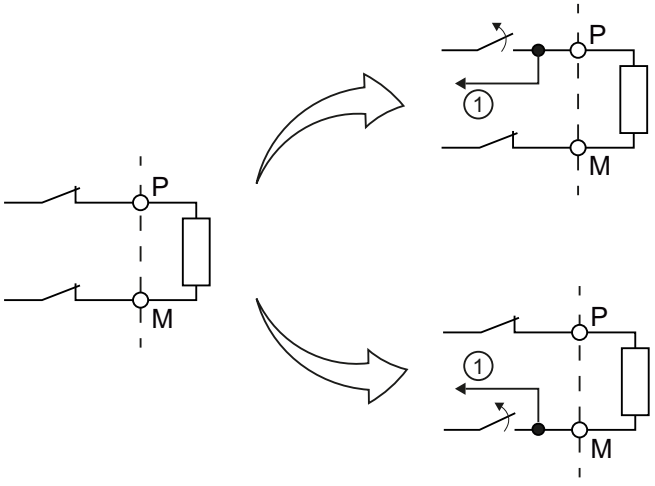
If the "Enable Dynamic Read Back" function is used, cross-circuits between 1-signal channels are not detected.
If an error caused by short-circuits (cross-circuits) is detected when you request the safety function (shutdown of the output), not only is this output passivated, but all outputs are shut down and the F-module is passivated.
Also take into consideration the respective requirements of your product standards regarding error detection time.

5.2.3 Parameters of the channels

5.2.3.1 Activated

If you select this check box, the corresponding channel is enabled for signal processing in the safety program.

You can deactivate an unused channel with this parameter.



5.2.3.2 Max. readback time, dark test and switch-off test

Function

Dark tests are switch-off tests with bit pattern test.

For "Disable dark test" mode, the parameter "Max. readback time, dark test and switch-off test" is only relevant for the process value change.

For a dark test, a test signal is switched to the output channel while the output channel is active (output signal "1"). This output channel is then briefly disabled (= "dark period") and read back. A sufficiently slow actuator does not respond to this and remains switched on.

① Readback

Figure 1-231 Functional principle of the dark test (PM switching)

This parameter allows you to set the time for the readback.

If the expected signals (P-readback and M-readback) could not be read back correctly after expiration of the max. readback time, dark test and switch-off test, the output channel is passivated.

No new process values are switched to the output channels while a bit pattern is still active (switch test is carried out). This means that a higher max. readback time, dark test and switch-off test increases the response time of the F-module.

⚠ WARNING

Through the configured "Max. readback time, dark test and switch-off test", short circuits (cross-circuits) to a signal with a frequency greater than 1/(2 x configured max. readback time, dark test and switch-off test) Hz cannot be detected (50:50 sampling ratio).
Short circuits (cross-circuits) to an output of the same module are recognized.

The parameter also has an effect on the short circuit detection (cross-circuit) with "1" signal when the output signal is changed from "1" to "0" with the safety program.

Setting the parameter "Max. readback time, dark test and switch-off test"

Because the fault response time is extended by the max. readback time, dark test and switch-off test, we recommend that you set the max. readback time, dark test and switch-off test by trial and error as low as possible, but high enough that the output channel is not passivated.

You determine the readback time required for your actuator with the diagram in the chapter Switching capacitive loads (Page 56).

If the capacity of the actuator is not known, it may be necessary for you to determine the value for the max. readback time, dark test and switch-off test by trial and error. This may also be necessary due to the part variances in the actuator or external influences.

Proceed as follows:

- Set the "Max. readback time, dark test and switch-off test" so that the output channel can be read back correctly but your actuator does not respond yet.
- For verification, use the process value "1" with a minimum duration that corresponds to the "Maximum test time" parameter.
- If the output channel is passivated sporadically, set a higher value for the max. readback time, dark test and switch-off test.
- If the output channel is passivated, the max. readback time, dark test and switch-off test is too small for a connected capacitive load. The discharge cannot take place within the configured max. readback time, dark test and switch-off test. Increase the max. readback time, dark test and switch-off test.

If you have set the max. readback time, dark test and switch-off test to the maximum value of 400 ms and there is still a passivation of the output channel, there is either an external fault or the connected capacity is outside the permitted range.

Test pulses of the dark test

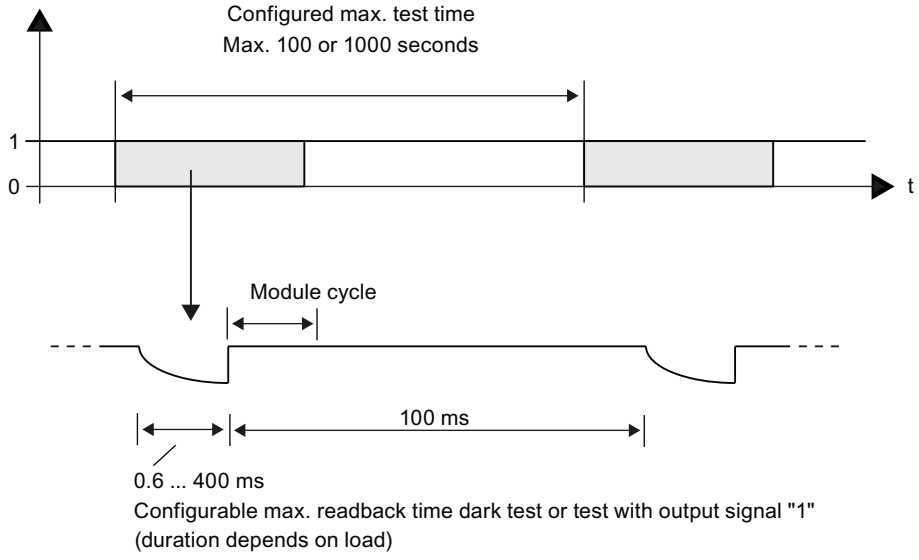


Figure 1-232 Test pulses of the dark test

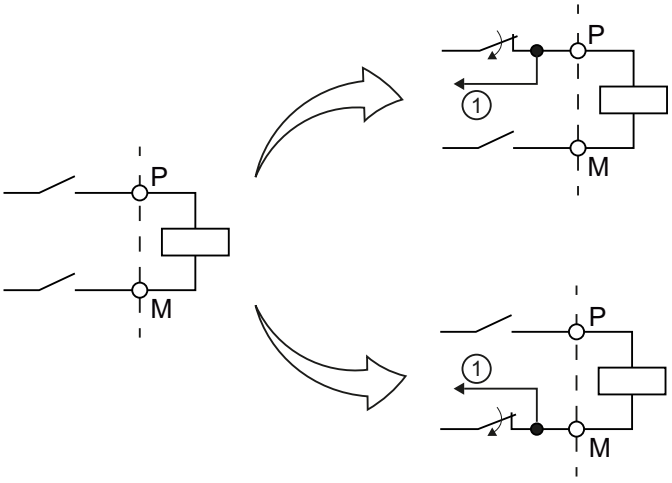
The interval between two test pulses amounts to at least 100 ms.

NOTE



Note that the test pulses can be T_{diff} longer than the set test time.
T_{diff} = max (150 µs, min (10% of the set test time, 300 µs))

5.2.3.3 Max. readback time switch on test

Function

The switch on test is part of the bit pattern test.

During the switch on test, the P-switch and M-switch of the output channel are alternately closed and read back when the output channel is inactive (output signal "0"). Contrary to the light test, no power flows through the connected load during the switch on test.

① Readback

Figure 1-233 Functional principle of the switch on test (PM switching)

This parameter allows you to set the time for the readback. If the signal was not read back correctly once the time has expired, the output channel is passivated.

The switch on test detects the following faults:

- Short circuit to L+ with output signal "0"
- Short circuit to ground with output signal "0"

⚠ WARNING

Through the configured readback time, short circuits (cross-circuits) to an interfering signal with a frequency > 1 / (2 x configured readback time) Hz can be suppressed (50:50 sampling ratio).
Short circuits (cross-circuits) to an output of the same module are recognized.

Setting readback time

Because the fault reaction time is extended by the length of the set readback time, we recommend that you set the readback time by trial and error as low as possible but high enough that the output channel is not passivated.

To determine the readback time required for your actuator, refer to the diagram in the section Switching capacitive loads (Page 56).

If the capacitance of the actuator is not known, you may have to determine the required value for the readback time switch-on test by trial and error. This may also be necessary due to the part variances in the actuator or external influences.

Proceed as follows:

- Set the readback time switch on test in such a way that the output channel can be read back correctly but your actuator does not respond yet.
- If the output channel is passivated sporadically, set a higher value for the maximum readback time switch on test.
- If the output channel is passivated, the readback time is too small for a connected capacitive load. The charge of the capacitive load cannot take place during the configured readback time. Increase the readback time.

If you have set the readback time to the maximum value of 5 ms and there is still a passivation of the output channel, there is either an external fault or the connected capacity is outside the permitted range.

To increase availability, we recommend that you maintain an interval to the determined limit for the times.

5.2.3.4 Channel failure acknowledge

Use on S7-1200/1500 F-CPUs

The parameter is only relevant if the F-module is operated on an S7-1200/1500 F-CPU.

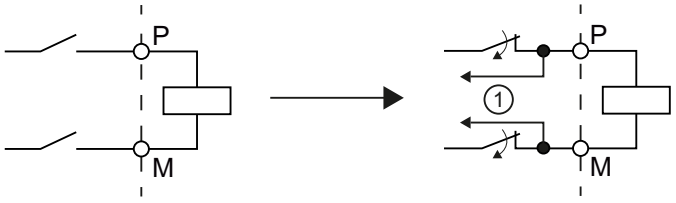
The parameter can only be set if the F-parameter "Behavior after channel fault" is set to "Passivate channel" and the F-parameter "Reintegration after channel fault" is set to "Adjustable".

The value of this parameter specifies how the channel reacts after a channel fault:

- Manual: A channel failure is reintegrated after manual acknowledgment.
- Automatic: The channel is reintegrated automatically after a channel fault. Manual acknowledgment is not necessary.

Use on S7-300/400 F-CPUs

The value of this parameter is not relevant in the case of operation on S7-300/400 F-CPUs. For S7-300/400 F-CPUs you set the corresponding property at the F-I/O DB by means of the ACK_NEC tag.



For detailed information about the F-I/O DB, refer to the SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual.

5.2.3.5 Activated light test

Function

Overload and wire break are detected with a 0 signal at the output. Wire break is only detected with a 0 signal at the output if the "Diagnosis: Wire break" parameter is activated in addition to the "Activated light test" parameter.

For a light test, a test signal is switched to the output channel while the output channel is inactive (output signal "0"). The output channel is switched on briefly during the light test (= "light period") and read back. A sufficiently slow actuator does not respond to this and remains switched off.

① Readback

Figure 1-234 Functional principle of the light test (PM switching)

In contrast to the switch on test, the P-switch and the M-switch switch at the same time during the light test and power flows through the connected load.

With bad readback signals, the signal is always present at the output channel for the configured readback time.

If a wire break or overload is detected after the maximum readback time has elapsed, the output channel is passivated.

No new process values are switched to the output channels while a bit pattern is still active (switch test is carried out). This means that a higher maximum readback time switch on test for the light test increases the response time of the F-module.

Test pulses of the light test

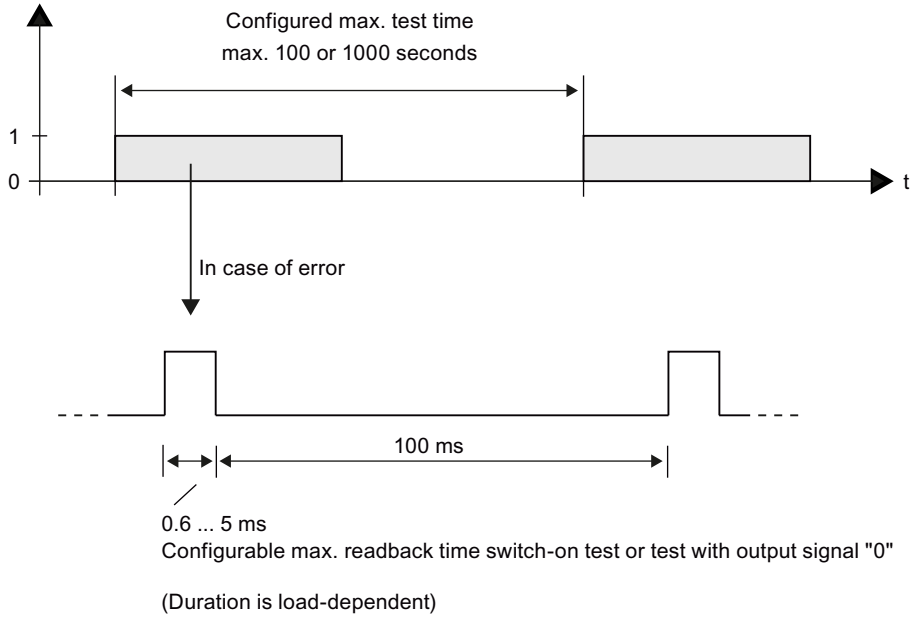


Figure 1-235 Test pulses of the light test

A light pulse with the configured duration takes place within the configured maximum test time per output channel.

If a light pulse returns a fault, the same light pulse (which means the same bit pattern) is repeated once after 100 ms. If the fault is still present, the maximum test time is automatically reduced to 60 seconds and a diagnostic message is generated. If the fault is no longer present, the output channel is reintegrated after the next fault-free test cycle.

5.2.3.6 Diagnosis: Wire break

You can use a wire break test to monitor the connection from the output channel to the actuator.

Selecting this check box enables the wire break monitoring for the relevant channel.

To detect a wire break with a "0" output signal, you must also enable the light test.

5.3 Address space

Address assignment of the digital output module F-DQ 4×24VDC/2A PM HF

The digital output module F-DQ 4×24VDC/2A PM HF occupies the following address areas in the F-CPU:

Table 1-521 Address assignment in the F-CPU

	Occupied bytes in the F-CPU:	
F-CPU	**In input range**	**In output range**
F-CPUs S7-300/400	IB x + 0 to x + 4	QB x + 0 to x + 4
F-CPUs S7-1200/1500	IB x + 0 to x + 5	QB x + 0 to x + 5

x = Module start address

Address assignment of the user data and the value status of digital output module F-DQ 4×24VDC/2A PM HF

The user data occupy the following addresses in the F-CPU out of all the assigned addresses of the digital output module F-DQ 4×24VDC/2A PM HF:

Table 1-522 Address assignment through user data

Byte in the F-CPU	**Assigned bits in F-CPU per F-module:**							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
IB x + 0	—	—	—	—	Value status DQ_3	Value status DQ_2	Value status DQ_1	Value status DQ_0
QB x + 0	—	—	—	—	DQ_3	DQ_2	DQ_1	DQ_0

x = Module start address

NOTE

You may only access the addresses occupied by user data and value status.
The other address areas occupied by the F-modules are assigned for functions including safety-related communication between the F-modules and F-CPU in accordance with PROFIsafe.

Additional information

You can find detailed information on F-I/O access in the SIMATIC Safety – Configuration and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual or S7 Distributed Safety - Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/22099875).

Value status (Page 49)

Applications of the F-I/O module

6

6.1 Applications of the F-DQ 4x24VDC/2A PM HF

You achieve SIL3/Cat.4/PLe with the following applications.
The wiring is performed on a suitable BaseUnit (Page 16).

6.2 Application: Wiring a load to each digital output

Each of the four fail-safe digital output consists of a P-switch DQ-P_n and an M-switch DQ-M_n. You connect the load between the P-switch and the M-switch. The two switches are always activated so that voltage is applied to the load. This circuit achieves SIL3/Cat.4/PLe.

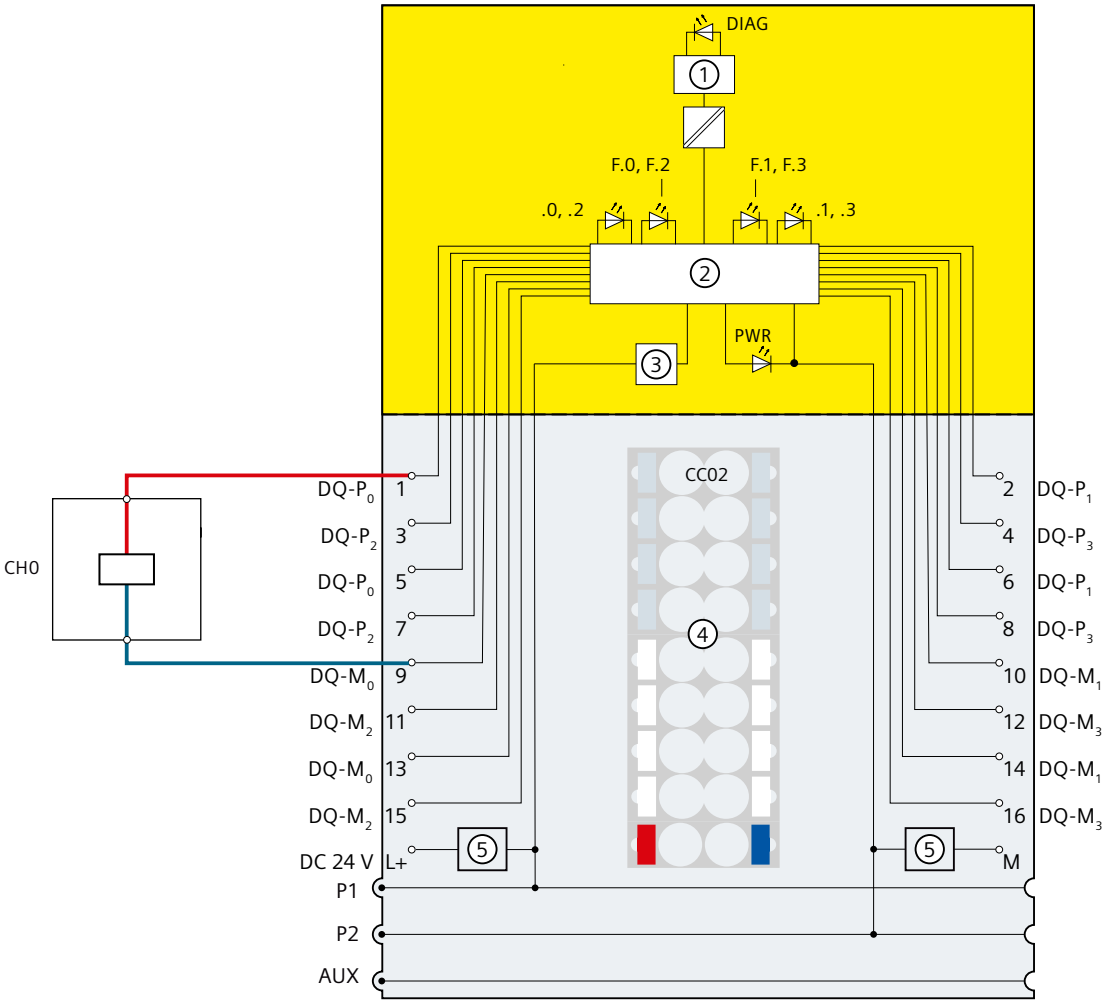

Figure 1-236 Wiring diagram for 1 relay each at 1 F-DQ of the digital output module F-DQ 4×24VDC/2A PM HF

WARNING

In order to achieve SIL3/Cat.4/PLe with this wiring, you must install a qualified actuator, for example, in accordance with IEC 60947.

6.3 Application: Connection of loads to L+ and M at each digital output

You can connect two relays using one fail-safe digital output. The following conditions should be kept in mind:

- Same reference potential
- The normally open contacts of the two relays must be connected in series.

This configuration achieves SIL3/Cat.4/PLe (process status readback required).

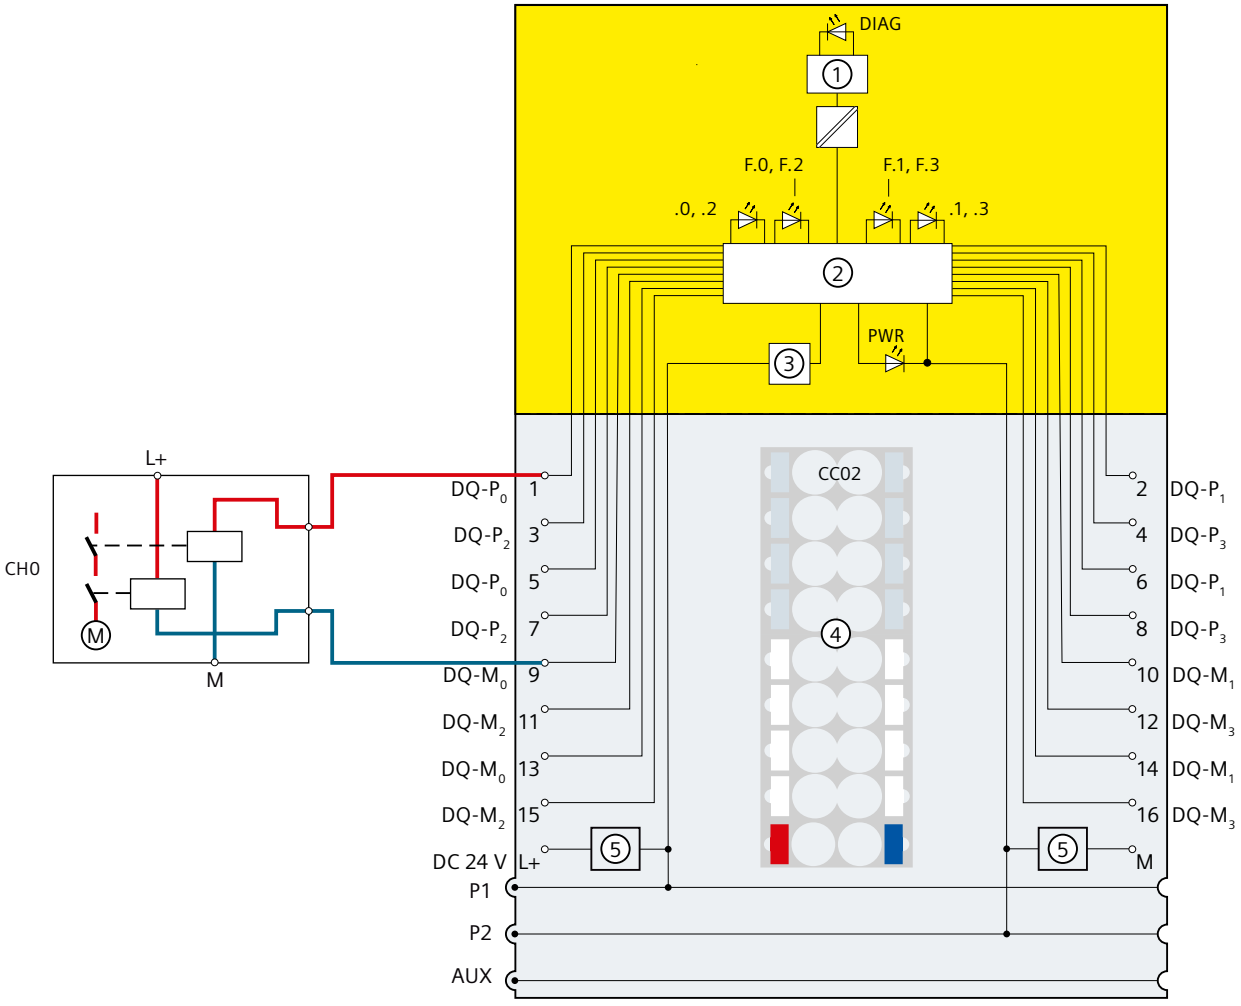

Figure 1-237 Wiring diagram for connecting 2 relays each to 1 F-DQ of the digital output module F-DQ 4×24VDC/2A PM HF

WARNING

When two relays are connected to one digital output, as shown in the figure above, the "wire break" and "overload" faults are detected only at the P-switch of the output (not at the M-switch).

⚠ WARNING

With a cross circuit between P-switch and M-switch of the output, the module detects the fault and switches off the output. But the actuator is still supplied with power due to the external fault.
To avoid cross-circuits between P- and M-switches of a fail-safe digital output, you need to lay the cables for connecting the relays to the P- and M-switch in such a way that they are protected against cross-circuits, for example as separately sheathed cables or in separate cable ducts.

NOTE

The digital output module F-DQ 4×24VDC/2A PM HF performs a bit pattern test depending on the parameter assignment. For this, the module outputs up to 5 ms pulses depending on the parameter assignment. This test (switch-on test) is run with a time offset between the P-switch and M-switch to prevent the actuator from being activated. This pulse may cause the corresponding relay to operated, which may reduce its service life.
We therefore recommend adhering to the wiring scheme described below.

6.4 Application: Wiring two loads in parallel to each digital output

To protect against cross-circuits between P-switch and M-switch in fail-safe digital outputs, we recommend the following wiring scheme. This circuit achieves SIL3/Cat.4/PLe.

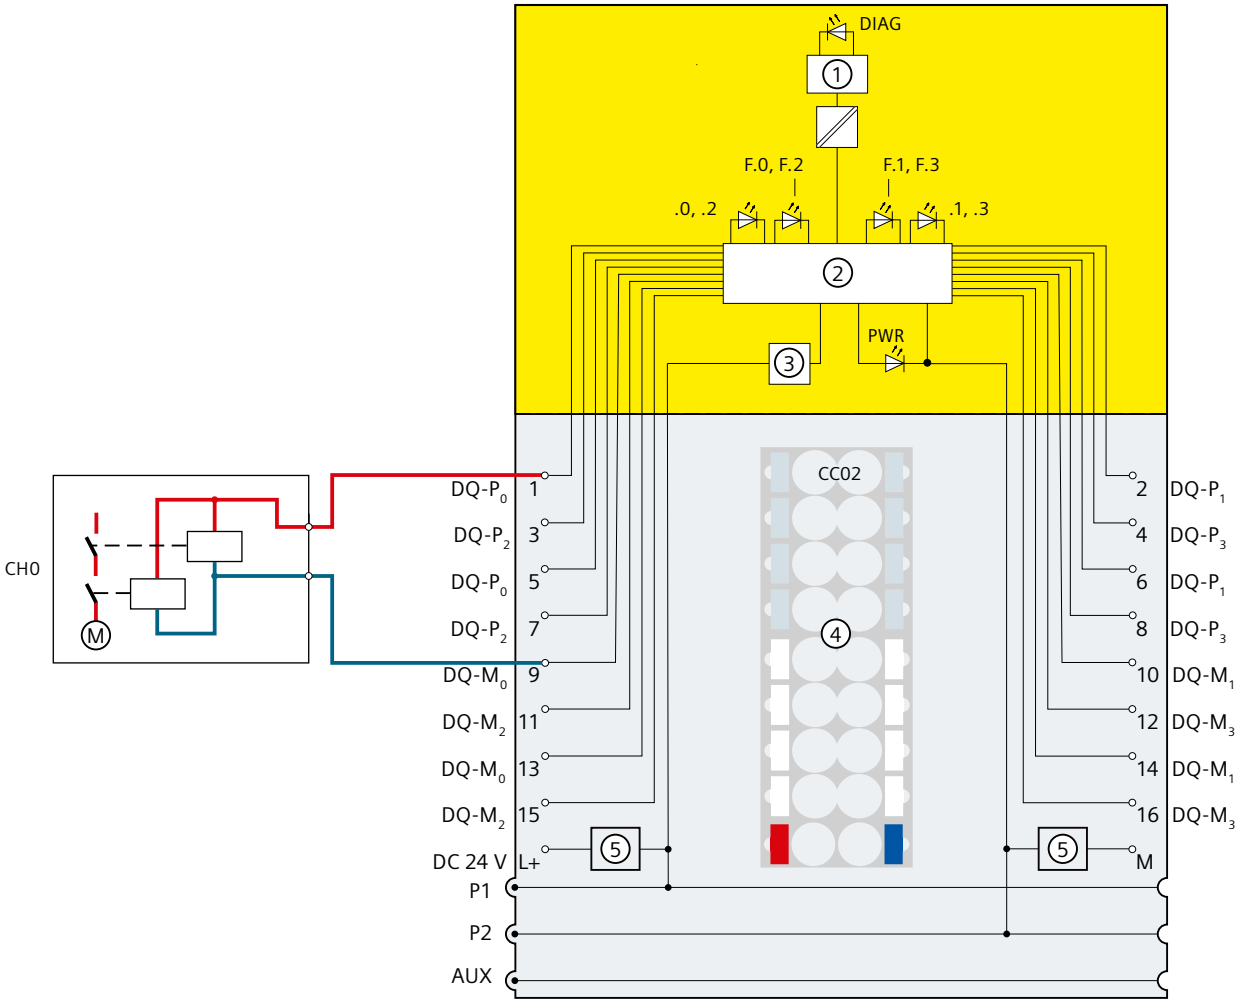

Figure 1-238 Wiring diagram for 2 relays each parallel at 1 F-DQ of the digital output module F-DQ 4×24VDC/2A PM HF

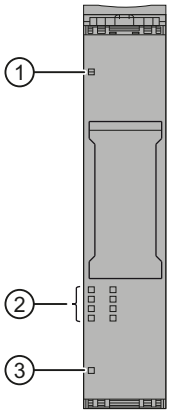
NOTE



With a parallel connection of two relays on one digital output (as shown above) the "wire break" fault is only detected if the wire break disconnects both relays from P or M. This diagnostics is not safety-related.

Interrupts/diagnostic messages

7

7.1 Status and error display

LED display

① DIAG (green/red)
② Channel status (green), channel fault (red)
③ PWR (green)

Figure 1-239 LED display

Meaning of the LED displays

The following tables explain the meaning of the status and error displays. Remedies for diagnostic messages can be found in section Diagnostic messages (Page 46).

WARNING

The DIAG LED and the channel status and channel fault LEDs of the outputs are not designed as safety-related LEDs and therefore may not be evaluated for safety-related activities.

PWR LED

Table 1-523 Meaning of the PWR LED

PWR	Meaning
□ Off	Supply voltage L+ missing
■ On	Supply voltage L+ available

DIAG LED

Table 1-524 Meaning of the DIAG LED

DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not okay
Flashing	Module parameters not configured
On	Module parameters configured and no module diagnostics
Flashing	Module parameters configured and module diagnostics
Flashing	Module waits for user acknowledgment

Channel status/channel fault LED

Table 1-525 Meaning of the channel status/channel fault LED

Channel status	Channel fault	Meaning
Off	Off	Process signal = 0 and no channel diagnostics
On	Off	Process signal = 1 and no channel diagnostics
Off	On	Process signal = 0 and channel diagnostics
Alternately flashing		Channel waiting for user acknowledgment

Channel status/DIAG/channel fault LED

Table 1-526 Meaning of the channel status/DIAG/channel fault LED

Channel status	DIAG	Channel fault	Meaning
Off	Flashing	All On	The PROFIsafe address does not match the configured PROFIsafe address
Flashing	Flashing	Off	Identification of the F-module when assigning the PROFIsafe address

7.2 Interrupts

Introduction

The F-DQ 4x24VDC/2A PM HF fail-safe digital output module supports diagnostic interrupts.

Diagnostic interrupt

The F-module generates a diagnostic interrupt for each diagnostic message described in section Diagnostic messages (Page 46).

The table below provides an overview of the diagnostic interrupts of the F-module . The diagnostic interrupts are assigned either to one channel or the entire F-module.

⚠ WARNING

Before acknowledging the short circuit diagnostic message, remedy the respective fault and validate your safety function. Proceed as described in section Diagnostic messages (Page 46) to eliminate the error.

Module-wide diagnostic interrupts:

- Overtemperature
- Parameter error
- Supply voltage missing
- Mismatch of safety destination address (F_Dest_Add)
- Safety destination address not valid (F_Dest_Add)
- Safety source address not valid (F_Source_Add)
- Safety watchdog time value is 0 ms (F_WD_Time)
- Parameter F_SIL exceeds SIL from specific device application
- Parameter F_CRC_Length does not match the generated values
- Version of F parameter set incorrect
- CRC1 fault
- Device-specific diagnostics information, see manual
- Inconsistent iParameters (iParCRC error)
- F_Block_ID not supported
- Transmission error: Inconsistent data (CRC error)
- Transmission error: Timeout (watchdog time 1 or 2 expired)
- Channel failure acknowledgment
- Watchdog tripped
- Invalid/inconsistent firmware present
- Diagnostic queue overflow
- F-address memory not accessible
- No valid F-address available
- Undertemperature
- Auxiliary voltage too high

- Auxiliary voltage too low
- F-module error (0x032F)

Channel-wide diagnostic interrupts

- Wire break
- Safety-related shutdown
- Short-circuit to L+
- Short-circuit to ground
- Frequency too high
- Output defective
- Readback failure
- Overload

7.3 Diagnostic messages

Diagnostic messages

Module faults are indicated as diagnostics (module status).

NOTE

You can connect multiple actuators per output
The diagnostics of the actuators influence each other in the case of multiple wiring.
This means:

- A wire break is only signaled if both actuators are affected.
- A single short-circuit affects both actuators.

Once the fault is eliminated, the F-module must be reintegrated in the safety program. For additional information on passivation and reintegration of F-I/O, refer to the SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual or S7 Distributed Safety - Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/22099875).

Table 1-527 Diagnostic messages of the F-DQ 4×24VDC/2A PM HF

Diagnostic message	Fault code	Meaning	Remedy
Overtemperature	5_H	An excessively high temperature was measured in the F-module.	Operate the F-module within the specified temperature range. (See Technical specifications (Page 51)) Once the fault has been eliminated, the F-module must be removed and inserted or the power switched OFF and ON
Wire break	6_H	Possible causes: • There is an interrupted cable between the module and actuator. • The channel is not connected (open).	• Establish a cable connection. • Disable the wire break detection for the channel in the parameter assignment. • Eliminate the short circuit.
Parameter error	10_H	Parameter assignment errors include: • The F-module cannot use the parameters (unknown, invalid combination, etc.). • The F-module parameters have not been configured.	Correct the parameter assignment.
Supply voltage missing	11_H	Missing or insufficient supply voltage L+	• Operate the F-module within the specified supply voltage range. • Check BaseUnit type
Safety-related shutdown	19_H	The channel was switched off for safety reasons due to an error on another channel. Possible causes: • There is a short-circuit. • The capacitive load is too high.	• Correct the process wiring. • Increase the test times (dark and light test).
Mismatch of safety destination address (F_Dest_Add)	40_H	The PROFIsafe driver has detected a different F-destination address.	Check the parameter assignment of the PROFIsafe driver and the address setting of the F-module.

Diagnostic message	Fault code	Meaning	Remedy
Safety destination address not valid (F_Dest_Add)	41_H	The PROFIsafe driver has detected an invalid F-destination address.	Check the parameter assignment of the PROFIsafe driver.
Safety source address not valid (F_Source_Add)	42_H	The PROFIsafe driver has detected an invalid F-source address.	
Safety watchdog time value is 0 ms (F_WD_Time)	43_H	The PROFIsafe driver has detected an invalid watchdog time.	
Parameter F_SIL exceeds SIL from specific device application	44_H	The PROFIsafe driver has detected a discrepancy between the SIL setting of the communication and the application.	
Parameter F_CRC_Length does not match the generated values	45_H	The PROFIsafe driver has detected a discrepancy in the CRC length.	
Version of F parameter set incorrect	46_H	The PROFIsafe driver has detected an incorrect version of the F-parameters or an invalid F_Block_ID.	
CRC1 fault	47_H	The PROFIsafe driver has detected inconsistent F-parameters.	
Device-specific diagnostics information, see manual	48_H	The PROFIsafe driver has received inconsistent fail-safe parameters.	
Inconsistent iParameters (iParCRC error)	$4B_H$	The PROFIsafe driver has detected inconsistent iParameters.	Check the parameter assignment.
F_Block_ID not supported	$4C_H$	The PROFIsafe driver has detected an incorrect Block ID.	Check the parameter assignment of the PROFIsafe driver.
Transmission error: Inconsistent data (CRC error)	$4D_H$	The firmware of the F-module has detected a CRC error. Possible causes: • The communication between F-CPU and F-module is interrupted. • Impermissibly high electromagnetic interference is present. • An error has occurred during the sign-of-life monitoring.	• Check the communication connection between the F-module and the F-CPU. • Eliminate the cause of the electromagnetic interference. • POWER OFF - ON of the station • Reassign the configuration and parameter assignments to the F-module (the station).
Transmission error: Timeout (watchdog time 1 or 2 expired)	$4E_H$	The firmware of the F-module has detected a timeout. Possible causes: • The F-monitoring time is set incorrectly. • A bus fault is present.	Check the parameter assignment. Make sure that your communication is operating correctly.
Channel failure acknowledgment	$4F_H$	A channel fault was detected. A confirmation is required to enable the channel.	Confirm the channel fault.
Watchdog tripped	103_H	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module has detected an internal error and reacted to it in a safety-oriented manner.	• Correct the fault. The module must then be pulled and plugged, or the power switched OFF and ON • If the F-module cannot be put into operation anymore, consider a replacement.
Short-circuit to L+	105_H	Short circuit to L+ can mean: • The output cable is short-circuited to L+. • There is a short circuit between two output channels. • The capacitive load is too high.	• Correct the process wiring. • Increase the test times (dark, light, switch-on tests).

Diagnostic message	Fault code	Meaning	Remedy
Short-circuit to ground	106_H	Short circuit to ground can mean: • The output cable is short-circuited to ground. • The output signal is short-circuited to ground. • There is a short circuit between two output channels. • The capacitive load is too high.	• Correct the process wiring. • Increase the test times (dark, light, switch-on tests).
Invalid/inconsistent firmware present	$11B_H$	The firmware is incomplete and/or firmware added to the F-module is incompatible. This leads to errors or functional limitations when operating the F-module.	• Perform a firmware update for all parts of the F-module and note any error messages. • Use only firmware versions released for this F-module.
Diagnostic queue overflow	$13E_H$	Overflow of the diagnostics memory. Not all pending diagnostics could be sent. This error can result in deactivation of the module up to switching on/off of the supply voltage.	Eliminate the previously reported error.
F-address memory not accessible	$30D_H$	F-source address placed in the coding element and F-destination address cannot be accessed.	Check whether the coding element is available or replace it.
No valid F-address available	$30E_H$	No valid PROFIsafe address is stored in the retentive memory. Possible causes: • Initial commissioning • Deliberate parameter change of the PROFIsafe address • Deviation between setpoint and actual configuration of the plant.	• Perform the assignment of the PROFIsafe address during initial commissioning or deliberate parameter changes. • Check the consistency between the setpoint and actual configuration.
Frequency too high	311_H	The maximum switching frequency of the F-module has been exceeded.	Reduce the switching frequency (see Technical specifications (Page 51)).
Undertemperature	312_H	The minimum permissible temperature limit has been violated.	Operate the F-module within the specified temperature range. (See Technical specifications (Page 51))
Output defective	$31D_H$	The F-module has detected an internal error. Possible causes: • The capacitive load is too high. • Short circuit to L+ or M • The F-module is defective	• Increase the test times (dark, light, switch-on tests). • Check the wiring. • Replace the F-module.
Readback failure	$31E_H$	The F-module has detected an internal error. Possible causes: • Impermissibly high electromagnetic interference is present. • The capacitive load is too high. • The F-module is defective.	• Increase the test times (dark, light, switch-on tests). • If the error persists, replace the F-module.
Overload	320_H	The maximum permissible output current has been exceeded. The output stage has been switched off. Possible causes: • A short circuit exists. • The capacitive load is too high.	Check the process wiring.

Diagnostic message	Fault code	Meaning	Remedy
Auxiliary voltage too high	321_H	The supply voltage is too high.	Check the supply voltage.
Auxiliary voltage too low	322_H	The supply voltage is too low.	Check the supply voltage.
F-module error (0x032F)	$32F_H$	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• The internal diagnostics has detected an error. Pulling and plugging the module or POWER OFF – POWER ON is necessary. • If the F-module cannot be put into operation anymore, consider a replacement.

Supply voltage outside the nominal range

If the supply voltage L+ is outside the specified value range, the DIAG LED flashes and the module is passivated.

When the voltage is then recovered (level must remain within the specified value for at least 1 minute (see Technical specifications (Page 51) Voltages, Currents, Potentials)), the DIAG LED stops flashing. The module remains passivated.

Generally applicable information on diagnostics

For information on diagnostics which apply to all fail-safe modules (e.g. for reading out the diagnostic functions, passivation of channels), refer to the SIMATIC Safety - Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual or S7 Distributed Safety - Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/22099875).

7.4 Value status

Properties

In addition to the diagnostic messages and the status and error display, the F-module makes available information about the validity of each input and output signal – the value status. The value status is entered in the process image along with the input signal.

Value status for digital input and output modules

The value status is additional binary information of a digital input or output signal. It is entered in the process image of the inputs (PII) at the same time as the process signal. It provides information about the validity of the input or output signal.

The value status is influenced by the wire break check, short-circuit, chatter monitoring, pulse extension, and plausibility check.

- 1_B: A valid process value is output for the channel.
- 0_B: A fail-safe value is output for the channel, or the channel is deactivated.

Assignment of the inputs and value status in the PII

Each channel of the F-module is assigned a value status in the process image of the inputs. You can find the assignment in section Address space (Page 34).

Reference

A detailed description of the evaluation and processing of the respective input signals can be found in the SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual.

Technical specifications

8

Technical specifications of F-DQ 4×24VDC/2A PM HF

The following table lists the technical specifications on the issue date. You can find a data sheet including daily updated technical specifications on the Internet (https://support.industry.siemens.com/cs/ww/en/pv/6ES7136-6DB01-0CA0/td?dl=en).

Article number	6ES7136-6DB01-0CA0
General information	
Product type designation	F-DQ 4x24VDC/2A PM HF
Firmware version	
• FW update possible	Yes
usable BaseUnits	BU type A0
Color code for module-specific color identification plate	CC02
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated from version	V20 with HSP / V21
• PROFINET from GSD version/GSD revision	GSDML V2.45
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes
power supply according to NEC Class 2 required	No
Input current	
Current consumption (rated value)	30 mA; without load
Current consumption, max.	21 mA; From the backplane bus
output voltage / header	
Rated value (DC)	24 V
Power	
Power available from the backplane bus	70 mW
Power loss	
Power loss, typ.	3 W
Address area	
Address space per module	
• Inputs	6 byte; S7-300/400F CPU, 5 byte
• Outputs	6 byte; S7-300/400F CPU, 5 byte
Hardware configuration	
Automatic encoding	Yes
• Electronic coding element type F	Yes

Article number	6ES7136-6DB01-0CA0
Digital outputs	
Type of digital output	Transistor
Number of digital outputs	4
Digital outputs, parameterizable	Yes
Short-circuit protection	Yes
• Response threshold, typ.	> 3.3 A
Open-circuit detection	Yes
• Response threshold, typ.	8 mA
Overload protection	Yes
• Response threshold, typ.	3 A
Limitation of inductive shutdown voltage to	sourcing output: -39 V DC in relation to 2M, sinking output: +47 V DC in relation to 2M
Controlling a digital input	Yes; digital output, according to IEC 61131-2, type 2
Switching capacity of the outputs	
• with resistive load, max.	2 A
• on lamp load, max.	10 W
Load resistance range	
• lower limit	12 Ω
• upper limit	2 000 Ω
Output voltage	
• for signal "1", min.	24 V; L+ (-0.5 V)
Output current	
• for signal "1" rated value	2 A
• for signal "0" residual current, max.	0.5 mA
Switching frequency	
• with resistive load, max.	30 Hz; Symmetrical
• with inductive load, max.	0.1 Hz; according to IEC 60947-5-1, DC-13, symmetrical
• with capacitive load, max.	30 Hz; observe chapter "Switching of capacitive loads" in the manual
• on lamp load, max.	10 Hz; Symmetrical
Total current of the outputs	
• Current per channel, max.	2 A; note derating data in the manual
• Current per module, max.	6 A; note derating data in the manual
Cable length	
• shielded, max.	1 000 m
• unshielded, max.	500 m
Interrupts/diagnostics/status information	
Diagnostics function	Yes
Substitute values connectable	No
Alarms	
• Diagnostic alarm	Yes
• Hardware interrupt	No
Diagnostics indication LED	
• RUN LED	Yes; green LED

Article number	6ES7136-6DB01-0CA0
• ERROR LED	Yes; red LED
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; green LED
• for channel diagnostics	Yes; red LED
• for module diagnostics	Yes; green/red DIAG LED
Potential separation	
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes
• between the channels and the power supply of the electronics	No
Isolation	
Isolation tested with	707 V DC (type test)
Standards, approvals, certificates	
Suitable for safety functions	Yes
Highest safety class achievable in safety mode	
• Performance level according to ISO 13849-1	PLe
• Category according to ISO 13849-1	Cat. 4
• SIL acc. to IEC 61508	SIL 3
Probability of failure (for service life of 20 years and repair time of 100 hours)	
– Low demand mode: PFDavg in accordance with SIL2	< 2.00E-04
– Low demand mode: PFDavg in accordance with SIL3	< 2.00E-05
– High demand/continuous mode: PFH in accordance with SIL2	< 1.00E-08 1/h
– High demand/continuous mode: PFH in accordance with SIL3	< 1.00E-09 1/h
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	0 °C
• horizontal installation, max.	60 °C
• vertical installation, min.	0 °C
• vertical installation, max.	50 °C
Altitude during operation relating to sea level	
• Installation altitude above sea level, max.	4 000 m; Restrictions for installation altitudes > 2 000 m, see manual
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	30 g

Temperature characteristic values

Mounting position	Maximum temperature	Total current across all channels
Horizontal	40 °C	6 A
	50 °C	5 A
	60 °C	4 A
Vertical	50 °C	4 A

NOTE

Due to the small size of output modules with higher loads, pay attention to the heat development between adjacent modules. If overtemperature occurs in an output module exposed to an elevated load, shutdown may result and reduce the plant availability. If you fully load an output module, the average total current of the modules directly adjacent to it should not exceed 75% of the values listed in the technical specifications. If you load directly adjacent modules with their maximum total current, reduce the maximum total current of the output module by 1 A (e.g., for horizontal installation up to 60 °C → total current of 3 A across all channels).

Dimension drawing

See ET 200SP BaseUnits (https://support.industry.siemens.com/cs/ww/en/view/59753521) manual

Response times

A

Introduction

The reaction time of the digital output module F-DQ 4×24VDC/2A PM HF is specified below. The reaction times of the digital output module F-DQ 4×24VDC/2A PM HF are included in the calculation of the reaction time of the F-system.

Definition of response time for fail-safe digital outputs

The response time represents the interval between an incoming safety message frame from the backplane bus and the signal change at the digital output.

Times required for the calculation

- Maximum cycle time: T_{cycle} = 5 ms
- Max. acknowledgment time (device acknowledgment time): T_{DAT} = 31 ms

You configure the dark test time (Readback time, T_{rb}) and switch-on time (Readback time switch-on test, T_{rb_swon}) in STEP 7.

Definition of maximum reaction time in an error-free scenario (worst case delay time, WCDT)

The maximum reaction time (T_{WCDT}) for fail-safe digital outputs in the error-free case is as follows:

Max. reaction time (T_{WCDT}) = 2 × T_{cycle} + Maximum T_{rb} (dark test time), T_{rb_swon} (switch-on time)

Definition of maximum reaction time if there is a fault/error (one fault delay time, OFDT)

Max. reaction time (T_{OFDT}) = 2 × T_{cycle} + Maximum T_{rb} (dark test time), T_{rb_swon} (switch-on time)

Maximum reaction time when a channel fault is detected by bit pattern test

Max. reaction time (T_{WCDT}) = 2 ×T_{cycle} + Maximum T_{rb} (dark test time), T_{rb_swon} (switch-on time) + configured test time

Mode of operation: Disable Dark Test for 48 hours - enabled

It can take up to a process value change 0-1 on the corresponding channel before a channel fault is detected. Note the restrictions in the section Disable Dark Test for 48 hours (Page 25).

Switching of loads

B

B.1 Connecting capacitive loads

If a digital output module F-DQ 4×24VDC/2A PM HF is connected to loads that require little current and have a capacitance, a short-circuit or overload may be detected. Reason: The capacitance cannot be sufficiently discharged or charged during the configured readback time of the bit pattern test.

The typical trend shown in the diagram below represents the correlation between load impedance and maximum switched load capacitance at a supply voltage of 24 V DC.

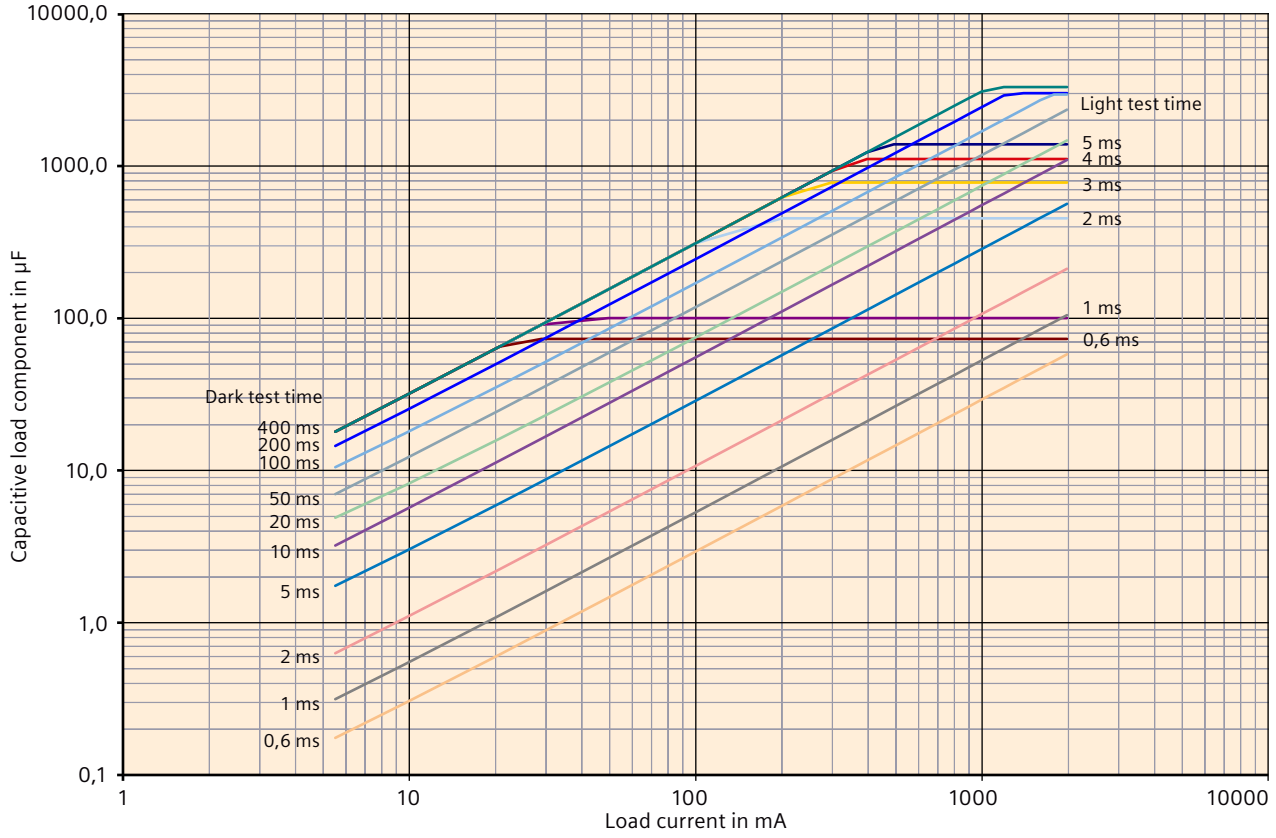


Figure 1-240 Switching of capacitive loads for digital output module F-DQ 4×24VDC/2A PM HF depending on the configured dark and light test time

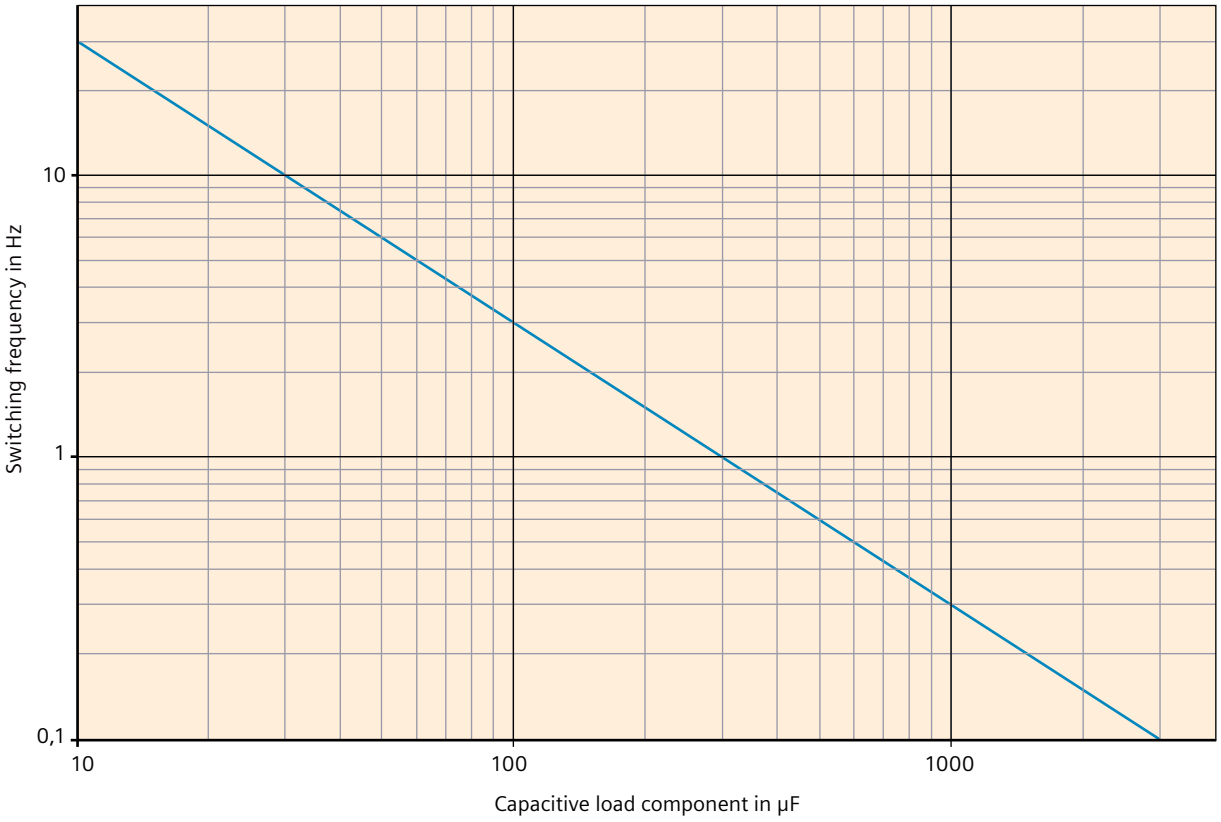

Figure 1-241 Maximum switching frequency depending on the capacity of the load

Remedy for detecting a short circuit

1. Determine the load current and capacitance of the load.
2. Locate the operating point in the diagram above.
3. If the operating point is above the curve, you must increase the load current until the new operating point is below the curve by connecting a resistor in parallel.

B.2 Switching of inductive loads

Switching of inductive loads

The diagram below shows the maximum permitted inductive loads as a function of the load current and switching frequency.

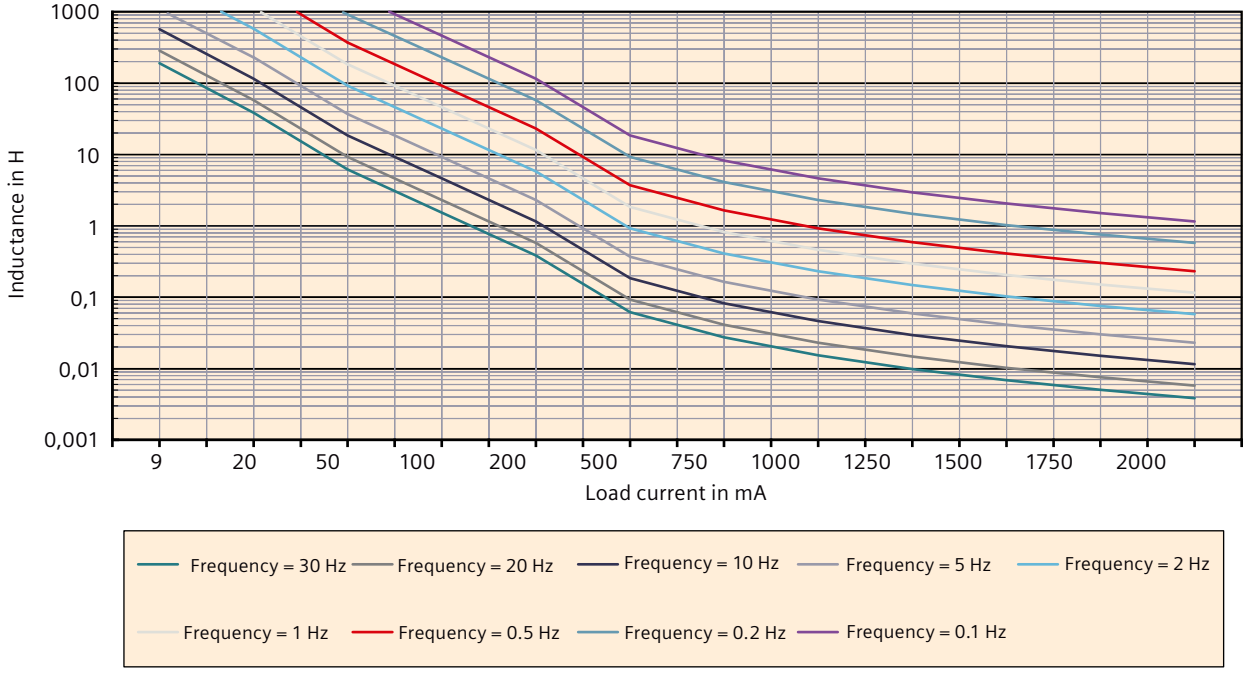

Figure 1-242 Switching of inductive loads for the digital output module F-DQ 4x24VDC/2A PM HF depending on load current and switching frequency

Preface

Purpose of the documentation

This manual supplements the system manual Distributed I/O System ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/58649293).

Functions that affect the system in general are described in this system manual.

The information in this manual and the system/function manuals provide support when you commission the system.

A description of the F-system SIMATIC Safety can be found in the programming and operating manual SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126).

Conventions

CPU: When the term "CPU" is used below, it refers to the central processing units of the S7-1200/1500 automation system and the S7-300/S7-400 automation systems of the previous generation and to CPUs of the ET 200SP distributed I/O system.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software " (STEP 7 TIA Portal)".

PII: Process image input.

Note the following identified notes:

NOTE

A note includes important information on the product described in the documentation, on handling the product or on the part of the documentation to which you ought to pay special attention.

Standards

You can find a dated reference to the respective standards in the certificate (https://support.industry.siemens.com/cs/ww/en/view/57141281) or in the EC Declaration of Conformity (https://support.industry.siemens.com/cs/ww/en/view/71764057) for the F-module.

Certified versions

You can find the certified product and firmware versions in Annex 1 of the report to the TÜV certificate (https://support.industry.siemens.com/cs/ww/en/view/57141289).

Recycling and disposal

For environmentally friendly recycling and disposal of your old equipment, contact a certified electronic waste disposal company and dispose of the equipment according to the applicable regulations in your country.

Important note for maintaining the operational safety of your system

⚠ WARNING

The operators of systems with safety-related characteristics must adhere to specific operational safety requirements. The supplier is also obliged to comply with special product monitoring measures. Siemens informs system operators in the form of personal notifications about product developments and properties which may be or become important issues in terms of operational safety.
You should subscribe to the corresponding notifications in order to obtain the latest information and to allow you to make any necessary modifications to your system.

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are

available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (https://www.siemens.com/cert).

ET 200SP documentation guide

1

1.1 Information classes ET 200SP

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.

This arrangement enables you to access the specific content you require.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Basic information

The System Manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP distributed I/O system.

The STEP 7 online help supports you in the configuration and programming.

Examples:

- ET 200SP System Manual
- System Manual ET 200SP HA/ET 200SP modules for devices used in a hazardous area
- Online help TIA Portal

Device information

Equipment manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

Examples:

- Equipment Manuals CPUs
- Equipment Manuals Interface Modules
- Equipment Manuals Digital Modules
- Equipment Manuals Analog Modules
- Equipment Manuals Motor Starter
- BaseUnits Equipment Manuals
- Equipment Manual Server Module
- Equipment Manuals Communications Modules
- Equipment Manuals Technology Modules

General information

The function manuals contain detailed descriptions on general topics relating to the SIMATIC ET 200SP distributed I/O system.

Examples:

- Function Manual ET 200AL/ET 200SP Mixed Configuration
- Function Manual Diagnostics
- Function Manual Communication
- PROFINET Function Manual
- PROFIBUS Function Manual
- Function Manual Designing Interference-free Controllers
- MultiFieldbus Function Manual

Product Information

Changes and supplements to the manuals are documented in a Product Information. The Product Information takes precedence over the device and system manuals.

You can find the latest Product Information on the ET 200SP distributed I/O system on the Internet. (https://support.industry.siemens.com/cs/de/en/view/73021864)

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet.
(https://support.industry.siemens.com/cs/cn/en/view/84133942)

Manual Collection fail-safe modules

The Manual Collection contains the complete documentation on the fail-safe SIMATIC modules, gathered together in one file.

You can find the Manual Collection on the Internet.
(https://support.industry.siemens.com/cs/ww/en/view/109806400)

1.2 Basic tools

Tools

The tools described below support you in all steps: from planning, over commissioning, all the way to analysis of your system.

TIA Selection Tool

The TIA Selection Tool tool supports you in the selection, configuration, and ordering of devices for Totally Integrated Automation (TIA).

As successor of the SIMATIC Selection Tools , the TIA Selection Tool assembles the already known configurators for automation technology into a single tool.

With the TIA Selection Tool , you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet.
(https://support.industry.siemens.com/cs/ww/en/view/109767888)

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities on various SIMATIC S7 stations as bulk operations independent of TIA Portal.

The SIMATIC Automation Tool offers a wide range of functions:

- Scanning of a PROFINET/Ethernet system network and identification of all connected CPUs
- Assignment of addresses (IP, subnet, Gateway) and device name (PROFINET device) to a CPU
- Transfer of the date and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- RUN/STOP mode switchover
- CPU localization through LED flashing
- Reading out of CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Firmware update of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet.
(https://support.industry.siemens.com/cs/ww/en/view/98161300)

PRONETA

SIEMENS PRONETA (PROFINET network analysis) is a commissioning and diagnostic tool for PROFINET networks. PRONETA Basic has two core functions:

- In the network analysis, you get an overview of the PROFINET topology. Compare a real configuration with a reference installation or make simple parameter changes, e.g. to the names and IP addresses of the devices.
- The "IO test" is a simple and rapid test of the wiring and the module configuration of a plant, including documentation of the test results.

You can find SIEMENS PRONETA Basic on the Internet:
(https://support.industry.siemens.com/cs/ww/en/view/67460624)

SIEMENS PRONETA Professional is a licensed product that offers you additional functions. It offers you simple asset management in PROFINET networks and supports operators of automation systems in automatic data collection/acquisition of the components used through various functions:

- The user interface (API) offers an access point to the automation cell to automate the scan functions using MQTT or a command line.
- With PROFIenergy diagnostics, you can quickly detect the current pause mode or the readiness for operation of devices that support PROFIenergy and change these as needed.
- The data record wizard supports PROFINET developers in reading and writing acyclic PROFINET data records quickly and easily without PLC and engineering.

You can find SIEMENS PRONETA Professional on the Internet.
(https://www.siemens.com/proneta-professional)

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and the optimal use of resources

You can find SINETPLAN on the Internet
(https://new.siemens.com/global/en/products/automation/industrial-communication/profinet/sinetplan.html).

1.3 S7 Failsafe Configuration Tool (S7-FCT)

SIMATIC S7-FCT

Failsafe Configuration Tool (FCT) enables you to GSD configure the following devices in third-party engineering systems:

- Selected, functionally fail-safe SIMATIC I/O devices
- Functionally fail-safe SIRIUS ACT PROFINET interfaces

The engineering system must meet the following requirements for this:

- Support of the CPD system integration acc. to "PROFIsafe - Profile for Safety Technology on PROFIBUS DP and PROFINET IO"
- TCI implementation to Conformance Class C3

Additional information on S7-FCT can be found on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109762827).

1.4 SIMATIC Technical Documentation

Additional SIMATIC documents will complete your information. You can find these documents and their use at the following links and QR codes.

The Industry Online Support gives you the option to get information on all topics. Application examples support you in solving your automation tasks.

Overview of the SIMATIC Technical Documentation

Here you will find an overview of the SIMATIC documentation available in Siemens Industry Online Support:

Industry Online Support International (https://support.industry.siemens.com/cs/ww/en/view/109742705)

Watch this short video to find out where you can find the overview directly in Siemens Industry Online Support and how to use Siemens Industry Online Support on your mobile device:

Quick introduction to the technical documentation of automation products per video (https://support.industry.siemens.com/cs/us/en/view/109780491)

YouTube video: Siemens Automation Products - Technical Documentation at a Glance (https://youtu.be/TwLSxxRQQsA)

mySupport

With "mySupport" you can get the most out of your Industry Online Support.

Registration	You must register once to use the full functionality of "mySupport". After registration, you can create filters, favorites and tabs in your personal workspace.
Support requests	Your data is already filled out in support requests, and you can get an overview of your current requests at any time.
Documentation	In the Documentation area you can build your personal library.
Favorites	You can use the "Add to mySupport favorites" to flag especially interesting or frequently needed content. Under "Favorites", you will find a list of your flagged entries.
Recently viewed articles	The most recently viewed pages in mySupport are available under "Recently viewed articles".
CAx data	The CAx data area gives you access to the latest product data for your CAx or CAe system. You configure your own download package with a few clicks: • Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files • Manuals, characteristics, operating manuals, certificates • Product master data

You can find "mySupport" on the Internet. (https://support.industry.siemens.com/My/ww/en)

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You can find the application examples on the Internet.
(https://support.industry.siemens.com/cs/ww/en/ps/ae)

Product overview

2.1 Properties

Article number

6ES7136-6DC00-0CA0

View of the module

① Module type and name
② LED for diagnostics
③ 2D matrix code
④ Connection diagram
⑤ LEDs for channel status
⑥ LED for supply voltage
⑦ Function class
⑧ Color identification module type
⑨ Function and firmware version
⑩ Color code to select the color identification labels
⑪ Article number

Figure 1-243 View of the module F-DQ 8x24VDC/0.5A PP HF

Properties

The module has the following technical characteristics:

- Fail-safe digital module
- PROFIsafe
- Supports the "RIOforFA-Safety" profile on F-CPUs S7-1200/1500.
- PROFIsafe address type 2
- 8 outputs, PP-switching (SIL3/Cat.4/PLe)
- Supply voltage L+
- Output current 0.5 A per output
- Sourcing output (PP-switching)
- Suitable for solenoid valves, DC contactors and signal lamps
- Direct interconnection to inputs of an F-DI possible
- Diagnostics display (DIAG red/green LED)
- Status display for each output (green LED)
- Fault display for each output (red LED)
- Diagnostics
  - e.g., short-circuit, channel-specific
  - e.g. supply voltage missing, module-specific
- Channel-specific or module-wide passivation

The module supports the following functions:

- Firmware update
- I&M identification data
- Service data (V1.0.1 and higher)

⚠ WARNING

The fail-safe performance characteristics in the technical specifications apply for a mission time of 20 years and a repair time of 100 hours. If a repair within 100 hours is not possible, remove the respective module from the BaseUnit or switch off its supply voltage before the 100 hours elapse. The module switches off independently after the 100 hours have expired. Follow the repair procedure described in section Diagnostics alarms (Page 43).

NOTE

Cyclic reading of I&M data

Cyclic reading of I&M data can affect the timing of the F-modules. You should therefore avoid short read cycles of less than 500 ms.

Accessories

The following accessory must be ordered separately:

- Labeling strips
- Color identification labels
- Reference identification labels
- Shield connection
- Electronic coding element as spare part (article number 6ES7193-6EF00-1AA0)

You can find additional information about accessories in the Distributed I/O System ET 200SP System Manual (https://support.industry.siemens.com/cs/ww/en/view/58649293).

Passivation of fail-safe outputs over a long period of time

⚠ WARNING

Unintentional activation of F-I/O with fail-safe outputs
If an F-I/O with fail-safe outputs is passivated for a period longer than that specified in the safety parameters (> 100 hours) and the fault remains uncorrected, you need to exclude the possibility that the F-I/O can be activated unintentionally by a second fault, and thus put the F-system in a dangerous state.
Even though it is highly unlikely that such hardware faults occur, you must prevent the unintentional activation of F-I/O with fail-safe outputs by using circuit measures or organizational measures.
One possibility is the shutdown of the power supply of the passivated F-I/O within a time period of 100 hours, for example.
The required measures are standardized for plants with product standards.
For all other plants, the plant operator must create a concept for the required measures and have it approved by the inspector.

Property of the individual shutdown of F-modules with fail-safe outputs:

A channel-specific shutdown occurs when a fault is detected. It is also possible to react to critical process states staggered over time or to perform safety-related shutdown of individual outputs.

Connecting

3

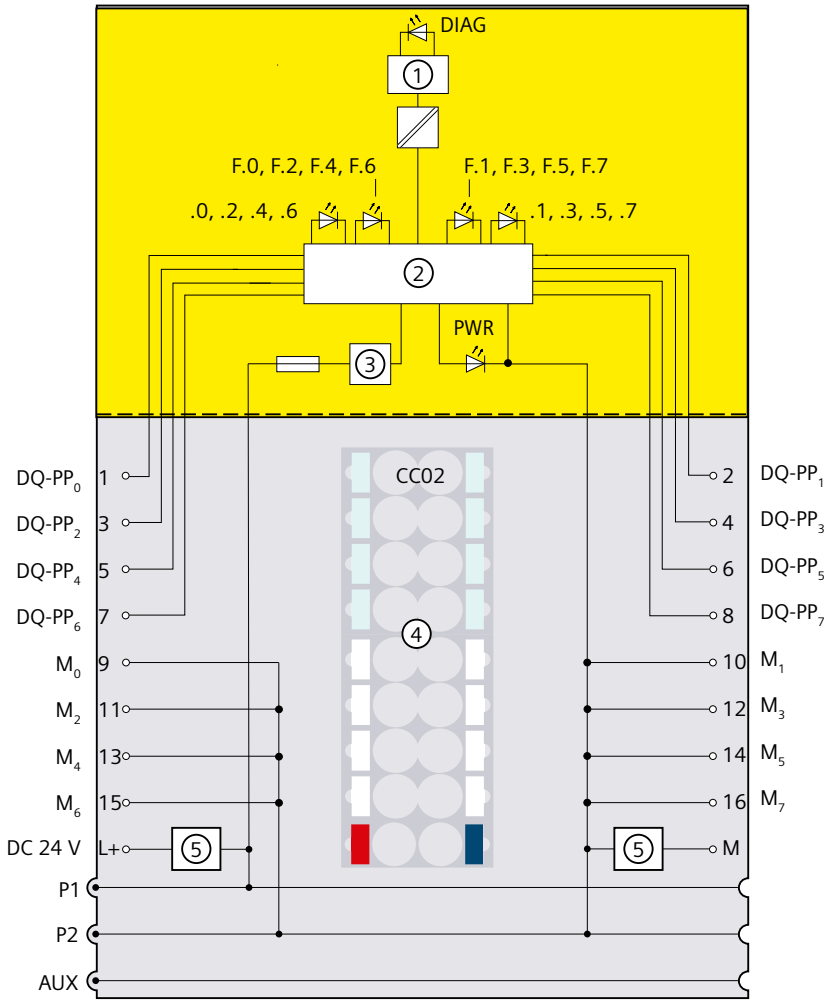
3.1 Wiring and block diagram

This section provides the block diagram of the F-DQ 8×24VDC/0.5A PP HF F-module with the terminal assignment.

You can find information about the various connection options and their configuration in the section Applications of the F-I/O module (Page 27) or Parameters/address space (Page 18).

You can find more information about wiring the BaseUnit in the ET 200SP Distributed I/O System (https://support.industry.siemens.com/cs/ww/en/view/58649293) system manual.

NOTE



The load group of the F-module must begin with a light-colored BaseUnit. Keep this in mind as well during configuration.

NOTE

Make sure that you only use the digital output module with BaseUnit type A0 during commissioning.

Block diagram

The following figure shows the terminal assignment of the F-DQ 8×24VDC/0.5A PP HF digital output module on BaseUnit BU type A0.

①	Backplane bus interface	M_n	Ground for connection of actuator of channel n.
②	Output electronics	P1, P2, AUX	Internal self-assembling voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
③	Reverse polarity protection	$DQ\text{-}PP_n$	Output bit n, channel n, PP-switching (sourcing output)
④	Color-coded label with color code CC02 (optional)	DIAG	LED error of diagnostics (green, red)
⑤	Filter circuit supply voltage (available in light-colored BaseUnit only)	.0 to .7	LED channel status (green)
24 VDC	Supply voltage L+ (feed for light-colored BaseUnit only)	F.0 to F.7	LED channel error (red)
M	Supply voltage ground	PWR	LED Power (green)

Figure 1-244 Block diagram

Parameters/address space

4

4.1 Parameters

Parameters for F-DQ 8x24VDC/0.5A PP HF

WARNING

Diagnostics functions should be activated or deactivated in accordance with the application, see section Applications of the F-I/O module (Page 27).

The following parameters are possible:

Table 1-528 Configurable parameters

Parameters	Value range	Default	Parameter reassignment in RUN	Scope
F-parameters:				
Manual assignment of F-monitoring time	• Disable • Enable	Disable	No	Module
F-monitoring time	1 to 65535 ms	150 ms	No	Module
F-source address	1 to 65534	Dependent on parameter assignment of the F-CPU	No	Module
F-destination address	1 to 65534	Suggested by F-system	No	Module
F-parameter signature (without addresses)	0 to 65535	Calculated by F-system	No	Module
Behavior after channel faults	• Passivate the entire module • Passivate channel	Passivate channel	No	Module
Reintegration after channel fault	• Adjustable • All channels automatically • All channels manually	(S7-300/400) Adjustable (S7-1200/1500) All channels manually	No	Module
F-I/O DB manual number assignment	• Disable • Enable	Disable	No	Module
F-I/O DB number	—	Suggested by F-system	No	Module
F-I/O DB name	—	Suggested by F-system	No	Module
DQ parameters:				
Maximum test period	• 100 s • 1000 s	1000 s	No	Module
Disable dark test for 48 hours	• Disable • Enable	Disable	No	Module

Parameters	Value range	Default	Parameter reassignment in RUN	Scope
Channel parameters:				
Channel n				
Activated	• Enable	Enable	No	Channel
Max. readback time light test / dark test	• 0.8 / 1.0 ms • 3.0 / 5.0 ms	0.8 / 1.0 ms	No	Channel
Activated light test	• Enable	Enable	No	Channel
Channel failure acknowledge	• Manual • Automatic The value range offered depends on the F-CPU in use and on the configuration of the F-parameter "Reintegration after channel fault".	(S7-300/400) Parameter is not supported (S7-1200/1500) Manual	No	Channel

4.2 Explanation of parameters

4.2.1 F-parameters

4.2.1.1 F-parameters

You must assign the PROFIsafe address (F-destination address together with F-source address) to the F-module before you put it into operation.

- You define the F-source address with the "Central F-source address" parameter in the F-CPU.
- An F-destination address unique throughout the CPU is automatically assigned for each F-module. You can manually change the F-destination addresses assigned in the hardware configuration.

You can find information on F-parameters for the F-monitoring time, the PROFIsafe address assignment (F-source address, F-destination address) and the F I/O DB in the manual SIMATIC Safety - Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126).

See also

S7 Distributed Safety - Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/22099875)

4.2.1.2 Behavior after channel fault

This parameter is used to specify whether the entire F-module is passivated or just the faulty channel(s) in the event of channel faults:

- "Passivate the entire module"
- "Passivate channel"

4.2.1.3 Reintegration after channel fault

Use this parameter to select how the channels of the fail-safe module are reintegrated after a fault.

Use in S7-300/400 F-CPUs
This parameter is always set to "Adjustable" when you use the fail-safe module in S7-300/400 F-CPUs.

You make the required setting in the F-I/O DB of the fail-safe module.

Use in S7-1500 F-CPUs
When using the fail-safe module in S7-1500 F-CPUs, you set this parameter in the STEP 7 dialog of the fail-safe module:

- "Adjustable"
- "All channels automatically"
- "All channels manually"

If you have set the "Behavior after channel fault" parameter to "Passivate channel", you enable individual setting of the reintegration type per channel with the parameter assignment "Adjustable". The reintegration type of the respective channel is specified with the "Channel failure acknowledge" channel parameter.

If you have set the "Behavior after channel fault" parameter to "Passivate the entire module", you can only select the same reintegration type for all channels.

4.2.2 Parameters of the channels

4.2.2.1 Maximum test period

With this parameter, you specify the time within which the light, dark tests (complete bit pattern test) should be performed throughout the module. When this time expires, the tests are repeated. In case of a fault, the test period is reduced to 60 seconds.

- Use "1000 s", for example, to conserve your actuators.
- Use "100 s" to detect faults more quickly.

4.2.2.2 Disable dark test for 48 hours

This option allows you to suppress the dark test.

To suppress dark test pulses, you must ensure that all channels together carry the 0-signal once within the 48 hours. If this condition is not fulfilled, all dark test pulses will be applied anyway on all channels after expiration of this time.

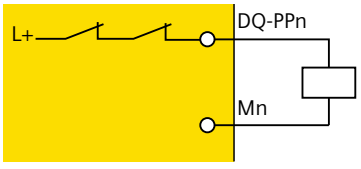
With 0-signal channels, the test pulses of light test continue to occur.

⚠ WARNING

When you use the function "Disable dark test for 48 hours", cross-circuits between channels with 1-signal are not detected.
If an error caused by short-circuits (cross-circuits) is detected when you request the safety function (shutdown of the output), not only is this output passivated, but all outputs are shut down and the F-module is passivated.
Also take into consideration the respective requirements of your product standards regarding error detection time.

When you activate the parameter "Disable dark test for 48 hours", all channels use the values set for channel 0 for the parameter "Max. readback time light test / dark test".

4.2.2.3 Activated



The channel is always activated for this F-module.

4.2.2.4 Max. readback time dark test

Function

Dark tests are shutdown tests with bit pattern test.

For a dark test, a test signal is switched to the output channel while the output channel has the 1-signal. This output channel is then briefly disabled (= "dark period") and read back. A sufficiently slow actuator does not respond to this and remains switched on.

① Readback

Figure 1-245 Functional principle of the dark test (PP switching)

This parameter allows you to set the time for the readback.

If the expected signals could not be read back correctly after expiration of the readback time dark test, the output channel is passivated.

No new process values are switched to the output channels while a bit pattern is still active (switch test is carried out). This means that a higher maximum readback time for the dark test increases the reaction time of the F-module.

⚠ WARNING

Through the configured dark test time, short-circuits (cross-circuits) to a signal with a frequency greater than 1/(2 x configured dark test time) Hz cannot be recognized (50:50 sampling ratio).
Short-circuits (cross-circuits) to an output of the same module are recognized.

The parameter also has an effect on the short-circuit detection (cross-circuit) with 1-signal when the output signal is changed from "1" to "0" with the safety program.

Setting readback time dark test

Because the fault reaction time is extended by the length of the readback time dark test, we recommend that you only use the large readback time dark test if the output channel would be passivated with the small readback time.

In case of the "Connecting a load per digital output" (Page 28) application, see the warnings and notes in the section describing the application.

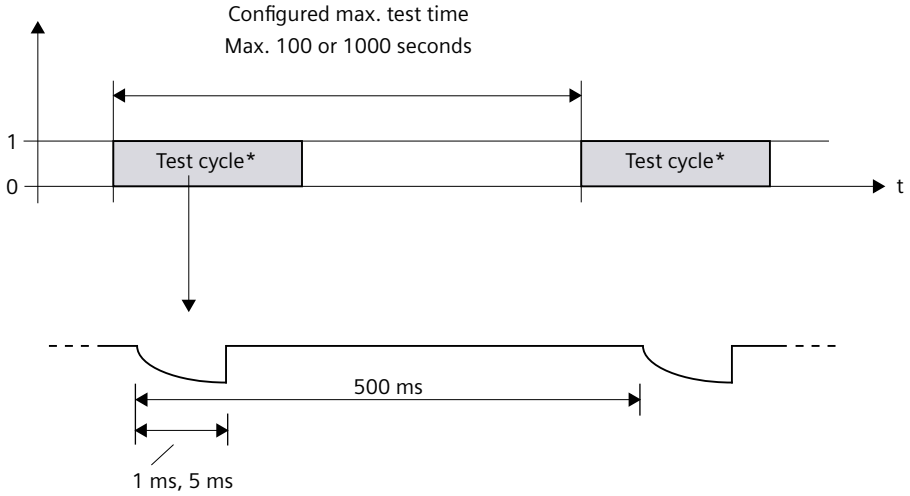
To determine the readback time required for your actuator, refer to the diagram in the section Switching capacitive loads (Page 54).

Setting readback time dark test with unknown actuator capacity

If the capacity of the actuator is not known, it may be necessary for you to set the larger readback time. This may also be necessary due to component variation in the

actuator or external influences.

Proceed as follows:



- Set the readback time dark test so that the output channel can be read back correctly but your actuator does not respond yet.
- For verification use a 1-signal with a minimum duration that corresponds to the "Maximum test period".
- If the output channel is passivated sporadically, set a higher value for the maximum readback time dark test.
- If the output channel is passivated, the readback time dark test is too small for a connected capacitive load. The discharge cannot take place during the configured readback time dark test. Increase the readback time dark test.

If you have set the readback time dark test to the maximum value of 5 ms and there is still a passivation of the output channel, there is either an external fault or the connected capacity is outside the permitted range.

To increase availability, we recommend that you maintain an interval to the determined limit for the times.

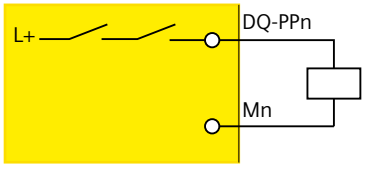
Test pulses of the dark test

The interval between two test pulses is 500 ms.

* Output of test pulses only during test cycle.

Figure 1-246 Test pulses of the dark test

NOTE



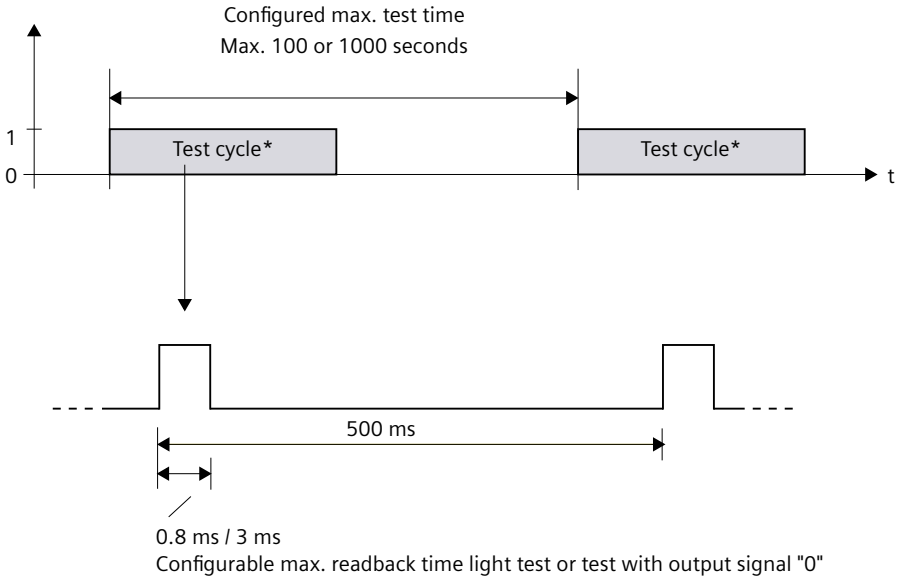
If the dark test detects an error, the affected channel is switched off with the error message "Short circuit to L+", all the other channels with the error message "Safety-related shutoff".

4.2.2.5 Max. readback time light test

Function

Short-circuit is detected with a 0-signal at the output.

For a light test, a test signal is switched to the output channel while the output channel has the 0-signal. The output channel is switched on briefly during the light test (= "light period") and read back. A sufficiently slow actuator does not respond to this and remains switched off.



① Readback

Figure 1-247 Functional principle of the light test

If the signal was not read back correctly once the maximum readback time light test has expired, the output channel is passivated.

No new process values are switched to the output channels while a bit pattern is still active (switch test is carried out). This means that a higher maximum readback time light test for the light test increases the reaction time of the F-module.

Test pulses of the light test

* Output of test pulses only during test cycle.

Figure 1-248 Test pulses of the light test

A light pulse with the configured duration takes place within the configured maximum test period per output channel.

If a light pulse returns a fault, the same light pulse (which means the same bit pattern) is repeated once after 500 ms. If the fault is still present, the maximum test period is automatically reduced to 60 seconds and a diagnostics alarm is generated. If the fault is no longer present, the output channel is reintegrated after the next fault-free test cycle.

4.2.2.6 Activated light test

The light test is always enabled for this F-module.

4.2.2.7 Channel failure acknowledge

Use on S7-1200/1500 F-CPUs
This parameter is only relevant if the fail-safe module is operated on an S7-1500 F-CPU, and can only be set if the F-parameter "Behavior after channel fault" is set to "Passivate channel" and the F-parameter "Reintegration after channel fault" is set to "Adjustable".

The value of this parameter specifies how the channel should react to a channel fault:

- Manual: A channel failure is reintegrated after manual acknowledgment.
- Automatically: The channel is reintegrated automatically after a channel fault. Manual acknowledgment is not necessary.

Use in S7-300/400 F-CPUs
The value of this parameter is not relevant in the case of operation on S7-300/400 F-CPUs. There you set the corresponding property at the F-I/O DB by means of the ACK_NEC tag.

For detailed information about the F-I/O DB, refer to the SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual.

4.3 Address space

Address assignment of the digital output module F-DQ 8x24VDC/0.5A PP HF

The digital output module F-DQ 8x24VDC/0.5A PP HF occupies the following address areas in the F-CPU:

Table 1-529 Address assignment in the F-CPU

	Occupied bytes in the F-CPU:	
F-CPU	**In input range**	**In output range**
S7-300/400 F-CPUs	IB x + 0 to x + 4	QB x + 0 to x + 4
S7-1200/1500 F-CPUs	IB x + 0 to x + 5	QB x + 0 to x + 5

x = Module start address

Address assignment of the user data and the value status of digital output module F-DQ 8x24VDC/0.5A PP HF

The user data occupy the following addresses in the F-CPU out of all the assigned addresses of the digital output module F-DQ 8x24VDC/0.5A PP HF:

Table 1-530 Address assignment of user data **in the input range**

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
IB x + 0	Value status DQ_7	Value status DQ_6	Value status DQ_5	Value status DQ_4	Value status DQ_3	Value status DQ_2	Value status DQ_1	Value status DQ_0

x = Module start address

Table 1-531 Address assignment of user data **in the output range**

Byte in the F-CPU	Assigned bits in F-CPU per F-module:							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
QB x + 0	DQ_7	DQ_6	DQ_5	DQ_4	DQ_3	DQ_2	DQ_1	DQ_0

x = Module start address

NOTE

You may only access the addresses occupied by user data and value status.
The other address areas occupied by the F-modules are assigned for functions including safety-related communication between the F-modules and F-CPU in accordance with PROFIsafe.

Additional information

For detailed information about F-I/O access, refer to the SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual.

S7 Distributed Safety - Configuring and Programming
(https://support.industry.siemens.com/cs/ww/en/view/22099875)

Applications of the F-I/O module

5

You achieve SIL3/Cat.4/PLe with the following applications.

You carry out the wiring on the appropriate BaseUnit. For more on this, see Connecting section in the system manual Distributed I/O System ET 200SP (https://support.industry.siemens.com/cs/ww/en/view/58649293).

5.1 Installation of the ground line between the power supply and the BaseUnit

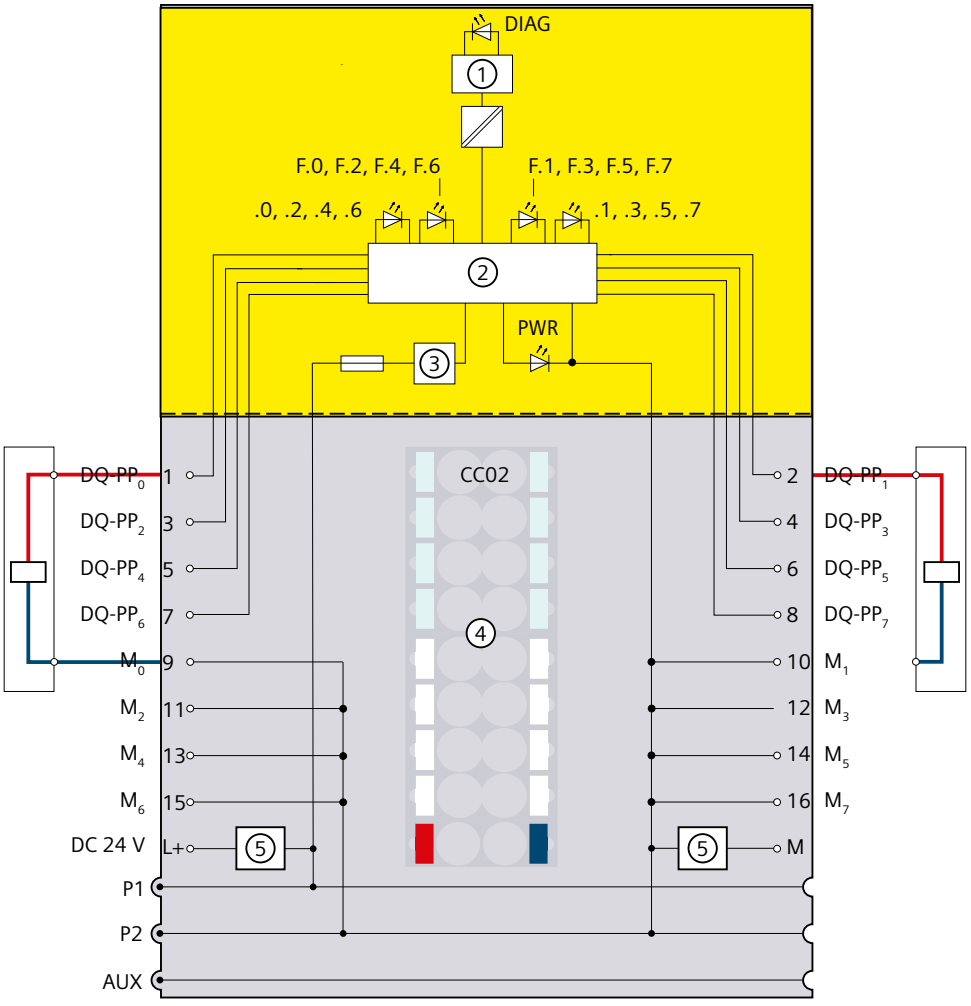
Interconnection	Achievable fail-safe performance characteristics	
	Single ground line	Redundant ground line
Connection of the load to the M_n terminal of the BaseUnit	SIL3/Cat.4/PLe	Not required
Connection of the load to the ground of the BaseUnit	SIL3/Cat.3/PLd	SIL3/Cat.4/PLe

In case of redundant installation of the ground line between the power supply and the BaseUnits, the ground connection to the BaseUnits must be installed as follows:

- When the fail-safe digital output module F-DQ 8x24VDC/0.5A PP HF is installed on a dark-colored BaseUnit, terminal M of this dark-colored BaseUnit must be additionally connected to the ground of the power supply.
- When the fail-safe digital output module F-DQ 8x24VDC/0.5A PP HF is installed on a light-colored BaseUnit, terminal M of the dark-colored BaseUnit installed to the right of the light-colored BaseUnit must be additionally connected to the ground of the power supply.

WARNING

When connecting the load to the ground of the power supply, you must run two ground lines between the power supply and the BaseUnits for safety reasons to achieve SIL3/Cat.4/PLe. Otherwise, the maximum residual current at signal "0" (specified in the technical specifications) cannot be maintained if a single ground line is interrupted.



See also

Connecting (Page 16)

5.2 Application: Wiring a load to each digital output

Each of the 8 fail-safe digital outputs consists of two P-switches, which form a PP-switch DQ-PP$_n$. You connect the load between the sourcing output DQ-PP$_n$ and ground. The ground may be the internal ground M$_n$ or an external ground. The two P-switches are always activated so that voltage is applied to the load. This circuit achieves SIL3/Cat.4/PLe.

To achieve SIL3/Cat.4/PLe see section Installation of the ground line between the power supply and the BaseUnit (Page 27).

① Backplane bus interface
② Output electronics
③ Reverse polarity protection
④ Color-coded label with color code CC02 (optional)
⑤ Filter circuit supply voltage (available in light-colored BaseUnit only)

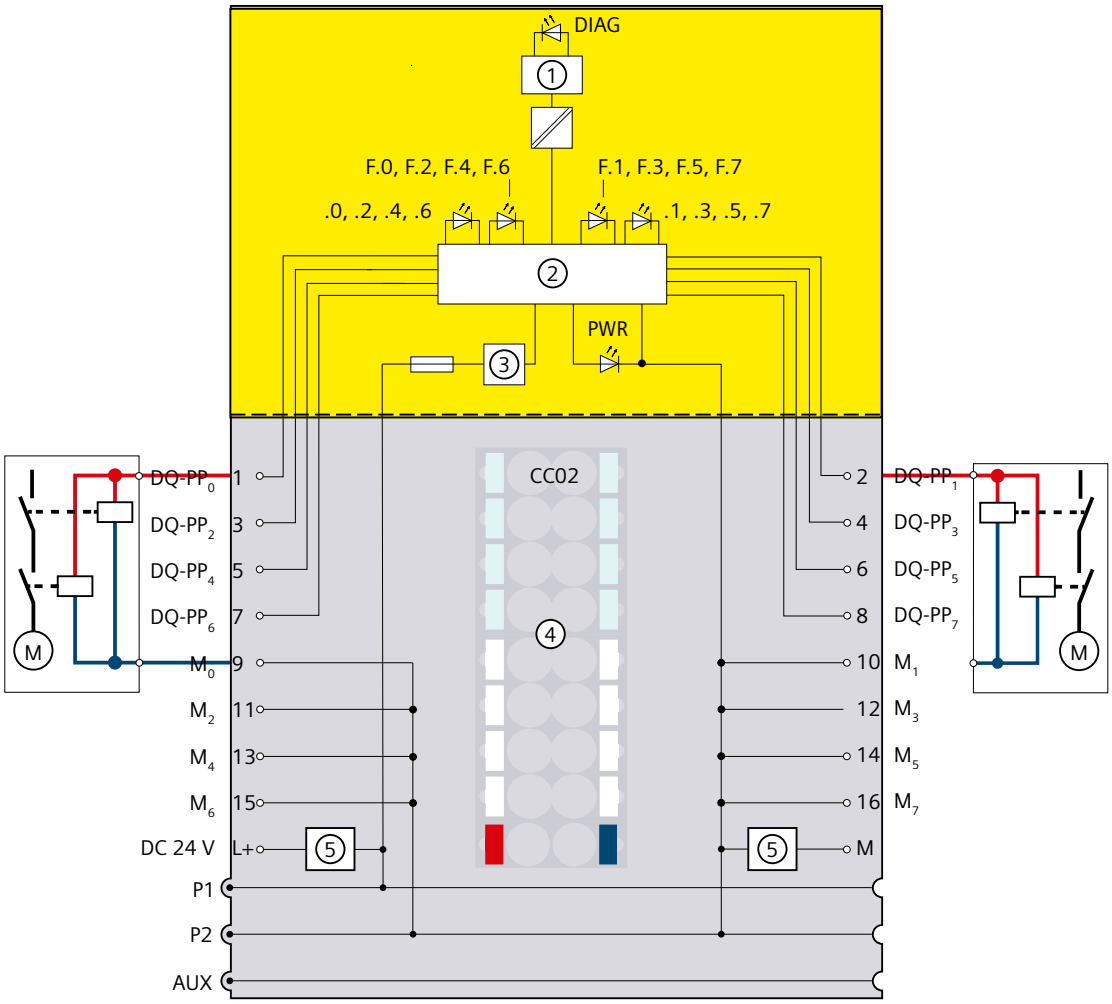
Figure 1-249 Wiring diagram for one relay each to a F-DQ of the digital output module F-DQ 8x24VDC/0.5A PP HF

⚠ WARNING

In order to achieve SIL3/Cat.4/PLe with this wiring, a suitably-qualified actuator, e.g. in accordance with IEC 60947, is required.

⚠ WARNING

The actuator can no longer be shut down if a cross circuit has developed between positive potential (e.g. L+) and DQ-PP_n. To prevent cross-circuits between positive potential (e.g. L+) and DQ-PP_n, you must route the lines used to connect the actuators in a cross-circuit-proof manner (for example, as separate, sheathed cables or in separate cable ducts).



⚠ WARNING

If there is a cross-circuit to another output at a non-passivated, switched off output, a brief 1-signal can occur with a duration of 2x max. cycle time (T_{cycle}) + Max. readback time dark test (T_{rb}).
If there is a cross-circuit between two outputs, the test pulses of light tests of the respective other output are also visible. With a different setting of the "Max. readback time light test" parameter, this can cause cyclically occurring 1-signals that last as long as the longest configured "Max. readback time light test".
If the above mentioned 1-signals dangerously affect the plant when a cross-circuit occurs between outputs, you need to guard against the cross-circuits between the outputs with a cross-circuit-proof installation, for example, with separate sheathed cables or separate cable ducts.

5.3 Application: Wiring two loads in parallel to each digital output

The ground may be the internal ground M_n or an external ground. This circuit achieves SIL3/Cat.4/PLe.

To achieve SIL3/Cat.4/PLe see section Installation of the ground line between the power supply and the BaseUnit (Page 27).

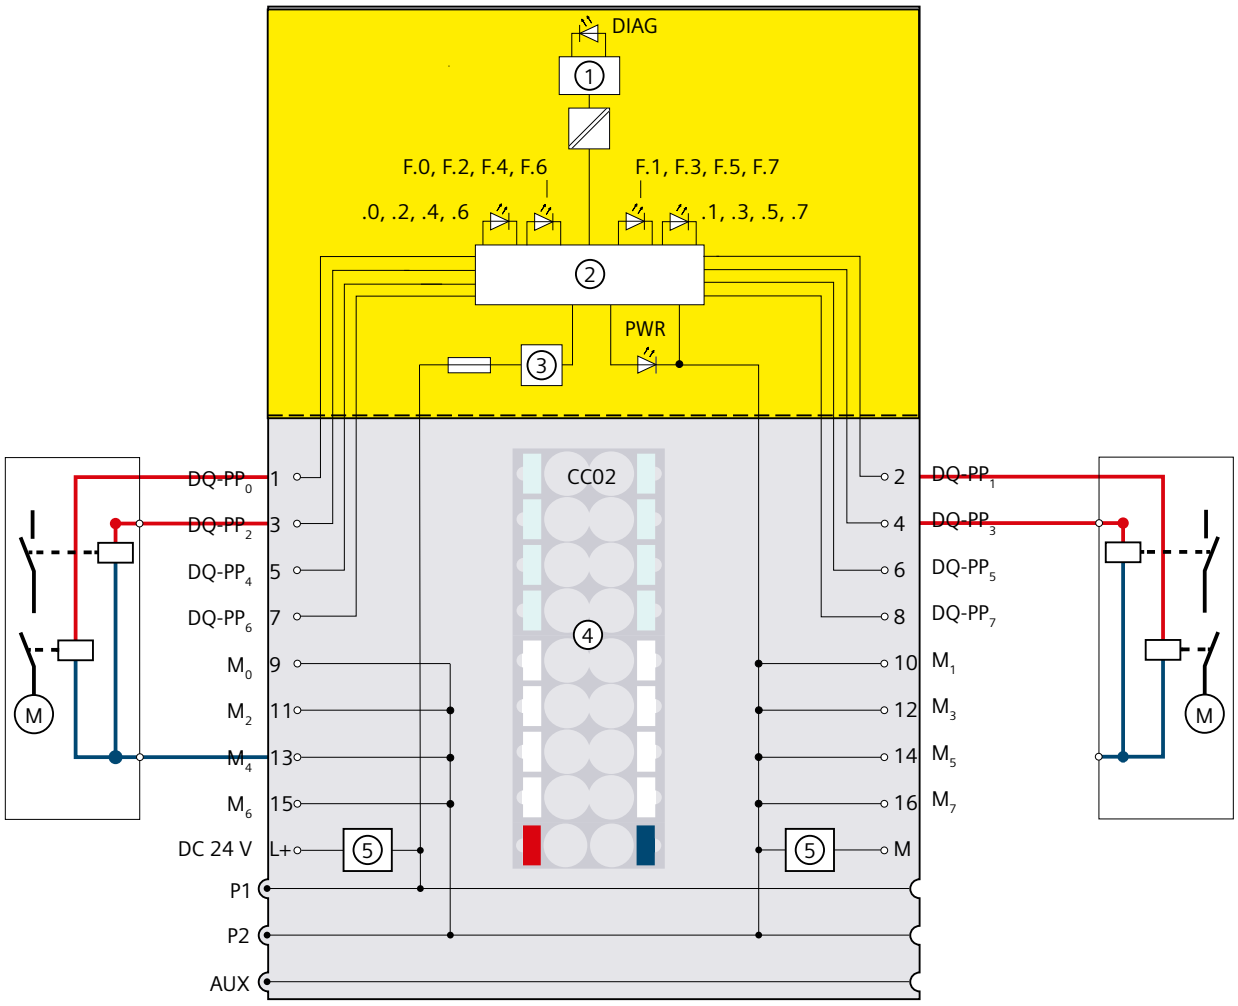
① Backplane bus interface
② Output electronics
③ Reverse polarity protection
④ Color-coded label with color code CC02 (optional)
⑤ Filter circuit supply voltage (available in light-colored BaseUnit only)

Figure 1-250 Wiring diagram for two relays in parallel to a F-DQ of the digital output module F-DQ 8x24VDC/0.5A PP HF

⚠ WARNING

The actuator can no longer be shut down if a cross circuit has developed between positive potential (e.g. L+) and DQ-PP_n. To prevent cross-circuits between positive potential (e.g. L+) and DQ-PP_n, you must route the lines used to connect the actuators in a cross-circuit-proof manner (for example, as separate, sheathed cables or in separate cable ducts).

⚠ WARNING



If there is a cross-circuit to another output at a non-passivated, switched off output, a brief 1-signal can occur with a duration of 2x max. cycle time (T_{cycle}) + Max. readback time dark test (T_{rb}).
If there is a cross-circuit between two outputs, the test pulses of light tests of the respective other output are also visible. With a different setting of the "Max. readback time light test" parameter, this can cause cyclically occurring 1-signals that last as long as the longest configured "Max. readback time light test".
If the above mentioned 1-signals dangerously affect the plant when a cross-circuit occurs between outputs, you need to guard against the cross-circuits between the outputs with a cross-circuit-proof installation, for example, with separate sheathed cables or separate cable ducts.

5.4 Application: Two-channel actuator connection via 2 digital outputs

Electronic outputs

Safety-related electronic outputs are always implemented internally using two channels. As a result, each of these outputs can be used for applications up to SIL3 according to EN 62061 or Cat.4/PLe according to EN ISO 13849-1. The two outputs must have an identical configuration and be controlled simultaneously. Passivation must take place module-wide.

The ground may be the internal ground M_n or an external ground. This circuit achieves SIL3/Cat.4/PLe. To achieve SIL3/Cat.4/PLe, see section Installation of the ground line between the power supply and the BaseUnit (Page 27).

① Backplane bus interface

② Output electronics

③ Reverse polarity protection

④ Color-coded label with color code CC02 (optional)

⑤ Filter circuit supply voltage (available in light-colored BaseUnit only)

Figure 1-251 Wiring diagram for two relays in parallel to two F-DQs of the digital output module F-DQ 8x24VDC/0.5A PP HF

WARNING

In order to achieve SIL3/Cat.4/PLe with this wiring, a suitably-qualified actuator, e.g. in accordance with IEC 60947, is required.

5.5 Application: Connection of a fail-safe digital input to each digital output

Each of the 8 fail-safe digital outputs can be connected to a fail-safe digital input of the type 1, 2 or 3 in accordance with IEC61131-2.

In this application, the input delay of the fail-safe digital input must be set so that the light test and the dark test of the fail-safe digital output do not impair the fail-safe digital input.

You can achieve SIL3/Cat.4/PLe with this circuit.

⚠ WARNING

To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified fail-safe digital input, e.g. ET 200SP F-DI 8x24VDC HF.

Input without ground return

To achieve SIL3/Cat.4/PLe see section Installation of the ground line between the power supply and the BaseUnit (Page 27).

If the fail-safe digital output module F-DQ 8x24VDC/0.5A PP HF and the fail-safe digital input module are supplied by different power supply units, the grounds of the two power supply units must be connected to each other.

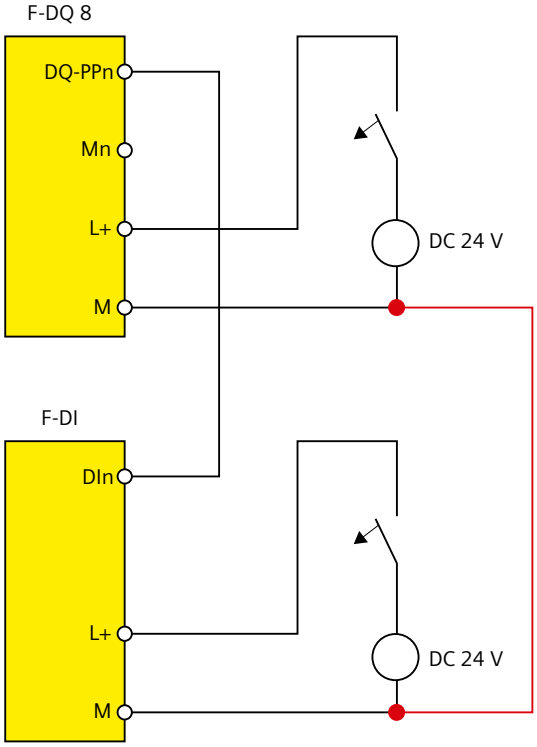


Figure 1-252 Wiring diagram of an output of the digital output module F-DQ 8x24VDC/0.5A PP HF with an input of a fail-safe digital input module (without ground return).

⚠ WARNING

To avoid an impermissible process value at the fail-safe digital input, the wiring must be installed so that an interruption of the connection between the ground of the fail-safe digital output module and the ground of the fail-safe digital input module can be excluded (e.g. redundant lines).

⚠ WARNING

In case of a cross-circuit between a positive potential (e.g. L+) and DQ-PP_n, a 1-signal is permanently present at the fail-safe digital input. To prevent cross-circuits between positive potential (e.g. L+) and DQ-PP_n, you must route the lines used to connect the fail-safe digital inputs in a cross-circuit-proof manner, for example, as separate, sheathed cables or in separate cable ducts.

⚠ WARNING

If there is a cross-circuit to another output at a non-passivated, switched off output, a brief 1-signal can occur with a duration of 2x max. cycle time (T_{cycle}) + Max. readback time dark test (T_{rb}).
If there is a cross-circuit between two outputs, the test pulses of light tests of the respective other output are also visible. With a different setting of the "Max. readback time light test" parameter, this can cause cyclically occurring 1-signals that last as long as the longest configured "Max. readback time light test".
If the above mentioned 1-signals dangerously affect the plant when a cross-circuit occurs between outputs, you need to guard against the cross-circuits between the outputs with a cross-circuit-proof installation, for example, with separate sheathed cables or separate cable ducts.

Input with ground return

To achieve SIL3/Cat.4/PLe see section Installation of the ground line between the power supply and the BaseUnit (Page 27).

In this application for potential-free, fail-safe digital inputs, the connection DI_n- of the fail-safe digital input is returned to the internal ground M_n of the fail-safe digital output module.

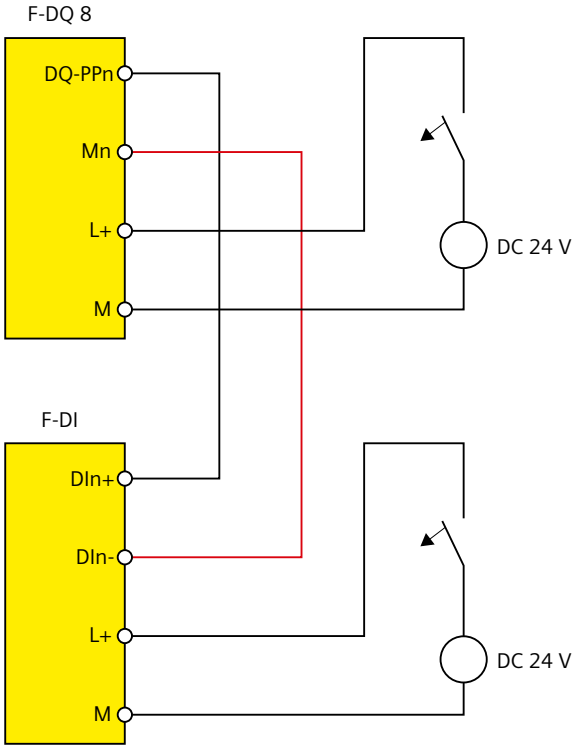

Figure 1-253 Wiring diagram of an output of the digital output module F-DQ 8x24VDC/0.5A PP HF with an input of a fail-safe digital input module (with ground return).

WARNING

In case of a cross-circuit between a positive potential (e.g. L+) and DQ-PP_n, a 1-signal is permanently present at the fail-safe digital input. To prevent cross-circuits between positive potential (e.g. L+) and DQ-PP_n, you must route the lines used to connect the fail-safe digital inputs in a cross-circuit-proof manner, for example, as separate, sheathed cables or in separate cable ducts.

WARNING

If there is a cross-circuit to another output at a non-passivated, switched off output, a brief 1-signal can occur with a duration of 2x max. cycle time (T_{cycle}) + Max. readback time dark test (T_{rb}).
If there is a cross-circuit between two outputs, the test pulses of light tests of the respective other output are also visible. With a different setting of the "Max. readback time light test" parameter, this can cause cyclically occurring 1-signals that last as long as the longest configured "Max. readback time light test".
If the above mentioned 1-signals dangerously affect the plant when a cross-circuit occurs between outputs, you need to guard against the cross-circuits between the outputs with a cross-circuit-proof installation, for example, with separate sheathed cables or separate cable ducts.

5.6 Application: Connection of the ET 200SP digital output module F-RQ 1x24VDC/24..230VAC/5A (6ES7136-6RA00-0BF0)

You can use any of the 8 fail-safe digital outputs to actuate one or more digital output modules F-RQ 1x24VDC/24..230VAC/5A.

Pay attention to the permitted current for the corresponding output channel and the total current over all outputs at the corresponding ambient temperature.

To achieve SIL3/Cat.4/PLe see section Installation of the ground line between the power supply and the BaseUnit (Page 27).

For operation of the digital output module F-RQ 1x24VDC/24..230VAC/5A as of FS 04, use of the following readback times is required: Channel parameter Max. readback time light test/dark test with the default value "0.8 / 1.0 ms".

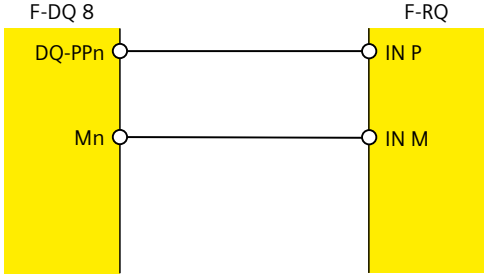

Figure 1-254 Wiring diagram

NOTE

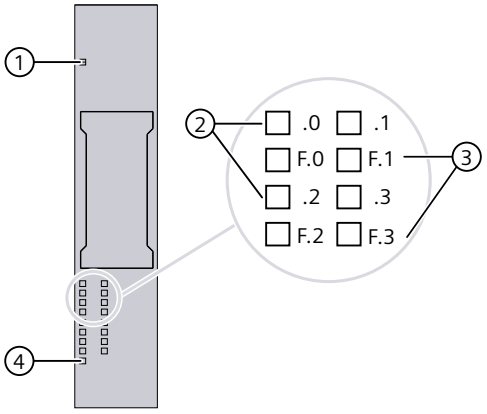
The output signals "OUT P, OUT M" of the digital output module F-RQ 1x24VDC/24..230VAC/5A are looped through from "IN P, IN M" and should therefore be considered like the output signals of the F-DQ 8x24VDC/0.5A PP HF "DQ-PP_n, M_n". For this reason, please observe the wiring rules for the F-DQ 8x24VDC/0.5A PP HF.

⚠ WARNING

The digital output module F-RQ 1x24VDC/24..230VAC/5A can no longer be shut down if a cross circuit has developed between positive potential (e.g. L+) and DQ-PP_n. To prevent cross-circuits between positive potential (e.g. L+) and DQ-PP_n, you must route the lines used to connect the digital output modules F-RQ 1x24VDC/24..230VAC/5A in a cross-circuit-proof manner, e.g. as separate, sheathed cables or in separate cable ducts.

⚠ WARNING

If there is a cross-circuit to another output at a non-passivated, switched off output, a brief 1-signal can occur with a duration of 2x max. cycle time (T_{cycle}) + Max. readback time dark test (T_{rb}).
If there is a cross-circuit between two outputs, the test pulses of light tests of the respective other output are also visible. With a different setting of the "Max. readback time light test" parameter, this can cause cyclically occurring 1-signals that last as long as the longest configured "Max. readback time light test".
If the above mentioned 1-signals dangerously affect the plant when a cross-circuit occurs between outputs, you need to guard against the cross-circuits between the outputs with a cross-circuit-proof installation, for example, with separate sheathed cables or separate cable ducts.



Interrupts/diagnostic messages

6

6.1 Status and error display

LED display

The following figure shows the LED display of the F-DQ 8x24VDC/0.5A PP HF.

① DIAG (green/red)
② Channel status (green)
③ Channel fault (red)
④ PWR (green)

Figure 1-255 LED display

Meaning of the LED displays

The following tables show the meaning of the status and error displays. You can find solutions for diagnostics alarms in section Diagnostics alarms (Page 43).

WARNING

The DIAG LED and the channel status and channel fault LEDs of the outputs are not designed as safety-related LEDs and therefore may not be evaluated for safety-related activities.

DIAG LED

Table 1-532 Error display of the LED DIAG

DIAG	Meaning
Off	Backplane bus supply of the ET 200SP not okay
Flashing	Module parameters not configured

DIAG	Meaning
On	Module parameters configured and no module diagnostics
Flashing	• Module parameters configured and module diagnostics • Operation in S7-1200/1500 F-CPUs: At least one channel is waiting for user acknowledgment.
Flashing	• Operation in S7-1200/1500 F-CPUs: The F-module expects user acknowledgment after a module error. • Operation in S7-300/400 F-CPUs: The F-module is waiting for user acknowledgment.

Channel status/channel fault LED

Table 1-533 Status display of the LEDs channel status / channel error

Channel status	Channel fault	Meaning
Off	Off	Process signal = 0 and no channel diagnostics
On	Off	Process signal = 1 and no channel diagnostics
Off	On	Process signal = 0 and channel diagnostics
Alternately flashing		• Operation in S7-1200/1500 F-CPUs: At least one channel is waiting for user acknowledgment. • Operation in S7-300/400 F-CPUs: At least one channel is waiting for user acknowledgment.

Channel status/DIAG/channel fault LED

Table 1-534 Status display of the LEDs channel status / DIAG / channel error

Channel status	DIAG	Channel fault	Meaning
Off	Flashing	All On	The PROFIsafe address does not match the configured PROFIsafe address or there is a module fault. See section Interrupts (Page 42).
Flashing	Flashing	Off	Identification of the F-module when assigning the PROFIsafe address

PWR LED

Table 1-535 Status display of LED PWR

PWR	Meaning
Off	Supply voltage L+ missing
On	Supply voltage L+ available

6.2 Interrupts

Introduction

The fail-safe digital output module F-DQ 8x24VDC/0.5A PP HF supports diagnostic interrupts.

Diagnostic interrupts

The F-module generates a diagnostic interrupt for each diagnostics alarm described in section Diagnostics alarms (Page 43).

The list below provides an overview of the diagnostic interrupts of the F-module. The diagnostic interrupts are assigned either to one channel or the entire F-module.

⚠ WARNING

Before acknowledging the short circuit diagnostics message, correct the respective fault and validate your safety function. In this case, follow the steps described in section Diagnostics alarms (Page 43).

Module-wide diagnostic interrupts

- Overtemperature
- Error
- Parameter error
- Supply voltage missing
- Safety-related shutoff
- Channel/component temporarily unavailable
- Mismatch of safety destination address (F_Dest_Add)
- Safety destination address not valid (F_Dest_Add)
- Safety source address not valid (F_Source_Add)
- Safety watchdog time value is 0 ms (F_WD_Time)
- Parameter F_SIL exceeds SIL from specific device application
- Parameter F_CRC_Length does not match the generated values
- Version of F-parameter set incorrectly
- CRC1 fault
- Save iParameter watchdog time exceeded
- Restore iParameter watchdog time exceeded
- Inconsistent iParameters (iParCRC error)
- F_Block_ID not supported
- Transmission error: Inconsistent data (CRC error)
- Transmission error: Timeout (watchdog time 1 or 2 expired)
- Module is defective
- Watchdog tripped
- Invalid/inconsistent firmware present
- F-address memory not accessible

- Undertemperature
- Supply voltage too high
- Supply voltage too low

Channel-wide diagnostic interrupts

- Short-circuit to L+
- Short-circuit to ground
- Channel failure acknowledgment
- Frequency too high

6.3 Diagnostics alarms

Diagnostics alarms

A diagnostics alarm is generated for each diagnostics event and the F-module flashes the DIAG LED. You can read out the diagnostics alarm, for example, from the diagnostics buffer of the F-CPU. You can evaluate the error codes using the user program.

NOTE

You can connect several actuators per output.
If several actuators are connected to an output, the diagnostics of each actuator affects the other ones.
In other words, a single short-circuit affects multiple actuators.

Once the fault is eliminated, the F-module must be reintegrated in the safety program. For additional information on passivation and reintegration of F-I/O, refer to the SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual.

Table 1-536 Diagnostics alarms, their meaning and possible remedies

Diagnostics alarm	Fault code	Meaning	Solution
Overtemperature	5_H	An excessively high temperature was measured in the F-module.	Operate the F-module within the specified temperature range (see Technical specifications (Page 48)) Once the temperature has been reduced and returns to the specified range, the F-module must be removed and inserted or the power switched OFF and ON.
Parameter error	10_H	Parameter assignment errors include: • The F-module cannot use the parameters (unknown, invalid combination, etc.). • The F-module parameters have not been configured.	Correct the parameter assignment.
Supply voltage missing	11_H	Missing or insufficient supply voltage L+	• Operate the F-module within the specified supply voltage range. • Check BaseUnit type

Diagnostics alarm	Fault code	Meaning	Solution
Safety-related shutoff	19_H	For safety purposes, channel was switched off due to an error on another channel. Possible causes: • A short-circuit exists. • The capacitive load is too high.	• Correct the process wiring. • Increase the test times (dark, light).
Channel/component temporarily unavailable	$1F_H$	The firmware version of the F-module is inconsistent.	Repeat the firmware update.
Mismatch of safety destination address (F_Dest_Add)	40_H	The firmware of the F-module has detected a different F-destination address.	• Check the parameter assignment of the PROFIsafe driver and the PROFIsafe address assigned to the F-module. • Assign the PROFIsafe address to the F-module (again).
Safety destination address not valid (F_Dest_Add)	41_H	The firmware of the F-module has detected an illegal different F-destination address.	Check the configuration/parameter assignment of the iPar server.
Safety source address not valid (F_Source_Add)	42_H	The firmware of the F-module has detected a different F-source address.	
Safety watchdog time value is 0 ms (F_WD_Time)	43_H	The firmware of the F-module has detected an invalid watchdog time.	
Parameter F_SIL exceeds SIL from specific device application	44_H	The firmware of the F-module has detected a discrepancy between the SIL setting of the communication and the application.	
Parameter F_CRC_Length does not match the generated values	45_H	The firmware of the F-module has detected a discrepancy in the CRC length.	
Version of F-parameter set incorrectly	46_H	The firmware of the F-module has detected an incorrect F_Par_Version or an invalid F_Block_ID.	
CRC1 fault	47_H	The firmware of the F-module has detected inconsistent F-parameters.	
Save iParameter watchdog time exceeded	49_H	iPar server does not respond to "save IPar" within 4.4 minutes.	
Restore iParameter watchdog time exceeded	$4A_H$	iPar server does not respond to "restore IPar" within 4.4 minutes.	Check the configuration/parameter assignment of the iPar server.
Inconsistent iParameters (iParCRC error)	$4B_H$	The firmware of the F-module has detected inconsistent iParameters.	Check the parameter assignment.
F_Block_ID not supported	$4C_H$	The firmware of the F-module has detected an incorrect block ID.	Check the parameter assignment of the PROFIsafe driver.
Transmission error: Inconsistent data (CRC error)	$4D_H$	The firmware of the F-module has detected a CRC error. Possible causes: • The communication between the F-CPU and F-module is disturbed. • Impermissibly high electromagnetic interference is present. • An error occurred in the sign-of-life monitoring.	• Check the communication connection between the F-module and F-CPU. • Eliminate the electromagnetic interference. • Power switched OFF and ON for station • Assign the configuration and parameter assignment to the F-module (of the station).

Diagnostics alarm	Fault code	Meaning	Solution
Transmission error: Timeout (watchdog time 1 or 2 expired)	$4E_H$	The firmware of the F-module has detected a timeout. Possible causes: • The F-monitoring time is set incorrectly. • A bus fault is present.	• Check the parameter assignment. • Ensure that communication is functioning correctly.
Module is defective	100_H	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module has detected an internal error and has reacted in a safety-related manner. • Wrong BaseUnit	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON • If the F-module cannot be put back into operation, consider replacing it. • Use a BaseUnit of the type A0.
Watchdog tripped	103_H	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module has detected an internal error and has reacted in a safety-related manner.	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON • If the F-module cannot be put back into operation, consider replacing it.
Short-circuit to L+	105_H	Short circuit to L+ can mean: • The output cable is short-circuited to L+. • The capacitive load between the channels is too high (for example, due to cable length or load current being too low). • There is a short circuit between two output channels. You must eliminate the error within 100 hours; otherwise, the F-module is permanently passivated and an acknowledgment is no longer possible.	• Correct the process wiring. • Increase the test times (dark, light). • Pay attention to the warnings in Applications of the F-I/O module (Page 27).
Short-circuit to ground	106_H	Short-circuit to ground can mean: • The output cable is short-circuited to ground. • The output signal is short-circuited to ground. • The capacitive load is too high. You must eliminate the error within 100 hours; otherwise, the F-module is permanently passivated and an acknowledgment is no longer possible.	• Correct the process wiring. • Increase the test times (dark, light). • Check the actuator.
Invalid/inconsistent firmware present	$11B_H$	The firmware is incomplete and/or firmware added to the F-module is incompatible. This leads to errors or functional limitations when operating the F-module.	• Perform a firmware update for all parts of the F-module and note any error messages. • Use only firmware versions released for this F-module.
Channel failure acknowledgment	$30B_H$	A channel fault was detected. Confirmation is required to enable the channel.	Confirm the channel fault.
F-address memory not accessible	$30D_H$	The F-source address and F-destination address stored in the coding element cannot be accessed.	Verify that the coding element is present or replace the coding element.
Frequency too high	311_H	The maximum switching frequency of the F-module has been exceeded.	Reduce the switching frequency (see Technical specifications (Page 48))

Diagnostics alarm	Fault code	Meaning	Solution
Undertemperature	312_H	The minimum permissible temperature limit has been violated.	Operate the F-module within the specified temperature range (see Technical specifications (Page 48)) Once the temperature has increased and returns to the specified range, the F-module must be removed and inserted or the power switched OFF and ON.
Supply voltage too high	321_H	The supply voltage is too high.	Check the supply voltage and then test the safety application.
Supply voltage too low	322_H	• The supply voltage is too low. • EMC, wrong BaseUnit	Check the supply voltage and then test the safety application.

Supply voltage outside the nominal range

If the supply voltage L+ is outside the specified value range, the DIAG LED flashes and the module is passivated.

A supply voltage that is too low is detected for voltages less than 17 V. A supply voltage that is too high is detected for voltages greater than 32 V.

When the voltage is then recovered (level must remain within the specified value range for at least 1 minute (see Technical specifications (Page 48): Voltages, Currents, Potentials)), the DIAG LED stops flashing. The module remains passivated.

Generally applicable information on diagnostics

Information on diagnostics that pertains to all fail-safe modules (for example, readout of diagnostics functions or passivation of channels) is available in the SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual.

6.4 Value status

Properties

In addition to the diagnostics alarm and the status and error display, the F-module provides information about the validity of each input and output signal – the value status. The value status is entered in the process image along with the input signal.

Value status for digital input and output modules

The value status is additional binary information of a digital input or output signal. It is entered in the process image of the inputs (PII) at the same time as the process signal. It provides information about the validity of the input or output signal.

The value status is affected by a short-circuit and the plausibility check.

- 1_B: A valid process value is output for the channel.
- 0_B: A fail-safe value is output for the channel, or the channel is deactivated.

Assignment of the inputs and value status in the PII

Each channel of the F-module is assigned a value status in the process image of the inputs. You can find the assignment in section Address space (Page 25).

Reference

A detailed description of the evaluation and processing of the respective input signals can be found in the SIMATIC Safety – Configuring and Programming (https://support.industry.siemens.com/cs/ww/en/view/54110126) manual.

Technical specifications

7

Technical specifications of F-DQ 8x24VDC/0.5A PP HF

The table below shows the technical specifications as of 12/2022. A data sheet with technical specifications updated on a daily basis can be found on the Internet (https://support.industry.siemens.com/cs/ww/en/pv/6ES7136-6DC00-0CA0/td?dl=en).

Article number	6ES7136-6DC00-0CA0
General information	
Product type designation	F-DQ 8x24 V DC/0.5 A PP HF
Firmware version	
• FW update possible	Yes
usable BaseUnits	BU type A0
Color code for module-specific color identification plate	CC02
Product function	
• I&M data	Yes; I&M0 to I&M3
Engineering with	
• STEP 7 TIA Portal configurable/integrated from version	V14 SP1 with HSP 202
• STEP 7 configurable/integrated from version	V5.5 SP4 HF5
• PROFINET from GSD version/GSD revision	V2.31
Supply voltage	
Rated value (DC)	24 V
permissible range, lower limit (DC)	19.2 V
permissible range, upper limit (DC)	28.8 V
Reverse polarity protection	Yes
power supply according to NEC Class 2 required	No
Input current	
Current consumption (rated value)	75 mA; without load
Current consumption, max.	21 mA; From the backplane bus
output voltage / header	
Rated value (DC)	24 V
Power	
Power available from the backplane bus	70 mW
Power loss	
Power loss, typ.	3 W
Address area	
Address space per module	
• Inputs	6 byte; 5 bytes non-RIOforFA; 6 bytes RIOforFA
• Outputs	6 byte; 5 bytes non-RIOforFA; 6 bytes RIOforFA

Article number	6ES7136-6DC00-0CA0
Hardware configuration	
Automatic encoding	Yes
• Electronic coding element type F	Yes
Digital outputs	
Type of digital output	Transistor
Number of digital outputs	8
Digital outputs, parameterizable	Yes
Short-circuit protection	Yes
• Response threshold, typ.	Min. 0.7 A
Open-circuit detection	No
Limitation of inductive shutdown voltage to	Typ. -39 V
Controlling a digital input	Yes
Switching capacity of the outputs	
• with resistive load, max.	0.5 A
• on lamp load, max.	2 W
Load resistance range	
• lower limit	48 Ω
• upper limit	12 000 Ω
Output voltage	
• for signal "1", min.	24 V; L+ (-0.5 V)
Output current	
• for signal "1" rated value	0.5 A
• for signal "0" residual current, max.	0.5 mA
Switching frequency	
• with resistive load, max.	30 Hz; Symmetrical
• with inductive load, max.	0.1 Hz; according to IEC 60947-5-1, DC-13, symmetrical
• with capacitive load, max.	2 Hz; Symmetrical
• on lamp load, max.	10 Hz; Symmetrical
Total current of the outputs	
• Current per channel, max.	0.5 A; note derating data in the manual
• Current per module, max.	3 A; note derating data in the manual
Total current of the outputs (per module)	
horizontal installation	
– up to 40 °C, max.	3 A
– up to 50 °C, max.	2.5 A
– up to 60 °C, max.	2 A
vertical installation	
– up to 50 °C, max.	2 A
Cable length	
• shielded, max.	100 m
• unshielded, max.	100 m
Interrupts/diagnostics/status information	
Diagnostics function	Yes
Substitute values connectable	No

Article number	6ES7136-6DC00-0CA0
Alarms	
• Diagnostic alarm	Yes
Diagnostics indication LED	
• RUN LED	Yes; green LED
• ERROR LED	Yes; red LED
• Monitoring of the supply voltage (PWR-LED)	Yes; green PWR LED
• Channel status display	Yes; green LED
• for channel diagnostics	Yes; red LED
• for module diagnostics	Yes; green/red DIAG LED
Potential separation	
Potential separation channels	
• between the channels	No
• between the channels and backplane bus	Yes
• between the channels and the power supply of the electronics	No
Isolation	
Isolation tested with	707 V DC (type test)
Standards, approvals, certificates	
Suitable for safety functions	Yes
Highest safety class achievable in safety mode	
• Performance level according to ISO 13849-1	PLe
• Category according to ISO 13849-1	Cat. 4
• SIL acc. to IEC 61508	SIL 3
Probability of failure (for service life of 20 years and repair time of 100 hours)	
– Low demand mode: PFDavg in accordance with SIL3	< 6.00E-05
– High demand/continuous mode: PFH in accordance with SIL3	< 2.00E-09 1/h
Ambient conditions	
Ambient temperature during operation	
• horizontal installation, min.	0 °C
• horizontal installation, max.	60 °C
• vertical installation, min.	0 °C
• vertical installation, max.	50 °C
Altitude during operation relating to sea level	
• Installation altitude above sea level, max.	4 000 m; with derating
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	48 g

Response times

A

Introduction

You can find the reaction times of the F-DQ 8x24 V DC/0.5 A PP HF digital output module below. The reaction times of the F-DQ 8x24 V DC/0.5 A PP HF digital output module are included in the calculation of the F-system reaction time.

Use the SIMATIC STEP7 Reaction Time Table (https://support.industry.siemens.com/cs/ww/en/view/93839056) for this.

Definition of reaction time for fail-safe digital outputs

The reaction time represents the interval between an incoming safety message frame from the backplane bus and the signal change at the digital output.

Times required for the calculation

- Max. cycle time: T_{cycle} = 8 ms
- Max. acknowledgment time (Device Acknowledgment Time): T_{DAT} = 16 ms

The maximum reaction time in the case of fault (One Fault Delay Time, OFDT) is equivalent to the maximum reaction time with no faults (Worst Case Delay Time, WCDT).

You assign the parameters for maximum readback time dark test (T_{rb}) and maximum readback time light test (T_{rb_lt}) in STEP 7 or the TIA Portal.

Operating mode: Disable dark test for 48 hours – disabled

Maximum reaction time with no faults (Worst Case Delay Time, WCDT)
$t <= 4 * T_{cycle}$

Maximum reaction time with detection of a channel fault by readback
$t <= 6 * T_{cycle} + T_{rb}$

Maximum reaction time with detection of a channel fault by bit pattern test
$t <= 2 * T_{cycle}$ + maximum test period

Operating mode: Disable dark test for 48 hours – enabled

Maximum reaction time with no faults (Worst Case Delay Time, WCDT)
$t <= 5 * T_{cycle} + T_{rb} + T_{rb_lt}$

Maximum reaction time with detection of a channel fault
A channel fault may not be detected until a 0-1 process value change takes place on the corresponding channel. Please note the restrictions detailed in section Disable dark test for 48 hours (Page 21)

Switching of loads

B

B.1 Connecting capacitive loads

If an F-DQ 8x24VDC/0.5A PP HF digital output module is interconnected with loads that have an excessive capacitance, this can lead to detection of a short-circuit. Reason: The capacitance cannot be sufficiently discharged or charged during the configured readback time of the bit pattern test.

The typical trend shown in the diagram below represents the correlation between load current and maximum switchable load capacitance at a supply voltage of 24 V DC.

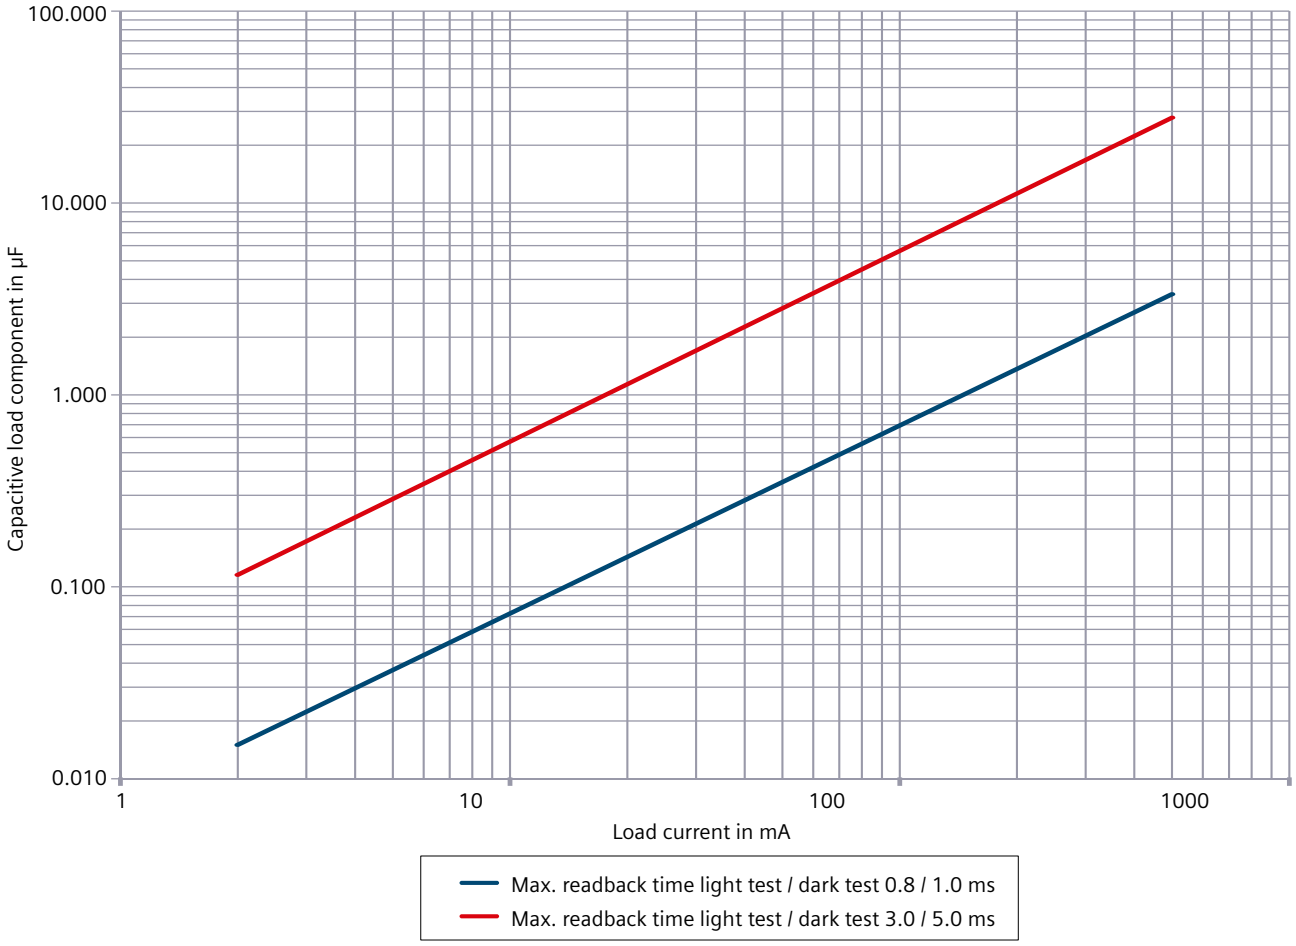

Figure 1-256 Switching of capacitive loads for the F-DQ 8x24VDC/0.5A PP HF digital output module depending on the configured max. readback time light test / dark test.

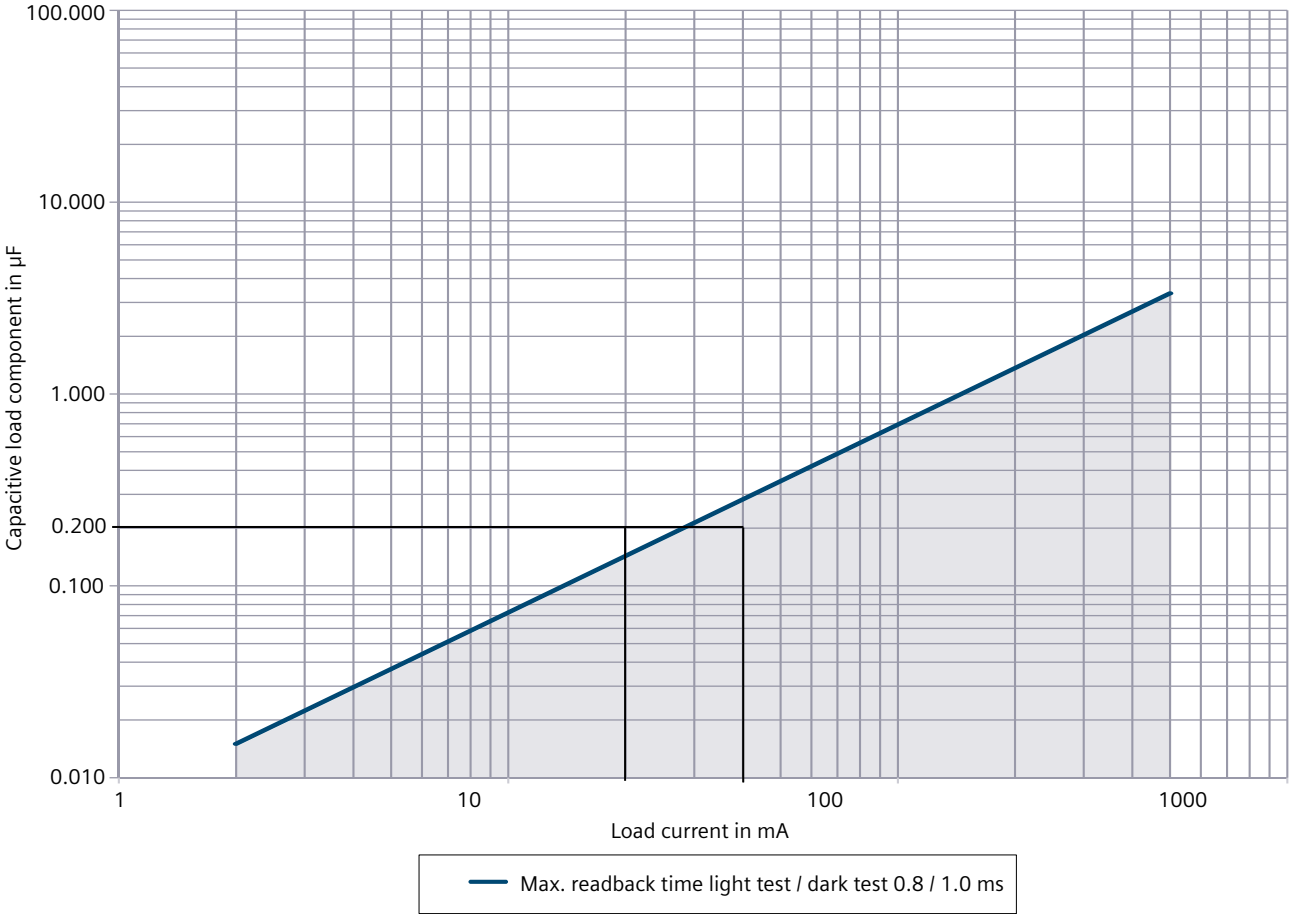

Remedy for detecting a short circuit

1. Determine the load current and capacitance of the load.
2. Locate the operating point in the diagram above.
3. If the operating point is above the trend, select an actuator with higher current consumption so that the new operating point is below the curve.

Example

You have configured a maximum readback time light test/dark test of "0.8 / 1.0 ms". You have set the load current to 20 mA and the capacity to 0.2 µF. The operating point is thus outside the range defined by the trend (gray background).

Solution: Select an actuator with higher current consumption. In this example, 40 mA. Alternatively, you can configure the parameter "Max. readback time light test / dark test" with "3.0 / 5.0 ms".

B.2 Switching of inductive loads

Switching of inductive loads

The diagram below shows the maximum permitted inductive loads as a function of the load current and switching frequency.

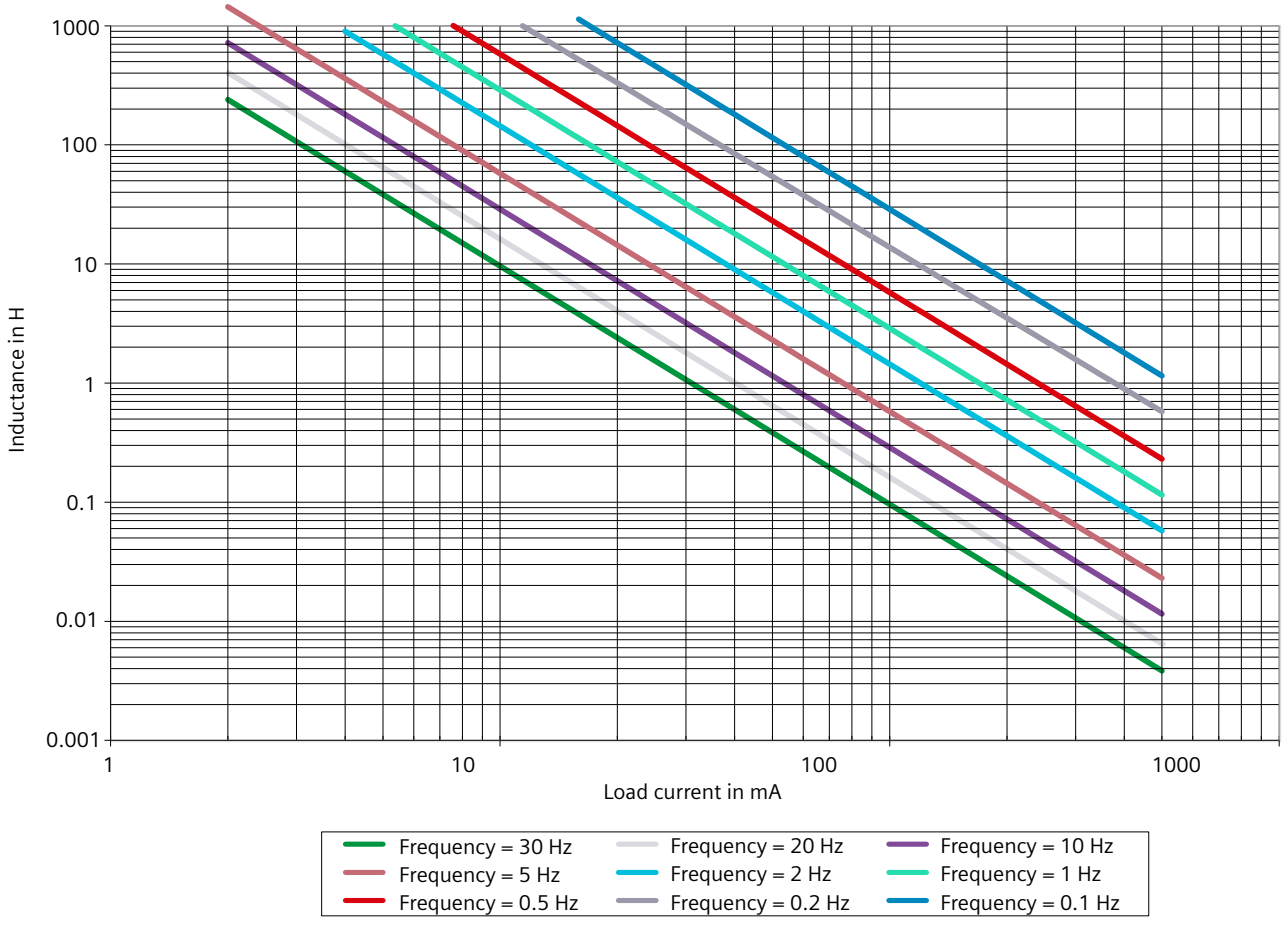

Figure 1-257 Switching of inductive loads for the F-DQ 8x24VDC/0.5A PP HF digital output module depending on the load current and switching frequency

Preface

Purpose of this documentation

This manual complements the system manual ET 200SP distributed I/O system. General functions of the ET 200SP are described in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

The information in this manual and the system manual supports you when commissioning the ET 200SP system.

Conventions

Pay particular attention to notes highlighted as follows::

NOTE

A note contains important information on the product described in the documentation, on handling the product or on the part of the documentation to which you should pay special attention.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, solutions, machines, equipment and/or networks. They are important components in a holistic industrial security concept. With this in mind, Siemens' products and solutions undergo continuous development. Siemens recommends strongly that you regularly check for product updates.

For the secure operation of Siemens products and solutions, it is necessary to take suitable preventive action (e.g. cell protection concept) and integrate each component into a holistic, state-of-the-art industrial security concept. Third-party products that may be in use should also be considered. You can find more information about industrial security on the Internet (http://www.siemens.com/industrialsecurity).

To stay informed about product updates as they occur, sign up for a product-specific newsletter. You can find more information on the Internet (http://support.automation.siemens.com).

Guide to the documentation

1

1.1 Guide to the documentation for the digital output module F-RQ 1x24VDC/24..230VAC/5A

Introduction

The documentation of the SIMATIC products has a modular structure and includes topics relating to your automation system.

The complete documentation of the ET 200SP system consists of different modules made up of system manuals, function manuals and device manuals.

The STEP 7 (online help) information system supports you when configuring and programming your automation system.

Overview of the documentation for the fail-safe digital output module F-RQ 1x24VDC/24..230VAC/5A

The table below lists additional documents that complement this description of the fail-safe digital output module F-RQ 1x24VDC/24..230VAC/5A and that are available on the Internet.

Table 1-537 Documentation for the fail-safe digital output module F-RQ 1x24VDC/24..230VAC/5A

Topic	Documentation	Most important contents
Description of the system	System manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)	• Application planning • Installation • Connecting up • Commissioning • Approvals • TÜV certificates
BaseUnits	Manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300)	Technical specifications
Description of the SIMATIC Safety F-system	Programming and operating manual SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126)	• Configuring • Programming • Approvals

SIMATIC manuals

The latest manuals for SIMATIC products are available on the Internet (http://www.siemens.com/automation/service&support) for free download.

Functional Safety Services

Siemens Functional Safety Services support you with a comprehensive package of services from risk assessment and verification right through to plant commissioning and modernization. We also offer consultation on the use of fail-safe and fault-tolerant SIMATIC S7 automation systems.

You will find more detailed information on the Internet (http://www.siemens.com/automation/service&support).

Please e-mail any queries you may have e-mail (mailto:safety-services.industry@siemens.com).

Product overview

2

2.1 Properties of the F-RQ 1x24VDC/24..230VAC/5A

Article number

6ES7136-6RA00-0BF0

View of the module

Figure 1-258 View of the F-RQ 1x24VDC/24..230VAC/5A module

Properties

- Technical properties
  - Digital module with 1 relay output (2 isolated NO contacts)
  - Safety class SIL3/category 4/PLe can be achieved if the F-RQ module is controlled by a fail-safe output (for example F-module F-DQ 4x24VDC/2A PM HF)
  - Control voltage 24 VDC
  - Total current for both NO contacts 5 A max.
  - Isolated from control voltage
  - Suitable for solenoid valves, DC contactors and signal lamps
- Supported system functions
  - I&M identification data
  - Firmware update

⚠ WARNING

The fail-safe performance characteristics in the technical specifications apply for a service life of 20 years and a repair time of 100 hours. If a repair within 100 hours is not possible, remove the module in question from the BaseUnit or switch off its supply voltage before 100 hours are up.

Accessories

The following components can be used with the module:

- Labeling strips
- Color identification labels
- Reference identification labels

Connecting up

3

3.1 Terminal assignment

General terminal assignment

Table 1-538 Terminal assignment for F-RQ 1x24VDC/24..230VAC/5A

Terminal assignment for F-RQ 1x24VDC/24..230VAC/5A (6ES7136-6RA00-0BF0)						
Terminal	**Assign-ment**	**Terminal**	**Assign-ment**	**Description**	**BaseUnit**	**Color identification label (terminals 1 to 16)**
1	RQ_{01}+ [13]	**2**	RQ_{01}- [14]	• RQ_n+, RQ_n-: Channel n • IN: Control input • OUT: Control input for loop-through	BU20-P8+A4-+0B	 CC42 6ES7193-6CP42-2MB0
3	RQ_{02}+ [23]	**4**	RQ_{02}- [24]			
5	—	**6**	—			
7	—	**8**	—			
9	IN P	**10**	OUT P			
11	IN M	**12**	OUT M

3.2 Block diagram

Block diagram

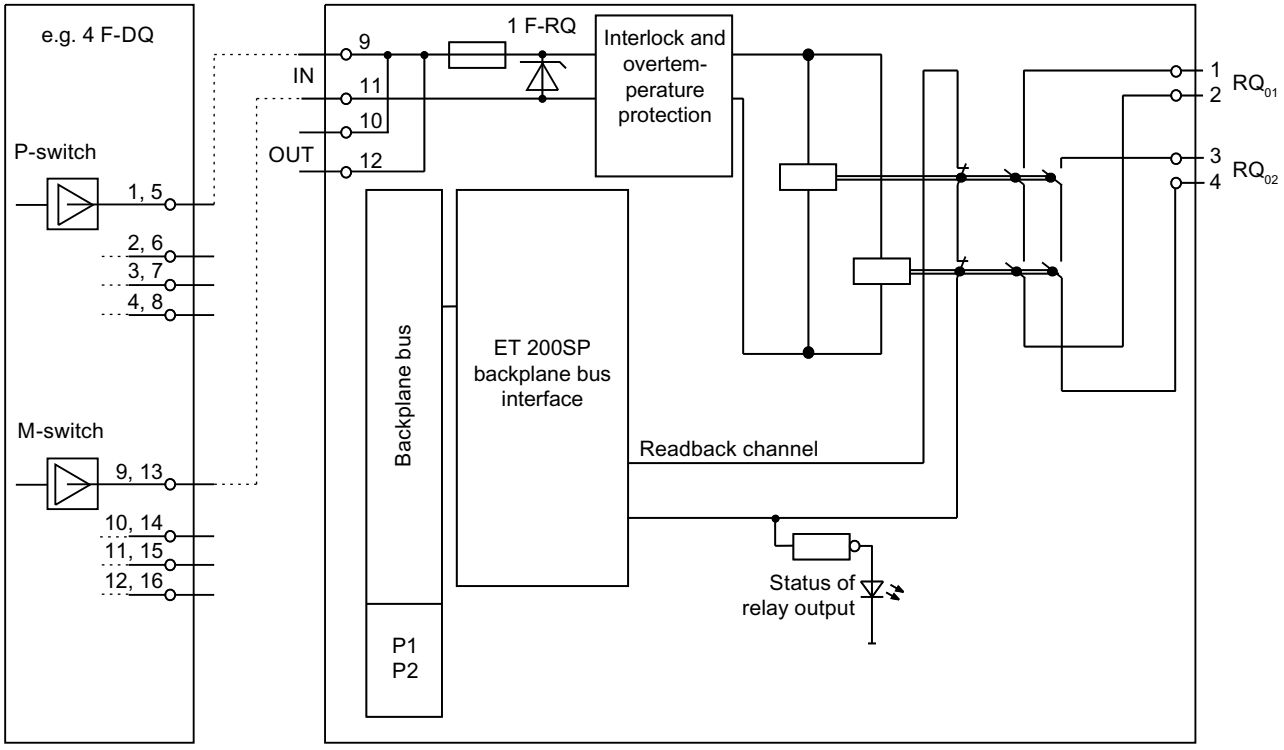

Figure 1-259 Block diagram F-RQ 1x24VDC/24..230VAC/5A

Addressing

4

4.1 Address space

Address assignment of the digital output module F-RQ 1x24VDC/24..230VAC/5A

The digital output module F-RQ 1x24VDC/24..230VAC/5A occupies the following address ranges in the F-CPU:

Table 1-539 Address assignment in the F-CPU

Occupied bytes in the F-CPU:	
in input range	**in output range**
x.0 and x.1	—

x = Module start address

Address assignment of the user data of the digital output module F-RQ 1x24VDC/24..230VAC/5A

Of the occupied addresses of the digital output module F-RQ 1x24VDC/24..230VAC/5A, the user data occupies the following addresses in the F-CPU:

Table 1-540 User data address assignment in the input range

Byte in the F-CPU	Assigned bits in F-CPU per F-RQ module:							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
x + 0	—	—	—	—	—	—	RQ_1 Inverted readback channel (corresponds to process signal at IN)	RQ_0 Readback channel

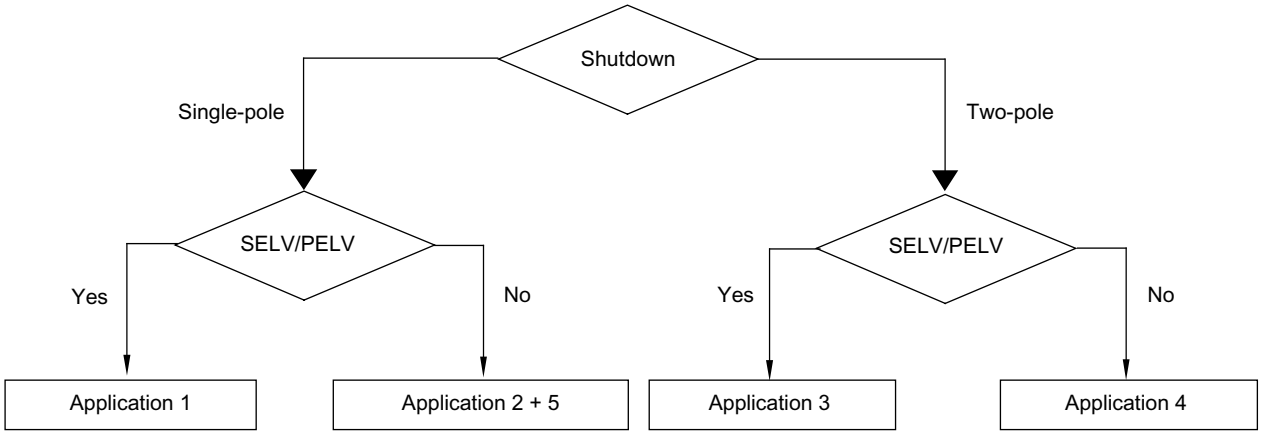
x = Module start address

The user data is in the standard process image of the inputs and is not transferred to the F-CPU in safety-related communication. The readback channel in the user program is therefore displayed as a non-failsafe variable.

NOTE

With migration projects from the ET 200S product family, note the following:
The readback channel RQ_0 (bit 0) allows direct interconnection with the FDBACK instruction (F-block F_FDBACK) to its FEEDBACK input without additional inversion.
The readback channel RQ_1 (bit 1) is inverted.

Additional information



For detailed information about F-I/O access, refer to the SIMATIC Safety, Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Applications of the F-I/O module

5

5.1 Applications of the F-RQ 1x24VDC/24..230VAC/5A

You can achieve SIL3/category 4/PLe in the following applications if the activating F-module supports SIL3/category 4/PLe.

The wiring is carried out on the suitable BaseUnit (http://support.automation.siemens.com/WW/view/en/58532597/133300).

Wiring the 24 VDC power supply

Apply the 24 VDC control voltage to IN P (terminal 9) and IN M (terminal 11). The 24 VDC supply line is usually connected via a sourcing/sinking fail-safe output (e.g. digital output module F-DQ 4x24VDC/2A PM HF). Wire the P output (sourcing) of the F-DQ to the IN P of the F-RQ module and the M output (sinking)to the IN M of the F-RQ module.

As an alternative, you can also connect to a sourcing-sourcing fail-safe output. However, note that external short-circuits to P at the P input cannot be controlled. In this case, IN M would be connected directly to the control voltage ground.

NOTICE
Connecting the control voltage to the IN P and IN M inputs with the reverse polarity will destroy the F-module.

Wiring the load voltage and the load

The connectors of the relay output are electrically isolated NO contacts. This means that power must be supplied to these contacts from an external source. Connect the load supply (supply 1) and the load (load 1) in series to the RQ_{01} connectors (terminals 1;2). This ensures that the NO contacts of the relay interrupt the current flow of the power supply through the load. Due to the two relay contacts connected in series, the current flow can still be interrupted if one of the two relays has a fault..

The second circuit is independent of the first. They are logically interconnected by the common control. This means that the potential in the RQ_{02} (terminals 3;4), supply 2 and load 2 circuit may be different.

⚠ WARNING

If you connect a non-SELV/PELV power supply to one channel, you must not use the other channel.

Parameter assignment of the digital output module F-DQ 4x24VDC/2A PM HF

Assign the following parameters for the channel of the F-DQ 4x24VDC/2A PM HF digital output module to be activated:

Table 1-541 Parameter assignment

Parameter	
Max. readback time dark test	1 ms
Max. readback time switch on test	1 ms

As the relays are highly inductive, you have the option of activating "Diagnostics: wire break" *or* "enable light test".

5.2 Application 1: 2 loads, single-pole switch-off

Wiring diagram

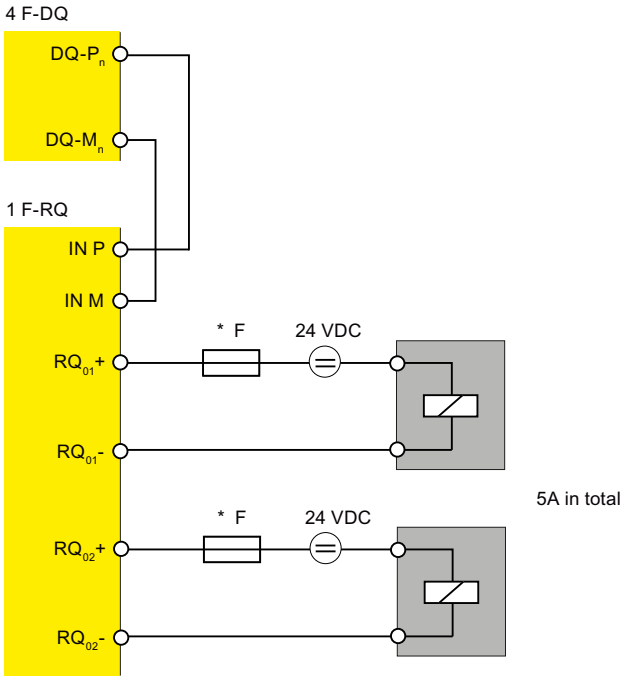


Figure 1-260 Wiring diagram of the F-RQ 1x24VDC/24..230VAC/5A to an F-DQ module

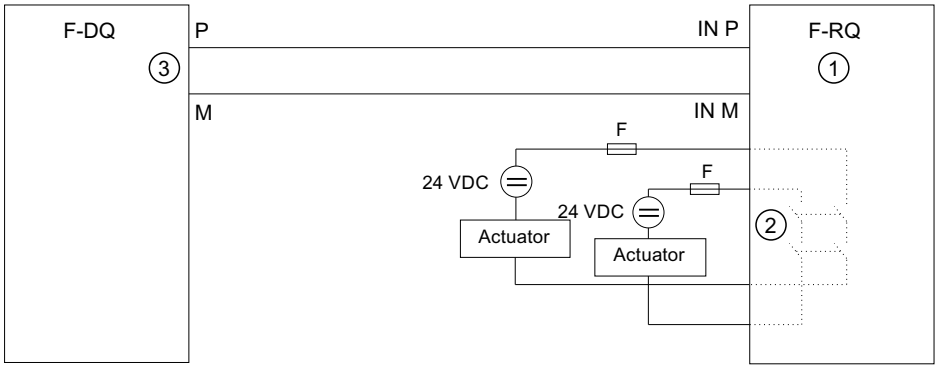

In this application, you can use one F-RQ module for single-pole switching of two loads with a total of 5A and one/two SELV/PELV power supplies.

WARNING

* Always install an external fuse with the following properties to protect the relay contacts from overload and short-circuits: Fuse, 6 A, operating class gL/gG or C6A miniature circuit breaker, rated short-circuit current of 400 A.
Note that for applications in accordance with EN 50156-1 the specified rated current of the overcurrent protective device must be multiplied by a safety factor of 0.6 to rule out the error "non-opening of contact elements due to permanent contact welding".

Reading back the relay contacts

In the safety program, always compare the readback value returned by the F-RQ module with the control status. In *STEP 7 Safety Advanced*, you can use the instruction "FDBACK: Feedback circuit monitoring" in your safety program (see the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual).

① F-RQ with integrated FEEDBACK input
② Relay contacts for switching the load
③ Output Q

Figure 1-261 Wiring example for the FDBACK instruction

If the 24 VDC control voltage falls below the value required for relay pick-up or if the wire to the input connectors breaks, the relays are released and "1" is read back instead of "0". This fault is only detected if the F-DQ module output is switched on.

If one of the two load contacts connected in series fails to open, "0" is read back by the module. The fault is detected by comparing this readback value with the setpoint "1" in the safety program. This fault is only detected if the control voltage is switched off.

NOTE

SIL3/category 4/PLe requires that there is a signal change at least once a month and that the process status is read back.

SIL2/category 3/PLd requires that there is a signal change at least once a year and that the process status is read back.

If a fault is detected during this function test, replace the F-RQ module.

5.3 Application 2: 1 load, single-pole switch-off

Wiring diagram

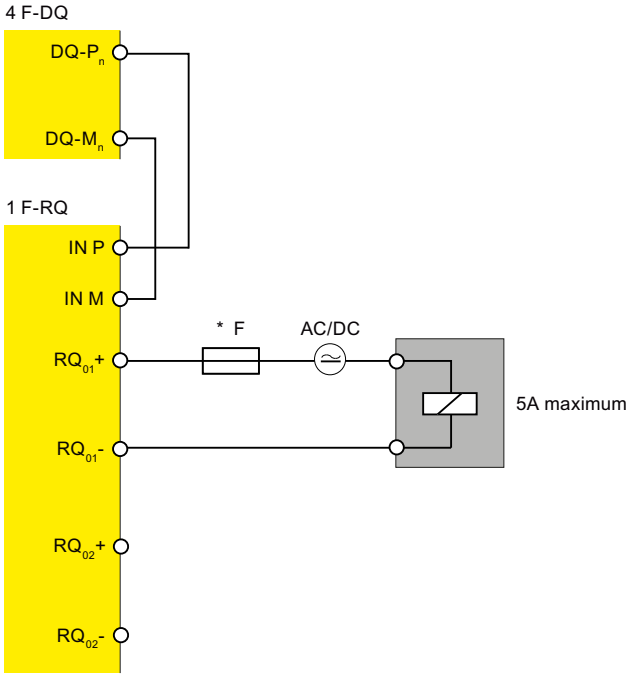

Figure 1-262 Wiring diagram of the F-RQ 1x24VDC/24..230VAC/5A to an F-DQ module

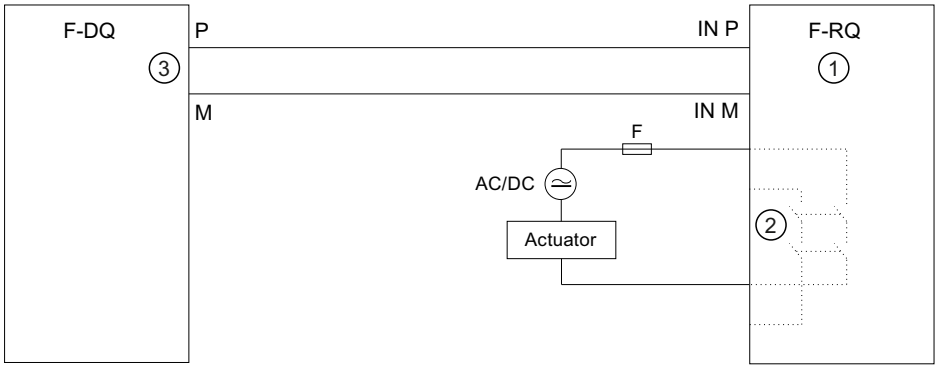

This application allows single-pole switching of one load with a total of 5A with one F-RQ module.

WARNING

* Always install an external fuse with the following properties to protect the relay contacts from overload and short-circuits: Fuse, 6 A, operating class gL/gG or C6A miniature circuit breaker, rated short-circuit current of 400 A.
Please note that for applications in accordance with EN 50156-1, the specified rated current of the overcurrent protective device must be multiplied by the safety factor 0.6 to rule out the error "non-opening of contact elements due to permanent contact welding".

Reading back the relay contacts

In the safety program, always compare the readback value returned by the F-RQ module with the control status. In *STEP 7 Safety Advanced*, you can use the instruction "FDBACK: Feedback circuit monitoring" in your safety program (see the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual).

① F-RQ with integrated FEEDBACK input
② Relay contacts for switching the load
③ Output Q

Figure 1-263 Wiring example for the FDBACK instruction

If the 24 VDC control voltage falls below the value required for relay pick-up or if the wire to the input connectors breaks, the relays are released and "1" is read back instead of "0". This fault is only detected if the F-DQ module output is switched on.

If one of the two load contacts connected in series fails to open, "0" is read back by the module. The fault is detected by comparing this readback value with the setpoint "1" in the safety program. This fault is only detected if the control voltage is switched off.

NOTE

SIL3/category 4/PLe requires that there is a signal change at least once a month and that the process status is read back.
SIL2/category 3/PLd requires that there is a signal change at least once a year and that the process status is read back.
If a fault is detected during this function test, replace the F-RQ module.

5.4 Application 3: 1 load, two-pole switch-off with 1 F-RQ module

Wiring diagram

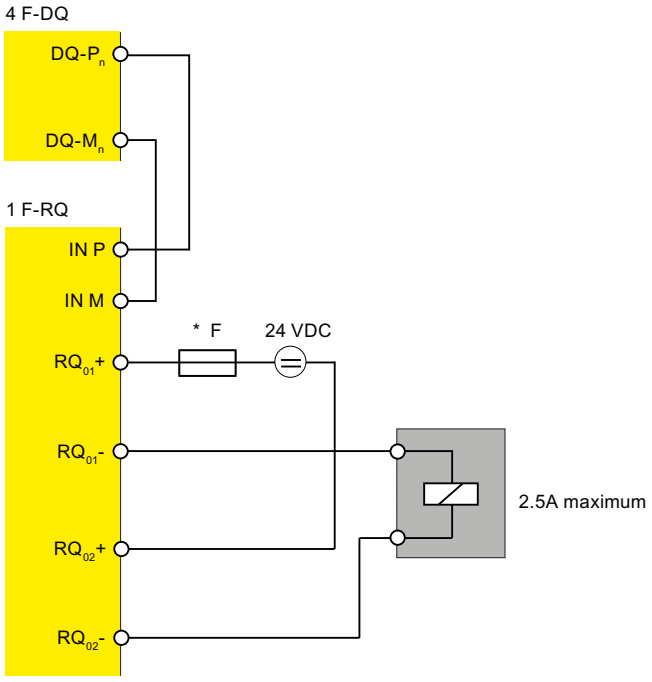

Figure 1-264 Wiring diagram for two F-RQ 1x24VDC/24..230VAC/5A to one F-DQ module

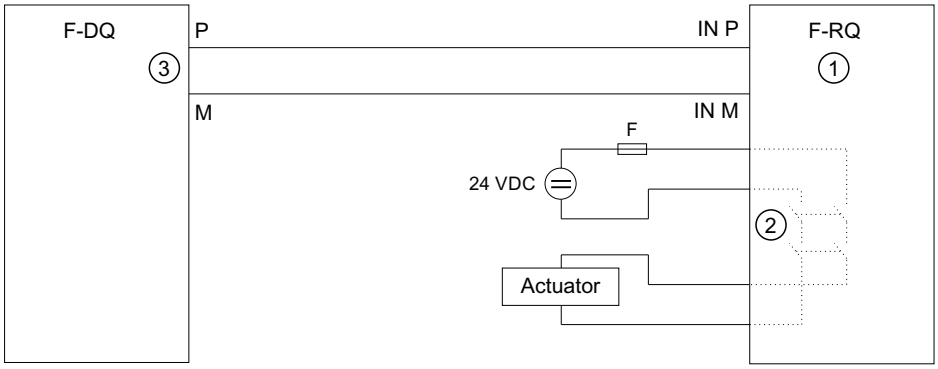

This application allows two-pole switching with one F-RQ module of one load with a maximum of 2.5A and an SELV/PELV power supply.

WARNING

* Always install an external fuse with the following properties to protect the relay contacts from overload and short-circuits: Fuse, 6 A, operating class gL/gG or C6A miniature circuit breaker, rated short-circuit current of 400 A.
Note that for applications in accordance with EN 50156-1 the specified rated current of the overcurrent protective device must be multiplied by a safety factor of 0.6 to rule out the error "non-opening of contact elements due to permanent contact welding".

Reading back the relay contacts

In the safety program, always compare the readback value returned by the F-RQ module with the control status. In *STEP 7 Safety Advanced*, you can use the instruction "FDBACK: Feedback circuit monitoring" in your safety program (see the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual).

① F-RQ with integrated FEEDBACK input
② Relay contacts for switching the load
③ Output Q

Figure 1-265 Wiring example for the FDBACK instruction

If the 24 VDC control voltage falls below the value required for relay pick-up or if the wire to the input connectors breaks, the relays are released and "1" is read back instead of "0". This fault is only detected if the F-DQ module output is switched on.

If one of the two load contacts connected in series fails to open, "0" is read back by the module. The fault is detected by comparing this readback value with the setpoint "1" in the safety program. This fault is only detected if the control voltage is switched off.

NOTE

SIL3/category 4/PLe requires that there is a signal change at least once a month and that the process status is read back.
SIL2/category 3/PLd requires that there is a signal change at least once a year and that the process status is read back.
If a fault is detected during this function test, replace the F-RQ module.

5.5 Application 4: 1 load, two-pole switch-off with 2 F-RQ modules

Wiring diagram

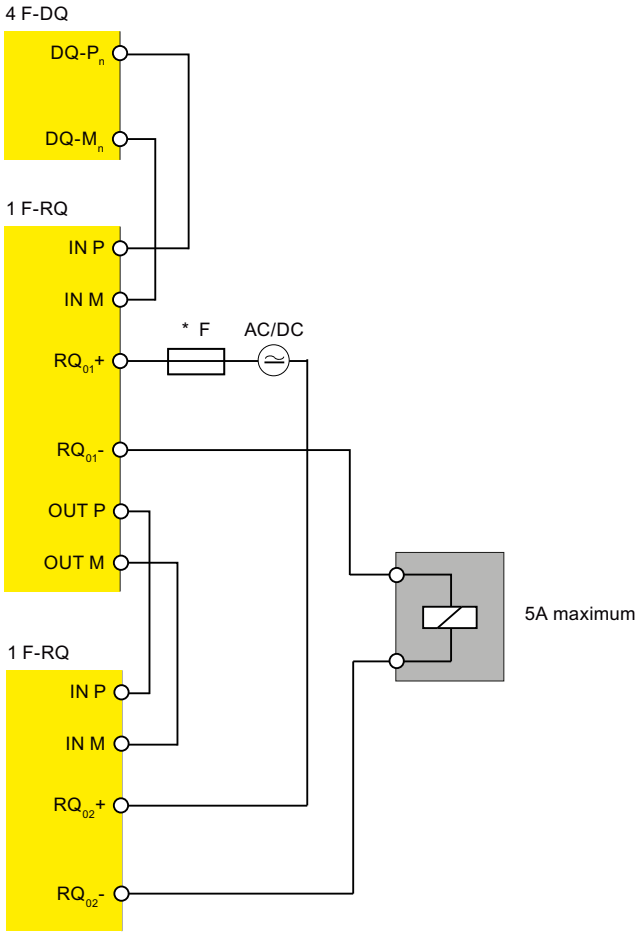

Figure 1-266 Wiring diagram for two F-RQ 1x24VDC/24..230VAC/5A to one F-DQ module

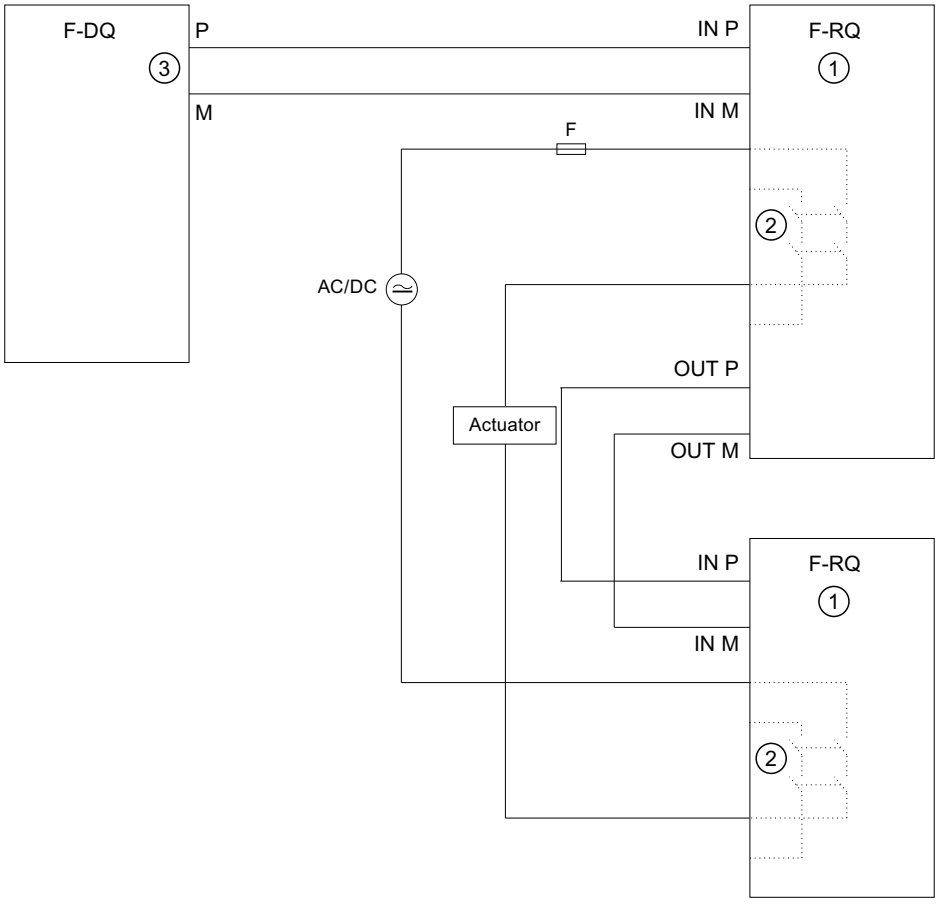


This application allows two-pole switching of one load with a max. of 5A with two F-RQ modules.

⚠ WARNING

* Always install an external fuse with the following properties to protect the relay contacts from overload and short-circuits: Fuse, 6 A, operating class gL/gG or C6A miniature circuit breaker, rated short-circuit current of 400 A.
Note that for applications in accordance with EN 50156-1 the specified rated current of the overcurrent protective device must be multiplied by a safety factor of 0.6 to rule out the error "non-opening of contact elements due to permanent contact welding".

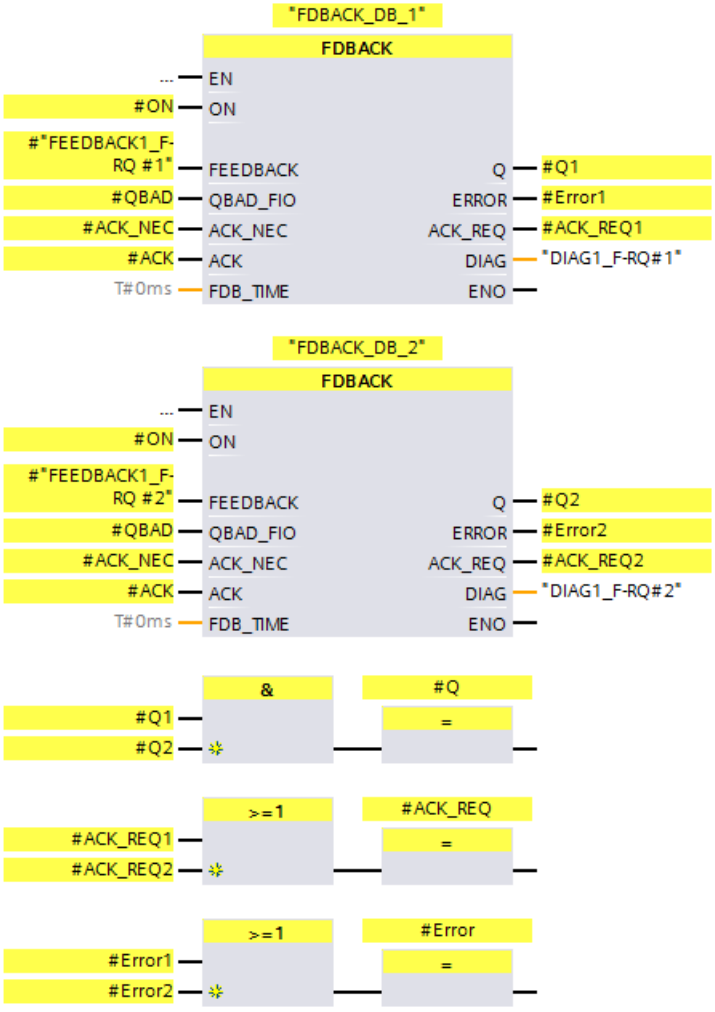
Reading back the relay contacts

In the safety program, always compare the readback value returned by the F-RQ module with the control status. In *STEP 7 Safety Advanced*, you can use the instruction "FDBACK: Feedback circuit monitoring" in your safety program (see the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual).

① F-RQ with integrated FEEDBACK input
② Relay contacts for switching the load
③ Output Q

Figure 1-267 Wiring example for the FDBACK instruction

If the 24 VDC control voltage falls below the value required for relay pick-up or if the wire to the input connectors breaks, the relays are released and "1" is read back instead of "0". This fault is only detected if the F-DQ module output is switched on.



If one of the two load contacts connected in series fails to open, "0" is read back by the module. The fault is detected by comparing this readback value with the setpoint "1" in the safety program. This fault is only detected if the control voltage is switched off.

NOTE

SIL3/category 4/PLe requires that there is a signal change at least once a month and that the process status is read back.
SIL2/category 3/PLd requires that there is a signal change at least once a year and that the process status is read back.
If a fault is detected during this function test, replace the F-RQ module.

Program example

For this application, program an FDBACK instruction for each F-RQ module as follows:

5.6 Application 5: 2 loads, single-pole switch-off with 2 F-RQ modules

Wiring diagram

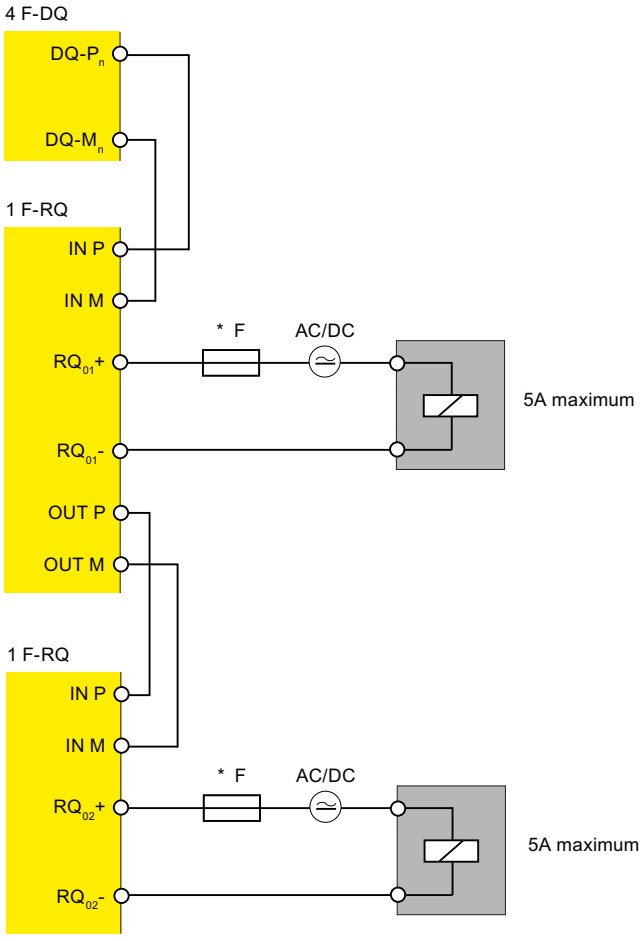


Figure 1-268 Wiring diagram for two F-RQ 1x24VDC/24..230VAC/5A to one F-DQ module

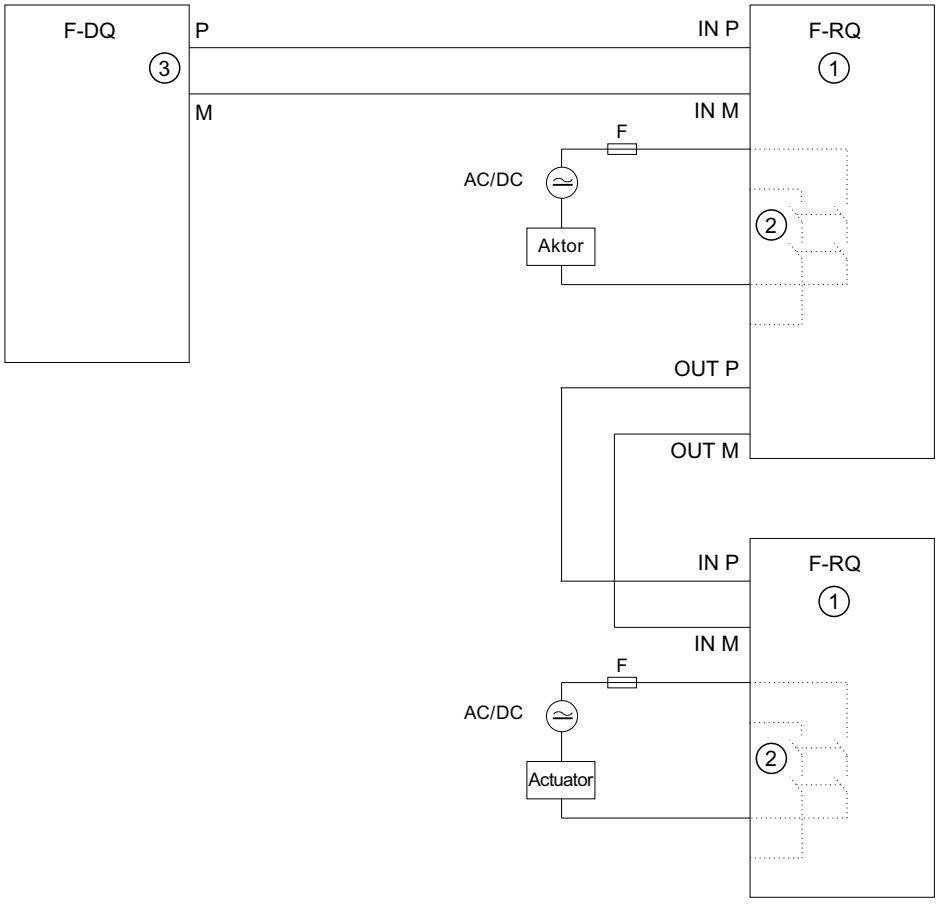


This application allows the single-pole switching of two loads with 5A each with two F-RQ modules. One power supply is not SELV/PELV.

WARNING

* Always install an external fuse with the following properties to protect the relay contacts from overload and short-circuits: Fuse, 6 A, operating class gL/gG or C6A miniature circuit breaker, rated short-circuit current of 400 A.
Note that for applications in accordance with EN 50156-1 the specified rated current of the overcurrent protective device must be multiplied by a safety factor of 0.6 to rule out the error "non-opening of contact elements due to permanent contact welding".

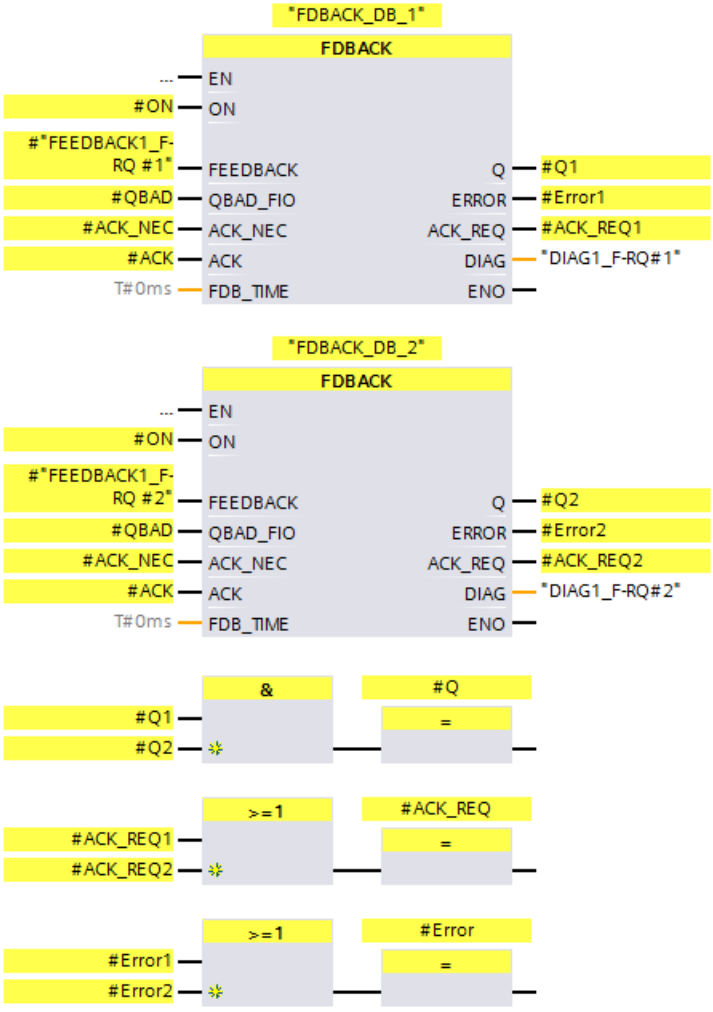
Reading back the relay contacts

In the safety program, always compare the readback value returned by the F-RQ module with the control status. In *STEP 7 Safety Advanced*, you can use the instruction "FDBACK: Feedback circuit monitoring" in your safety program (see the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual).

① F-RQ with integrated FEEDBACK input
② Relay contacts for switching the load
③ Output Q

Figure 1-269 Wiring example for the FDBACK instruction

If the 24 VDC control voltage falls below the value required for relay pick-up or if the wire to the input connectors breaks, the relays are released and "1" is read back instead of "0". This fault is only detected if the F-DQ module output is switched on.



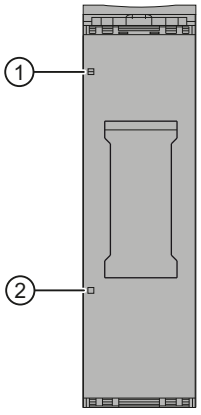
If one of the two load contacts connected in series fails to open, "0" is read back by the module. The fault is detected by comparing this readback value with the setpoint "1" in the safety program. This fault is only detected if the control voltage is switched off.

NOTE

SIL3/category 4/PLe requires that there is a signal change at least once a month and that the process status is read back.
SIL2/category 3/PLd requires that there is a signal change at least once a year and that the process status is read back.
If a fault is detected during this function test, replace the F-RQ module.

Program example

For this application, program an FDBACK instruction for each F-RQ module as follows:



Status and error display

6

6.1 Status and error display

LED display

① DIAG (green/red)
② Channel status (green)

Figure 1-270 LED display

Meaning of the LED displays

The following tables explain the meaning of the status and error displays.

WARNING

The DIAG LED and the channel status LED of the output are not designed as safety-related LEDs and therefore must not be evaluated for safety-related activities.

DIAG LED

Table 1-542 Meaning of the DIAG LED

DIAG	Meaning
□ Off	Backplane bus supply of the ET 200SP not OK
☼ Flashing	Module parameters not set
■ On	Module parameters set and no module diagnostics

Channel status LED

Table 1-543 Meaning of the channel status LED

Status	Meaning
□ Off	Process signal = 0
■ On	Process signal = 1

Technical specifications

7

7.1 Technical specifications

Technical specifications of F-RQ 1×24VDC/24...230VAC/5A

	6ES7136-6RA00-0BF0
Product type designation	F-RQ 1x24VDC/24 ... 230VAC/5A
General information	
Hardware product version	01
Firmware version	V1.0.0
Product function	
I&M data	Yes; I&M0 to I&M3
Engineering with	
STEP 7 TIA Portal configurable/integrated as of version	V13
STEP 7 configurable/integrated as of version	V5.5 SP4 and higher
Installation type/mounting	
Rail mounting possible	Yes; standard mounting rail
Supply voltage	
Type of supply voltage	24 VDC
Rated value (DC)	24 V; coil voltage
Low limit of permitted range (DC)	20.4 V
High limit of permitted range (DC)	28.8 V
Power	
Power consumption from the backplane bus	100 mW
Power loss	
Power loss, typ.	1 W
Address range	
Address space per module	
Input	1 byte
Digital outputs	
Number of outputs	1
Voltage induced on current interruption limited to	No
Control of a digital input	Yes
Switching capacity of outputs	
With resistive load, max.	5 A
With lamp load, max.	25 W
Switching frequency	
With resistive load, max.	2 Hz
With inductive load, max.	0.1 Hz; see information in the manual

	6ES7136-6RA00-0BF0
With inductive load (to IEC 60947-5-1, DC13), max.	0.1 Hz
With inductive load (to IEC 60947-5-1, AC15), max.	2 Hz
Total current of the outputs (per module)	
Horizontal installation	
Up to 40 ℃, max.	5 A; note derating information in the manual
Up to 50 ℃, max.	4 A; note derating information in the manual
Up to 60 ℃, max.	3 A; note derating information in the manual
Vertical installation	
Up to 50 ℃, max.	3 A; note derating information in the manual
Relay outputs	
Number of relay outputs	1; 2 NO contacts
Rated input voltage of relay coil L+ (DC)	24 V
Current consumption of relays (coil current of all relays), max.	70 mA
External fuse for relay outputs	Yes, 6 A, see information in the manual
Relay approved acc. to UL 508	Yes; Pilot Duty B300 R300
Switching capacity of contacts	
With inductive load, max.	See additional description in the manual
With resistive load, max.	See additional description in the manual
Thermal continuous current, max.	5 A
Contact rating, min.	1 mA
Contact rating after exceeding 300 mA, min.	10 mA
Contact rating after exceeding 300 mA, max.	5 A
Rated switching voltage (DC)	24 V
Rated switching voltage (AC)	230 V
Length of cable	
Cable length, shielded, max.	500 m; for load contacts
Cable length unshielded, max.	300 m; for load contacts
Control cable (input), max.	10 m
Interrupts/diagnostics/status information	
Diagnostics messages	
Diagnostics	Yes, firmware update
Diagnostics display LED	
RUN LED	Yes; green/red DIAG LED
Channel status display	Yes; green LED
Electrical isolation	
Electrical isolation, channels	
Between channels	Yes; only with SELV / PELV
Between the channels and the backplane bus	Yes
Between the channels and the supply voltage of the electronics	Yes
Permitted potential difference	
Between channels and backplane bus/supply voltage	250 VAC (reinforced insulation)
Between backplane bus and supply voltage	60 VAC/75 VDC

	6ES7136-6RA00-0BF0
Insulation	
Insulation test voltage	2545 VDC 2 s (routine test)
Overvoltage category	III
Tested with	
Between channels and backplane bus/supply voltage	2545 VDC 2s (routine test), surge voltage test 7200 VDC/5 positive and 5 negative pulses (type test)
Between backplane bus and supply voltage	707 VDC (type test)
Standards, approvals, certificates	
Suitable for safety functions	Yes
Maximum achievable safety class in safety mode	
Performance level according to EN ISO 13849-1:2008	PLe
Category according to ISO 13849-1:2008	4
SIL according to IEC 61508:2010	SIL 3
Low demand (PFD) acc. to SIL2	<1.00E-04, proof test interval 1 year
Low demand (PFD) acc. to SIL3	<1.00E-05, proof test interval 1 month
High demand (PFH) acc. to SIL2	<1.00E-08 1/h, proof test interval 1 year
High demand (PFH) acc. to SIL3	<6.00E-09 1/h, proof test interval 1 month
Dimensions	
Width	20 mm
Weights	
Weight, approx.	56 g

Supplement to the technical specifications

Technical specifications	
Relay outputs	
Current consumption of relays (coil current of all relays), min.	20 mA
Permitted potential difference	
• Between NO contacts	75 VDC / 60 VAC
Insulation tested	
• Between the NO contacts	707 VDC (type test)

Derating

NOTE

As the modules are small, you need to monitor the heat build-up between adjacent modules if output modules are subject to high loads. A temperature rise in an output module exposed to a high load can result in shutdown and reduce plant availability. If the operating voltage > 25 VDC, the average total current of the modules directly adjacent should not exceed 50% of the levels listed in the technical specifications, and the ambient temperature should not exceed 50 °C.

If the ambient temperature exceeds 50 °C, supply voltage L+ must not exceed 25 VDC.

Dimension drawing

See ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300) manual

7.2 Mechanical and climatic ambient conditions

In contrast to the specifications for mechanical environmental conditions and mechanical environmental conditions testing in the "Mechanical and climatic ambient conditions" section of the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual, the following applies to this F-module:

Mechanical ambient conditions

The following table shows the mechanical ambient conditions in the form of sinusoidal vibrations.

Table 1-544 Mechanical ambient conditions

Frequency band	ET 200SP with BusAdapter BA 2×FC	ET 200SP with BusAdapter BA 2×RJ45/ BA 2xSCRJ
5 ≤ f ≤ 8.4 Hz	3.5 mm amplitude	
8.4 ≤ f ≤ 150 Hz	1 g constant acceleration	

Tests of mechanical ambient conditions

The following table provides important information about the type and scope of the tests for ambient mechanical conditions.

Table 1-545 Tests of mechanical ambient conditions

Check for ...	Test standard	Comment
Vibration	Vibration test according to IEC 60068-2-6 (sinus)	Type of vibration: Frequency sweeps with a rate of change of 1 octave/minute. • 5 Hz ≤ f ≤ 8.4 Hz, 3.5 mm constant amplitude • 8.4 Hz ≤ f ≤ 150 Hz, 1 g constant acceleration Duration of vibration: 10 frequency sweeps per axis at each of three vertically aligned axes

Check for ...	Test standard	Comment
Shock	Shock, tested according to IEC 60068-2-27	Type of shock: Half sine Shock intensity: 150 m/s^2 peak value, 11 ms duration Direction of shock: 3 shocks in each direction (+/-) at each of three vertically aligned axes

7.3 Switching capacity and service life of contacts

Switching capacity and service life of contacts

You can extend the service life beyond the value indicated in the tables below by installing an external protective circuit.

The tables below show the switching capacity and service life of the contacts.

Table 1-546 Switching capacity and service life of contacts with resistive load

Voltage	Current	Duty cycles (typ.) NO contact
24 VDC	5.0 A	350000
	3.0 A	500000
	2.0 A	750000
	1.0 A	1800000
	0.5 A	4000000
230 VAC	5.0 A	100000
	3.0 A	150000
	2.0 A	200000
	1.0 A	400000
	0.5 A	800000

Table 1-547 Switching capacity and service life of contacts **with inductive load according to IEC 947-5-1 DC 13/ AC15**

Voltage	Current	Duty cycles (typ.) NO contact
24 VDC	1.0 A	100000
	0.5 A	200000

Response times

A

A.1 Response times

Introduction

The section below shows the response times of the digital output module F-RQ 1x24VDC/24..230VAC/5A. The response times of digital output module F-RQ 1x24VDC/24..230VAC/5A are included in the calculation of the F-system response time.

Definition of response time for fail-safe relay outputs

The response time defines the interval between controlling by means of a fail-safe digital output module until the signal change at the relay output.

Maximum response time without errors

The maximum response time for fail-safe relay outputs when there are no errors is equal to:

Max. response time = 16 ms

Readback response time

The readback response time for fail-safe relay outputs is equal to:

Readback response time = 30 ms

Maximum response time until error detection

Max. response time = cycle time of the safety program + max. readback time of the FDBACK instruction + max. response time of the F-DQ module + max. response time of the F-RQ module + 12.8 ms

Safety instructions

2

Important safety instructions

⚠ WARNING

Failure to observe this information may result in death, severe injury, and serious property damage.
For operation in Pollution Degree 2 environment.

⚠ WARNING

Failure to observe this information may result in death, severe injury, and serious property damage.
When used in hazardous environments corresponding to Class I, Division 2 or Class I, Zone 2, the device must be installed in a cabinet or an enclosure. To comply with EU Directive 94/9 (ATEX 95), this enclosure must meet the requirements of at least IP54 according to EN 60529.

⚠ WARNING

Explosion hazard; failure to observe this information may result in death, severe injury, and serious property damage.
Wires must not be connected to the device or disconnected from the device within a flammable or combustible environment.

⚠ WARNING

Explosion hazard; failure to observe this information may result in death, severe injury, and serious property damage.
Do not disconnect live wires from the device if it cannot be ensured that an explosive atmosphere is not present in the environment.

⚠ WARNING

Explosion hazard; failure to observe this information may result in death, severe injury, and serious property damage.
Replacement of components may impair suitability for Class I, Division 2 or Zone 2.

⚠ WARNING

Explosion hazard; failure to observe this information may result in death, severe injury, and serious property damage.
Do not open the device when the supply voltage is switched on.

⚠ WARNING

Connection only to safety extra-low voltage with limiting of output voltage to max. 40 V under fault condition

Connect the BaseUnit only to an AS-i power supply unit that meets the conditions indicated in the Section "Power supply units for AS-Interface". Connection to a higher voltage may result in death, severe injury, and serious property damage.

For this reason, you are only permitted to connect safety extra-low voltage (SELV) with limited power source (LPS) according to IEC 60950-1, EN 60950-1, VDE 0805-1 to the supply connections.

The supply of the device must comply with NEC Class 2, as described by the National Electrical Code (r) (ANSI / NFPA 70).

⚠ WARNING

Failure to observe this information may result in death, severe injury, and serious property damage.

Take measures to prevent transient overvoltages of more than 40% of the rated voltage. You can ensure this by using only AS-i power supply units that meet the requirements indicated in Section Terminal assignment (Page 20) in "Power supply units for AS-Interface". Transient overvoltages are not permitted to exceed 119 V under any circumstances. This will ensure compliance with an ATEX requirement.

⚠ CAUTION

Failure to observe this information may result in property damage and bodily injury

This device is only suitable for use in areas defined as Class I, Division 2, Groups A, B, C, and D and is not suitable for use in hazardous areas.

⚠ WARNING

To be operated by experienced users only

Improper operation may result in death, severe injury, and serious property damage. Users must be familiar with ASIsafe and the safety system used, e.g., SIMATIC, Distributed Safety, SIMATIC Safety Advanced.

Only an experienced user is permitted to teach the code sequences of safe AS-i slaves (organizational specification).

⚠ CAUTION

Failure to observe this information may result in property damage and bodily injury

This equipment is only suitable for use in areas defined as Class I, Zone 2, Group IIC and in non-hazardous areas.

NOTICE

Checking parameters

Check that all parameters are correctly set before final acceptance.

NOTICE

Reaction to faults in fail-safe modules
If you are using the module in safety-critical applications, the PROFIsafe mechanism of passivation and reintegration is enabled and must be used.
Observe the information concerning passivation and other fault reactions in the documentation for the ET 200SP Distributed I/O System, see Section Documentation guide (Page 5).

NOTICE

Single-channel use of safe AS-i input slaves
The values in the PROFIsafe process image input have Safety Integrity Level SIL 3.
If two-channel interconnection is not used for a safe AS-i input slave, the application has a maximum safety integrity level of SIL 2 or less. The configuration tool / STEP 7 cannot detect this.
You must ensure that the signals are correctly processed in the safety application.

NOTICE

Ensure that the plant is functioning correctly in productive operation
Carry out a function test before the system goes into productive operation.

Important note for maintaining the operational safety of the system

NOTE

Newsletter containing information on product development and product features
Owners of systems with safety-related characteristics must ensure compliance with special operational safety requirements. Suppliers are required to comply with special product monitoring measures. For this reason, Siemens publishes a special newsletter containing information on product developments and features that are (or could be) relevant to operation of systems from a safety perspective. A newsletter keeps you constantly up to date in this regard. A subscription to the newsletter is necessary so that you can make any needed changes to your system. To sign up for the newsletter, go to:
Internet (https://www.industry.siemens.com/newsletter)
Select "Service & Support" > "Industry Online Support" > "Automation Technology" > "AS-Interface". Select the "Update" entry type.

Product overview

3

3.1 Properties of the F-CM AS-i Safety ST

Item number

3RK7136-6SC00-0BC1

View of the module

Figure 1-272 View of the F-CM AS-i Safety ST module

Use of the module

The F-CM AS-i Safety ST module is a communication module for use in the SIMATIC ET 200SP Distributed I/O System.

The F-CM AS-i Safety ST module features a 20 mm wide ET 200SP module housing. A BaseUnit (BU) is required for use in the ET 200SP. The F-CM AS-i Safety ST module can be plugged in to:

- BaseUnit Type C0
- BaseUnit Type C1

The F-CM AS-i Safety ST fail-safe communication module expands a standard AS-Interface network to include safety-related communication.

The F-CM AS-i Safety ST module reads the input states of safety-related AS-Interface input modules and provides these states to a fail-safe F-CPU for further evaluation.

In the opposite direction, the F-CM AS-i Safety ST module receives safe output states of an F-CPU and outputs them for control of safety-related outputs on AS-Interface.

The F-CM AS-i Safety ST fail-safe module supports safety-related applications up to SIL 3 according to EN 62061 or safety category up to PL e according to EN 13849-1. The input and

output values of the safety-related AS-i slaves are addressed using the safe cyclic process image. You need an F-CPU for safe processing.

The F-CM AS-i Safety ST module has no AS-i master functionality. For operation of the AS-i network, you need a CM AS-i Master ST module (3RK7137-6SA00-0BC1) or another AS-i master conforming to AS-i Specification V3.0.

You can plug several F-CM AS-i Safety ST modules into one SIMATIC ET 200SP station. An F-CM AS-i Safety ST occupies 16 input bytes and 8 output bytes in the I/O address space. The number of F-CM AS-i Safety ST modules that can be plugged in depends on:

- The maximum address space of the utilized interface module (IM) of the ET 200SP
- The amount of address space occupied by other modules

Up to five module combinations of CM AS-i Master ST (32 input bytes/32 output bytes) and F-CM AS-i Safety ST (16 input bytes/8 output bytes) can be plugged in to one SIMATIC ET 200SP station with standard interface module IM 155-6 PN ST having a maximum address space of 256 input bytes/256 output bytes. If other modules are present in the ET 200SP station, the available address space and the maximum number of AS-i modules are reduced.

In a SIMATIC ET 200SP station with High Feature Interface Module IM 155-6 PN HF and a maximum address space of 1 440 input bytes/1 440 output bytes, a correspondingly greater number of modules can be plugged in.

You can find additional information in ET 200SP System Manual (http://support.automation.siemens.com/WW/view/en/58649293/0/en).

Properties

- Technical properties
  - Gateway between PROFIsafe and ASIsafe, without master functionality
  - Expands a standard AS-i network to include safety-related communication (ASIsafe)
  - Transfer of safety-related digital I/O values in the cyclic process image
  - Monitoring of up to 31 safety-related input slaves
  - Control of up to 16 safety-related AS-i output slaves or switch-off groups
  - Power supplied from the AS-i voltage
  - Use of various interconnection types (1oo1 and 1oo2) is possible
  - Input delay of 0 ms to 150 ms can be assigned for each channel
  - Startup test can be activated for each channel
  - Discrepancy monitoring can be configured for each channel
  - Sequence monitoring can be set for each channel
  - Channel-wise passivation
  - Test for 0 signal before reintegration
  - 8 LED displays for status and error diagnostics
- Supported functions
  - I&M identification data
  - PROFIsafe V2.4
  - Firmware update

NOTICE
Max. proof test interval When the proof test interval has expired, you must replace the device; see "Technical specifications (Page 74)".

- New properties as from FW V1.0.1
  As from product version 02, the module is shipped with FW V1.0.1 (or higher).
  - Extended functions (diagnostic texts)
  - New messages
  - New diagnostics data record 206

For more information, see Section "Parameterizing (Page 31)".

Accessories

The following components can be used with the module:

- Labeling strips
- Reference identification label

Ease of maintenance

The following features support maintenance:

- Code sequences are saved in the coding element. As a result, teaching of the code sequences does not have to be repeated after an F-CM AS-i Safety ST module is replaced.
- Use is automated to the greatest extent possible. This applies, in particular, to the teaching of the code sequences of safe AS-i slaves.
- An F-address that has already been assigned is stored in the coding element. This means that there is no need to repeat teaching-in after replacing the F-CM AS-i Safety ST module.
- The module/BaseUnit concept allows you to easily replace defective hardware. Remove the defective module from the rack and plug in the new module.

Further information can be found in the Section "Code sequences (Page 61)".

Certifications

More detailed information regarding certifications can be found in the ET 200SP System Manual (http://support.automation.siemens.com/WW/view/en/58649293/0/en).

3.2 Operating modes of the F-CM AS-i Safety ST

3.2.1 Standard mode

Self test during device startup

After the AS-i voltage is switched on (PWR LED shows steady green light), the F-CM AS-i Safety ST module performs a comprehensive self-test. During this test, all LEDs are lit for approximately 3 seconds. Exception: the "DIAG" LED is controlled directly by the ET 200SP backplane bus and indicates the communication status for the ET 200SP system.

Checking of the F-address

After the self-test, the module checks the F-address. If no valid F-address is available, the "DIAG" and "PROFIsafe" LEDs flash red (the status LED flashes green). You must then assign the F-address, see Section "F-parameters (Page 33).

Downloading of the module parameters

The F-CM AS-i Safety ST then begins to read in code sequences of the safe AS-i slaves on the connected AS-i bus. At the same time, the module downloads the module parameters that were stored in the PLC CPU. The module parameters can only be downloaded when the operating voltage is applied to the interface module of the ET 200SP and the parameters have been made available by the PLC CPU during startup of the ET 200SP station.

The "Status" LED flashes green until the module parameters are completely downloaded or the PLC CPU is in STOP state, or the PLC communication is interrupted.

Cyclic data exchange of safe input/output data

When a valid set of module parameters has been downloaded and the PLC CPU is in "RUN" state, the safe input/output data is evaluated according the parameter assignment and exchanged with the PLC CPU.

The PROFIsafe protocol is used for the data exchange.

The "Status" LED is lit green during cyclic data exchange.

If the F-CM AS-i Safety ST module starts cyclic data exchange directly after startup, but communication cannot yet be established on the AS-i bus, the F-CM AS-i Safety ST module supplies the substitute value "0" in the input image. Passivation is delayed by a maximum of 30 s in this case. As a result, communication can start on the AS-i bus within this time window without passivation. After this time window, the input/output channels are passivated if there is no AS-i communication.

3.2.2 Error statuses

NOTE

Statuses not considered to be errors

The F-CM AS-i Safety ST module does not consider the following statuses to be errors, i.e. no alarm and no passivation is triggered:

- Waiting for start-up test
- Input/output with value = 0 in the process image without error condition, e.g. normal opening of the input contacts by pressing an emergency stop button or opening a protective door.

Diagnostic information can be read out in the user program using data records. For information, please refer to Section "Data records for diagnostics (Page 45)".

3.2.2.1 Serious device fault

Description

Examples of conditions that trigger a serious device fault are:

- Fault in the electronics
- Repeated synchronization error

You can read the following pattern on the LEDs:

Table 1-550 LED display for a serious device fault

LED	Display
"Status"	☐ "Off"
"Error"	■ Red "On"
"CFG"	■ Red "On"
"PSF"	■ Red "On"

In the event of a serious device fault, communication with the F-CM AS-i Safety ST module, e.g., reading a data record, is not possible. The substitute value "0" is processed for inputs and outputs, and all channels are passivated.

1. Switch off the module.
2. Wait for the module to cool down, if necessary.
3. Switch on the device again.
4. If the error persists after the module is switched on, the module must be replaced.

3.2.2.2 Device fault

Description

Examples of conditions that trigger a device fault are:

- Device fault (e.g. sporadic synchronization error, see also DS92)
- Configuration error (e.g. problem with contact to backplane bus, coding plug missing, see also DS92)

You can read the following pattern on the LEDs:

Table 1-551 LED display for device faults

LED	Display
"Status"	☐ "Off"
"Error"	✳ Red "flashes"
"CFG"	☐ "Off"
"PSF"	☐ "Off"

In the event of a device fault of this type, communication with the F-CM AS-i Safety ST module is only possible. e.g., for reading out additional diagnostic information via data records. The substitute value "0" is processed for inputs and outputs, and all channels are passivated.

- Make sure that the station is properly grounded.
- Check whether the coding element is present or replace it if necessary.
- Plug the module into the BaseUnit in an untwisted position.

Switch off the module. If the error persists after the module is switched on and no external error cause can be found, the module must be replaced.

3.2.2.3 Process signal error

Description

Examples of conditions that trigger a process signal error are:

- Discrepancy error at the inputs of a safe AS-i input slave
- Sequence error at the inputs of a safe AS-i input slave
- Sporadic code sequence error (from FW V1.0.1), e.g. fault caused by EMC in the input circuit
- Code sequence error at a safe AS-i input slave, e.g. due to cross-circuit at the inputs
- Failure of a safe AS-i input slave

You can read the following pattern on the LEDs:

Table 1-552 LED display for discrepancy error or sequence error

LED	Display
"Status"	■ Green "On"
"Error"	□ "Off"
"CFG"	□ "Off"
"PSF"	✲ Red "flashes"

Table 1-553 LED display for code sequence errors (e.g. due to cross-circuit) or for slave failure

LED	Display
"Status"	■ Green "On"
"Error"	□ "Off"
"CFG"	✲ Red "flashes"
"PSF"	✲ Flashes red if the CPU is in RUN "off" if the CPU is in STOP.

In the event of a process signal error, the F-CM AS-i Safety ST module remains in cyclic data exchange. Only at the safe input slave involved in each case is the substitute value "0" processed and the channel passivated. After the cause of the error has been eliminated, the channel can be reintegrated via the safety program.

The "PSF" LED goes out only after all channels have been reintegrated.

The "DIAG" LED switches from flashing red to green as soon as all errors that led to a passivation of the individual channels have been cleared.

Communication with the F-CM AS-i Safety ST module is possible, for example, for reading out additional diagnostic information via data records.

Response to code sequence errors

- **Sporadic code sequence error**
  Momentary interruption to code sequence, e.g. due to electromagnetic interference on the sensor cable.
  Behavior as from firmware V1.0.1:
  - Sporadic code sequence error leads to passivation of the channel, which must then be reintegrated.
  - Safety input bit of the channel is reset to substitute value 0 until the channel is reintegrated.
  - The resetting to the substitute value 0 takes place without any delay.
  - Diagnostic alarm is triggered (after a short delay, in order to distinguish between sporadic code sequence errors and general code sequence errors).
  - **Response to FW V1.0.0**

  - No message as diagnostic alarm in FW V1.0.0 and no passivation of the channel.
  - Safety input bit of the channel is reset to substitute value 0 without a delay and automatically switches to the process value 0 or 1 if there is no interference to the code sequence.

- **Code sequence error (general)**
  Permanent interruption to code sequence, e.g. due to electromagnetic interference on the sensor cable or code sequence corruption after replacement of the fail-safe input module.
  Behavior (identical for firmware V1.0.0 and V1.0.1 or higher):
  - Code sequence error leads to passivation of the channel, which must then be reintegrated.
  - Safety input bit of the channel is reset to substitute value 0 until the channel is reintegrated.
  - The reset to the substitute value 0 takes place without a delay, while the diagnostic alarm is triggered after a short delay (delay necessary in order to distinguish between sporadic code sequence errors and general code sequence errors).

3.2.2.4 Parameter assignment error

Description

In the event of invalid configuration data, the cyclic data exchange will not start.
You can read the following pattern on the LEDs:

Table 1-554 LED display for parameter assignment errors

LED	Display
"Status"	✳ Green "flashing"
"Error"	☐ "Off"
"CFG"	☐ "Off"
"PSF"	✳ Red "flashes"

1. Check the hardware configuration in *STEP 7*.
2. Perform a compilation.
3. Download the configuration data to the PLC CPU.

3.3 Firmware update

Performing a firmware update

Information about updating the firmware can be found in the ET 200SP System Manual.

NOTE

Noting the firmware version
After a firmware update, mark the current firmware version on the housing of the F-CM AS-i Safety ST.

NOTE

Requirement for the firmware update
Always perform the firmware update of the F-CM AS-i Safety ST in a separate ET 200SP rack. Ensure that no other modules besides the interface module (IM), the F-CM AS-i Safety ST, and the terminating server module are located in the ET 200SP rack.
During the firmware update of the F-CM AS-i Safety ST module, the associated CPU must be in the STOP operating state. To do this, switch the CPU to the STOP state before starting the firmware update.

NOTE

If the FW V1.0.0 is replaced by another FW version, then an intermediate step is necessary. If you would like to replace a higher FW version with FW version V1.0.0, then this intermediate step is also necessary.
As an intermediate step, the Bootloader Version (B1.0.0) of the firmware must be loaded before the actual firmware V1.x.x.

NOTICE

Observe references to the download page for executing the firmware change Failure to do so can result in the destruction of the device.
The firmware versions are made available in the Online Support:
Online Support (https://support.industry.siemens.com/cs/ww/en/view/109743655)

NOTICE

Checking the firmware version for F-permission
Before using a new firmware version, check whether it is permitted for use in the respective module.
The permissible firmware version is specified in the appendices of the F-CM AS-i Safety ST Safety certificate.

See also:

Certificate for failsafe module F-CM AS-i Safety ST (3RK7136-6SC00-0BC1) (https://support.industry.siemens.com/cs/ww/en/view/90477145)

Certificate for ET 200SP modules (http://support.automation.siemens.com/WW/view/en/49368678/134200)

Handling of the F-address and the code sequences

NOTE

Saving of the F-address in the coding element
During a firmware update, the F-address that is saved in the coding element is retained. Observe the information in the description of the firmware version.

NOTE

Saving of the code sequences in the coding element
During a firmware update, the ASIsafe code sequences that are saved in the coding element are retained. Observe the information in the description of the firmware version.

LED behavior during a firmware update

During a firmware update, the LEDs exhibit the following behavior:

- "DIAG" LED flashes red.
- "ADDR" LED flashes green.
- "PWR" LED lights up green.
- The rest of the LEDs are Off.

NOTE

Supply voltage during a firmware update
The AS-i voltage and the supply voltage of the ET 200SP station must not be switched off during a firmware update.

On successful completion of a firmware update, the module performs a hot restart. It is not necessary to switch off the voltage.

After the restart, the LEDs indicate the status of the F-CM AS-i Safety ST same as after a device startup.

If the firmware update cannot be completed, switch the AS-i voltage off and back on again and repeat the firmware update.

Connection

4

4.1 Terminal assignment

Requirement

For connecting, you require a BaseUnit:

- Type C1 (dark BaseUnit, e.g., item number 6ES7193-6BP20-0BC1)
- Type C0 (light BaseUnit, e.g., item number 6ES7193-6BP20-0DC0)

Note that, within a BaseUnit group for AS-i consisting of light and dark BaseUnits, only the AS-i modules CM AS-i Master ST and F-CM AS-i Safety ST may be combined. Other module types of the ET 200SP must always be separated from the BaseUnit group for AS-i using light BaseUnits.

⚠ WARNING

Connection of the BaseUnit only to safety extra-low voltage with limiting of output voltage to max. 40 V under fault condition
Connect the BaseUnit only to AS-i power supply units that meet the requirements given in Section "Power supply units for AS-Interface". Connection to a higher voltage may result in death, severe injury, and serious property damage.

Variants

Use with light BaseUnit Type C0
If the F-CM AS-i Safety ST module is connected to an AS-i network whose AS-i master is located outside the ET 200SP station, use the light BaseUnit Type C0.

If the AS-i master is located within the ET 200SP station, you can also use the light BaseUnit. However, you must wire the AS-i network explicitly using the connecting terminals.

The light BaseUnit Type C0 has no internal connection to the module plugged in on the left.

Use with dark BaseUnit Type C1
If you are using a combination of CM AS-i Master ST and F-CM AS-i Safety ST on the same AS-i network, use the dark BaseUnit. In this case, plug the CM AS-i Master ST module into a light BaseUnit Type C0. Next to it on the right, plug the F-CM AS-i Safety ST module into a dark BaseUnit Type C1.

In this case, connect the AS-i network to the light BaseUnit. The dark BaseUnit does not have to be connected to the AS-i network because the connection is made automatically via the BaseUnit group.

In contrast to other BaseUnit types, for the BaseUnits Type C0 and Type C1, the P1 and P2 busbars of the BaseUnit are electrically isolated from the front panel connecting terminals 1L/2L (ASI+) and 1N/2N (ASI-). An electrical connection is made in each case via the plugged-in CM AS-i Master ST module or F-CM AS-i Safety ST module.

The AS-i voltage connected to the light BaseUnit Type C0 is applied through the plugged CM AS-i Master ST module to the busbars. The busbars of the BaseUnit group are connected-through. The F-CM AS-i Safety ST module is supplied with AS-i voltage via the busbars of the dark BaseUnit Type C1. It is not permitted to continue the AS-i voltage from the front panel connecting terminals 1L/2L (ASI+) and 1N/2N (ASI-) of the dark BaseUnit because this type of current draw can cause an overload in the modules.

If you want to maintain the voltage supply of the F-CM AS-i Safety ST module when the CM AS-i Master ST module is unplugged from the light BaseUnit, you can wire an external connection of the connecting terminals 1L/2L (ASI+) and 1N/2N (ASI-) between the light BaseUnit Type C0 and the dark BaseUnit Type C1.

Grouping of a light BaseUnit Type C0 with several dark BaseUnits Type C1
The use of a single F-CM AS-i Safety ST module on an AS-i network is generally sufficient. If several F-CM AS-i Safety ST modules are being used on an AS-i network by means of series connected dark BaseUnits Type C1, you must wire an external connection of the connecting terminals 1L/2L (ASI+) and 1N/2N (ASI-) between the light BaseUnit Type C0 and a dark BaseUnit Type C1. This will prevent an overload of the modules. A current draw from the dark BaseUnit is not allowed. Additional information about this can be found in "Use with dark BaseUnit Type C1".

General terminal assignment

Table 1-555 Terminal assignment of the F-CM AS-i Safety ST

Terminal	Assignment	Description
1	TEACH1	Connection of the "TEACH" button (optional) See Section Code sequences (Page 61).
2	TEACH2	
3	RES	Reserved
4	RES	Reserved
5	RES	Reserved
6	RES	Reserved
1L, 2L[1)]	ASI+	Dark BaseUnit Type C1: optional connection of the AS-i cable, positive polarity Light BaseUnit Type C0: connection of the AS-i cable, positive polarity
1N, 2N [1)]	ASI-	Dark BaseUnit Type C1: optional connection of the AS-i cable, negative polarity Light BaseUnit Type C0: connection of the AS-i cable, negative polarity

1) The terminals are connected through in the BaseUnit.

Connecting an external "TEACH" button

You can connect a "TEACH" button to the "TEACH1" and "TEACH2" terminals of the F-CM AS-i Safety ST module. The "TEACH" button enables the transfer of code sequences of the connected safe AS-i input slaves. This function is activated by closing the button contact on the TEACH1 and TEACH2 terminals.

The maximum cable length between the terminal and "TEACH" button is 0.5 m.

Use two wires routed in parallel for connecting the button (not included in the scope of delivery).

Additional rules and instructions for operating the ET 200SP with fail-safe modules

Observe generally the information in Section "Connecting" in the following documentation:

- Manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293/0/en)
- Product Information ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/78361093/0/en)

The conditions for connecting sensors and actuators to the modules of the ET 200SP also apply generally to the connecting of sensors and actuators to the slaves and modules of the AS-i network.

In addition, the information in the documentation of the AS-i component applies.

Ensure that all components of the AS-i network are connected in such a way that the voltage applied to the safety-related AS-i modules is limited to a maximum of 40 V.

The ET 200SP modules CM AS-i Master ST and F-CM AS-i Safety ST have internal safe electrical isolation from the backplane bus of the ET 200SP.

Power supply units for AS-Interface

A connected power supply unit must have the following properties:

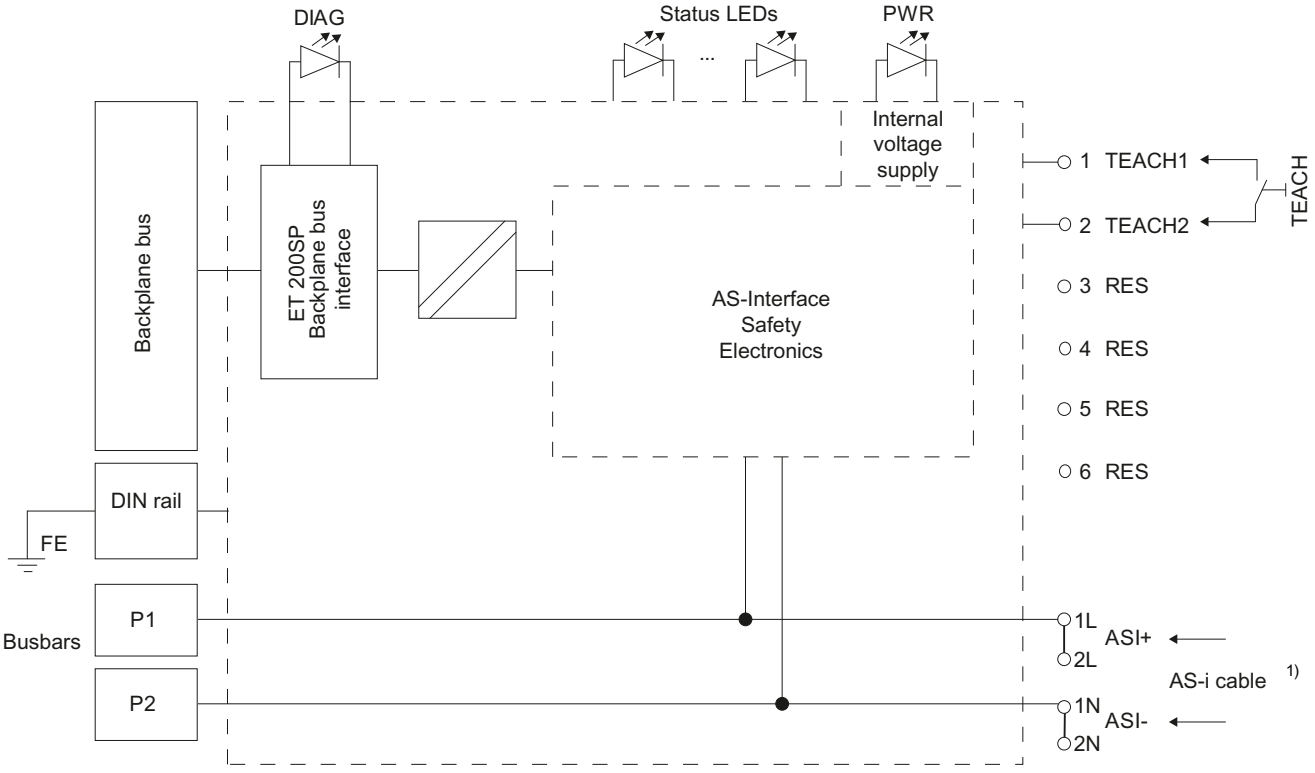
- Rated output voltage 30 V DC (AS-Interface Standard) or 24 V DC (AS-i Power24V)
- PELV/SELV (Protective/Safety Extra-Low Voltage) standard
- Residual ripple < 250 mVpp
- Limiting of output voltage to a maximum of 40 V in the event of a fault, including a second fault.

The Siemens power supply units for AS-Interface meet these requirements. For additional information, refer to the operating instructions of the power supply unit.

Use an AS-Interface power supply unit with integrated data decoupling or a combination of a power supply unit that meets the above-indicated requirements and an AS-i data decoupling unit.

In the following text, the expression "AS-i power supply unit" stands, unless described otherwise, for an AS-Interface power supply unit with integrated data decoupling or a combination of a power supply unit and an AS-i data decoupling unit.

When AS-i Power24V is used, there are limitations on the cable length (max. 50 m AS-i cable) and usability of AS-i components and connected sensors/actuators due to the reduced voltage.



Use a PELV / SELV power supply when operating the F-CM AS-i Safety ST module on PROFIsafe.

Additional notes:

- AS-Interface System Manual (http://support.automation.siemens.com/WW/view/en/26250840/0/en)
- FAQ "Compatibility for AS-i Power24V" (http://support.automation.siemens.com/WW/view/en/20025980/133000)

4.2 Schematic circuit diagram

Schematic circuit diagram

1) AS-i cable: Connection not applicable for dark BaseUnit

Figure 1-273 Schematic diagram of F-CM AS-i Safety ST

Connection to busbars

Requirement:

- An AS-i power supply unit is connected to the light BaseUnit Type C0 of the BaseUnit group.
- A CM AS-i Master ST module is plugged into the light BaseUnit.

If you plug an F-CM AS-i Safety ST module into a dark BaseUnit Type C1, the F-CM AS-i Safety ST module will be automatically supplied with AS-i voltage via the busbars.

It is not permitted to continue the AS-i voltage from the front panel connecting terminals 1L, 2L (ASI+) and 1N, 2N (ASI-) of the dark BaseUnit because this type of current draw can cause an overload of the modules.

Note the additional explanations in Section Terminal assignment (Page 20).

Configuring

5

5.1 Configuring the F-CM AS-i Safety ST

Notes on configuration

You configure the ET 200SP station and its F-CM AS-i Safety ST module and assign their parameters with *STEP 7*.

There is currently no provision for configuration via a GSD file, because the GSD configuration procedure does not permit safety-related parameter assignment (according to PROFIsafe Specification V2.4).

NOTE

F-CM AS-i Safety ST in the hardware catalog of *STEP 7*

If the F-CM AS-i Safety ST module is not listed in the hardware catalog of *STEP 7* , you will need a "Hardware Support Package". This HSP can be obtained from the Internet using the corresponding function in *STEP 7*.

NOTE

Operation under S7 F systems is not approved.

NOTE

The data exchange with "F-DX-MOD" is not supported.

Software for configuration of the F-CM AS-i Safety ST

Configuration software	Requirements	Installation information
STEP 7 (classic) V5.5 SP3 HF4 or higher with Distributed Safety	Hardware Support Package HSP 2093[1)] Internet	Online Help for *STEP 7*
STEP 7 (classic) V5.5 SP4 or higher with Distributed Safety		
STEP 7 (TIA Portal) V13 or higher with Safety Advanced	Hardware Support Package HSP 70[1)] Internet (http://support.automation.siemens.com/WW/view/en/29156492/133100)	
STEP 7 (TIA Portal) V14 or higher with Safety Advanced / Basic		

1) Download optional, if not already contained in the hardware catalog

NOTE

Observe the online help on *STEP 7*.

The "S7 F-Configuration Pack" can be found on the Internet (http://support.automation.siemens.com/WW/view/en/15208817).

Procedure

1. Assign the parameters of the F-CM AS-i Safety ST module according to your safety application.
2. Configure the AS-i Master in such a way that it includes all AS-i slaves in the communication – including the control addresses for safe AS-i outputs that are activated in the F-CM AS-i Safety ST module.
3. Download the hardware configuration to the PLC-CPU.
4. Assign the associated F-address to the F-CM AS-i Safety ST module.
5. Start the teaching and transferring of the code sequences of the safe AS-i input slaves.
6. Create the safety program in the F-CPU.
7. Test your application.

Information concerning these steps can be found in the following sections and in the manuals of the utilized devices.

⚠ WARNING

Failure to observe this information may result in death, severe injury, and serious property damage
Observe instructions in the programming and operating manuals

Observe the instructions in the manuals.

5.2 Safety-related communication with AS-Interface

5.2.1 Operating principle of code sequences of safe AS-i slaves

For realization of safety-related communication, each safe AS-i input slave sends a code sequence over the AS-i bus. To prevent a mix-up of the AS-i input slaves on an AS-i bus, each AS-i input slave sends a different code sequence. The code sequences are permanently stored in the AS-i input slave.

The F-CM AS-i Safety ST module checks every code sequence for correct data content. Depending on the result of the evaluation, the module sets the the safe input image.

During initial commissioning, the F-CM AS-i Safety ST module must teach the code sequences of all safe AS-i input slaves present on the AS-i bus and transfer them to non-volatile memory. In so doing, the module detects both the slaves for which input monitoring is activated as well as the other safe input slaves.

After replacement of a safe AS-i input slave, the new code sequence must be taught and saved.

If the code sequence is not saved for a safe AS-i input slave, or if the code sequence does not correspond to the saved code sequence, the input channel will be passivated and assigned the substitute value "0".

As soon as the F-CM AS-i Safety ST module detects a new code sequence, the code sequences are automatically taught. Confirm the transfer of the code sequences into the memory to prevent unauthorized changes to the AS-i component.

You will find more information about teaching code sequences, and the LED behavior, in Section "Code sequences (Page 61)".

You can find a description of the individual parameters in the Section "Process signal errors (Page 15)".

5.2.2 Operating principle of the safe AS-i outputs

Safety-related communication for safe AS-i outputs also uses code sequences. However, they have a different data structure compared to the code sequences of safe AS-i input slaves. The code sequences for safe AS-i outputs do not have to be taught and transferred.

For the function of a safe AS-i output, you need the following components:

- A control unit
- An evaluation unit

Control unit

The control unit outputs safety-related IN or OUT control commands to the AS-i bus. The control unit is integrated in the F-CM AS-i Safety ST module. The control unit assumes an active position in the communication. It acts like an AS-i slave and has an AS-i address that must be called by the AS-i master. The values in the output data of the AS-i master are not relevant in this case. The F-CM AS-i Safety ST module inserts the safety-related control data into the communication data.

Besides controlling the OFF state according to specification, a control unit can control up to four different output switching states: F-OUT 1, F-OUT 2, F-OUT 3, and F-OUT 4. The F-CM AS-i Safety ST module, however, makes available only the output switching state F-OUT 1, i.e., The OFF and ON states are controlled.

In addition to the switching states, a control unit can send out two different auxiliary signals: AUX1 and AUX2. You can use these auxiliary signals for error acknowledgement in the evaluation unit. For technical reasons, the AUX1 and AUX2 signals are mapped in the safe process image output. The auxiliary signals are not safety-related signals, however. During control by the safety program, the F-CM AS-i Safety ST module sends a sequence from each auxiliary signal one after the other on the AS-i bus. Up to 16 different control units can be activated in the F-CM AS-i Safety ST module. The control units are managed in the F-CM AS-i Safety ST module as switching group 0 to switching group 15.

If you want to use more than 16 different control units, you can plug two F-CM AS-i Safety ST modules into the ET 200SP station.

Observe the information on the bus configuration in Section AS-i bus configuration with multiple F-CM AS-i Safety ST modules (Page 28).

NOTICE
Uniqueness of the AS-i address on the AS-i bus Carefully check the AS-i addresses for the control of the safe AS-i outputs. Ensure that the assigned AS-i address exists only once on the AS-i bus. This is particularly important when you are using multiple devices that can control safe AS-i outputs on the same AS-i bus. If this is not observed, reliable shutdown of a safe output module is not guaranteed.

Evaluation unit

The evaluation unit reads the safety-related control commands ON or OFF on the AS-i bus and passes corresponding switching commands, e.g., to switching contacts. In case of error, e.g., communication error on the AS-i bus, the evaluation unit switches off. The evaluation unit is integrated in the safe AS-i output module to which, for example, drive contactor coils are connected. The evaluation unit behaves as a passive unit in the AS-i communication. The master does not detect the evaluation unit and does not call it. The evaluation unit monitors the communication of the AS-i address of the control unit and reacts to its safety-related control signals.

You set the AS-i address (see Section "Control unit") the evaluation unit is to monitor.

You can set multiple evaluation units to the same address so that a control unit can control multiple safe output modules simultaneously.

NOTICE
Bus cycle time for safe AS-i outputs An evaluation unit requires a minimum AS-i bus cycle time. Ensure that at least 5 AS-i addresses are present on the AS-i bus. Otherwise, the control unit goes to error state. When A/B slaves are used, at least 5 different numerical AS-i addresses must be present. That is, a combination of slave addresses 1A and 1B count as 1 numerical address. The F-CM AS-i Safety ST module does not have a monitoring function for this configuration rule.

5.3 AS-i bus configuration with multiple F-CM AS-i Safety ST modules

The F-CM AS-i Safety ST module generates an additional physical bus load on the AS-i cable.

To avoid faults due to too low levels of the communication signals on the AS-i cable, the entire bus load on the AS-i cable must not exceed a maximum value.

The following rules apply to the determination of the physical bus load on the AS-i cable:

Device type	Bus load value
Slave with A/B address	0.5
Slave with standard address	1.0
F-CM AS-i Safety ST module	2.5
Maximum value as sum of all devices	35.0

Determine the total bus load by adding the bus load values of the components connected to the AS-i cable. You do not have to include the standard AS-i master and AS-i power supply unit system components when calculating the bus load.

To avoid disturbances, the maximum bus load must not exceed the value 35.

The bus load value of the F-CM AS-i Safety ST module remains unchanged if switching groups are activated in the F-CM AS-i Safety ST module for control of safe outputs. In other words, the internally generated AS-i addresses do not influence the bus load value.

If you connect additional components, e.g., an MSS 3RK3 modular safety system, to the AS-i cable, you must take into consideration the bus load values of these components. For more detailed information, refer to the relevant manual.

When a repeater is used, this yields multiple cable segments for which the bus load can be determined separately.

The following configuration examples result from the table:

- In a fully expanded AS-Interface network configuration (with 31 slaves with standard address), you can install 1 F-CM AS-i Safety ST module.
- In an AS-Interface network configuration with 30 slaves with standard address, you can install 2 F-CM AS-i Safety ST modules.

5.4 Configuring with STEP 7 (classic)

With *STEP 7* (classic) the F-CM AS-i Safety ST module is configured independently of the configuration of further ET 200SP modules, e.g. CM AS-i Master ST.

If a safe AS-i slave, which is not available on the connected AS-i network, is configured on the F-CM AS-i Safety ST module, then this configuration error is not recognized when compiling the configuration. The F-CM module does not report that the slave cannot be detected until operation is in progress or code sequences are being read.

5.5 Configuring with the TIA Portal

TIA Portal V13 SP1

With TIA Portal V13 SP1, an F-CM AS-i Safety module can only be configured in combination with an AS-i master, necessitating the configuration of the AS-i slaves in STEP 7.

The AS-i subnet of the AS-i master, including the configured AS-i slaves, must be linked to the configuration with the F-CM.

The safety parameters of the AS-i input slaves are set in the properties window of the AS-i slaves.

TIA Portal V14 or higher

From TIA Portal V14 onwards, an F-CM AS-i Safety module can be configured:

- In combination with an AS-i Master, necessitating the configuration of the AS-i slaves in STEP 7. The AS-i subnet of the AS-i master, including the configured AS-i slaves, must be linked to the configuration with the F-CM.
  The safety parameters of the AS-i input slaves are set in the properties window of the AS-i slaves.
- Regardless of an AS-i master, i.e. no configuration of the AS-i slaves in STEP 7 is required. In this case, the parameters of the AS-i input slaves are set in the properties window of the F-CM AS-i Safety ST module.

In the case of safe inputs/outputs, the "Configuration status" output field in the properties of the F-CM reports whether the configuration of the F-CM is compatible with the configuration of the connected AS-i subnet. If a safe AS-i slave, which is not available on the connected AS-i network, is configured on the F-CM module, then the compilation of the configuration is nevertheless still possible. During operation or when reading the code sequences, however, the F-CM module reports that the slave cannot be detected.

The affected input address is passivated.

Configuration of safe AS-i outputs

The F-CM module contains a control unit for the safe AS-i outputs, see Section "Functional principle of the safe AS-i outputs (Page 26)".

TIA Portal V13 SP1

When configuring with TIA Portal V13 SP1, this control unit is not visible in the network view on the AS-Interface subnet of the AS-i master. The configuration of the F-CM module, however, is always combined with the AS-i master.

TIA Portal V14 or higher

In TIA Portal V14 or higher, the control unit must additionally be configured as a virtual slave on the AS-i subnet of the master, in the event that the AS-i slaves are configured in STEP 7.

A virtual slave is inserted automatically if a safe AS-i output is activated in the properties of the F-CM module and the F-CM module is already linked with the AS-i subnet. If necessary, by using the "Add AS-i Slave to AS-i network" button, the virtual slave can be inserted in the properties of the F-CM module under "Safe outputs". If no AS-i subnet is connected to the F-CM when the "Add AS-i slave to AS-i network" button is actuated, a subnet is automatically inserted.
The virtual slave can be managed like any other slave on the subnet, which means that all AS-i slave addresses existing in the AS-i subnet are visible. The virtual slave can be deleted if the control of the safe AS-i output is no longer required.

If necessary, the virtual slave can also be inserted straight from the hardware catalog (3RK7136-6SC00-0BC1F-DQ) into the subnet of the master.

NOTE

The virtual slave 3RK7136-6SC00-0BC1F-DQ is not a hardware module that is connected to the AS-i cable, but only a tool for the configuration of the AS-i master. The AS-i address assigned to the virtual slave 3RK7136-6SC00-0BC1F-DQ is emulated in the F-CM AS-i Safety module as soon as the corresponding safe output is activated in the properties of the F-CM.

If the AS-i master is engineered without configuring the AS-i slaves in STEP 7, i.e. either configuration of the AS-i slaves via the "SET" button or via the control panel in the TIA Portal, then the secure outputs in the F-CM must be configured and must have been loaded into the station before the configuration of the AS-i slaves is read into the master by means of the "SET" button or via the control panel in the TIA Portal.

Assigning parameters / Setting the address space 6

6.1 Parameters

List of parameters

Table 1-556 F-parameters

Parameter	Value range	Default setting	Parameter reassignment in RUN	Scope
F-monitoring time (ms)	1 ... 65534 ms	150 ms	No	F-CM AS-i Safety ST
F-source address	1 ... 65534	Assigned by the F-system	No	F-CM AS-i Safety ST
F-destination address	1 ... 65534	Is suggested by the F-system	No	F-CM AS-i Safety ST

For information on the F-parameters and the assignment of the F-address, refer to the Programming and Operating Manuals:

- SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126).
- S7 Distributed Safety (http://support.automation.siemens.com/WW/view/en/22099875/0/en)

Table 1-557 Potential group / AS-i network

Parameter	Value	Default setting	Parameter reassignment in RUN	Scope
BaseUnit with AS-i voltage supply	Potential group: The AS-i network of the left module (dark BaseUnit) is used New potential group: New AS-i network (light BaseUnit)	The AS-i network of the left module (dark BaseUnit) is used	No	F-CM AS-i Safety ST

Table 1-558 Module parameters: Behavior after channel faults

Parameter	Value	Default setting	Parameter reassignment in RUN	Scope
Behavior after channel faults	Passivate the channel (setting cannot be changed).	Passivate the channel	-	F-CM AS-i Safety ST

Safe inputs
Up to 31 safe AS-i input slaves are monitored. Open the settings for each required AS-i address. Activate the input monitoring and assign the parameters.

Table 1-559 Module parameters: Safe inputs, AS-i address 1 to 31

Parameter	Value	Default setting	Parameter reassignment in RUN	Scope
Activate input monitoring	• Disable • Enable	Disable	No	If this parameter is not activated, none of the following settings are possible.
I address	Output field, value is calculated automatically	-	No	Channel / safe AS-i input slave
Input delay (ms)	0 ms, 50 ms ... 150 ms[1)]	0 ms	No	Channel / safe AS-i input slave
Sensor evaluation	• 1oo1 evaluation • 1oo2 evaluation, equivalent	1oo2 evaluation	No	Channel / safe AS-i input slave
Startup test	• Disable • Enable	Disable	No	Channel / safe AS-i input slave
Discrepancy monitoring	• Disable • Enable	• "Disable" if 1oo1 evaluation • "Enable" if 1oo2 evaluation	No	Channel / safe AS-i input slave
Discrepancy behavior	Supply "0" value[2)]	Supply "0" value	-	Channel / safe AS-i input slave
Discrepancy time infinite	• Disable • Enable	Disable	No	Channel / safe AS-i input slave
Discrepancy time (ms)	0 ms ... 60 000 ms	500 ms	No	Channel / safe AS-i input slave
Sequence monitoring	• Deactivated • In ascending order (input 1 before input 2 at HIGH state) • In descending order (input 2 before input 1 at HIGH state)	Deactivated	No	Channel / safe AS-i input slave
Reintegration after discrepancy error	Test 0 signal necessary on both channels[2)]	Test 0 signal necessary on both channels	-	F-CM AS-i Safety ST
Configuration status	-	-	-	(read-only)

1) In increments of 10 ms

2) The setting cannot be changed.

Safe outputs
You can activate up to 16 safe AS-i switching groups Open the settings for each required switching group. Activate the output control and set the associated AS-i address.

Table 1-560 Safe outputs: Switching group 0 to 15

Parameter	Value	Default setting	Parameter reassignment in RUN	Scope
Activate output control	• Disable • Enable	Disable	No	If this parameter is not activated, none of the following settings are possible.
AS-i address	1 ... 31		No	Channel / safe AS-i output slave
AS-i address switching output	Output field, value is calculated automatically	-	No	Channel / safe AS-i output slave
AS-i address error acknowledgement	Output field, value is calculated automatically	-	No	Channel / safe AS-i output slave
Configuration status	-	-	-	(read-only)

You will find additional information in the Programming and Operating Manuals:

- SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126)
- S7 Distributed Safety (http://support.automation.siemens.com/WW/view/en/22099875/0/en)

6.2 Explanation of the parameters

6.2.1 F-parameters

Specify F-destination address for F-I/O of the PROFIsafe address type 2

The F-destination address of F-I/O of the PROFIsafe address type 2 is automatically assigned for every F-CPU.

F-source address

With the parameter "Central F-source address" you specify the F-source address for the F-I/O of the PROFIsafe address type 2 assigned to this F-CPU. The F-source address must be unique throughout the network.

NOTE
A change to the parameter "Central F-source address" results in a modification to the safety program when it is recompiled. A new acceptance may therefore be required, as this centrally modifies the F-source address of all F-I/O devices of address type 2 retrospectively.

S7 Distributed Safety (http://support.automation.siemens.com/WW/view/en/22099875/0/en)
SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126/0/en)

6.2.2 Potential group / AS-i network

Here, you set:

- The BaseUnit you are using.
- How the F-CM AS-i Safety ST I/O module is connected to the AS-i network.

The module can be connected to the AS-i cable by external wiring or automatically via the module plugged in on the left.

- Enable new AS-i network (light BaseUnit)
- Use AS-i network of the left module (dark BaseUnit)

BaseUnit with voltage supply

Enable new AS-i network (light BaseUnit)
Select this option if the module is plugged into a light BaseUnit.

Connect the module to the AS-i cable (ASI+ / ASI-) via the BaseUnit. The module is supplied with voltage from the AS-i cable. Connect the AS-i cable to an AS-i power supply unit or to a combination of a data decoupling unit and a suitable power supply unit.

There is no module-internal connection of the AS-i cable to the module plugged in on the left.

With TIA Portal or with STEP 7 (classic) the F-CM AS-i Safety module is configured independently of the configuration of the module inserted on the left (normally: CM AS-i Master ST).

⚠ WARNING

Connection of the BaseUnit only to safety extra-low voltage with limiting of output voltage to max. 40 V under fault condition
Connect the BaseUnit only to AS-i power supply units that meet the requirements named in Section Terminal assignment (Page 20), "Power supply units for AS-Interface". Connection to higher voltage may result in death, severe injury, and serious property damage.

Use AS-i network of the left module (dark BaseUnit)
Select this option if the module is plugged into the dark BaseUnit.

The module inserted on the left must be a CM AS-i Master ST module (normal situation) or another F-CM AS-i Safety ST module (special case).

The module is connected to the AS-i cable of the module plugged in on the left and supplied with voltage via the module-internal connection.

The module-internal connection is designed only for supplying power to the F-CM AS-i Safety ST I/O module. If several dark BaseUnits are connected in series, a direct connection of the dark BaseUnits to the AS-i cable using external wiring is additionally recommended.

Supplying power to AS-i modules, e.g., AS-i slaves, via the terminals of the dark BaseUnit is not permitted.

With TIA Portal, the F-CM AS-i Safety ST module uses the same AS-Interface subnet as the module inserted on the left (normally: CM AS-i Master ST).

With STEP 7 (classic) the F-CM AS-i Safety module is configured independently of the configuration of the module inserted on the left (as a rule: CM AS-i Master ST).

⚠ WARNING

Connection of the BaseUnit only to safety extra-low voltage with limiting of output voltage to max. 40 V under fault condition

Connect the BaseUnit only to AS-i power supply units that meet the requirements named in Section Terminal assignment (Page 20), "Power supply units for AS-Interface". Connection to higher voltage may result in death, severe injury, and serious property damage.

6.2.3 Module parameters - General

Behavior after channel faults

This parameter is permanently set to "Passivate the channel".

After channel faults have occurred, only the faulty PROFIsafe channels are passivated. The PROFIsafe channel corresponds to the safe input and output address in the process image.

6.2.4 Module parameters - Safe inputs

Configuration status

A valid evaluation is only possible if a compatible safe AS-i slave is actively operating on the network.

Input monitoring where there is a missing safe input or a missing AS-i slave causes a passivation of the input address. If no configuration of the slaves is saved in the STEP 7 project, the settings of the AS-i master must ensure that the connected compatible safe AS-i slave is actively operating, for example, using the "SET" button of the master.

Input monitoring activated

With activation of the input monitoring, you activate the corresponding AS-i slave as an input channel for signal processing in the safety program. The AS-i address must be assigned to a safe AS-i input slave.

When the input monitoring is activated, the value of the input channel is calculated based on the input states of the assigned safe AS-i input slave and the evaluation conditions specified by the parameter assignment. If a fault occurs, the substitute value "0" is transferred and the channel is passivated.

If input monitoring is deactivated, the substitute value "0" is transferred. The channel is not passivated.

If required, the AS-i slave can be monitored by another evaluation module, e.g., by another F-CM AS-i Safety ST module, the 3RK3 Modular Safety System. This applies both when input monitoring is deactivated and when it is activated.

NOTE

Call of the AS-i slave
The AS-i slave must be called by the AS-i master. Set up the configuration of the AS-i master in such a way that the communication of the AS-i master with the AS-i address functions properly.

NOTE

Slave profile
A safe AS-i input slave has the slave profile (IO.ID) = 0.B or 7.B.

I address

The input bit address of the input channel for the signal processing in the safety program is indicated here. It is calculated automatically from the start of the inputs entered on the "Addresses" tab.

Input delay

To suppress coupled-in interference or brief switching pulses, you can set an input delay for each AS-i slave. This will suppress interference pulses whose pulse time is less than the set input delay, in ms. The input delay applies to both channels of the channel pair of the AS-i slave.

NOTE

Time of fault suppression shortened by up to 75 ms
It can take 15 AS-i cycles until the valid code sequence is detected. As a result, the time of the fault suppression is shortened by up to 75 ms compared to the set value.

A long input delay suppresses longer interference pulses but results in a longer response time.

Range of values:	0 to 150 ms
Default	0 ms

The values 0, 50 to 150 ms can be selected in 10 ms increments.

The input delay time acts in addition to the system response time. Suppressed interference pulses are not visible in the safety program.

Evaluation of the sensors

This parameter specifies how the connected sensors are to be evaluated.

1oo1 evaluation
In 1oo1 evaluation, the sensor exists once and is connected to the first input of the safe AS-i slave via a single channel. You jumper the second input of the AS-i slave. Instead of the jumper, you can also connect another single-channel sensor to the second input. Only when both inputs supply an ON signal does the F-CM AS-i Safety ST module transfer the "1" value to the safety program (the two inputs are ANDed).

The individual states of the two inputs of the AS-i slave are not visible in the safety program.

A discrepancy analysis is not performed in 1oo1 evaluation.

1oo2 evaluation, equivalent
In 1oo2 (2v2) evaluation, equivalent, both inputs of the safe AS-i slave are occupied by one two-channel sensor or by two single-channel sensors. The two single-channel sensors then belong together functionally as a pair.

The input signals are compared internally for equivalence. The two inputs of the AS-i slave are combined to form a channel pair.

A discrepancy analysis is possible in 1oo2 evaluation, equivalent.

Discrepancy analysis

If you are using a two-channel sensor or two single-channel sensors that acquire the same physical process variable, the sensors will, for example, respond with a delay due to the limited accuracy of their arrangement to each other. For fail-safe inputs, the discrepancy analysis for equivalence is used to infer errors from the time characteristic of two signals of the same functionality. For two associated input signals, if different levels are detected after the input delay time has expired, the discrepancy analysis is started. A check is made to determine if the difference has disappeared after expiration of an assignable time period, the so-called discrepancy time. If not, there is a discrepancy error.

Startup test

If the "Startup test" parameter is activated, after startup of the channel or after a cross-circuit error (code sequence error), the value transferred to the safety program is kept at the substitute value "0" until the connected sensor has been correctly actuated at least once. Afterwards, the value of the input channel is calculated according to the set functionality.

The actuation of the sensor is defined to mean that both inputs of the safe AS-i slave must supply an ON signal, e.g., both switching contacts of the sensor are closed. Then, they must supply an OFF signal, e.g., switching contacts open. Finally, an ON signal must be supplied again, e.g., switching contacts closed. During the sensor actuation phase, none of the following errors may occur:

- Discrepancy error
- Sequence error
- Cross-circuit error (code sequence error)

After reintegration is complete, you must perform a startup test. For this purpose, you actuate the sensor to be monitored once.

A discrepancy error or a sequence monitoring error does not trigger a new startup test.

Discrepancy monitoring

If the discrepancy monitoring is activated, a discrepancy analysis is performed. This is the normal setting for 1oo2 evaluation, equivalent, in order to achieve high error uncovering.

You can deactivate the discrepancy monitoring for special situations. This corresponds in principle to 1oo1 evaluation of sensors. Check whether the lower error uncovering is sufficient for the required safety level. You may possibly use a sensor with integrated error uncovering. If required, you can activate the sequence monitoring.

When 1oo2 evaluation of the sensors is set, discrepancies in signal states between input 1 and input 2 are monitored.

When discrepancy monitoring is activated, the discrepancy time starts to elapse as soon as a difference is detected between the signal on input 1 and the signal on input 2. If the set discrepancy time is exceeded and the difference continues to exist, a discrepancy error is triggered.

Before switch-on, the signal value 0 must be present at both inputs, even when a discrepancy error has not occurred or the discrepancy time has not been set to "infinite".

If the "Evaluation of the sensors" parameter has been assigned with 1oo1, discrepancy monitoring is not performed.

Discrepancy behavior

This parameter is permanently set to "Supply 0 value".

The discrepancy behavior determines the value that is made available to the safety program in the F-CPU during the discrepancy, i.e., while the discrepancy time is running.

After expiration of the set input delay time, once an "OFF" signal is detected at one of the two input channels of the channel pair involved, this parameter setting causes the value "0" to be provided to the safety program in the F-CPU. This setting does not affect the sensor-actuator response time as a result of the discrepancy time.

Discrepancy time infinite

If you activate "Discrepancy time infinite", the time period for the discrepancy analysis never expires. As a result, a time-related discrepancy error will not be detected.

Nevertheless, the following switch-on condition applies: After a channel has been switched off, a "0" signal must be read in simultaneously at both input channels of the relevant channel pair before the channel can be switched on again.

If this condition is not satisfied, especially in the event of a single-channel switch-off (i.e., signal OFF at only one of the two input channels of the relevant channel pair) followed by a change to signal ON at both input channels, a discrepancy error will be detected at the time of the change to signal ON (at both input channels) even though the time for the discrepancy analysis has not expired. In data record 202, the bit 0.2 "= 1" is set in the status of the input monitoring of AS-i address n.

A discrepancy error is only detected if both input channels of the affected channel pair have not received the "0" signal simultaneously.

If "Discrepancy time infinite" is deactivated, the discrepancy analysis uses the value set for the "Discrepancy time" parameter.

Discrepancy time

You can specify the discrepancy time in the range of 0 to 60 000 ms for each channel pair.

The following settings are required:

- "Sensor evaluation": 1oo2 evaluation, equivalent
- "Discrepancy monitoring": Active
- "Discrepancy time infinite": Deactivated

In most cases, the discrepancy time is started but does not completely elapse, because the signal differences are evened out again after a short time.

Select a large enough discrepancy time so that in error-free cases, the difference between the two signals always disappears before the discrepancy time expires.

If the input signals do not match after expiration of the assigned discrepancy time, e.g., due to a mechanical defect of the sensor or sensor wire break, a discrepancy error is detected.

When discrepancy time is running, the switch-on condition also applies that after a channel has been switched off, a "0" signal must be read in simultaneously at both input channels of the relevant channel pair before the channel can be switched on again. If this condition is not satisfied, especially in the event of brief switch-off of a channel (due to signal OFF at only one of the two input channels) followed by a change to signal ON at both input channels, a discrepancy error will be detected at the time of the change to signal ON (at both input channels) if the time for the discrepancy analysis has not expired.

A detected discrepancy error indicates to the user that the switch-on condition is not satisfied.

Assign a discrepancy time that is greater than the input delay time.

Sequence monitoring

Overview

The sequence monitoring monitors the sequence of the signals of the channel pair when there is a signal change OFF >>> ON at the inputs of the safe AS-i slave.

The following settings are possible:

- Deactivated: The sequence is not a condition that has to be satisfied for switching on the function output.
- Ascending order: Input 1 before input 2 at "HIGH" state
- Descending order: Input 2 before input 1 at "HIGH" state

If the sequence is violated, the "Sequence condition violated" error is detected. The value transferred to the safety program is kept at "0" until the "OFF" signal is read in at both input channels. Switch-on condition is, for example, both switching contacts of the sensor open. The inputs must be switched on one after the other in the assigned sequence and must not switch on simultaneously.

You can activate the sequence monitoring if 1oo2 evaluation, equivalent, is set for the sensor evaluation. In this case, the discrepancy monitoring can be activated or deactivated.

Deactivated

The sequence of the inputs is not monitored.

Ascending order: Input 1 before input 2 at "HIGH" state

For switch-on of the channel, input channel 1 must first read in and hold an "ON" signal followed by input channel 2.

When the channel is switched off, the sequence of the input channels is not monitored.

Descending order: Input 2 before input 1 at "HIGH" state
For switch-on of the channel, input channel 2 must first read in and hold an "ON" signal followed by input channel 1.
When the channel is switched off, the sequence of the input channels is not monitored.

Reintegration after discrepancy error

This parameter is permanently set to: "Test 0-signal necessary on both channels".
A discrepancy error is not considered to be rectified until an "OFF" signal is present again at both input channels. Reintegration of the PROFIsafe channel is then possible.

6.2.5 Module parameters - Safe outputs

Configuration status

For operation of the switching group the AS-i master must activate communication with the associated AS-i address of the control unit in the F-CM. For this reason the configuration of the AS-i network must include a virtual AS-i slave with the profile IO.ID.ID2 = 6.B.D and ID1 = 0. If the slaves are not configured, the AS-i master must be set such that the AS-i address of the control unit in the F-CM is actively operating, for example, using the "SET" button of the master while the F-CM module is being configured and connected to the AS-i master.

Activate output control

With this parameter, you activate the corresponding switching group and the associated AS-i address of the control unit in the F-CM AS-i Safety ST module.
You will find additional information in Section Operating principle of the safe AS-i outputs (Page 26), "Operating principle of the safe AS-i outputs."
When output control is activated, the control unit in the F-CM AS-i Safety ST module is switched on so that the F-CM AS-i Safety ST module generates an additional AS-i address on the AS-i Bus. The associated value is output from the safe process image via this AS-i address.
When output control is deactivated, the corresponding control unit in the F-CM AS-i Safety ST module is switched off, and an AS-i slave is not emulated on the AS-i bus.

AS-i address

Here, you set the AS-i address within the range of 1 to 31 that the F-CM AS-i Safety ST module is to use for control of a safe AS-i output.

⚠ WARNING

Uniqueness of the AS-i address on the AS-i bus
Carefully check the AS-i addresses for the control of the safe AS-i outputs. Ensure that the assigned AS-i address exists only once on the AS-i bus. This is particularly important when you are using multiple devices that can control safe AS-i outputs on the same AS-i bus. If this is not observed, reliable shutdown of a safe output module is not guaranteed.

NOTE

Communication of the AS-i master with the AS-i address
The AS-i address of the control unit must be called by the AS-i master. Set up the communication of the AS-i master in such a way that communication with the AS-i address of the control unit functions properly.

NOTE

Slave profile of the control unit in the F-CM AS-i Safety ST module (control of a safe AS-i output)
The AS-i address of the control unit corresponds to a slave with slave profile (IO.ID.ID2) = 6.B.D and ID1 = 0.

Q address switching output

The output bit address is displayed here. It determines the switching state of the safe output (control signal F-OUT 1). Interconnect the "Q address switching output" in your safety program according to the required safety logic.

The output bit address is calculated automatically from the start of the outputs entered on the "Addresses" tab.

Q address error acknowledgment

The output bit address that sends an acknowledgment signal to the safe output is displayed here.

The output bit address is calculated automatically from the start of the outputs entered on the "Addresses" tab.

A positive edge (0 >>> 1) triggers the F-CM AS-i Safety ST module to first send the AUX1 auxiliary signal to the safe output followed by the AUX2 auxiliary signal. Another positive edge is necessary for sending another sequence of auxiliary signals.

The auxiliary signals are used, in general, for acknowledging an error state at the safe output. Refer to the AS-Interface (http://support.automation.siemens.com/WW/view/en/26250840/0/en) System Manual and the Operating Instructions of the safe output module

(http://support.automation.siemens.com/WW/view/en/43666143/0/en) used to find out which functions the auxiliary signals are used for.

NOTE

"Q address error acknowledgment"
The "Q address error acknowledgment" does not trigger an error acknowledgment in the F-CM AS-i Safety ST module. Rather, as described above, it sends an acknowledgement signal to the safe output module on the AS-i bus.

6.3 Address space

6.3.1 Address assignment for user data and value status of the F-CM AS-i Safety ST module

Input and output address assignment

Of the assigned addresses of the F-CM AS-i Safety ST module, the user data occupy the following addresses in the F-CPU:

Table 1-561 Input address assignment in the F-CPU

Byte in the F-CPU	Assigned bits in the F-CPU per F-CM AS-i Safety ST module							
	Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**	**Bit 0**
x + 0	DI0.7 AS-i address 7	DI0.6 AS-i address 6	DI0.5 AS-i address 5	DI0.4 AS-i address 4	DI0.3 AS-i address 3	DI0.2 AS-i address 2	DI0.1 AS-i address 1	DI0.0 Reserved

x + 15	Reserved							

X = Module start address

NOTICE

Process value "0" is transmitted as a non-safety related value

Based on the transfer principle of the code sequences, the process value "1" is transferred via AS-Interface as a safe value, so that the enable for switching on a machine can be issued in a safety-related manner. If an error occurs during transfer of the value "1", this error is detected and substitute value "0" is used.

The process value "0" is transferred via AS-interface as an unsafe value. That is, a faulty transmission of the "0" value cannot be detected. The "0" value must therefore not be used as safety-related information that initiates a dangerous action (e.g. feedback "0" of a switch position).

Table 1-562 Output address assignment in the F-CPU

Byte in the F-CPU	Assigned bits in the F-CPU per F-CM AS-i Safety ST module							
	Bit 7	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**	**Bit 0**

x + 4	Reserved							
...								
x + 7	Reserved							

X = Module start address

The error acknowledgment bit initiates the AUX1 and AUX2 signals one after the other.

NOTE

Use of the error acknowledgment bit of a safe AS-i output

The values in the PROFIsafe process output image have Safety Integrity Level SIL 3. In addition to the switching states, a control unit can send out two different auxiliary signals to a safe AS-i output: AUX1 and AUX2. These auxiliary signals are not safety-related signals. You can use the auxiliary signals for error acknowledgement in the evaluation unit. For technical reasons, these error acknowledgment bits are mapped in the safe process output image. If error acknowledgment bits are sent to a safe AS-i output, the *STEP 7* or SIMATIC Manager configuration tool is unable to detect that the error acknowledgment bits are not safe. This means: No warnings or faults will be output for it when the safety application is generated. The user is responsible for the correct processing of these signals in the safety application.

6.3.2 Value status

Properties

For each input signal and output signal, the F-CM AS-i Safety ST module provides information about the signal's validity, i.e., the "value status". Like the input signal, the value status is stored in the process image.

Value status for the digital input and output modules

The value status is binary supplementary information of a digital input or output signal. It is entered in the process input image simultaneously with the process signal. The value status provides information regarding the validity of the input or output signal.

The value status is influenced by the following:

- Code sequence errors, e.g, caused by a permanent fault on the AS-i bus, wiring error, etc.
- Missing safe AS-i input slaves
- Channel faults
- Replacement of a safe AS-i slave by a non-safe AS-i slave
- Discrepancy error
- Sequence error

Value status = 1: A valid process value is output for the channel.

Value status = 0: A substitute value is output for the channel or the channel is deactivated.

Assignment of the inputs and outputs to the value status in the process image

A value status is assigned to each channel of the F-CM AS-i Safety ST module in the process input image.

Additional information

A detailed description of the evaluation and processing of the value status can be found in the Programming and Operating Manual SIMATIC Safety - Programming and Configuring (http://support.automation.siemens.com/WW/view/en/54110126/0/en).

See also

Address assignment for user data and value status of the F-CM AS-i Safety ST module (Page 42)

6.4 Data records for diagnostics

For diagnostic purposes, you can read out the following data records via your user program. In firmware V1.0.1 or higher the diagnostics data record 206 is available. This data record contains a summary of the information that is relevant for a comprehensive diagnosis via your user program.

NOTE

Use of the DS 206 for diagnostic purposes is recommended (firmware V1.0.1 or higher).

The data records 92, 202 and 204 are required for the diagnosis via the user program for a module with firmware V1.0.0. For reasons of compatibility, these data records also remain available in firmware V1.0.1 or higher.

See also

Firmware update (Page 18)

6.4.1 DS 92 Device-specific diagnostics

Meaning

NOTE
Use of the data set 206 is recommended for diagnosis via the user program (firmware V1.0.1 or higher).

Data record 92 contains device-specific messages and information on the device function states of the F-CM AS-i Safety ST module.

For some events, the F-CM AS-i Safety ST module generates a diagnostic alarm.

The following applies for diagnostic alarms of the F-CM AS-i Safety ST module with firmware V1.0.0:

- The "Error code" column in the table below indicates which events are relevant here. If the associated bit changes in the data record, a diagnostic alarm with the indicated error code is generated (incoming alarm when bit changes to value "1" and outgoing alarm when bit changes to value "0").
- The text inside parentheses after the error code corresponds to the error text that is specified for the given error code according to the PROFIBUS Standard. Several error codes can be output. If no error code is specified ("-"), a diagnostic alarm is not generated.
- The diagnostic alarms in firmware V1.0.1 or higher are described in Section "DS 206 Diagnostic Data Record (Page 56)".

15 ... 17	Reserved	-	-
18.0	Group error code sequence_Logic	24 ("Switch-off")	A code sequence error or logic error is present for at least one safe input. Bytes 90 ... 91 contain the AS-i address of the first safe input for which the error is present.
18.1	Reserved	-	-
18.2	Group_Message_Input_Triggered	-	At least one monitored safe input has value status "0". Possible cause: • Startup test necessary • Safety sensor triggered Bytes 94 ... 95 contain the AS-i address of the first safe input for which the value status "0" is present.
18.3 ... 18.7	Reserved	-	-
19 ... 21	Reserved	-	-
22.0 ... 22.1	Reserved	-	-

Byte.Bit	Description	Only with firmware V1.0.0: Error code (decimal) in the diagnostic alarm	Remark
22.2	Timeout	24 ("Switch-off") 8 ("Lower limit undershot")	An internal data processing error has occurred. The F-CM AS-i Safety ST module signals a device fault. Bit 13.2 is additionally set.
22.3 ... 22.6	Reserved	-	-
22.7	AS-i slave failure	26 ("External error")	No communication is detected in the case of at least one monitored safe input slave or control unit for a safe AS-i output.
23.0 ... 23.7	Reserved	-	-
24 ... 25	Reserved	-	-
26.0 ... 26.3	Reserved	-	-
26.4	Coding element error	24 ("Switch-off") 27 ("Unclear error")	A data error occurred or coding element is missing when a coding element is accessed. The F-CM AS-i Safety ST module signals a device fault.
26.5 ... 26.7	Reserved	-	-
27 ... 28	Reserved	-	-
29.0 ... 29.7	Reserved	-	-
30 ... 33	Reserved	-	-
34 ... 35	Parameter assignment error object	-	Object number for which a parameter assignment error was detected. 0 = No error 1 ... 31 = The number corresponds to the AS-i address of a safe input. 32 ... 47 = A number 32 ... 47 corresponds to the number of the switching group 0 ... 15
36 ... 37	Reserved	-	-
38.0	AS-i bus error	26 ("External error")	The AS-i data communication is interrupted, substitute values in the interconnection logic
38.1	AS-i parameter assignment error	26 ("External error")	In addition, the AS-i address of the affected AS-i slave with the lowest address is entered in byte 55. If an AS-i address of an output switching group is not included by the AS-i master in the data communication, this bit is set. A substitute value will be used instead.
38.2	AS-i configuration error	-	In addition, the AS-i address of the affected AS-i slave with the lowest address is entered in byte 39. This bit is set when SET ≠ ACTUAL on the AS-i bus, when, for example, an AS-i slave is missing. A substitute value will be used instead.

Byte.Bit	Description	Only with firmware V1.0.0: Error code (decimal) in the diagnostic alarm	Remark
38.3	AS-i voltage too low	-	If the AS-i voltage is too low during operation, a serious device fault results.
38.4	Reserved	-	-
38.5	AS-i communication okay	-	-
38.6 ... 38.7	Reserved	-	-
39	Incorrect AS-i address	-	AS-i address of the AS-i slave that the device has identified as faulty: 0 = No error 1 ... 31 = AS-i slave address
40 ... 47	Reserved	-	-
48.0	ASIsafe safe input active	-	As soon as safe AS-i slaves become monitored, this bit is set.
48.1	ASIsafe safe output active	-	If safe AS-i outputs are controlled, this bit is set.
48.2 ... 48.7	Reserved	-	-
49.0	ASIsafe code sequences missing	26 ("External error")	Safe input In addition, the AS-i address is entered in byte 50.
49.1	ASIsafe code sequences duplicated	24 ("Switch-off") 19 ("Communication error")	In addition, the AS-i address is entered in byte 50.
49.2	ASIsafe code sequences new	-	New code sequences are available for transfer. In addition, the AS-i address is entered in byte 50.
49.3	ASIsafe code sequences known	-	The code sequences are taught and saved in the coding element.
49.4	ASIsafe code sequence error	24 ("Switch-off") 19 ("Communication error")	In addition, the AS-i address is entered in byte 50.
49.5	ASIsafe code sequence teaching active	-	The code sequences are being collected. When the code sequences for all safe AS-i input slaves detected on the bus are taught, this bit is reset.
49.6 ... 49.7	Reserved	-	-
50	Code sequence error object	-	This bit contains the lowest AS-i address for which a code sequence problem has occurred. Code sequence problems are: • 49.0 ASIsafe code sequences missing (Prio 3) • 49.1 ASIsafe code sequences duplicated (Prio 1) • 49.2 ASIsafe code sequences new (Prio 4) • 49.4 ASIsafe code sequence error (Prio 2)
51 ... 54	Reserved	-	-

Byte.Bit	Description	Only with firmware V1.0.0: Error code (decimal) in the diagnostic alarm	Remark
55	Switching group error object	-	This byte contains the lowest AS-i address that is configured for an output switching group but is not addressed by the master. Correct the slave configuration of the master.
56 ... 61	Reserved	-	-
62.0	F_Dest_Adr does not match	24 ("Switch-off") 19 ("Communication error") 64 ("Different destination address")	-
62.1	F_Dest_Adr invalid	24 ("Switch-off") 19 ("Communication error") 65 ("Invalid destination address")	The coding element does not contain an F-address.
62.2	F_Source_Adr invalid	24 ("Switch-off") 19 ("Communication error") 66 ("Invalid source address")	-
62.3	F_WD-Time_0	24 ("Switch-off") 19 ("Communication error") 67 ("Watchdog time is 0 ms")	F_WD-Time value is 0 ms.
62.4	F_SIL value	24 ("Switch-off") 19 ("Communication error") 68 ("Parameter 'F_SIL' exceeds the appl. SIL")	F_SIL value exceeds SIL value of the specified device application
62.5	F_CRC_Length	24 ("Switch-off") 19 ("Communication error") 69 ("Parameter 'F_CRC_Length' does not match ...")	F_CRC_Length value does not match the actual CRC length.
62.6	F_Par_Version	24 ("Switch-off") 19 ("Communication error") 70 ("Incorrect F-parameter version or F_Block_ID")	F_Par_Version does not match the F-parameter set or F-Block_ID is invalid Block_ID
62.7	CRC1 error	24 ("Switch-off") 19 ("Communication error") 71 ("CRC1 error")	-
63.0 ... 63.2	Reserved	-	-
63.3	iPAR_CRC error	24 ("Switch-off") 19 ("Communication error") 75 ("Inconsistent I-parameters [iParCRC error]")	-
63.4	Operator acknowledge requested	-	Channel is ready for reintegration
63.5 ... 63.7	Reserved	-	-
64 ... 65	Reserved	-	-
70 ... 89	Reserved	-	-
90 ... 91	Object_Code_Sequence_Logic	-	AS-i address of the first safe AS-i slave for which a code sequence error or logic error is present. See also bit 18.0. 0 = No error 0 = No error 1 ... 31 = AS-i slave address ≥32 = Internal error numbers

Byte.Bit	Description	Only with firmware V1.0.0: Error code (decimal) in the diagnostic alarm	Remark		
92 ... 93	Reserved	-	-		
94 ... 95	Object_input_triggered	-	AS-i address of the first safe AS-i slave for which the input_triggered message is present. See also bit 18.2.		
			0	=	No error
			1 ... 31	=	AS-i slave address
			≥32	=	Internal error numbers
96 ... 199	Reserved	-	-		

6.4.2 DS 202 Status safe inputs/outputs

Description

NOTE
Use of the data set 206 is recommended for diagnosis via the user program (firmware V1.0.1 or higher).

DS 202 contains non-safety-related status information for the safe input slaves and for the control of the safe output slaves.

The status information for the control of the safe output slaves relates either to the control units activated in the F-CM AS-i Safety ST module or to data of external control units for safe output slaves that is also read on the AS-i bus.

Table 1-564 DS 202 Status safe inputs/safe outputs

Byte	Description
0 ... 1	Reserved
2 ... 5	Status input monitoring AS-i address 1
6 ... 9	Status input monitoring AS-i address 2
10 ... 13	Status input monitoring AS-i address 3
14 ... 17	Status input monitoring AS-i address 4
18 ... 21	Status input monitoring AS-i address 5
22 ... 25	Status input monitoring AS-i address 6
26 ... 29	Status input monitoring AS-i address 7
30 ... 33	Status input monitoring AS-i address 8
34 ... 37	Status input monitoring AS-i address 9
38 ... 41	Status input monitoring AS-i address 10
42 ... 45	Status input monitoring AS-i address 11
46 ... 49	Status input monitoring AS-i address 12
50 ... 53	Status input monitoring AS-i address 13
54 ... 57	Status input monitoring AS-i address 14
58 ... 61	Status input monitoring AS-i address 15
62 ... 65	Status input monitoring AS-i address 16
66 ... 69	Status input monitoring AS-i address 17

Byte	Description
70 ... 73	Status input monitoring AS-i address 18
74 ... 77	Status input monitoring AS-i address 19
78 ... 81	Status input monitoring AS-i address 20
82 ... 85	Status input monitoring AS-i address 21

106 ... 109	Status input monitoring AS-i address 27
110 ... 113	Status input monitoring AS-i address 28
114 ... 117	Status input monitoring AS-i address 29
118 ... 121	Status input monitoring AS-i address 30
122 ... 125	Status input monitoring AS-i address 31
126 ... 129	Status output control switching group 0
130 ... 133	Status output control switching group 1
134 ... 137	Status output control switching group 2
138 ... 141	Status output control switching group 3
142 ... 145	Status output control switching group 4
146 ... 149	Status output control switching group 5
150 ... 153	Status output control switching group 6
154 ... 157	Status output control switching group 7
158 ... 161	Status output control switching group 8
162 ... 165	Status output control switching group 9
166 ... 169	Status output control switching group 10
170 ... 173	Status output control switching group 11
174 ... 177	Status output control switching group 12
178 ... 181	Status output control switching group 13
182 ... 185	Status output control switching group 14
186 ... 189	Status output control switching group 15
190 ... 199	Reserved

Table 1-565 Input monitoring: Structure of the status information in DS 202

Byte.Bit	Message bit		Remark
0.0	Value = 1:	Startup test necessary	-
0.1	Value = 1:	Sequence condition violated	-
0.2	Value = 1:	Discrepancy condition violated	-
0.3	Value = 1:	Safety sensor triggered	-
0.4 ... 0.7	Reserved		-
1.0	Value = 1:	Code sequence error	Cross-circuit at input
1.1 ... 1.7	Reserved		-
2.0	Reserved		-
2.1	Value = 1:	Switch-on condition not met	-
2.2 ... 2.7	Reserved		-
3.0 ... 3.7	Reserved		

Table 1-566 Output control: Structure of the status information in DS 202

Byte.Bit	Message bit	Remark
0.0	Output active	The control unit of the switching group sends the "F-OUT 1" control signal.
0.1 ... 0.7	Reserved	-
1.0 ... 1.3	Reserved	-
1.4	Auxiliary signal AUX1 sent	Auxiliary control signal AUX1 was transferred with value "1." If the error acknowledgment bit in the output process image has the value "0", the message is reset.
1.5	Auxiliary signal AUX2 sent	Auxiliary control signal AUX2 was transmitted with value "1." If the error acknowledgment bit in the output process image has the value "0", the message is reset.
1.6 ... 1.7	Reserved	-
2.0 ... 2.7	Reserved	-
3.0 ... 3.7	Reserved	-

6.4.3 DS 204 Status code sequences

Description

NOTE
Use of the data set 206 is recommended for diagnosis via the user program (firmware V1.0.1 or higher).

The DS 204 contains the statuses of all AS-i slaves that are known to the F-CM AS-i Safety ST module.

Table 1-567 DS 204: Status code sequence for an AS-i address in DS 204

Byte	Description
0 ... 13	Reserved
14 ... 17	Status code sequence for AS-i address 1
18 ... 21	Status code sequence for AS-i address 2
22 ... 25	Status code sequence for AS-i address 3
26 ... 29	Status code sequence for AS-i address 4
30 ... 33	Status code sequence for AS-i address 5
34 ... 37	Status code sequence for AS-i address 6
38 ... 41	Status code sequence for AS-i address 7
42 ... 45	Status code sequence for AS-i address 8
46 ... 49	Status code sequence for AS-i address 9
50 ... 53	Status code sequence for AS-i address 10
54 ... 57	Status code sequence for AS-i address 11
58 ... 61	Status code sequence for AS-i address 12
62 ... 65	Status code sequence for AS-i address 13
66 ... 69	Status code sequence for AS-i address 14
70 ... 73	Status code sequence for AS-i address 15
74 ... 77	Status code sequence for AS-i address 16

Byte	Description
78 ... 81	Status code sequence for AS-i address 17
82 ... 85	Status code sequence for AS-i address 18
86 ... 90	Status code sequence for AS-i address 19
90 ... 91	Status code sequence for AS-i address 20
94 ... 97	Status code sequence for AS-i address 21
98 ... 101	Status code sequence for AS-i address 22
102 ... 105	Status code sequence for AS-i address 23
106 ... 109	Status code sequence for AS-i address 24
110 ... 113	Status code sequence for AS-i address 25
114 ... 117	Status code sequence for AS-i address 26
118 ... 121	Status code sequence for AS-i address 27
122 ... 125	Status code sequence for AS-i address 28
126 ... 129	Status code sequence for AS-i address 29
130 ... 133	Status code sequence for AS-i address 30
134 ... 137	Status code sequence for AS-i address 31
138 ... 199	Reserved

Table 1-568 Assignment of the bits of an AS-i address in the "Status code sequence" data structure

Byte	Bit	Description	Setting	Meaning of the setting
0	0 ... 2	Status of the slave	= 0	No slave present
			= 1	Standard slave (not safety-related)
			= 2	Safe slave, but the code sequence type safe input/safe output is not yet decoded.
			= 3	Code sequence type safe output
			= 4	Code sequence type safe input
			= 5 ... 7	Reserved
	3	-	Reserved	-
	4 ... 6	Status of parameter assignment	= 0	No safe AS-i output slave or AS-i input slave is configured.
			= 1	Reserved
			= 2	Safe AS-i slave is configured The detected slave corresponds to the activation.
			= 3	Safe AS-i slave is configured The detected slave does not correspond to the activation.
			= 4 ... 7	Reserved
	7	-	Reserved	-
1	0 ... 2	Status of the code sequence	= 0	Code sequence irrelevant: No activation or no slave is present.
			= 1	Code sequence missing: No code sequence is taught or transferred.
			= 2	Code sequence duplicated: At least one other slave has the same code sequence.
			= 3	Code sequence new: The taught code sequence does not correspond to the transferred code sequence.
			= 4	Code sequence known: The taught code sequence does not correspond to the transferred code sequence.
			= 5 ... 7	Reserved
	3	-	Reserved	-

Byte	Bit	Description	Setting	Meaning of the setting
1	4 ... 5	Status of the safe input 1	= 0	The input is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Input signal = 0: The contact is open.
			= 3	Input signal = 1: The contact is closed.
	6 ... 7	Status of the safe input 2	= 0	The input is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Input signal = 0: The contact is open.
			= 3	Input signal = 1: The contact is closed.
2	0 ... 1	Status of the "F-OUT 1" control signal for safe output	= 0	The output is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Control signal for output = 0
			= 3	Control signal for output = 1
	2 ... 3	Status of the "F-OUT 2" control signal for safe output	= 0	The output is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Control signal for output = 0
			= 3	Control signal for output = 1
	4 ... 5	Status of the "F-OUT 3" control signal for safe output	= 0	The output is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Control signal for output = 0
			= 3	Control signal for output = 1
	6 ... 7	Status of the "F-OUT 4" control signal for safe output	= 0	The output is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Control signal for output = 0
			= 3	Control signal for output = 1
3	0 ... 1	Status of the auxiliary signal 1	= 0	The signal is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Auxiliary signal = 0
			= 3	Auxiliary signal = 1
	2 ... 3	Status of the auxiliary signal 2	= 0	The signal is not present (or the code sequence type is not yet decoded).
			= 1	Error, e.g., code sequence error
			= 2	Auxiliary signal = 0
			= 3	Auxiliary signal = 1
	4 ... 7	-	Reserved = 0	-

6.4.4 DS 206 Diagnostic data record

Meaning

NOTE
Use of the data set 206 is recommended for diagnosis via the user program (firmware V1.0.1 or higher).

Data record 206 contains a summary of the information that is relevant for a comprehensive diagnosis of the F-CM AS-i Safety ST module via your user program.

For some events, the F-CM AS-i Safety ST module generates a diagnostic alarm.

The following applies for diagnostic alarms of the F-CM AS-i Safety ST module with firmware V1.0.1 or higher:

- The "Error code" column in the table below indicates which events are relevant here.
- If the associated bit changes in the data record, a diagnostic alarm with the indicated error code is generated (incoming alarm when bit changes to value "1" and outgoing alarm when bit changes to value "0").
- If no error code is specified ("-"), a diagnostic alarm is not generated.
- The diagnostic alarms for firmware V1.0.0 are described in Section "DS 92 Device-specific diagnosis (Page 46)".

Table 1-569 DS 206 Diagnosis

Byte.Bit	Description In the case of binary values, the description declares the status "1"	FW V1.0.1 and higher: Error code (decimal) in the diagnostic alarm	Remark
0	Version High	-	-
1	Version Low	-	-
2.0	Overtemperature	1048	Maximum operating temperature exceeded
2.1	Undertemperature	786	Ambient temperature too low
2.2	Incorrect parameter value	16	Configuration data contains errors
2.3	Incorrect or inconsistent firmware	283	Firmware is faulty Firmware update necessary
2.4	Supply voltage too high	1038	AS-i voltage too high
2.5	Supply voltage too low	1039	AS-i voltage too low
2.6	Program cycle time exceeded	259	Internal cycle time exceeded
2.7	Device fault	1059	Self-test has determined a device fault. For details, see further error messages.
3.0	Serious device fault	9	Serious device fault. No communication possible
3.1	Teaching necessary	1055	New code tables are available for transfer.
3.2	Normal operation	-	Cyclic I/O data exchange active
3.3	Startup	-	Parameters are loaded No cyclic I/O data exchange
3.4	Serious device fault	-	Serious device fault. No communication possible
3.5	I/O device signal error	-	One or more channels are passivated
3.6	Code sequence cannot be read correctly	-	A code sequence is non-existent or incomplete

Byte.Bit	Description In the case of binary values, the description declares the status "1"	FW V1.0.1 and higher: Error code (decimal) in the diagnostic alarm	Remark
3.7	Reintegration necessary	-	Error is cleared, but at least one channel is still passivated
4.0	Access to device settings	-	Assignment of the F-address Acceptance of the code sequences Firmware update
4.1	ASIsafe code table teaching active	-	Teach LED flashes yellow; code sequences are collected. Is reset when the code tables for all safe AS-i input slaves detected on the bus have been taught.
4.2	Diagnostic memory overflow	33	Too many simultaneous error messages
4.3	Change of parameters not permissible	-	Modification of parameter data is rejected in normal mode
4.4 ... 4.7	Reserved	-	-
5.0	Status LED flashes green	-	-
5.1	Status LED lit green	-	-
5.2	Error LED flashes red	-	-
5.3	CFG LED flashes red	-	-
5.4	PSF LED flashes red	-	-
5.5	Teach LED flashes yellow	-	-
5.6	Teach LED lit yellow	-	-
5.7	ADDR LED flashes green	-	-
6.0	No access possible to the retentive storage of the F-address	781	The coding element (type H) in the BaseUnit is missing or there is an access error
6.1	Different destination address (F_Dest_Add)	64	The PROFIsafe driver has detected a different F-destination address.
6.2	Invalid target address (F_Dest_Add)	65	The PROFIsafe driver has detected an inadmissible F-destination address.
6.3	Invalid source address (F_Source_Add)	66	The PROFIsafe driver has detected an inadmissible F-source address.
6.4	Watchdog time is 0 ms (F_WD_Time or F_WD_Time2)	67	The PROFIsafe driver has detected an inadmissible watchdog time.
6.5	Parameter "F_SIL" exceeds the application-specific SIL	68	The PROFIsafe driver has detected a discrepancy between the communication SIL setting and the application SIL setting.
6.6	Parameter "F_CRC_Length" does not match the generation	69	The PROFIsafe driver has detected a discrepancy in the CRC length.
6.7	Incorrect F-parameter version or F_Block_ID	70	The PROFIsafe driver has detected an incorrect version of the F-parameters or an invalid F_Block_ID.
7.0	CRC1 error	71	The PROFIsafe driver has detected inconsistent F-parameters.
7.1	Inconsistent i-parameters (iParCRC error)	75	The PROFIsafe driver has detected inconsistent i-parameters.
7.2	PROFIsafe communication error (timeout)	92	
7.3	PROFIsafe communication error (CRC)	F93	

Byte.Bit	Description In the case of binary values, the description declares the status "1"	FW V1.0.1 and higher: Error code (decimal) in the diagnostic alarm	Remark
7.4	PROFIsafe address assignment error	F94	Coding element contains inadmissible data
7.5 ... 7.7	Reserved	-	-
8	Configured AS-i address for output switching group 0	-	-
9	Configured AS-i address for output switching group 1	-	-
10	Configured AS-i address for output switching group 2	-	-
11	Configured AS-i address for output switching group 3	-	-
12	Configured AS-i address for output switching group 4	-	-
13	Configured AS-i address for output switching group 5	-	-
14	Configured AS-i address for output switching group 6	-	-
15	Configured AS-i address for output switching group 7	-	-
16	Configured AS-i address for output switching group 8	-	-
17	Configured AS-i address for output switching group 9	-	-
18	Configured AS-i address for output switching group 10	-	-
19	Configured AS-i address for output switching group 11	-	-
20	Configured AS-i address for output switching group 12	-	-
21	Configured AS-i address for output switching group 13	-	-
22	Configured AS-i address for output switching group 14	-	-
23	Configured AS-i address for output switching group 15	-	-
24 ... 27	Status AS-i address 1	-	-
28 ... 31	Status AS-i address 2	-	-
32 ... 35	Status AS-i address 3	-	-
36 ... 39	Status AS-i address 4	-	-
40 ... 43	Status AS-i address 5	-	-
44 ... 47	Status AS-i address 6	-	-
48 ... 51	Status AS-i address 7	-	-
52 ... 55	Status AS-i address 8	-	-
56 ... 59	Status AS-i address 9	-	-
60 ... 63	Status AS-i address 10	-	-
64 ... 67	Status AS-i address 11	-	-

Byte.Bit	Description In the case of binary values, the description declares the status "1"	FW V1.0.1 and higher: Error code (decimal) in the diagnostic alarm	Remark
68 ... 71	Status AS-i address 12	-	-
72 ... 75	Status AS-i address 13	-	-
76 ... 79	Status AS-i address 14	-	-
80 ... 83	Status AS-i address 15	-	-
84 ... 87	Status AS-i address 16	-	-
88 ... 91	Status AS-i address 17	-	-
92 ... 95	Status AS-i address 18	-	-
96 ... 99	Status AS-i address 19	-	-
100 ... 103	Status AS-i address 20	-	-

Table 1-570 Status AS-i addresses: Structure of the status information

Byte.Bit	Description	FW V1.0.1 and higher: Error code (decimal) in the diagnostic alarm	Remark
0.0	Reserved	-	-
0.1	Discrepancy error, channel status 0/1	1041	When the error occurs, the pair of channels at input 1 has the status "0" and at input 2 the status "1".
0.2	Discrepancy error, channel status 1/0	1042	When the error occurs, the pair of channels at input 1 has the status "1" and at input 2 the status "0".
0.3 ... 0.4	Reserved	-	-
0.5	Sequence error, channel status 0/1	1045	When the error occurs, the pair of channels at input 1 has the status "0" and at input 2 the status "1".
0.6	Sequence error, channel status 1/0	1046	When the error occurs, the pair of channels at input 1 has the status "1" and at input 2 the status "0".
0.7	Sequence error, channel status 1/1	1047	When the error occurs, the pair of channels at input 1 has the status "1" and at input 2 the status "1".
1.0	Input slave missing or of the incorrect type	1050	-
1.1	Control unit of the output switching group not in cyclic data exchange	1051	The AS-i master does not address the configured AS-i address of the output switching group.

Byte.Bit	Description	FW V1.0.1 and higher: Error code (decimal) in the diagnostic alarm	Remark
1.2	Code sequence error (systematic fault)	1054	Permanent interruption to code sequence, e.g. due to electromagnetic interference on the sensor cable or code sequence corruption after replacement of the safe input module.
1.3	Code sequence missing in the memory of the F-CM	1056	-
1.4	ASIsafe code sequences duplicated	1057	Identical code sequence occurs several times
1.5	Sporadic code sequence error	1058	Momentary interruption to code sequence, e.g. due to electromagnetic interference on the sensor cable.
1.6 ... 1.7	Reserved	-	-
2.0	Safety sensor triggered	-	-
2.1	Switch-on condition not met		The safe input value has been reset to the status "0"
2.2	Startup test necessary	-	Test of the input is necessary: Both inputs of the channel pair must assume the status "0".
2.3	Status of process image (user data)	-	-
2.4	Value status	-	Value status = 1: A valid process value is output for the channel. Value status = 0: A substitute value is output for the channel (error on channel or the channel is deactivated).
2.5... 2.7	Reserved	-	-
3.0	Safe AS-i input slave configured	-	-
3.1	Safe AS-i output slave configured	-	-
3.2	Unsafe slave detected	-	-
3.3	Safe slave detected, type unknown	-	-
3.4	Safe slave detected, type input slave	-	-
3.5	Safe slave detected, type output slave	-	-
3.6	Slave is located in cyclic data exchange	-	-
3.7	Reserved	-	-

Code sequences

7

The principle of the ASIsafe code sequences is briefly explained in Section Safety-related communication with AS-Interface (Page 26).

The F-CM AS-i Safety ST module manages the code sequences of the safe AS-i slaves in two steps. First, the F-CM AS-i Safety ST module reads all code sequences on the AS-i bus and checks whether the respective code sequence is plausible. This operation is referred to as "teaching the code sequences". The code sequences taught in this way are in volatile memory. The taught code sequences are transferred to the non-volatile memory after a request by the user.

Initial commissioning

During initial commissioning, the F-CM AS-i Safety ST module must teach the code sequences of all safe AS-i input slaves present on the AS-i bus and transfer them to non-volatile memory. In so doing, the module detects both the slaves for which input monitoring is activated as well as the other safe input slaves.

Replacement of a safe AS-i input slave

After replacement of a safe AS-i input slave, the new code sequence must be taught and saved.

If the code sequence is not saved for a safe AS-i input slave, or if the code sequence does not correspond to the saved code sequence, the input channel will be passivated and assigned the substitute value "0".

As soon as the F-CM AS-i Safety ST module detects a new code sequence, the code sequences are automatically taught. Confirm the transfer of the code sequences into the memory to prevent unauthorized changes to the AS-i component.

For the transfer of the code sequences to the non-volatile memory, you can open the "Teach ASIsafe" dialog by pressing the "Teach ..." button.

Alternatively, the transfer is also possible by pressing the optional "TEACH" button (at least 3 s).

Replacement of the F-CM AS-i Safety ST module

The non-volatile memory is located in the BaseUnit. The transferred code sequences are retained in this memory after replacement of the F-CM AS-i Safety ST module.

Below is a description of the options offered by the F-CM AS-i Safety ST module for transferring code sequences.

See also

Connection (Page 20)

7.1 Transferring code sequences via STEP 7 online access

When code sequence are managed via *STEP 7* online access, you have the option of monitoring the status of the existing code sequences in a graphic overview. In particular, the graphic overview offers advantages for initial commissioning. In addition, you can use the graphic overview for transferring the code sequences of replaced slaves during operation. You can open the graphic overview for diagnostic purposes without changing the saved code sequences. The transfer of taught code sequences is possible but not mandatory.

In order to open this dialog, there must be an online connection to the controller or to the F-CM AS-i Safety ST module. Load the hardware configuration into the modules of the controller before teaching the code sequences so that the online configuration of the F-CM AS-i Safety ST module matches the offline configuration.

7.1.1 "Teach ASIsafe code sequences" dialog

The "Teach ASIsafe code sequences" dialog contains an overview of the code sequences of the existing safety-related AS-i slaves. In this dialog, you start the transfer of the code sequences read in on the AS-i bus into the memory of the F-CM AS-i Safety ST module.

The "Teach ASIsafe code sequences" dialog does not make any changes to the module configuration. You can open the dialog for information purposes during operation. The information displayed in the dialog are obtained online from the F-CM AS-i Safety ST module. There is no comparison with the offline configuration in this case.

Within the "AS-i addresses 0...15" and "AS-i adresses 16...31", you see the following information for each AS-i address:

- Slave status
- Code sequence
- F-IN 1 ... 2
- F-OUT 1 ... 4

For the AS-i address 0, only information about the slave status can be displayed because a slave with the address 0 does not exchange cyclic input/output data.

Below this information you see:

- The "Transfer taught code sequences" button
- The "Progress of teaching operation" display

By double-clicking the "Close" button, you can exit the dialog at any time. If the button is actuated, the data will not be changed. If the code sequences have not been transferred or have only been partially transferred, a corresponding notice appears.

"Slave Status" column

The "Slave status" column shows the following information about the AS-i address via a color code:

Gray	The address does not exist on the AS-i bus. It is not needed in the configuration of the F-CM AS-i Safety ST module (input monitoring control / output monitoring control deactivated)
Green (without check mark)	The address belongs to a slave that exists on the AS-i bus. However, the slave is not needed in the configuration of the F-CM AS-i Safety ST module (input monitoring control / output monitoring control deactivated). The slave on the AS-i bus is a safe slave or a standard slave. It is available for use by the AS-i master or another module.
Green (with check mark)	The address is present on the AS-i bus and corresponds to the configuration of the F-CM AS-i Safety ST module (input monitoring or output monitoring is activated).
Yellow	An error has been detected: The address is present on the AS-i bus but does not correspond to the configuration of the F-CM AS-i Safety ST module (input monitoring control or output monitoring control is activated). Check the slave. Replace the slave with the required slave or change the configuration.
Red	An error has been detected: The address is not present on the AS-i bus but is needed in the configuration of the F-CM AS-i Safety ST module (input monitoring or output monitoring is activated). • Check whether the slave exists on the AS-i bus and has been included in the communication by the AS-i master. • Check whether the slave is contained in the configuration of the AS-i master. Correct the configuration of the AS-i bus, if required.

"Code sequence" column

The "Code sequence" column shows the following information about the AS-i address via a color code:

Gray	No code sequence is needed for the address.
Green (without check mark)	A code sequence was taught but not transferred to the memory. Start the transfer of the code sequence by double-clicking the "Transfer taught code sequences" button.
Green (with check mark)	The code sequence was transferred to the non-volatile memory. Note: This status is also displayed when the output control is activated for this address. The code sequences for safe outputs are automatically predefined in the F-CM AS-i Safety ST module. They are not transferred to the non-volatile memory of the code sequences.

Yellow	An error has been detected: A code sequence was taught that is already being used by another slave. The code sequence cannot be used. Replace the slave with a different slave.
Red	Warning or error: The address is sending an incomplete or invalid code sequence. Check whether both inputs of the safe input slave are assigned with the "ON" signal. If required, actuate the associated safety contacts. The contacts must be closed. • Check whether a cross-circuit exists at the inputs. If necessary, correct the wiring of the inputs.

"F-IN 1 ... 2" column

The "F-IN 1 ... 2" column shows the following information about the AS-i address via a color code:

The numbers 1 to 2 designate the number of the input channel.

Gray	The input channel is not present. A safe input slave was not detected at the address.
Green	The input channel shows the value 1 ("ON" status).
White	The input channel shows the value 0 ("OFF" status).
Yellow	The input channel shows the value 0 ("OFF" state) or is not present. Note: The status indication is unambiguous once the code sequence has been taught for a safe input slave (both inputs assigned with "ON" signal), or when an "ON" signal has been read in for an externally controlled safe output slave.
Red	An error was detected, e.g., a code sequence error: The status of the input channel cannot be read in. Substitute value 0 is used.

"F-OUT 1 ... 4" column

The "F-OUT 1 ... 4" column shows the following information about the AS-i address via a color code:

The numbers 1 to 4 designate the number of the output channel.

Gray	The output channel is not present. A safe output channel was not detected at the address.
Green	The output channel shows the value 1 ("ON" status).

White	The output channel shows the value 0 ("OFF" status).
Yellow	The output channel shows the value 0 ("OFF" state) or is not present. Note: The status indication is unambiguous once the code sequence has been taught for a safe input slave (both inputs assigned with "ON" signal), or when an "ON" signal has been read in for an externally controlled safe output slave.
Red	An error was detected, e.g., a code sequence error: The status of the output channel cannot be read in.

If the output control is activated for the address, the F-CM AS-i Safety ST module can control the status for F-OUT 1. The F-CM AS-i Safety ST module cannot control F-OUT 2 ... 4. The value 0 is output here.

If an external control unit uses the output address, the dialog shows the statuses for F-OUT 1 ... 4 read in on the AS-i bus.

7.1.2 Transferring taught code sequences

In order for the input data of a safe AS-i input slave to be evaluated and made available to the safety program, the taught code sequences must be transferred to the non-volatile memory.

To do so, click the "Transfer taught code sequences..." button.

A dialog opens prompting you whether the code sequences are to be transferred. With "Yes" you confirm that you are addressing the correct module. For checking purposes, the "ADDR" LED flashes green on the front of the F-CM AS-i Safety ST module The code sequences are transferred to the non-volatile memory. The input data of the safe AS-i input slaves are then evaluated. Reintegration in the safety program is enabled.

With "No" you cancel the prompt without transferring the code sequence.

⚠ WARNING

The switching on of plant components may result in death, severe injury, and serious property damage.
Depending on the safety program, the transfer of code sequences may cause plant components to be switched on. Before transferring the code sequences, ensure that no personal injury or property damage can occur. After transferring the code sequences, check the safety equipment for proper functioning.

The "Transfer taught code sequences" button is deactivated when all taught code sequences have already been transferred to the non-volatile memory.

7.1.3 "Progress of teaching operation" display

You can track the progress of the teaching operation.

Progress bar "Teaching in progress":
If at least one safe slave is detected on the AS-i bus whose code sequence has not yet been taught an active progress bar and the text "Teaching in progress" is displayed. Check the displays in the "Code sequences" column and ensure that the safe slaves send their code sequences.

For further information, refer to the "'Code sequence' column".

Taught slaves:
The "Taught slaves" output field shows the number of already transferred code sequences in relation to the number of code sequences that must still be transferred. You will additionally see the numerical ratio as a percentage. When 100% is indicated, all code sequences have been transferred to the non-volatile memory.

You will find additional information in the section "Accept taught code sequences".

7.2 Transferring code sequences with the "TEACH" button.

The use of the "TEACH" button provides an easy way of transferring taught code sequences.

The "TEACH" button can be used, for example, to transfer code sequences of replaced modules during operation. However, it is also suitable for initial commissioning.

To learn how to connect the button to the BaseUnit, refer to Section "Connecting". You can track the progress of the code sequence transfer via the LEDs.

Press the "TEACH" button for at least 3 s. This action causes all currently taught code sequences that are unique and consistent to be transferred to the non-volatile memory. The input data of the safe AS-i input slaves are then evaluated. Reintegration in the safety program is enabled.

⚠ WARNING

The switching on of plant components may result in death, severe injury, and serious property damage.
Depending on the safety program, the transfer of code sequences may cause plant components to be switched on. Before transferring the code sequences, ensure that no personal injury or property damage can occur. After transferring the code sequences, check the safety equipment for proper functioning.

When the transfer of the code sequences has been ended successfully, the "TEACH" LED goes out and you can release the "TEACH" button.

If you press the "TEACH" button before all code sequences are taught, the code sequences received up to then will be transferred.

7.3 Final steps

7.3.1 Reintegrating passivated input channels

The input channels of the F-CM AS-i Safety ST module for which no valid code sequences are saved supply the substitute value "0" and are passivated.

After the transfer of the code sequences, the passivated channels must be reintegrated so that the application can work with the real process values.

The procedure for this can be found in the following Programming and Operating Manuals:

- SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126/0/en)
- S7 Distributed Safety (http://support.automation.siemens.com/WW/view/en/22099875/0/en)

After transferring the code sequences, check the safety equipment for proper functioning.

Alarm, fault, and system events

8

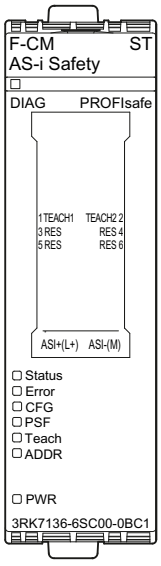
8.1 Overview

Diagnostics options

The following diagnostics options are available for the F-CM AS-i Safety ST module:

- LEDs on the module
- Diagnostics in *STEP 7*:
  - Diagnostic buffer
- Alarm messages in user program

See also



Meaning of the LEDs (Page 69)

8.2 LED statuses

8.2.1 Arrangement of the LEDs on the F-CM AS-i Safety ST

Introduction

LEDs on the front plate of the respective module display module-internal and module-external faults. The LEDs and their evaluation are described in the manuals for the relevant modules of the SIMATIC devices.

DIAG	Diagnosis
STATUS	Operating state of the module
Error	Operating state of the module
CFG	Fault on the AS-i bus
PSF	Process signal error, e.g.,channel fault on AS-i-F input slave
Teach	Teaching: Teaching of code sequences
ADDR	Addressing of the F-CM AS-i Safety ST module. F-addressing and teaching. The LED indicates whether the module is conducting safety-relevant communication with the software tool.
PWR	Supply voltage

Figure 1-274 LEDs of F-CM AS-i Safety ST

8.2.2 Meaning of the LEDs

The "F-CM AS-i Safety ST" module has 8 LEDs on the front:

LED "DIAG"

The "DIAG" LED displays the general status of the ET 200SP module

Table 1-571 Meaning of the "DIAG" LED

"DIAG"	Meaning
☐ Off	The voltage is not OK.
✳ Green flashes	The F-CM AS-i Safety ST module is not ready for operation. The module parameters are not assigned.
■ Green ON	The F-CM AS-i Safety ST module is parameterized and error-free. No diagnostic alarms of the F-CM AS-i Safety ST are active.
✳ Red flashes	The F-CM AS-i Safety ST module is parameterized and indicates a diagnostic fault, or a firmware update is in progress.
✳ ✳ The two-color LED alternately flashes red/green	The position (ping) is displayed for 3 seconds.

LED "Status"

The "Status" and "Error" LEDs indicate the operating state of the device.

Table 1-572 Meaning of the "Status" LED

"Status"	Meaning
■ Green ON	• The F-CM AS-i Safety ST module is OK. • Cyclic I/O data exchange active
✳ Green flashes	• The system is powering up. • No cyclic I/O data exchange

LED "Error"

The "Status" and "Error" LEDs indicate the operating state of the device.

Table 1-573 Meaning of the "Error" LED

"Error"	Meaning
■ Red ON	**Serious device fault, e.g.,** • Fault in the electronics • Overtemperature
✳ Red flashes	**Device fault, e.g.,** • Intermittent data processing error (EMC problem) • Contact problem with the backplane bus • Missing coding element in the BaseUnit • Missing firmware update
□ Off	No error

LED "CFG"

The "CFG" LED indicates errors on the AS-i bus.

Table 1-574 Meaning of the "CFG" LED

"CFG"	Meaning
■ Red ON	The AS-i bus is OK, but a code sequence error exists.
✳ Red flashes	Fault on the AS-i bus: • A code sequence does not exist or it is incomplete.
□ "Off"	All code sequences are completely transferred.

LED "PSF"

The "PSF" LED indicates process signal errors at one or more channels of the module.

Table 1-575 Meaning of the "PSF" LED

LED "PSF"	Meaning
■ Red ON	PROFIsafe channel fault for the complete F-CM AS-i Safety ST module, e.g. fault on F-CM AS-i input slave
✳ Red "flashes"	• Discrepancy error at the inputs of a safe AS-i input slave • Sequence error at the inputs of a safe AS-i input slave • Code sequence error at a safe AS-i input slave, e.g., due to cross-circuit at inputs or an EMC problem • Failure of a safe AS-i input slave The channel involved is passivated. The "PSF" LED goes out only after all channels have been reintegrated.
□ "Off"	No process signal error

LED "TEACH"

This LED indicates teaching of safe AS-i slaves. The "TEACH" LED indicates the progress of the teaching operation.

Table 1-576 Meaning of the "TEACH" LED

LED "TEACH"	Meaning
■ Yellow ON	The code sequences have been successfully taught, but have not yet been accepted. Transfer the code sequences either via the STEP 7 online dialog or by pressing the optional "TEACH" button (for at least 3 s). For more information, see the Section "Code sequences (Page 61)".
✳ Yellow flashes	Teaching of code sequences in progress.
□ "Off"	The code sequences are completely transferred.

LED "ADDR"

The "ADDR" LED indicates that the device is conducting safety-relevant communication with a software tool.

Table 1-577 Meaning of the "ADDR" LED

LED "ADDR"	Meaning
✳ Green flashes	Feedback that the module is addressed: • For assignment of the F-address • For transfer of the code sequences • Firmware update in progress
□ Off	Not relevant

LED "PWR"

The "PWR" LED indicates the status of the voltage supply.

Table 1-578 Meaning of the "PWR" LED

LED "PWR"	Meaning
■ Green ON	AS-i voltage is applied.
□ "Off"	Insufficient AS-i voltage is applied.

8.3 Diagnostic messages

The F-CM AS-i Safety ST module generates one or more alarms when various events occur.

NOTE

When replacing an F-CM AS-i Safety module with firmware V1.0.0, the following must be observed:

With firmware V1.0.1 or higher, the F-CM AS-i Safety ST module generates a modified range of alarm messages compared with V1.0.0.

If the user program evaluates the error numbers of the generated alarms directly, the user program may have to be adapted if the firmware version is changed (e.g. when changing a device). If necessary, the firmware version of a replacement device can be modified to the previously used firmware version (see Section "Firmware update (Page 18)").

It is expected that the upgrading of the firmware version from V1.0.0 to V1.0.1 will not usually have any influence on the user program. The safety functionality of the F-CM AS-i Safety ST module does not change when the firmware is replaced.

If, after the replacement of a device, an alarm message of the F-CM AS-i Safety module appears in the message system (e.g. on an HMI panel), which contains an error code instead of a message text, then the assigned message texts are not known to the message system. In order to update the message texts, the project must be re-compiled with a current version of the TIA Portal / STEP 7 and loaded into the controller or into the message system. The function of the message system can be checked by generating an alarm (e.g. by removing an assigned AS-i safety slave).

Diagnostic messages for firmware V1.0.0

The following applies for firmware V1.0.0: Which events lead to which alarm messages is indicated in the description of data record DS 92 "Device-specific diagnostics" (Page 46).

The alarms use the diagnostic codes 0 to 31 according to the PROFIBUS Standard.

Diagnostic messages as from firmware V1.0.1

The following applies as from firmware V1.0.1: Which events lead to which alarm messages is indicated in the description of data record DS 206 "Data record diagnostics" (Page 56).

The alarms use diagnostic codes in the extended range of values according to the PROFINET Standard. The alarms allow a meaningful system diagnosis to be made, specifying the type of error and the AS-i address affected.

8.4 Replacement of defective devices

8.4.1 Replacing a safe AS-i input slave

Replace a failed safe AS-i input slave with a new device of the same type and assign the correct AS-i address to the slave. This address assignment can be performed automatically by the AS-i master (see manual of the AS-i master) or manually, e.g., with the AS-i addressing device (1904-2AB02).

Close the contacts on the inputs of the safe AS-i input slave so that the slave sends the code sequences.

The F-CM AS-i Safety ST module detects a new code sequence automatically and teaches it. For reintegration, the taught code sequence must be transferred.

The transfer can be started from the STEP 7 online dialog or by pressing the optional "TEACH" button (at least 3 s). For more information, see Section Code sequences (Page 61).

Observe the "CFG" and "TEACH" LEDs, see Section Meaning of the LEDs (Page 69).

To exclude impermissible duplicate code sequences for two safe input slaves, code sequences from all safe input slaves present on the AS-i bus must be transferred, regardless of whether the monitoring is activated or deactivated.

8.4.2 Replacing the safe AS-i output module (evaluation unit)

After replacement of a safe AS-i output module (evaluation unit), no setting is necessary on the F-CM AS-i Safety ST module.

Observe the operating instructions of the AS-i output module, and set the correct F-address for the AS-i output module and the AS-i address of any integrated standard slave.

An error acknowledgment for the affected output switching group must be performed, if necessary. See Section 6.3 Address space.

Non-safety related AS-i slaves (standard slaves) are not evaluated by the F-CM AS-i Safety ST module. Observe the replacement instructions in the operating instructions of the AS-i master or the slave.

8.4.3 Replacing the F-CM AS-i Safety ST module

When the F-CM AS-i Safety ST module is replaced, the new device automatically receives all necessary settings from the head module (IM) of the ET 200SP and the coding element in the BaseUnit.

When replacing an F-CM AS-i Safety module with firmware V1.0.0, the instructions in Section "DS 206 Diagnostic data record (Page 56)" must be observed.

For more information, see Manual "ET 200SP Distributed I/O System (http://support.automation.siemens.com/WW/view/en/58649293/0/en)

Technical specifications

9.1 Technical data in Siemens Industry Online Support

Technical data sheet

You can also find the technical data of the product at Siemens Industry Online Support (https://support.industry.siemens.com/cs/ww/en/ps/15757/td).

1. Enter the full article number of the desired device in the "Product" field, and confirm with the Enter key.
2. Click the "Technical data link.

9.2 Configuration software

Information on the configuration software that you can use can be found in the Table "Software for configuration of the F-CM AS-i Safety ST" in Section Configuring the F-CM AS-i Safety ST (Page 24).

9.3 Safe technical specifications

Safety characteristics

Table 1-579 Maximum achievable safety class in safety mode

Standard	Designation	Value
SIL according to IEC 61508	SIL	3
EN ISO 13849-1[1)]	PL	e
	Category	4

1) Performance Level

Table 1-580 **Safety characteristics**

Characteristic	Designation	Value
High Demand according to SIL 3[1)] Total value for AS-i system with the F-CM AS-i Safety ST module[2)]	PFH_D	1.00×10^{-9} x 1 / h 1.89×10^{-9} x 1 / h
Individual value for F-CM AS-i Safety ST	PFH_D	0.89×10^{-9} x 1 / h
Individual value for AS-Interface transfer procedure	PFH_D	1.00×10^{-9} x 1 / h
Individual value for AS-Interface slave[2)]	PFH_D	0
Proof test interval	T1	20 years
Low Demand according to SIL 3[3)] Total value for AS-i system with the F-CM AS-i Safety ST module[2)]	PFD	2.00×10^{-5} 1.55×10^{-5}
Individual value for F-CM AS-i Safety ST	PFD	0.55×10^{-5}
Individual value for AS-Interface transfer procedure	PFD	1.00×10^{-5}
Individual value for AS-Interface slave[2)]	PFD	0
Mean Time To dangerous Failure	$MTTF_d$	≥100 years (37 000 years) High (according to EN ISO 13849-1)
Diagnostic Coverage level	DC	>99 %
Common Cause Failure	CCF	75 points (requirements met according to EN ISO 13849-1)

1) Probability of a dangerous failure in the case of an operating mode with high or continuous demand rate

2) Value "0" as an approximation for the individual value for AS-Interface slave applies only under the assumption that the PFH

3) Probability of a dangerous failure in the case of an operating mode with lower demand rate

9.4 Response times

The response times specified below represent worst case specifications. The response times relate to the switch-off operation (status change "1" → "0").

The response times for the switch-on operation (status change "0" → "1") can be longer but are not relevant for the given safety-related examination.

Maximum response time in the input direction

The maximum response time in the input direction results from the calculation of the response time from the safe AS-i input slave up to the head module (IM) of the ET 200SP:

max.	5 ms	AS-i bus cycle with maximum configuration
max.	5 ms	Disturbance in AS-i bus cycle with maximum configuration
max.	20 ms	Module-internal processing
max.	2 ms	Transfer ET 200SP backplane bus
max.	32 ms	Total response time in input direction (with 0 ms input delay)

⚠ WARNING

Increased response time

If an input delay time > 0 is assigned for a safe input, this input delay time must be added to the total response time.

In the total response time indicated above, external influencing variables are **not** included:

- Response time of the sensor
- Additional response time in the safe AS-i input slave (see operating instructions)
- Bus response time between the head module (IM) of the ET 200SP and the controller
- Response time of the controller
- Timeout time (F-monitoring time) of the controller in case of PROFIsafe failure

These influencing variables must be taken into consideration when calculating the system response time of the total system.

In the above-indicated total response time, it is taken into consideration that a maximum of 4 AS-i bus cycle times elapse between a safe input slave failure and detection of an error.

Maximum response time in the output direction

The maximum response time in the output direction results from the calculation of the response time from the head module (IM) of the ET 200SP to the safe AS-i input slave (evaluation unit).

max.	2 ms	Transfer ET 200SP backplane bus
max.	20 ms	Module-internal processing
max.	5 ms	AS-i bus cycle with maximum configuration
max.	5 ms	Disturbance in AS-i bus cycle with maximum configuration
max.	32 ms	Total response time in output direction (for disturbance-free PROFIsafe transmission)

⚠ WARNING

Increased response time

In case of PROFIsafe failure, the total response time in the output direction increases by the set timeout time of the F-CM AS-i Safety ST module (see F-parameters, F-monitoring time).

In the total response time indicated above, external influencing variables are **not** included:

- Response time of the controller
- Bus response time between the controller and the head module (IM) of the ET 200SP
- Response time in the safe AS-i output module (evaluation unit), see operating instructions
- For response time of the safe AS-i output module (evaluation unit) in case of AS-i failure, see operating instructions
- Response time of the actuator (e.g., contactor)

These influencing variables must be taken into consideration when calculating the system response time of the total system.

Additional information

Further information is provided in

System Manual SIMATIC Industrial Software Safety Engineering in SIMATIC S7 (http://support.automation.siemens.com/WW/view/en/12490443/0/en)

For calculation of response times, the following aid is available on the Internet:

- For S7 Distributed Safety, the Excel file S7fcotia.xls (http://support.automation.siemens.com/WW/view/en/25412441)

9.5 Calculation of monitoring times and response times

The Excel file S7fcotia.xls for S7 Distributed Safety is available on the Internet to aid the approximate calculation of the runtime of the F-runtime group, the minimum F-monitoring time, and the maximum response time of the safety program:

S7fcotia (http://support.automation.siemens.com/WW/view/en/25412441)

Additional information is available in Manual "Safety Engineering in SIMATIC S7".

You can download this free of charge on the Internet at:

Safety Engineering in SIMATIC S7
(http://support.automation.siemens.com/WW/view/en/12490443/0/en)

Notes on completing the Excel file S7fcotia.xls (when used without IE/PB Link)

Tab "max. runtime F-run-time group"
Enter the number of modules (in the relevant F-runtime group) in the "F-CM AS-i Safety ST" row under "ET 200SP fail-safe modules".

Tab "min. F-Monitoring times"
In the "Configuring the PROFIsafe monitoring time" section, select one of the following variants depending on which head module (IM) of the ET 200SP is being used.

- Variant 3 (distributed F-I/O via PROFINET IO)

Use the values from the following table.

Table 1-581 Values for calculating the minimum F-monitoring times

Description	Designation	Value
Max. acknowledgment time of the F-CM AS-i Safety ST	T_DAT	20 ms
F-I/O with inputs and outputs	-	Yes

Tab "max. response times"
In the "Input" section, select one of the following variants for the relevant signal flow of the safety function depending on which head module (IM) of the ET 200SP is being used:

- Variant 3 (distributed F-I/O via PROFINET IO)

Use the values from the following table.

Table 1-582 Values for calculating the max. response times

Description	Designation	Value
Max. discrepancy time (Note: The safe value 0 is supplied while the discrepancy time is running)	T_DIS	0
Maximum response time in error-free operation	T_WCDT	20 ms
Maximum response time when an error is present	T_OFDT	20 ms

Description	Designation	Value
Max. acknowledgment time of the F-I/O	T_DAT	20 ms
Configured PROFIsafe monitoring time	T_PSTO, conf.	F_WD_TIME (see the setting on the PROFISAFE tab of the properties dialog)
Max. response time of sensor Note: For T_Sensor_DLY, the part of the system starting from the F-CM AS-i Safety ST module up to the sensor, including the AS-i bus, is considered.	T_Sensor_DLY	10 ms (signal flow of AS-i Bus) + Assigned input delay + Response time of the sensor + Additional response time in the safe AS-i input slave

Preface

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (https://www.siemens.com/industrialsecurity).

Preface

Purpose of the documentation

This device manual complements the system manual ET 200SP distributed I/O system. General functions of the ET 200SP are described in the *ET 200SP Distributed I/O System* system manual (http://support.automation.siemens.com/WW/view/en/58649293).

The information provided in this device manual and the system manual enables you to commission the ET 200SP distributed I/O system.

The information in this manual and the system/function manuals provide support when you commission the system.

A description of the F-system SIMATIC Safety can be found in the *SIMATIC Safety – Configuring and Programming* programming and operating manual (https://support.industry.siemens.com/cs/ww/en/view/54110126).

Conventions

CPU: When the term "CPU" is used hereafter, it refers to the fail-safe CPUs of the S7-1200/1500 automation system, prior generation S7-300/S7-400 automation systems, and ET 200 CPUs.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software STEP 7 (TIA Portal).

Please observe notes marked as follows:

NOTE

A note includes important information on the product described in the documentation, on handling the product, or on the part of the documentation to which you ought to pay special attention.

Documentation guide

1

1.1 ET 200SP Documentation guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.

Basic information

The system manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information

Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics, and technical specifications.

General information

The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system (for example, diagnostics, communication, Web server, motion control, and OPC UA).

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (http://support.automation.siemens.com/ww/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the most of your Industry Online Support.

In "mySupport" you can store filters, favorites and tags, request CAx data and put together your personal library in the Documentation area. Furthermore, your data is automatically filled into support requests and you always have an overview of your current requests.

You need to register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

In the Documentation area of "mySupport", you have the possibility to combine complete manuals or parts of them to make your own manual. You can export the manual in PDF format or in an editable format.

You can find "mySupport" - Documentation on the Internet (http://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx Data

In the CAx Data area of "mySupport", you can access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx Data on the Internet (http://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus in individual products.

You can find the application examples on the Internet (https://support.industry.siemens.com/sc/ww/en/sc/2054).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure, and order devices for Totally Integrated Automation (TIA).

This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.

With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (https://support.industry.siemens.com/cs/us/en/view/109767888).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to run commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independently of the TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the data and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- Operating mode switchover RUN/STOP
- Localization of the CPU by means of LED flashing
- Reading out CPU error information
- Reading the CPU diagnostic buffer
- Reset to factory settings
- Updating the firmware of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

With SIEMENS PRONETA (PROFINET network analysis), you analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview independently scans PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a system.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance include the following items:

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long-term and optimal exploitation of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

Safety technology support

Siemens provides online comprehensive support for your use of safety technology. A Safety Evaluation Tool assists you in determining required safety levels, Functional Examples guide you in your safety applications, Siemens training (SITRAIN) classes offer training in safety standards and products, and you can calculate your maximum system response time using the SIMATIC STEP 7 Safety Advance F-Execution Times, F-Runtimes, F-Monitoring and Reaction Times Excel file (RT_calculator) Excel file.

You can find the Safety Evaluation Tool on the Internet (http://www.siemens.com/safety-evaluation-tool).

You can find Functional Examples on the Internet (http://www.siemens.com/safety-functional-examples).

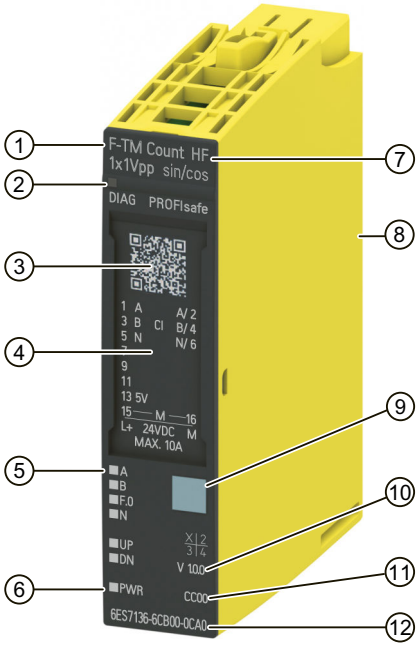
You can find SITRAIN classes on the Internet (http://www.siemens.com/sitrain-safetyintegrated).

You can find the RT_calculator on the Internet (https://support.industry.siemens.com/cs/ww/en/view/58856512).

Product overview

2

2.1 Properties



Article number

6ES7136-6CB00-0CA0

Firmware version

This manual describes the properties of the module with firmware version 1.00 or later.

View of the module

①	Module type and name	⑦	Function class
②	LED for diagnostics	⑧	Electronic coding element connector (not shown)
③	2D matrix code	⑨	Color coding module type
④	Wiring diagram	⑩	Function and firmware version
⑤	LEDs for channel status	⑪	Color code for selecting the color identification labels
⑥	LED for supply voltage	⑫	Article number

Figure 1-275 View of the F-TM Count 1x1Vpp sin/cos HF module

Use of the module

The F-TM Count module reports events and statuses based on configured parameters and external movement operations in the SIMATIC ET 200SP distributed I/O system. It provides a SIN/COS encoder interface that can safely count up to a maximum speed of 200 kHz.

The F-TM Count module features a 15-mm wide, ET 200SP module housing. Refer to *Connecting* (Page 20) for a list of compatible BaseUnits (BUs).

The F-TM Count module supports safety-related applications up to SIL CL 3 according to EN 62061, or Cat. 4, PL e according to EN 13849-1. The input and output values of the safety-related F-TM Count module are addressed using the process image. You need an F-CPU for safety processing.

Properties

The F-TM Count module has the following technical properties:

- Failsafe module
- PROFIsafe (under supported system functions)
- 200 kHz counter input
- SIL 3, Cat. 4, PL e
  - Diagnostic display (DIAG red/green LED)
  - Status display for each input (green LED)
  - Error display for each input (red LED)
- Single configurable channel:
  - Interfaces:
    Sin/Cos differential encoder signals A, A/, B, B/, N and N/
    5 V DC encoder supply that is short-circuit proof
    Module supply voltage L+ (24V)
  - Count range: 32 bits
  - Monitoring of encoder signals for wire break, short-circuit and signal quality
  - Monitoring of supply voltage
- Supported encoder/signal types:
  - Sin/Cos differential encoder with and without N signal
- Supported system functions:
  - Module and channel diagnostics
  - Firmware update
  - Identification and maintenance data (I&M 0-3)

Accessories

You can use the following accessories with the F-module; however, the accessories are not included in the product package:

- Labeling strips
- Color identification labels
- Reference identification labels
- Shield connector (article number 6ES7193-6SC00-1AM0)
- Cable (article number 6FX8008-1BD31-XXXX) sold by the meter or equivalent

Article numbers are provided for those items unique to the F-TM Count module. Additional information about accessories can be found in the *ET 200SP Distributed I/O System* system manual (http://support.automation.siemens.com/WW/view/en/58649293).

2.2 Functions

2.2.1 Safety

What are fail-safe automation systems?

Safety-related systems are primarily concerned with applications whose failure could have impact upon the safety of people and/or the environment. As a result, safety-related systems are used to mitigate hazards or failures that are likely to cause physical harm. Their intent is to achieve safety to an acceptable level of tolerable risk.

F-systems serve to control processes and ensure safe states upon detected failures. Failures are detected using very high levels of diagnostic coverage. Upon detection of failures, actions are taken to attempt to bring the respective application to a safe state.

F-systems provide improved fault detection and fault localization through detailed diagnostic identification and reporting. This is the primary difference between fail-safe systems and standard systems. Use of fail-safe systems should be considered for applications in which hazards are inherently present and may result in physical harm.

Supported safety monitoring functions

The F-TM Count module provides safety monitoring functions that may be used to monitor speed, position, and/or direction. These safety monitoring functions can be optionally enabled to report safety events if configured safety limits are exceeded. The safety monitoring functions include the following:

- Safe Direction (SDI) is used to monitor the direction of motion.
- Safety Limited Speed (SLS) is used to monitor that the motion does not exceed a preset speed limit.
- Safe Operating Stop (SOS) is used to monitor for unintentional movement.

⚠ WARNING

The F-TM Count module cannot take action that affects the safety functions.
The F-TM Count module reports when the parameter limits are exceeded to the F-CPU.
You must ensure code in your safety program does the following:

- Examines the safety-monitoring event data from the module
- Takes the necessary action to result in the appropriate outcome (for example, slowing down, or shutting down movement)

2.2.2 Detection of counting signals

The F-TM Count module monitors the encoder signals and evaluates them as quadrature encoded signals. The count direction is determined by the phase relationship of the encoder signals.

You can specify the counter characteristics using the functions described below.

Counting limits

You can configure the behavior of the counter at the counting limits. The counting limits define the counter value range used.

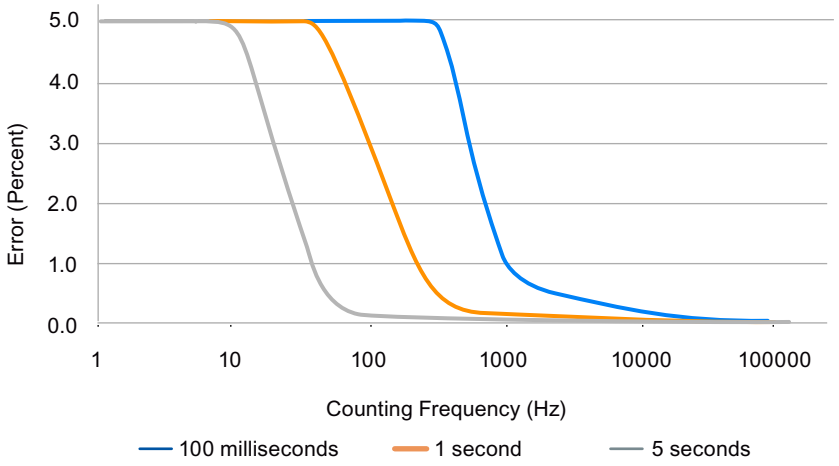
Start value

You can configure a start value within the counting limits.

2.2.3 Measured value determination

You can select one at a time from the following measured values reported:

- Frequency measurement with the unit of millihertz (-800000000 to +800000000 meaning -800000.000 to +800000.000 Hz)
- Period measurement with the unit of microseconds (-25000000 to +25000000 meaning -25.000000 to +25.000000 seconds)
- Velocity measurement is the calculated velocity * 1000 to include fractional portion of the calculation (-2147483648 to 2147483647 meaning -2147483.648 to +2147483.647 velocity unit)



All measured values are returned as scaled integers with the units noted above.

Negative values are reported when counting down, positive values are reported when counting up.

Update time

Calculated measured value accuracy is influenced by the duration of selected update times. You can configure the interval at which the technology module updates the measured values cyclically to the F-CPU. Setting a longer update time interval allows the module to collect more data to calculate a more accurate measured value, but reaction time increases.

The following figure illustrates the effect of update time on the approximate accuracy of measured value calculations:

For example: the figure shows that at a frequency of 100 Hz, the percent error in the measured value is about 10 times greater at a 1 second update time as compared to a 5 second update time.

NOTE

The safety reaction time is influenced by the chosen update time when using measured values as part of your safety program (for example, at about 100 Hz, the relative error with a 1 second update time is approximately three times greater than a 5 second update time). For additional information, refer to Response times of the F-TM Count module (Page 75).

NOTE

The user should consider the measured value accuracy at the user's specified counting frequency range when determining the Safety Limited Speed "Speed limit" setting.

Gate control

Software (SW) gating is required to control when counting is permissible. When the SW gate is open, counting is enabled.

When the SW gate is closed the following occurs:

- Counting is disabled until the gate is opened again. Position is not maintained if movement occurs.
- Measured value calculations are still performed, but the last reported measured value is continually reported until the gate is opened again.
- Safety monitoring operations will still be performed. However, their progress is paused until the gate is again opened. Movement that violates specified limits will not be detected.

You can configure the reaction to the gate opening.

Examples of determining measured values

Use STEP 7 device configuration to set the values for the module in the following examples. For your velocity in meters per second, you set the "Time Base for Velocity Measurement" field to the value "1 second" and the "Counts per Unit for Velocity" to how many counts per meter the encoder will generate. The velocity value returned to your safety program will be the meters per second value * 1000. Multiplying the meters per second value by 1000 ensures the velocity value has sufficient resolution to show the fractional portion of the calculation.

Setting "Velocity" in meters per second
You set the parameter values as follows:

- "Measured value" to "Velocity"
- "Update Time" to 1000 milliseconds - Provides an updated velocity calculation to your safety program every second (1000 milliseconds)
- "Time Base for Velocity Measurement" value to "1 second"
- "Counts per Unit for Velocity" to 100 if your encoder generates 100 counts per meter

In this example, if you measured 452 counts during the one second update time and there are 100 counts per meter, the movement distance is 4.52 meters during the one second update time. Since the desired unit is meters per second, the velocity returns as a scaled value (velocity * 1000) and your safety program sees the velocity as 4520. You would then interpret the value as 4.520 meters per second.

Setting the "Update Time" to "100 milliseconds"
Use the same setup as the previous example, but set the "Update Time" to 100 milliseconds.

In this example, if you measure about 45 counts during the update time, convert this to meters per second. The result is a velocity measurement of 4500 which is 4.500 meters per second.

The module measured 4.5 meters per second, which is fewer than the previous measurement 4.52 meters per second. This results in you losing some resolution in the velocity measurement because of the shorter update time.

Setting the "Time Base for Velocity Measurement" to "100 milliseconds"
Use the same setup as the first example, but set the "Time Base for Velocity Measurement" to meters per 100 milliseconds.

In this example, if you measure 452 counts during the one second update time and there are 100 counts per meter, the movement distance is 4.52 meters during the one second update time. Since you want meters per 100 milliseconds, the velocity returns as a scaled value (velocity * 1000) and your safety program sees the velocity as 452. You would then interpret the value as 0.452 meters per 100 milliseconds.

2.2.4 Counter control and feedback

The safety-related counter input (feedback) and output (control) data are transferred to and from the F-CPU, via the PROFIsafe protocol to ensure the configured system operates safely.

Control

The following commands are set by your safety program and sent from the F-CPU to the F-TM Count module:

- Open SW Gate
- Reset Other Events
- Reset Safe Speed
- Reset Safe Stop
- Reset Safe Direction
- Set Start Value
- Enable Safe Speed
- Enable Safe Stop
- Enable Safe Direction
- Safe Direction

Feedback

The following feedback status and event data are sent from the F-TM Count module to the F-CPU:

- Direction Status
- Count Status
- Set Start Value Status
- Reset Other Events Status
- Reset Safe Speed Status
- SW Gate Status
- Reset Safe Stop Status
- Reset Safe Direction Status
- Value status (CQ HSC0)
- Zero Event
- Underflow Event
- Overflow Event
- Safe Speed Event
- Safe Stop Event

- Safe Direction Event
- HSC0 Current Value
- HSC0 Measured Value

See also

Refer to "Explanation of parameters (Page 32)" for additional information on the F-TM Count module control interface commands and feedback status and event data.

2.2.5 Counter input diagnostics

Counter discrepancy

The module uses multiple internal counters to monitor the single counter-module input. Discrepancy tests are performed to ensure respective internal counter values are compared for acceptable equivalency. If these evaluations do not provide expected results, a channel diagnostic event is generated.

After generating the diagnostic event, the module reinitializes its internal count to the last valid count before the discrepancy was detected. The module then continues monitoring the encoder and accumulating counts while the diagnostic is present.

A count value of zero and status values of zero (safe state values) are provided to your safety program while the diagnostic is present. When the error is resolved and the channel is reintegrated, the module will return the accumulated count and status values to your safety program.

⚠ WARNING

Discrepancy errors may result in a loss of counts due to the count being set back to the last known good values.
Your safety program must determine whether the reported count value remains representative of actual position.
If the position is lost, your safety program must do a homing operation and then reset the counter to its respective start value.

Maximum signal frequency

The F-TM Count module evaluates the input frequency. When encoder signal frequency reaches the maximum frequency rating (200 kHz), a reintegratable frequency error is generated.

⚠ WARNING

The count value can potentially be affected when exceeding the maximum supported signal frequency.
Your safety program must determine whether the reported count value remains representative of actual position. If position is lost, your safety program must do a homing operation and then reset the counter to its respective start value.

In situations where encoder signal frequency exceeds 250 kHz, the module generates a module is defective buffer diagnostic message. However, the module is not defective since the fatal error was caused by external events. The module must be power cycled to recover from the error.

N signal plausibility monitoring

This feature is only available when the encoder signal type is selected as an "A, B, N" signal and the "Pulses per revolution" is set to a non-zero value during module configuration in STEP 7. The test uses the "Pulses per revolution" parameter to determine the expected number of counts per revolution of the encoder. In situations where the N signal is not received at the configured "Pulses per revolution", a channel diagnostic event is generated.

The module continues monitoring the encoder and accumulating counts while the diagnostic is present. While the diagnostic is present, a count value of zero and status values of zero (safe state values) are provided to your safety program. When the error is resolved and the channel is reintegrated the module will return the accumulated count and status values to your safety program.

⚠ WARNING

It is possible for a channel fault to occur that is not readily detected by the module diagnostics if N signal plausibility monitoring is disabled.
Loss of the safety function can result in unexpected machine or process operation, which can cause death, severe personal injury, and/or property damage.
If N signal plausibility monitoring is disabled, N signal or wire break errors detected are not reported and you might not achieve your required level of safety. You must provide your own safety measures if you disable these features.

A and B signal monitoring

Signal monitoring evaluates the quality of the A and B signals. The following A and B signal quality faults can cause a channel diagnostic event to be generated.

- Phase angle of A and B signal has shifted from 90°
- Signal amplitude (voltage) is too great or too small
- Wire break, shorted signals, or encoder failure

NOTE

A wire break might not be detected if the encoder is stopped. However, movement of the encoder position will result in detection of the break.

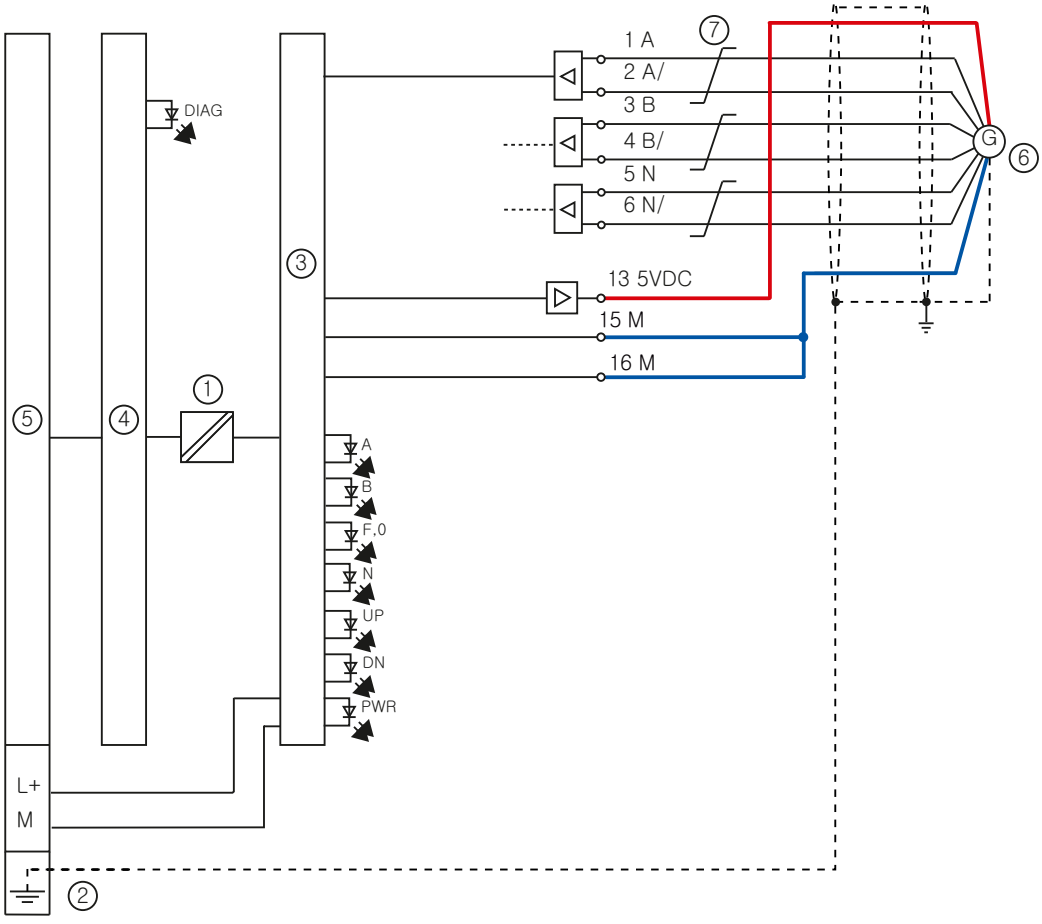
The module continues monitoring the encoder and accumulating counts while the diagnostic is present. While the diagnostic is present, a count value of zero and status values of zero (safe state values) are provided to your safety program. When the error is resolved and the channel is reintegrated the module will return the accumulated count and status values to your safety program.

⚠ WARNING

The count value can potentially be affected when a signal quality fault occurs.
Your safety program must determine whether the reported count value remains representative of actual position. If position is lost, your safety program must do a homing operation and then reset the counter to its respective start value.

⚠ WARNING

Signal monitoring allows the module to meet SIL, Cat., PL rating. It is possible for a channel fault to occur that is not readily detected by the module diagnostics if signal monitoring is disabled.
Disabling this feature reduces the safety rating to SIL 1, Cat. 2, PL c, which causes a loss of the safety function. Disabling this feature can result in unexpected machine or process operation, which can cause death, severe personal injury, and/or property damage.
If signal monitoring is disabled, A and B signal or wire break errors detected are not reported and you might not achieve your required level of safety. You must provide your own safety measures if you disable these features.



Connecting

3

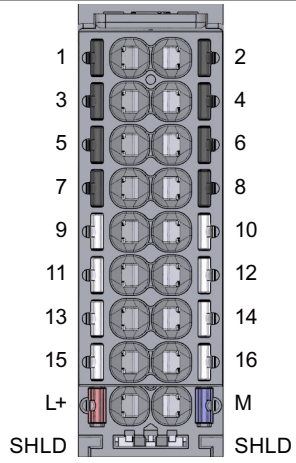
3.1 Wiring and block diagram

This section provides the block diagram of the F-TM Count 1x1Vpp sin/cos HF module with the terminal assignment.

Block diagram

① Electrical isolation
② Shield connection on the BaseUnit
③ Technology
④ Backplane bus interface module of the F-TM Count module
⑤ Backplane bus
⑥ Sin/Cos encoder
⑦ Twisted in pairs

Figure 1-276 Block diagram with sin/cos encoder



BaseUnit

The BaseUnit is not included with the delivery of the module.

You can find information on wiring the BaseUnit, connecting cable shields, etc. in the Connecting section of the *ET 200SP Distributed I/O System*, system manual (https://support.industry.siemens.com/cs/pl/en/view/58649293).

Pin assignment of the BaseUnit

Table 1-583 Pin assignment of BaseUnit BU15-P16+A10+2B, BU type A0

Designation	Signal name		View	Signal name		Designation
SIN/COS differential encoder with or without signal N						
Encoder signal A	A	1		2	A/	Encoder signal A/
Encoder signal B	B	3		4	B/	Encoder signal B/
Encoder signal N	N	5		6	N/	Encoder signal N/
—	—	7		8	—	—
—	—	9		10	—	—
—	—	11		12	—	—
Encoder supply 5 V DC	5 VDC	13		14	—	—
Encoder supply ground	M	15		16	M	Encoder supply ground
Supply voltage 24 V DC	L+				M	Ground for supply voltage
Shield	—				—	Shield

Supply voltage L+/M

You connect the supply voltage to terminals L+ and M on a light BaseUnit. For a dark BaseUnit, the supply voltage of the module to the left is used. An internal protection circuit protects the F-TM Count module from reverse polarity of the supply voltage. The F-TM Count module monitors whether the supply voltage is connected.

⚠ CAUTION

Electrical noise risk
Electrical noise on the 24 V DC voltage supply lines can yield unexpected results. For example, inserting and removing modules into an I/O base that is powered on can generate electrical noise.
Avoid actions that have the possibility to generate electrical noise on the 24 V DC voltage supply lines. Electrical noise can occur when I/O connectors make and break contact between the base and module. This noise can become visible to all modules and sensors connected within the potential group. For F-TM Count applications, sensors include encoders, especially externally powered 24 V DC sensors. The electrical noise could result in unexpected influences, such as A and B signal failures. In this situation Siemens recommends a separate potential group for the F-TM Count module and encoder.

Encoder supply

The encoder supply from the F-TM Count module provides 5 V DC encoder sensor supply voltage. The encoder supply is only switched off during the following occurrences:

- There is a fatal error
- There is a firmware update in progress

NOTE

The F-TM Count module can only support 5 V DC encoders using the module's internal sensor supply. However, 10 to 30 V DC incremental encoders can be supported when externally powered.

3.2 Requirements for the Encoder

Encoder Characteristics

The selected incremental encoder must include the following capabilities:

- encoder generated signals at 1Vpp centered at 2.5V
- encoder generated A and B differential sinusoidal signals
- differential signals between A and A/, B and B/
- A and B signals are 90° phase-shifted
- N signal support is optional; the N terminals are unconnected when not used

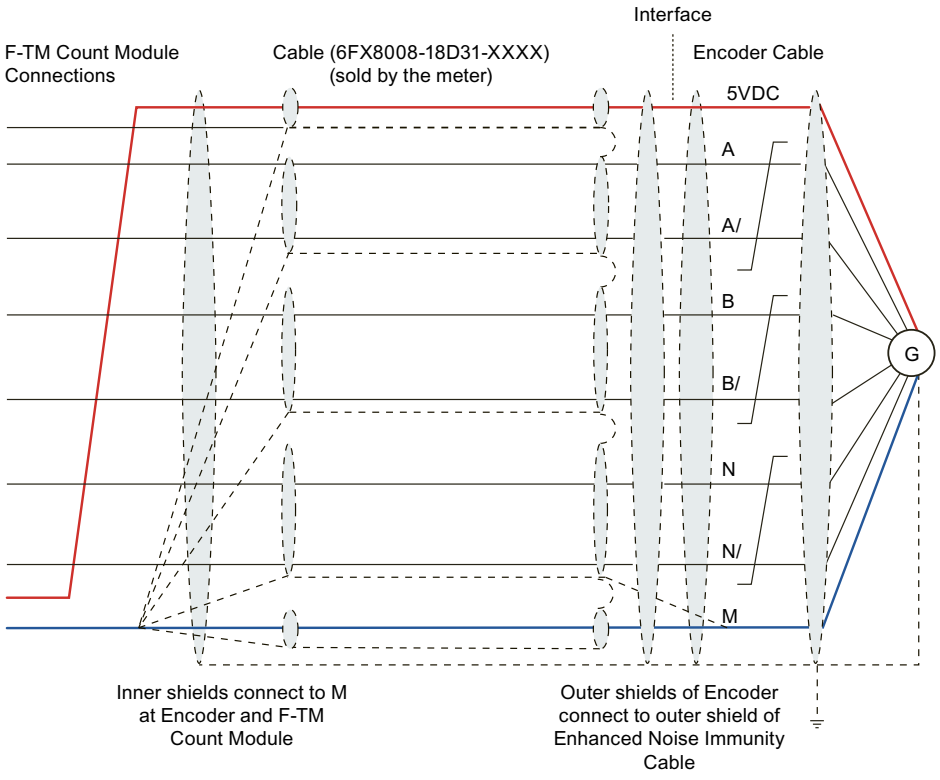
Encoder signal names are defined by the encoder manufacturer and can differ from the signal names used in this manual. Signals herein are designated with the letters A, A/, B, B/, N and N/.

Due to anticipated safety application requirements when using the F-TM Count module, the connected encoder is evaluated in a safety-related manner. Encoder-generated faults, including correct A-to-B signal phase offsets, incorrect output signal voltages (1Vpp), wire breaks, parasitic oscillations, etc., are detected by the F-TM Count module. These faults are detected for any connected encoder, whether safety-rated or non-safety-rated.

To determine the achievable safety rating for the application, the encoder's functional safety failure characteristics must be determined--i.e., SIL, CAT, PL, $MTTF_d$, and $B10_d$. If such information cannot be found on the encoder manufacturer's data sheet, then the failure response data must be requested from the encoder manufacturer.

If encoders are used that specify no safety ratings, it is recommended that the failure response of the selected encoders causes the encoder signals to fall outside of the valid 1Vpp range. This allows the F-TM Count module to detect the encoder failure. Failure scenarios must be clarified with encoder manufacturers.

Siemens-specific encoder references may be found within the following SIOS entry:



SINAMICS S120 drive system for SINUMERIK Safety Integrated
(https://support.industry.siemens.com/cs/de/en/view/33512621)

Immunity

⚠ WARNING

Failure to use properly shielded cable will result in degraded performance of the module because of lack of immunity.
To meet noise immunity standards, it is necessary to use cable (article number 6FX8008-1BD31-XXXX) sold by the meter for cable lengths greater than 1 meter or equivalent.

Wiring using the cable is shown in the following figure:

NOTICE
The right side of the F-TM Count module may exhibit some sensitivity to electrostatic discharge (ESD). Care should be taken to avoid exposure to ESD. If possible, it is recommended the F-TM Count module is not the last module on the right of the mounted configuration.

Radio frequency (RF) interference on encoder cables

Some encoders are sensitive to conducted RF on encoder cables. This can occur if the encoder cable is in a cable tray with other cables that can cause RF interference (for example, control cables).To prevent interference with the encoders, route control and encoder/sensor cables separately from each other. In the unlikely event that the encoder is still affected, you can place Type 28B ferrite clamp filters on the encoder cable at the encoder.

NOTE

For more information about the evaluation of differential signals, see "Quadrature evaluation of differential signal" (Page 43).

Parameters/address space

4

4.1 Configuring the F-TM Count module

All connected fail-safe I/O must have their operating properties configured by the STEP 7 Safety.

You have the responsibility to ensure that no unconfigured modules are connected in a fail-safe automation system.

Refer to the Configuring chapter of the *SIMATIC Safety - Configuring and Programming* manual (https://support.industry.siemens.com/cs/ww/en/view/54110126) for step-by-step instructions.

Fail-Safe CPUs

You can use any of the following F-CPUs with the F-TM Count module:

- S7-1200/1500 F
- S7-300/400 F
- ET 200SP F
- ET 200S F
- ET 200pro F

Hardware components for PROFINET fail-safe system

You can use the following fail-safe PROFINET hardware components in a fail-safe system:

- F-CPUs with built-in PROFINET interface
- F-CPUs with optional PROFINET communication module (CM) interface modules
- Fail-Safe inputs and outputs (F-I/O), such as:
  - ET 200SP fail-safe modules
  - Fail-Safe GSDML-based, PROFIsafe-capable I/O devices (for example, a light curtain or laser scanner)

Hardware components for PROFIBUS DP fail-safe system

You can use the following fail-safe PROFIBUS DP components in a fail-safe system:

- F-CPUs with built-in PROFIBUS interface (PROFIBUS DP master)
- F-CPUs with optional PROFIBUS DP CM interface modules
- Fail-Safe inputs and outputs (F-I/O), such as:
  - ET 200SP fail-safe modules
  - Fail-Safe GSD-based, PROFIsafe-capable DP slaves (for example, a light curtain or laser scanner)

4.1.1 Using STEP 7 (TIA Portal V17 or greater)

Assigning a PROFIsafe address

These are the three basic steps for assigning PROFIsafe addresses:

1. Configure the F-destination address and F-source address in the hardware configuration in STEP 7 Safety and download the hardware configuration.
2. Identify the F-TM Count modules to which you want to assign the configured F-destination and F-source addresses.
3. You must assign the PROFIsafe address (F-destination address together with F-source address) to the F-module before you put it into operation as follows:
   - Right click on the F-TM Count module in the Device view in STEP 7.
   - Select "Assign PROFIsafe address" in the context menu.
   - Select the desired "Identification" method (LED flashing or serial number).
   - Select the check box on the left-hand side for the F-TM Count to assign an address to.
   - Click the "Identification" button.
   - Verify that the "Identification" method is correct (i.e. A and B channel LEDs flashing or serial number is correct).
   - Click the "Assign PROFIsafe addr..." button.
   - Click "Yes" in the prompt that follows.
   - If successful, the module is now operational.

NOTE

Refer to the *SIMATIC Safety - Configuring and Programming* manual (https://support.industry.siemens.com/cs/ww/en/view/54110126) for further information about PROFIsafe address identification and assignment.

Configuring F-TM Count module parameters

You specify the properties of the F-TM Count module in STEP 7 using various parameters. Depending on the settings, not all parameters are available.

You set the parameters of the module as follows:

1. Insert an ET 200SP CPU or an ET 200SP PROFINET or PROFIBUS interface module from the hardware catalog.
2. Insert the F-TM Count module from the hardware catalog under "Technology modules->Counting->F-TM Count".
3. Select the F-TM Count module (on the Device view or Device overview) and view the module's "Properties" tab.
4. In the "Properties" view, on the "General" tab, select the drop-down arrows for "Module parameters" and "TM-C parameters" to and see a subset of the properties of the "F-parameters" and "TM-C parameters".
5. Select "F-parameters" property or one of the "TM-C parameters" properties in the left-side property tree and then set values in the right-side property fields.
6. A successful compile and download of your hardware configuration to an F-CPU automatically configures your F-TM Count module.

4.1.2 Using STEP 7 (TIA Portal) with GSDML (versions of TIA Portal prior to V17)

Configuring F-modules with a GSDML file

If you need to configure F-modules with a GSDML file, you need the *S7-FCT* in order to calculate the F_iPar_CRC and assign the PROFIsafe addresses. Operating instructions and additional information for the *S7-FCT V2.0 - Fail-safe Configuration Tool* can be found on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109763833).

You can find *S7-FCT* on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109762827).

Assigning a PROFIsafe address

These are the three basic steps for assigning PROFIsafe addresses:

1. Configure the F-destination address and F-source address in the hardware configuration in STEP 7 Safety and download the hardware configuration.
2. Identify the F-TM Count modules to which you want to assign the configured F-destination and F-source addresses. F-destination addresses are generally assigned with lower numbers (for example, less than 100) for GSDML configured devices, and should be within the range of the F-CPU F-destination address range for PROFIsafe address type 1 devices.
3. Use "Assigning the F-source address and F-destination addresses to the F-I/Os" section in the instructions for the *S7-FCT V2.0 - Fail-safe Configuration Tool* on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109763833) to assign the PROFIsafe address (F-destination address together with F-source address) to the F-module before you put it into operation.

NOTE

Refer to the *SIMATIC Safety - Configuring and Programming* manual (https://support.industry.siemens.com/cs/ww/en/view/54110126) for further information about PROFIsafe address identification and assignment.

Configuring F-TM Count module parameters

You specify the properties of the F-TM Count module in STEP 7 using various parameters. Depending on the settings, not all parameters are available.

You set the parameters of the module as follows:

1. Insert the IM 155-6 PN interface module from the hardware catalog under "Other field devices->PROFINET I/O->I/O->SIEMENS AG->ET 200SP->Interface modules".
2. Insert the F-TM Count module from the hardware catalog under "Module->TM->Counting->F-TM Count". Select PROFIsafe V2.4 if you are using an S7-300 or S7-400 F-CPU. Select PROFIsafe V2.6 version if you are using an S7-1200 or S7-1500 F-CPU.
3. Select the F-TM Count module (on the Device view or Device overview) and view the module's "Properties" tab.
4. In the "Properties" view, on the "General" tab, select the drop-down arrows for "Module parameters" and "TM-C parameters" to see a subset of the properties of the "F-parameters" and "TM-C parameters".

5. Select "F-parameters" property or one of the "TM-C parameters" properties in the left-side property tree and then set values in the right-side property fields.
6. Start the S7-FCT for the F-TM Count module and calculate the F_iParCRC.
7. Copy the F_iParCRC into the intended PROFIsafe parameter of the F-TM Count module.
8. A successful compile and download of your hardware configuration to an F-CPU automatically configures your F-TM Count module.

4.2 Reinitialize on parameterization download

Each time parameterization of the F-module occurs, reinitialization of internal module states is required. This means that internal module states are equivalent to power-up states. Reinitializing results in the following changes in the module:

- Process image status and event bits are reset
- Counter value is reinitialized to the start value
- Measured value calculations are reinitialized
- Process image command enables are reset
- Safety monitoring intermediate values are reset (for example, intermediate values associated with SOS, SDI, and SLS calculations)

In addition to a user commanded download of parameters from STEP 7 (TIA Portal), parameters will be downloaded, and the counter module will be reinitialized in the following circumstances:

- Power cycling of the F-CPU
- Pull/Plug of the module
- Power cycling the 24V user power to the module
- Power cycling of the IM on a remote rack
- Pull/Plug of the PROFInet cable to the IM remote rack

4.3 Reaction to CPU STOP

You set the response of the F-TM Count module to CPU STOP for the module in the device configuration.

Table 1-584 Response of technology module to CPU STOP

Option	Meaning
Continue counting	The F-TM Count channel continues to count pulses while the F-CPU is in STOP mode or while PROFIsafe communication is lost.
Stop counting	The F-TM Count channel does not continue to count. This is equivalent to closing the SW gate.

⚠ WARNING

In situations where the F-CPU is in STOP mode, the count value can potentially be affected.

The count value can be affected by the following behaviors:

- Your safety program states that may result during the commanded transition to STOP mode.
- External channel-related errors that could occur while the F-CPU is in STOP mode.
- Power cycling of the module while the F-CPU is in STOP mode.
- Your safety program control of the software gate signal when transitioning again to RUN mode. Closing of the software gate results in the loss of counts during external movement.

Your safety program must determine whether the reported count value remains representative of actual position when the behaviors above occur. If the position is lost, your safety program must do a homing operation and then reset the counter to its respective start value.

4.4 Reactions to counting limit violation

A counting limit can be violated when the counter value exceeds the high or low counting limit. Reactions to violating a counting limit are as follows:

Table 1-585 Response of technology module to counting limit violation

Option	Meaning
Continue counting	The F-TM Count channel continues to count pulses while the counting limit is violated after setting the count to either the opposite limit or to the start value.
Stop counting	The F-TM Count channel does not continue to count. This is equivalent to closing the SW gate.

4.5 Parameters of the F-TM Count

The following parameter settings are possible:

Table 1-586 Settable parameters and their default setting

Parameter	Value range	Default setting	Parameter reassignment in RUN	Scope STEP 7 (TIA Portal); STEP 7; GSD file
F-parameters				
Manual assignment of F-monitoring time	Check box: • Enable • Disable	Disable	No	Module
F-monitoring time [1]	14 to 65535 ms in 1 ms steps	150 ms	No	Module
F-destination address	1 to 65534	Address supplied by F-CPU (Always enabled)	No	Module
TM-C parameters				
Signal Monitoring	• Disable • Enable	Enable	No	Channel
Encoder related parameters				
Signal type [2]	• Sin/Cos encoder (A, B, N) • Sin/Cos encoder (A, B)	Sin/Cos encoder (A, B, N)	No	Channel
Invert direction	• Disable • Enable	Disable	No	Channel
Pulses per revolution	0 to 32767	1024	No	Channel
Reaction to signal N	• No reaction to signal N • Synchronization at signal N	No reaction to signal N	No	Channel
Counter parameters				
High counting limit	-2147483647 to 2147483647	2147483647	No	Channel
Start value	-2147483648 to 2147483647	0	No	Channel
Low counting limit	-2147483648 to 2147483646	-2147483648	No	Channel
Reaction to violation of a counting limit	• Continue counting • Stop counting	Continue counting	No	Channel
Reset when counting limit is violated	• Start value • Opposite counting limit	Start value	No	Channel
Reaction to gate start	• Set to start value • Continue with current value	Set to start value	No	Channel
Safety monitoring				
Measured value	• Frequency • Velocity • Period duration	Frequency	No	Channel
Update time	0 ms to 25000 ms	100 ms	No	Channel
Time base for velocity measurement [3]	• 1 millisecond • 10 milliseconds • 100 milliseconds • 1 second • 60 seconds	1 second	No	Channel

1 STEP 7 uses this number to set the F-monitoring time in each F-TM Count module unless you select the check box for "Manual Assignment of F-monitoring time" in that module configuration and assign a different time.

2 If (A, B) is selected, then "Pulses per revolution" and "Reaction to N signal" are disabled.

3 Velocity must be selected to configure this parameter.

Parameter	Value range	Default setting	Parameter reassignment in RUN	Scope
				STEP 7 (TIA Portal); STEP 7; GSD file
Counts per unit for velocity measurement [3]	1 to 65535	1	No	Channel
Safety Function - Safe Stop	• Enable • Disable	Disable	No	Channel
Standstill tolerance	0 to 65535 (counts)	0	No	Channel
Safety Function - Safe Direction	• Enable • Disable	Disable	No	Channel
Monitoring tolerance	0 to 65535 (counts)	0	No	Channel
Safety Function - Limited Speed [2]	• Enable • Disable	Disable	No	Channel
Speed limit [3]	0 - 2147483647 (Velocity * 1000)	0	No	Channel
Reaction to CPU STOP				
Reaction to CPU STOP	• Continue counting operation • Discontinue counting operation	Continue counting operation	No	Channel

1 STEP 7 uses this number to set the F-monitoring time in each F-TM Count module unless you select the check box for "Manual Assignment of F-monitoring time" in that module configuration and assign a different time.

2 If (A, B) is selected, then "Pulses per revolution" and "Reaction to N signal" are disabled.

3 Velocity must be selected to configure this parameter.

4.6 Explanation of parameters

4.6.1 F-parameters

Manual assignment of F-monitoring time

This is a selection to enable the "Manual assignment of F-monitoring time".

F-monitoring time

The monitoring time of safety-related PROFIsafe communication occurring between the F-CPU and the F-I/O module.

F-source address

A unique network-wide address for the fail-safe CPU assigned to the F-CPU with the "Central F-source address" parameter.

F-destination address

A unique F-destination address for each fail-safe module.

F-parameter signature (with addresses)

A signature for all F-parameters including F-addresses; used to easily determine whether parameterization changes have occurred.

F-parameter signature (without addresses)

Signature for all F-parameters without F-addresses; used to easily determine whether parameterization changes have occurred.

Behavior after channel fault

Specifies a passivation response by the F-TM Count module to channel faults. (Always set to "Passivate channel" for the F-TM Count module since there is a single channel.)

Reintegration after channel fault

Specifies a switchover from fail-safe values to process data (reintegration) after channel faults are eliminated. (Always set to "All channels manually" for the F-TM Count module since RIOforFA is not supported.)

RIOforFA safety

Specifies whether the module supports the "RIOforFA-Safety" profile. (Always set to "No" for the F-TM Count module since RIOforFA is not supported.)

PROFIsafe mode

Specifies the PROFIsafe mode being used by the F-module.

PROFIsafe protocol version

Specifies the PROFIsafe protocol version being used by the F-module.

F-I/O DB manual number assignment

You must select the check box to manually set the DB number of the F-I/O DB. An F-I/O DB is automatically created during compilation for each configured F-I/O module.

F-I/O DB number

The number of the F-I/O DB that is created during compilation.

F-I/O DB name

Specifies the symbolic name of the F-I/O DB that is created during compilation.

4.6.2 TM-C parameters

Selection of channel activation

Enables channel activation. The counter channel is always activated since there is only a single channel.

Selection of operating type: Counting/Position input

Enables whether to provide integer counter value. This selection is always enabled for the counter module and a counter value is always returned.

Selection of operating type: Measuring

Enables whether to provide an additional counter measured value. This selection is always enabled for the counter module and a measured value is always returned.

Signal monitoring

Allows you to enable or disable signal monitoring. Signal monitoring evaluates the quality of A and B signals for phase, voltage, and wire break. If signal monitoring is disabled, you must evaluate and provide safety measures suitable for your application. See "A and B signal monitoring" in "Counter input diagnostics (Page 17)" for the effects on safety and the precautions you must make if you disable signal monitoring.

⚠ WARNING

It is possible for a channel fault to occur that is not readily detected by the module diagnostics if signal monitoring is disabled.
Disabling this feature reduces the safety rating to SIL 1, Cat. 2, PL c, which causes a loss of the safety function. Disabling this feature can result in unexpected machine or process operation, which can cause death, severe personal injury, and/or property damage.
If signal monitoring is disabled, A and B signal or wire break errors detected are not reported and you might not achieve your required level of safety. You must provide your own safety measures if you disable these features.

Signal Type

Specifies whether the encoder is providing A, B, or A, B, N signals. If (A, B) is selected, then Pulses per revolution and Reaction to N signal are disabled.

Invert direction

Specifies whether to reverse the counting direction.

Pulses per revolution

Specifies the total number of Sin/Cos pulses per revolution of the encoder. This is used for N signal plausibility monitoring. This field is only enabled when the "Signal type" selected is sin/cos encoder (A, B, N). Specifying a 0 value in this field disables N signal plausibility monitoring.

Signal evaluation

Specifies how many events per Sin/Cos pulse are counted. Only quadrature mode is supported. Quadrature mode evaluates all zero crossings of the sin/cos encoder signals, so that counts per revolution equal pulses per revolution times four.

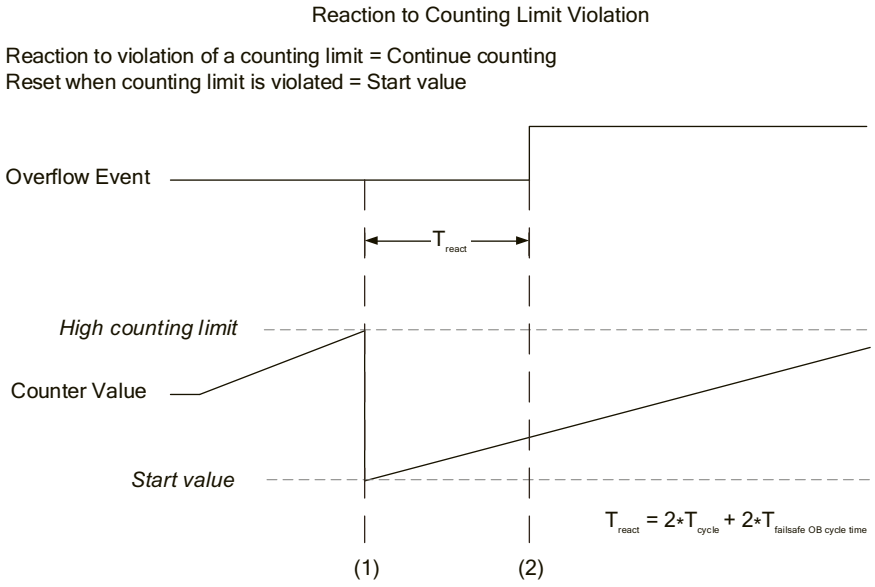
Reaction to signal N

Specifies whether the reaction is to ignore the N signal or set the count to the start value. This field is only enabled when the "Signal type" selected is sin/cos encoder (A, B, N).

High counting limit

You limit the counting range by setting the high counting limit. An overflow event is triggered in the feedback interface when the current count exceeds the high counting limit. The current count will then be set to the start value or the low counting limit depending on parameterization. You can also select whether counting stops or continues after exceeding the high counting limit. The high counting limit must be greater than or equal to the start value and must be greater than the low counting limit. The allowed range is -2147483647 to 2147483647. The default setting is 2147483647.

Start value



You specify the initial count value when counting starts by configuring the start value. The current count will be set to the start value after power up, after downloading parameters, when explicitly set, and other situations depending on configuration. The start value must be a value between or equal to the counting limits. The allowed range is -2147483648 to 2147483647. The default setting is 0.

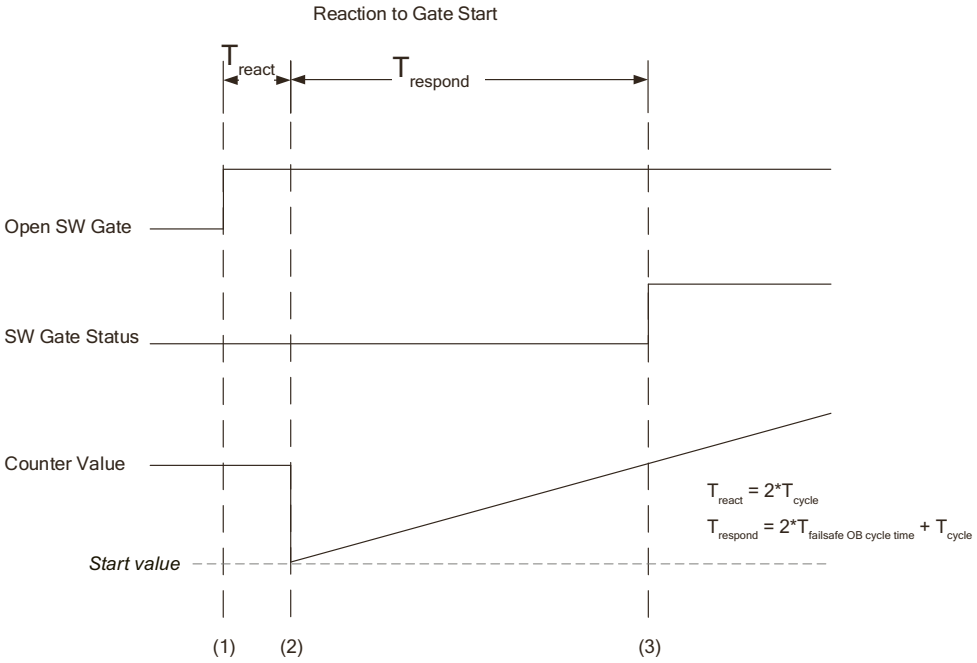
Low counting limit

You limit the counting range by setting the low counting limit. An underflow event is triggered in the feedback interface when the current count exceeds the low counting limit while counting down. The current count will then be set to the start value or the high counting limit depending on parameterization. The allowed range is -2147483648 to 2147483646. The default setting is -2147483648.

Reaction to violation of a counting limit

Specifies the reaction when either the high or low counting limit is exceeded. You can choose to either continue counting or to stop counting. If you choose to stop counting, you must close and reopen the software gate to resume counting.

1 Counter value exceeds the configured high counting limit, is reset to the start value, and counting continues.



2 User program sees "Overflow Event" go high to indicate the high counting limit was exceeded and sees an updated counter value.

Reset when counting limit is violated

Specifies whether the count value is set to the start value or opposite counting limit when a counting limit is exceeded.

Reaction to gate start

Specifies whether the count value is set to the start value or continues with the current value when the SW gate is opened. This action occurs each time the SW gate changes from closed to open.

1 User program sets "Open SW Gate" high to open the software gate and enable counting.
2 Module sees the "Open SW Gate" command, opens the software gate, and sets the counter value to the start value.
3 User program sees "SW Gate Status" go high and an updated counter value.

Measured value

Specifies one of a possible three different engineering unit conversions as follows:

- **Frequency**: The average number of counts per second reported in millihertz (hertz * 1000)
- **Period duration**: The average period between two counts in microseconds (seconds * 1000000)
- **Velocity**: The speed of movement in a given direction. Velocity represents the units of measure per time base * 1000.

Negative values are reported when counting down, positive values are reported when counting up.

NOTE

Fields directly associated with velocity calculations are only enabled when velocity is selected.

Update time

Specifies the interval at which the F-TM Count module updates the measured values to the F-CPU. Setting a longer update time interval allows the module to collect more data to calculate a more accurate measured value, but increases the reaction time.

NOTE

The safety reaction time is influenced by the chosen update time when using measured values, and SLS as part of the safety application program.

Time base for velocity measurement

Specifies the time base unit for the velocity you want for the calculation output in increments of milliseconds or seconds.

Counts per unit of measure

Specifies the number of counts from the incremental encoder per relevant distance unit for the velocity measurement.

Safety Function - Safe Stop

Enables safe operating stop (SOS) monitoring.

Standstill tolerance

Specifies the acceptable standstill tolerance allowed for the SOS function measured in counts.

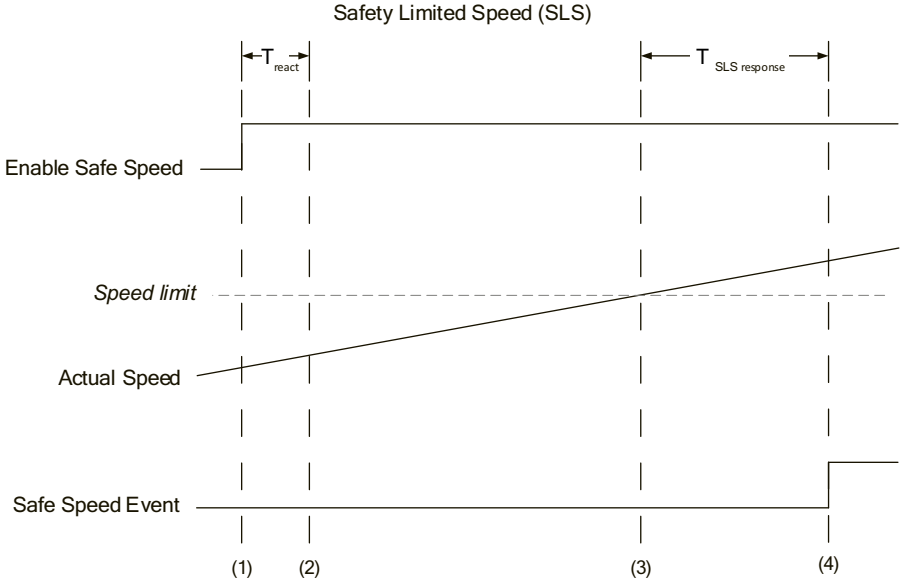
NOTE

The standstill tolerance selection is disabled if "Safety Function - Safe Stop" is disabled.

Safety Function - Safe Direction

Enables safe direction (SDI) monitoring.

Monitoring tolerance



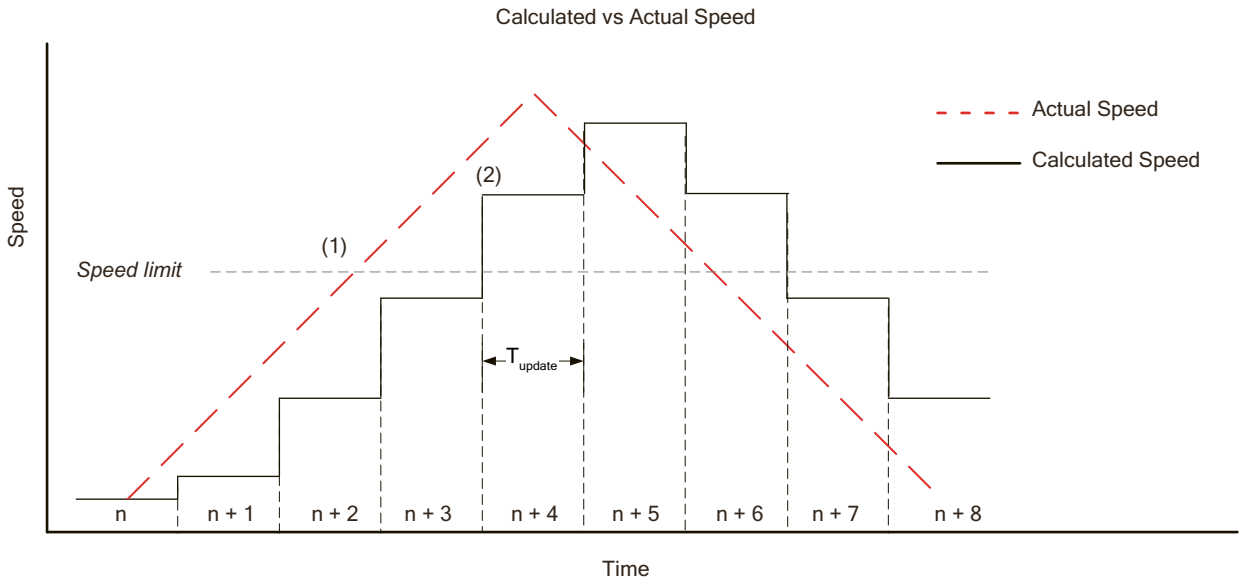
Specifies the acceptable tolerance in the unsafe direction for the SDI function measured in counts.

NOTE

The monitoring tolerance selection is disabled if "Safety Function - Safe Direction" is disabled.

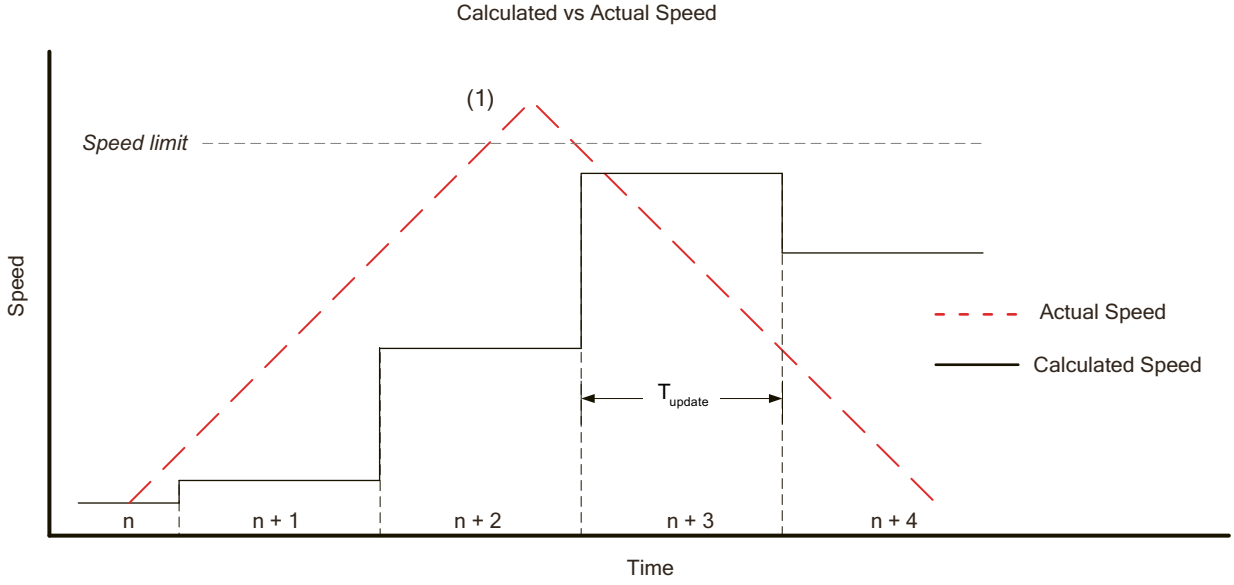
Safety Function - Limited Speed

Enables safety limited speed (SLS) monitoring only when "Velocity" is selected as the measured value.



$T_{react} = 2*T_{cycle}$

$T_{SLS\ response} = 2*T_{failsafe\ OB\ cycle\ time} + T_{cycle} + T_{update}$



1 User program set "Enable Safe Speed" high to initiate SLS monitoring
2 Module process the "Enable Safe Speed" value and SLS monitoring is started.
3 Calculated speed exceeds the configured speed limit, "Safe Speed Event" set in the module.
4 User program sees "Safe Speed Event" go high to indicate an overflow occurred.

The calculated speed is updated once per configured update time and represents the average speed over the preceding interval. When determining what update time to use, it is important to consider the update time's effect on filtering of momentary speed limit violations and the overall response time of the SLS monitoring. Larger update time values result in more filtering of speed limit violations as well as an extended response time.

1 Actual speed exceeds the configured speed limit during the "n+2" update interval. Due to the averaging of the calculated speed, the measured value does not yet exceed the limit so no safe speed event is issued by the module now.

2 The calculated speed first exceeds the speed limit during the "n+4" update interval. A safe speed event will be issued by the module now.

1 The actual speed exceeds the configured speed limit during the "n+2" update interval. Due to the averaging of the measured value, the calculated speed never exceeds the speed limit so no safe speed event is issued by the module. Larger update times effectively filter out short speed limit violations. Therefore, if the application needs to detect momentary speed limit violations, a shorter update time should be configured.

Speed limit

Specifies the maximum acceptable speed in velocity units for the SLS function only when velocity is selected.

NOTE

The speed limit selection is disabled if "Safety Function - Limited Speed" is disabled.

Reaction to CPU STOP

Specifies whether the channel continues to count pulses while the F-CPU is in STOP mode.

4.7 Behavior at the counting limits

"Reaction to violation of a counting limit" selections are defined as follows:

- **"Continue counting"**: After a violation of a counting limit, counting surpasses the limit and goes to either the start value or the opposite counting limit (depending upon configuration), and then continues.
- **"Stop counting"**: After a violation of a counting limit, counting surpasses the limit and goes to either the start value or the opposite counting limit (depending upon configuration), and then stops. To restart counting, the SW gate must be closed and reopened.

⚠ WARNING

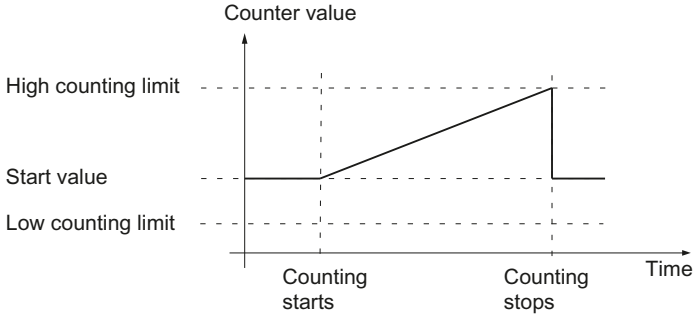
The "Stop counting" selection may not allow the module to react at counting limits.
Configuring the "Reaction to violation of a counting limit" selection to stop counting may have a direct and detrimental influence upon configured safety monitoring and measured value.
You must ensure your safety program has provisions for the immediate stopping of counting and any potential influence upon configured safety monitoring functions and measured value.

Violation of a counting limit

The high counting limit is violated when the current counter value is equal to the high counting limit and another up-count is received. The low counting limit is violated when the current counter value is equal to the low counting limit and another down-count is received.

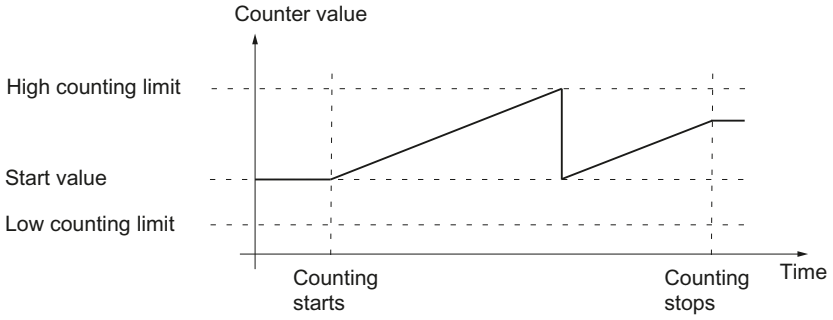
The appropriate status bit is set in the feedback interface in the event of limit violation:

Counting limit violated	Status bit
High counting limit	"Overflow Event" bit is set
Low counting limit	"Underflow Event" bit is set



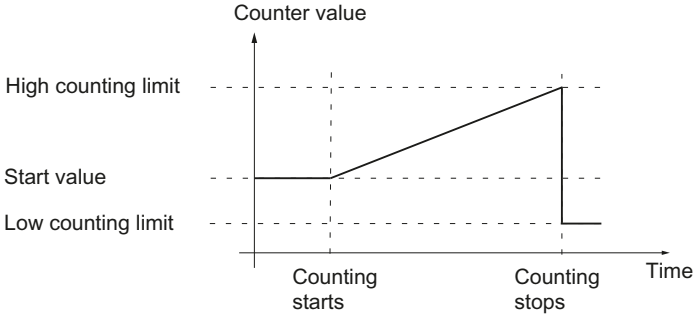
You can reset the status bits with "Reset Other Events" bit.

Following a counting limit violation, you can configure whether counting is to continue and whether counting is continued at the start value or at the opposite counting limit.

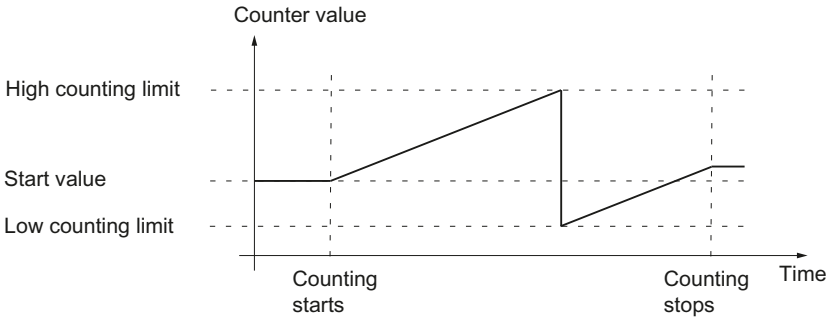


NOTE
The high and low counting limits define the value range of the counter.

Examples

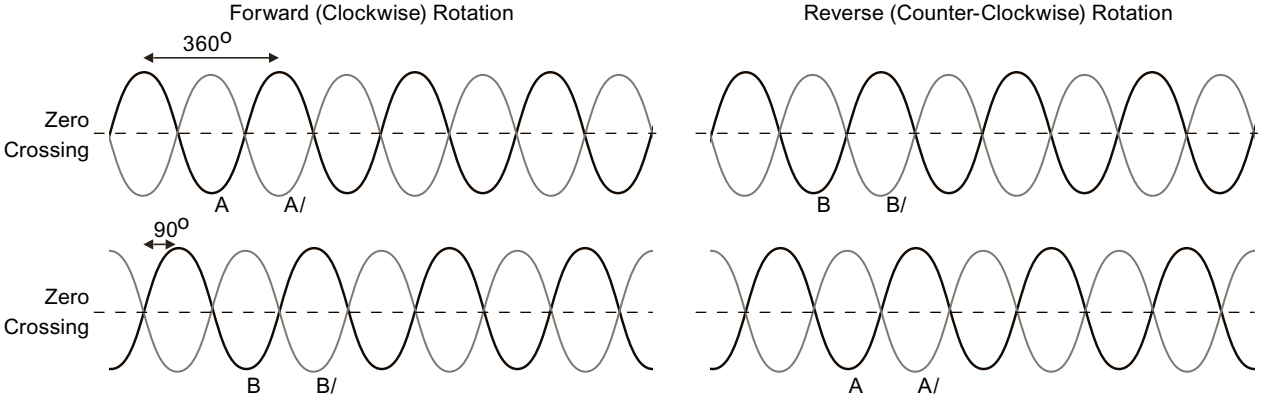


The figure below shows an example for terminating the counting process after an overflow and setting the counter to the start value:



The figure below shows an example for continuing the counting process after an overflow and setting the counter to the start value:

The figure below shows an example for terminating counting after an overflow and setting the counter to the opposite counting limit:



The figure below shows an example for continuing the counting process after an overflow and setting the counter to the opposite counting limit:

4.8 Quadrature evaluation of differential signals

With quadrature evaluation, the A and B signals are shifted by 90 degrees in relation to each other. When the A signal is leading, the movement is in the forward direction. When the B signal is leading, the movement is in the reverse direction.

Counting occurs at each "zero-crossing" of the A and B signals. As a result, each complete waveform has a total effect of 4 counts. For example, given a 200 kHz frequency, 800K counts per second can be achieved. These relationships are illustrated in the figure below:

4.9 Safety functions

This provides a quick overview of the principle mode of operation of the F-TM Count module safety functions.

The description of the safety functions is based on the definition according to standard EN 61800-5-2 and some simple examples for using the function.

The description of the functions is simplified, as far as possible, to clearly show essential properties and configuration options.

4.9.1 Safe Operating Stop (SOS)

SOS monitoring

SOS monitoring is initiated whenever the "Enable Safe Stop" bit is set in the control interface and subsequently processed by the F-TM Count module. SOS monitoring terminates whenever the "Enable Safe Stop" bit is reset in the process output image and subsequently processed by the module.

Each time SOS monitoring is initiated, the current position is stored. A "Safe Stop Event" is set whenever any movement is detected in either direction that exceeds the configured "Standstill tolerance" as measured from the stored position.

Standstill tolerance is configured in counts.

Once set, the "Safe Stop Event" bit remains set and counting continues after the event is triggered. The "Safe Stop Event" remains set until the "Reset Safe Stop" bit is set to 1, until a power cycle, or until a new parameterization is loaded.

Configuring a value of 0 for the standstill tolerance results in the "Safe Stop Event" being set immediately after the first pulse in either direction.

⚠ WARNING

Safe stop monitoring continues when counting is suspended and SOS monitoring is enabled.
Since there is no active counting operation, this safety function becomes ineffective. This can result in unexpected machine or process operation, which can cause death, severe personal injury, and/or property damage.
You must ensure steps outlined in safety standards applicable to your system are followed before the event bit is reset.

Using SOS monitoring

The safe stop position is stored when SOS monitoring is initiated by turning on the "Enable Safe Stop" bit and is used for the entire SOS monitoring session.

Your safety program examines the "Safe Stop Event" bit in the feedback interface and takes appropriate action during the SOS monitoring session.

Set the "Reset Safe Stop" bit to 1 to clear the "Safe Stop Event" bit in the feedback interface.

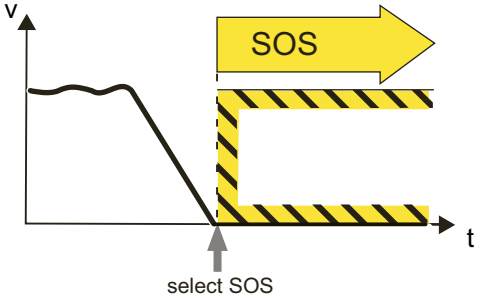
If you want to start a new SOS monitoring session, the "Enable Safe Stop" bit must be cleared in the module and then once again set in the module by separate executions of you safety program.

NOTE

The "Safe Stop Event" bit is also cleared by a power cycle, or when a new STEP 7 hardware configuration is downloaded.
If you reset the "Safe Stop Event" and the safe stop is still in violation, the "Safe Stop Event" bit will immediately set back to 1.

SOS suspension by external events

Suspension of counting operations can result from the following external events:



- SW gate closure
- Counting limit violation if module is configured to stop counting when the limit is violated. Refer to "Reactions to counting limit violation (Page 30)" for additional information.

NOTE

Counting operations that set the start value or exceed configured counting limits shall have no effect in determining whether a safe stop violation has occurred.
This means that regardless of how the "Reaction to violation of a counting limit" is configured and the current count is subsequently manipulated, the "Safe Stop Event" is only initiated upon violation of the specified "Standstill tolerance".

4.9.1.1 Function of SOS

The SOS function monitors the count value and notifies the user if the encoder/count deviates more than a defined amount from the stopped position.

SOS Selection

Example of how the function can be used

Example	Possible solution
A protective door can only be opened if a machine is in the safe standstill state.	• Stop the movement of the hazard from your safety program. • Ensure no further movement as follows: – Engage/energize (brake/motor) – Engage the safety related actuator • Enable SOS monitoring in the counter module via the safety program in the F-CPU • Disable the door lock to permit access to the machine • Perform an appropriate safety reaction if the "Safe Stop Event" ever occurs

4.9.1.2 Example using SOS monitoring

The protected machine areas can be entered without having to shut down the machine as long as SOS is active.

Machine stopping is monitored using an SOS tolerance window. At the instant this function becomes enabled, the current position is stored as the comparison position until SOS is disabled again.

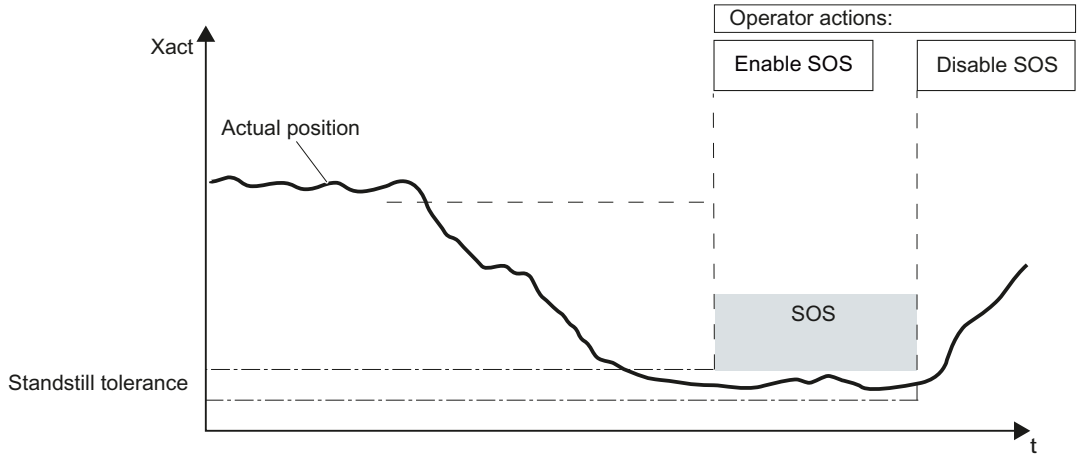


Figure 1-277 Standstill tolerance

4.9.1.3 Configuring SOS

In STEP 7 do the following to configure SOS monitoring:

- Configure "Safety Function - Safe Stop"
- Configure the "Standstill tolerance" in counts
- Download this project to the F-CPU

4.9.1.4 Enabling SOS

In your safety program, set the "Enable Safe Stop" bit to 1 to begin SOS monitoring.

From that point, if the module ever detects a movement in either direction that exceeds the configured "Standstill tolerance", the "Safe Speed Event" bit is set to 1.

4.9.1.5 Responding to SOS

Your safety program examines the "Safe Stop Event" bit and takes appropriate action when the bit is seen as 1. Once set, the "Safe Stop Event" bit remains set to 1 until either of the following actions occur:

- Your safety program sets the "Reset Safe Stop" bit to 1
- A power cycle
- A new STEP 7 hardware configuration is downloaded

4.9.2 Safety Limited Speed (SLS)

Safe speed monitoring

SLS monitoring is initiated whenever the "Enable Safe Speed" bit is set in the control interface and subsequently processed by the F-TM Count module. SLS monitoring terminates whenever the "Enable Safe Speed" bit is reset in the process output image and subsequently processed by the module.

A "Safe Speed Event" is set whenever the calculated speed in either direction is greater than the configured "Speed limit". Once set, the "Safe Speed Event" bit remains set and counting continues after the event is triggered. The "Safe Speed Event" remains set until the "Reset Safe Speed" control bit to 1, until a power cycle, or until a new parameterization is loaded.

Configuring a "Speed limit" value of 0 results in the "Safe Speed Event" being set immediately after the first pulse in either direction.

NOTE

Triggering a "Safe Speed Event" is also dependent on the measured value, configured as "Velocity", that updates your safety program once every update time.

⚠ WARNING

Safe speed monitoring continues when counting is suspended and SLS monitoring is enabled.

Since there is no active counting operation when counting is suspended, this safety function becomes ineffective. This can result in unexpected machine or process operation, which can cause death, severe personal injury, and/or property damage.

You must ensure steps outlined in safety standards applicable to your system are followed before the event bit is reset.

Using SLS monitoring

SLS monitoring is initiated by turning on the "Enable Safe Speed" bit.

Your safety program examines the "Safe Speed Event" bit in the feedback interface and takes appropriate action during the SLS monitoring session.

Set the "Reset Safe Speed" bit to 1 to clear the "Safe Speed Event" bit in the feedback interface.

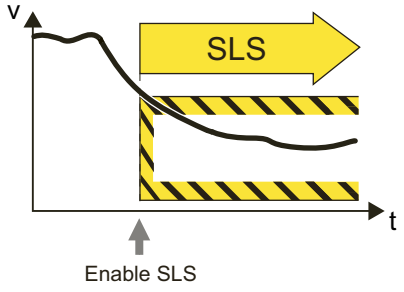
If you want to start a new SLS monitoring session, clear and enable the "Enable Safe Speed" bit must be cleared in the module and then once again set in the module by separate executions of you safety program.

NOTE

Once set, the "Safe Speed Event" bit is also cleared by a power cycle, or when a new STEP 7 hardware configuration is downloaded. If you reset the "Safe Speed Event" and the safe speed is still in violation, the "Safe Speed Event" bit will immediately set back to 1.

SLS suspension by external events

SLS monitoring suspension can result from the following external events:



- SW gate closure
- Counting limit violation if module is configured to stop counting when the limit is violated. Refer to "Reactions to counting limit violation" for additional information.

NOTE

Counting operations that set the start value or exceed configured counting limits have no effect in determining whether a safe speed violation has occurred.
This means that regardless of how the "Reaction to violation of a counting limit" is configured and the current count is subsequently manipulated, the "Safe Speed Event" is only initiated upon actual violation of the specified "Speed limit".

4.9.2.1 Function of Safety Limited Speed (SLS)

The SLS function monitors the encoder and notifies the user if the calculated speed exceeds the specified speed limit in either direction.

Examples of how the function can be used

Example	Possible solution
The machine operator must be able to enter the machine after the protective door has been opened and slowly move a horizontal conveyor with an acknowledgment button in the danger zone.	• Enable SLS in the counter via your safety program in the F-CPU. • The counter monitors the velocity of the horizontal conveyor.
A spindle drive, depending on the selection of the cutting tool, must not exceed a specific maximum speed.	• Enable SLS in the counter via your safety program in the F-CPU.

4.9.2.2 Configuring SLS

In STEP 7 do the following to configure SLS:

- Configure the "Measured Value" to be "Velocity" and specify the desired values for the following:
  - "Update time"
  - "Time base for velocity measurement"
  - "Counts per unit for velocity measurement"
- Configure "Safety Function - Limited Speed"
- Configure the "Speed limit"
- Download this project to the F-CPU

NOTE

SLS speed can only be configured if the measured value is set to velocity.

4.9.2.3 Enabling SLS

In your safety program, set the "Enable Safe Speed" bit to 1 to begin SLS monitoring.

From that point, if the module ever detects a speed in either direction that exceeds the configured "Speed limit", the "Safe Speed Event" bit is set to 1.

4.9.2.4 Responding to SLS

Your safety program examines the "Safe Speed Event" bit and takes appropriate action when the bit is seen as 1. Once set, the "Safe Speed Event" bit remains set until either of the following actions occur:

- Your safety program sets the "Reset Safe Speed" bit to 1
- A power cycle
- A new STEP 7 hardware configuration is downloaded

4.9.3 Safe Direction (SDI)

Safe direction (SDI) monitoring

SDI monitoring is initiated whenever the "Enable Safe Direction" bit is set in the control interface and subsequently processed by the F-TM Count module. SDI monitoring terminates whenever the "Enable Safe Direction" bit is reset in the process output image and subsequently processed by the module.

Each time safe direction monitoring is initiated, the current position and the specified safe direction are stored. The "Safe Direction Event" bit is set whenever a movement is detected in the unsafe direction and exceeds the configured "Monitoring tolerance". The "Monitoring tolerance" is measured from the farthest position achieved in the safe direction. As movement progresses in the safe direction, the tolerance of movement in the unsafe direction shall be measured from this farthest position.

Monitoring tolerance is configured in counts. The safe direction is specified in the process output image.

Once set, the "Safe Direction Event" bit remains set and counting continues after the event is triggered. The "Safe Direction Event" remains set until the "Reset Safe Direction" bit is set to 1, until a power cycle, or until a new parameterization is loaded.

Configuring a value of 0 for the monitoring tolerance results in the "Safe Direction Event" being set immediately after the first pulse in the unsafe direction.

⚠ WARNING

Safe direction monitoring continues when counting is suspended and SDI monitoring is enabled.

Since there is no active counting operation when counting is suspended, this safety function becomes ineffective. This can result in unexpected machine or process operation, which can cause death, severe personal injury, and/or property damage.

You must ensure steps outlined in safety standards applicable to your system are followed before the event bit is reset.

Using SDI monitoring

The safe direction is stored when SDI monitoring is initiated by enabling the "Enable Safe Direction" bit and is used for the entire SDI monitoring session. While the SDI monitoring session is in progress, subsequent changes to the "Safe Direction" bit are ignored.

Your safety program examines the "Safe Direction Event" bit in the feedback interface and takes appropriate action during the SDI monitoring session.

Set the "Reset Safe Direction" bit to 1 to clear the "Safe Direction Event" bit in the feedback interface.

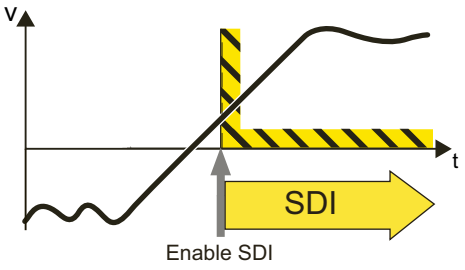
If you want to start a new SDI monitoring session, clear and enable the "Enable Safe Direction" bit must be cleared in the module and then once again set in the module by separate executions of you safety program.

NOTE

Once set, the "Safe Direction Event" bit is also cleared by a power cycle, or when a new STEP 7 hardware configuration is downloaded. If you reset the "Safe Direction Event" and the safe direction is still in violation, the "Safe Direction Event" bit will immediately set back to 1.

SDI suspension by external events

SDI monitoring suspension can result from the following external events:



- Software gate closure
- Counting limit violation if module is configured to stop counting when the limit is violated. Refer to "Reactions to counting limit violation" for additional information.

NOTE

Counting operations that set the start value or exceed configured counting limits have no effect in determining whether a safe direction violation has occurred.
This means that regardless of how the "Reaction to violation of a counting limit" is configured and the current count is subsequently manipulated, the "Safe Direction Event" is only initiated upon actual violation of the specified "Monitoring tolerance".

4.9.3.1 Function of Safe Direction (SDI)

The SDI function monitors the encoder and notifies the user if the encoder/count moves more than a defined amount in the unintended direction.

Examples of how the function can be used

Example	Possible solution
A protective door can only be opened if a conveyor belt moves in the safe direction (away from the operator).	• Specify the safe direction using the "Safe Direction" control bit in your safety program in the F-CPU. • Enable SDI in the counter via your safety program in the F-CPU. • Enable the locking mechanism of the protective doors via the PROFIsafe status bit of the counter.
When replacing the pressure cylinders of the plates, the conveyor can only move in the safe direction.	• Specify the safe direction using the "Safe Direction" control bit in your safety program in the F-CPU. • Enable SDI in the counter via your safety program in the F-CPU. • Inhibit the direction of motion that is not permitted in the counter.
Once the protection against jamming has been triggered, a roller shutter gate can only start moving in one direction.	
At an operational limit switch, the trolley of a crane can only start moving in the opposite direction.	

4.9.3.2 Configuring SDI

In STEP 7 do the following to configure SDI:

- Configure "Safety Function - Safe Direction"
- Configure the "Monitoring tolerance"
- Download this project to the F-CPU

4.9.3.3 Responding to SDI

Your safety program examines the "Safe Direction Event" bit and takes appropriate action when the bit is seen as 1. Once set, the "Safe Direction Event" bit remains set until either of the following actions occur:

- Your safety program sets the "Reset Safe Direction" bit to 1
- A power cycle
- A new STEP 7 hardware configuration is downloaded

4.10 Address space

Address space of the technology module

Table 1-587 Size of input and output addresses of the F-TM Count for PROFIsafe version 2.4 (with S7-300/S7-400)

	Control (Outputs)	Feedback (Inputs)
Range for control and feedback interface	6 bytes	14 bytes

Table 1-588 Size of input and output addresses of the F-TM Count for PROFIsafe version 2.6.1 (with S7-1200/S7-1500)

	Control (Outputs)	Feedback (Inputs)
Range for control and feedback interface	7 bytes	15 bytes

4.11 Control and feedback interface

4.11.1 Assignment of the control interface

Your safety program uses the control interface to influence the behavior of the F-TM Count module.

Control interface

The following table shows the assignment of the control interface:

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	Reset Safe Direction	Reset Safe Stop	Reserved	Reset Safe Speed	Reserved	Reserved	Reset Other Events	Open SW Gate
1	Safe Direc-tion	Enable Safe Direction	Enable Safe Stop	Enable Safe Speed	Reserved	Set Start Value	Reserved	Reserved

Explanations

Byte	Bit	Control bit/value	Explanations
0	0	Open SW Gate	The "Open SW Gate" bit controls when the software gate is open and counting is enabled. • 0: SW gate is closed and counting is stopped • 1: SW gate is open and counting is allowed
0	1	Reset Other Events	The "Reset Other Events" bit is used to reset the following event bits in the feedback interface: • Zero Event • Underflow Event • Overflow Event As long as the "Reset Other Events" bit is set to 1, the "Zero Event", "Underflow Event", and "Overflow Event" bits are continually cleared.
0	4	Reset Safe Speed	The "Reset Safe Speed" bit is used to reset the "Safe Speed Event" bit in the feedback interface. • 0: No action • 1: Clear the "Safe Speed Event" bit As long as the "Reset Safe Speed" bit is set to 1, the "Safe Speed Event" bit is continually cleared.
0	6	Reset Safe Stop	The "Reset Safe Stop" bit is used to reset the "Safe Stop Event" bit in the feedback interface. • 0: No action • 1: Clear the "Safe Stop Event" bit As long as the "Reset Safe Stop" bit is set to 1, the "Safe Stop Event" bit is continually cleared.
0	7	Reset Safe Direction	The "Reset Safe Direction" bit is used to reset the "Safe Direction Event" bit in the feedback interface. • 0: No action • 1: Clear the "Safe Direction Event" bit As long as the "Reset Safe Direction" bit is set to 1, the "Safe Direction Event" bit is continually cleared.

Byte	Bit	Control bit/value	Explanations
1	2	Set Start Value	The "Set Start Value" bit sets the current count to the configured start value. • 0: No action • 1: Set the count to the start value The "Set Start Value" action is initiated whenever this bit is set. The current count value is continually set to the "Start Value" while the "Set Start Value" bit is set to 1.
1	4	Enable Safe Speed	The "Enable Safe Speed" bit enables the SLS monitoring function. The "Enable Safe Speed" is set in the control interface. • 0: Disabled • 1: Enabled SLS monitoring is initiated in the module whenever the "Enable Safe Speed" bit is set. SLS monitoring is active until the "Enable Safe Speed" bit is reset or a power cycle occurs. SLS monitoring is reinitialized when a new STEP 7 hardware configuration is downloaded.
1	5	Enable Safe Stop	The "Enable Safe Stop" bit enables the SOS monitoring function. The "Enable Safe Stop" is set in the control interface. • 0: Disabled • 1: Enabled SOS monitoring is initiated in the module whenever the "Enable Safe Stop" bit is set. SOS monitoring is active until the "Enable Safe Stop" bit is reset or a power cycle occurs. SOS monitoring is reinitialized when a new STEP 7 hardware configuration is downloaded.
1	6	Enable Safe Direction	The "Enable Safe Direction" bit enables the SDI monitoring function. The "Enable Safe Direction " is set in the control interface. • 0: Disabled • 1: Enabled SDI monitoring is initiated in the module whenever the "Enable Safe Direction" bit is set. SDI monitoring is active until the "Enable Safe Direction" bit is reset or a power cycle occurs. SDI monitoring is reinitialized when a new STEP 7 hardware configuration is downloaded.
1	7	Safe Direction	The "Safe Direction" bit in the control interface specifies the safe direction of movement for the safe direction monitoring function. • 0: Counting down is the safe direction • 1: Counting up is the safe direction Changing the safe direction requires you to reset the "Safe Direction Enable" bit. The safe direction must be set prior to setting the "Enable Safe Direction" bit.

4.11.2 Assignment of the feedback interface

Your safety program receives current values and status information from the F-TM Count module by means of the feedback interface.

Feedback interface

The following table shows the assignment of the feedback interface:

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	Reset Safe Direction Status	Reset Safe Stop Status	SW Gate Status	Reset Safe Speed Status	Reset Other Events Status	Set Start Value Status	Count Status	Direction Status
1	Reserved	Safe Direction Event	Safe Stop Event	Safe Speed Event	Overflow Event	Underflow Event	Zero Event	Value status (CQ HSC0)
2...5	High Speed Counter 0 - Current Value DINT: Current counter value Value range: –2147483648 to 2147483647_D or 80000000 to $7FFFFFFF_H$							
6...9	High Speed Counter 0 - Measured Value Measured Value as a scaled DINT							

Explanations

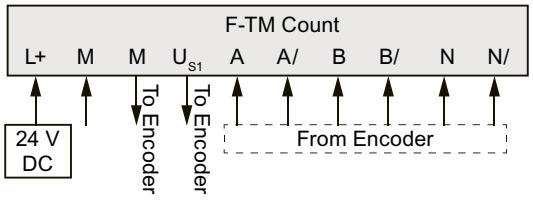
Byte	Bit	Feedback bit/value	Explanations
0	0	Direction Status	The "Direction Status" bit reflects the direction of the last movement. • 0: Last count was down • 1: Last count was up After power-up, the "Direction Status" bit resets to 0 and reinitializes to the actual state upon the next movement.
0	1	Count Status	The "Count Status" bit reflects the current counting status. • 0: No counts in the previous 500 ms • 1: At least one count received in the previous 500 ms
0	2	Set Start Value Status	The "Set Start Value Status" bit is used to acknowledge that the module has received and reacted to the "Set Start Value" bit from the control interface as follows: • When the "Set Start Value" bit is set to 1, the module sets the count value to the start value, then sets the "Set Start Value Status" bit to 1 • When the "Set Start Value" bit is set to 0, the "Set Start Value Status" bit is also set to 0
0	3	Reset Other Events Status	The "Reset Other Events Status" bit is used to acknowledge that the module has received and reacted to the "Reset Other Events" bit from the control interface as follows: • When the "Reset Other Events" bit is set to 1, the module resets the "Overflow Event", "Underflow Event", and "Zero Event" bits, then the "Reset Other Events Status" bit is set to 1 • When the "Reset Other Events" bit is set to 0, the "Reset Other Events Status" bit is set to 0

Byte	Bit	Feedback bit/value	Explanations
0	4	Reset Safe Speed Status	The "Reset Safe Speed Status" bit is used to acknowledge that the module has received and reacted to the "Reset Safe Speed" bit in the control interface as follows: • When the "Reset Safe Speed" bit is set to 1, the module resets the "Safe Speed Event" bit, then the "Reset Safe Speed Status" bit is set to 1 • When the "Reset Safe Speed" bit is set to 0, the "Reset Safe Speed Status" bit is set to 0
0	5	SW Gate Status	The "SW Gate Status" bit is used to acknowledge that the module has received and reacted to the "Open SW Gate" bit from the control interface as follows: • When the "Open SW Gate" bit is set to 1, the module performs the configured gate action, then the "SW Gate Status" bit is set to 1 • When the "Open SW Gate" bit is set to 0, the "SW Gate Status" bit is also set to 0
0	6	Reset Safe Stop Status	The "Reset Safe Stop Status" bit is used to acknowledge that the module has received and reacted to the "Reset Safe Stop" bit from the control interface as follows: • When the "Reset Safe Stop" bit is set to 1, the module resets the "Safe Stop Event" bit, then the "Reset Safe Stop Status" bit is set to 1 • When the "Reset Safe Stop" bit is set to 0, the "Reset Safe Stop Status" bit is set to 0
0	7	Reset Safe Direction Status	The "Reset Safe Direction Status" bit is used to acknowledge that the module has received and reacted to the "Reset Safe Direction" bit from the control interface as follows: • When the "Reset Safe Direction" bit is set to 1, the module resets the "Safe Direction Event" bit, then the "Reset Safe Direction Status" bit is set to 1 • When the "Reset Safe Direction" bit is set to 0, the "Reset Safe Direction Status" bit is set to 0
1	0	Value status (CQ HSC0)	The value status bit provides information on the validity operational quality of the corresponding channel. • 0: Fail-safe values (0 values) are provided for the channel • 1: Valid process values are provided for the channel
1	1	Zero Event	The "Zero Event" bit is set whenever the current count value transitions to 0. • 0: No event • 1: Count transitioned to 0 The "Zero Event" occurs when the count transitions to 0 from either direction. The "Zero Event" bit remains set until the module's "Reset Other Events" bit is set to 1 and remains cleared as long as the "Reset Other Events" bit is set to 1.
1	2	Underflow Event	The "Underflow Event" bit is set whenever the current count value exceeds the configured "Low Counting Limit". • 0: No violation of limit • 1: Low counting limit was exceeded The "Underflow Event" bit remains set until the module's "Reset Other Events" bit is set to 1 and remains cleared as long as the "Reset Other Events" bit is set to 1.
1	3	Overflow Event	The "Overflow Event" bit is set whenever the current count value exceeds the configured "High Counting Limit". • 0: No violation of the limit • 1: High counting limit was exceeded The "Overflow Event" bit remains set to 1 until the module's "Reset Other Events" bit is set to 1 and remains cleared as long as the "Reset Other Events" bit is set to 1.

Byte	Bit	Feedback bit/value	Explanations
1	4	Safe Speed Event	The "Safe Speed Event" bit informs the safety program that a safe speed violation has occurred. • 0: No violation • 1: The calculated speed, in either direction, was detected to be greater than the configured "Speed limit" The "Safe Speed Event" bit is cleared following an event when the "Reset Safe Speed" bit is set to 1 in the control interface.
1	5	Safe Stop Event	The "Safe Stop Event" bit informs the safety program that a safe stop violation has occurred. • 0: No violation • 1: A movement was detected in either direction that exceeded the configured "Standstill tolerance" as measured from the stored position The "Safe Stop Event" bit is cleared following an event when the "Reset Safe Stop" bit is set to 1 in the control interface.
1	6	Safe Direction Event	The "Safe Direction Event" bit informs the safety program that a safe direction violation has occurred. • 0: No violation • 1: A movement was detected in the unsafe direction that exceeded the configured "Monitoring tolerance" The "Safe Direction Event" bit is cleared following an event when the "Reset Safe Direction" bit is set to 1 in the control interface.
2...5	31...0	High Speed Counter 0 - Current Value	This signed double integer (DINT) value shows the current count. The position corresponds to the sign and the count value (process value). The count value assumes values between -2147483648 and 2147483647 unless restricted by the high and low counting limits.
6...9	31...0	High Speed Counter 0 - Measured Value	The measured value is returned as a scaled integer (DINT) value shown as one of the following, depending upon configuration: • Frequency is in millihertz (hertz * 1000) • Period is in microseconds (seconds * 1000000) • Velocity is units of measure per time base you select (velocity * 1000) Note that negative values are reported when counting down, positive values are reported when counting up.

Applications of the F-I/O module

5



5.1 Application mode 1: A/B with N

Application mode 1: A/B with N

The F-TM Count module supports the following application mode:

- A, B differential encoder signals
- N pulse per revolution differential encoder signal

The figure below is an example of the A/B with N application mode:

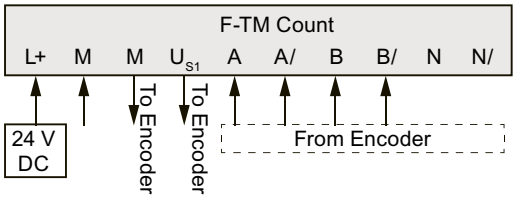
NOTE

The encoder may also be powered from an external source. If an external source is used, only the M supply voltage "To Encoder" must be connected to the encoder's ground/external power source ground.

WARNING

An external source of power for the encoder must be at the same ground potential as the power source for the F-TM Count module.

Ensure that ground potential for the external power source for the encoder and the F-TM Count module power source are the same. Any potential differences in the two power sources will cause current to flow through the modules that can cause damage to F-TM Count module, power supplies and the encoder.



5.2 Application mode 2: A/B without N

Application mode 2: A/B without N

The F-TM Count module supports the following application mode:

- A, B differential encoder signals

The figure below is an example of the A/B without N application mode:

NOTE

The encoder may also be powered from an external source. If an external source is used, only the M supply voltage "To Encoder" must be connected to the encoder's ground/external power source ground.

WARNING

An external source of power for the encoder must be at the same ground potential as the power source for the F-TM Count module.
Ensure that ground potential for the external power source for the encoder and the F-TM Count module power source are the same. Any potential differences in the two power sources will cause current to flow through the modules that can cause damage to F-TM Count module, power supplies and the encoder.

Interrupts/diagnostic messages 6

6.1 Reactions to faults

Reactions to startup of the fail-safe system and to faults

The fail-safe concept depends on the identification of a safe state for all process variables.

The safety function requires that safe state values be applied to the fail-safe channel instead of process values (passivation of the fail-safe module or channel) in the following situations:

- When the fail-safe system is started up
- If module faults are detected, such as RAM or processor failures
- If errors are detected during safety-related communication between the fail-safe CPU and the fail-safe module through the PROFIsafe safety protocol (communication error)
- If module channel faults occur (for example, N signal plausibility monitoring or discrepancy errors)

The fail-safe CPU enters detected system faults into the diagnostic buffer.

Automatic safety measures and the PROFIsafe protocol ensure that the safe state is set if the system detects a fault.

Fail-safe modules do not remember errors upon power cycle. When the system is powered down and then restarted, the modules detect any faults that still exist.

Fail-Safe value for fail-safe modules

If the F-TM Count module input channel is passivated, the fail-safe system always provides "0" values for the count value, measured value, and event and status bits.

Timeout of the PROFIsafe message (F-monitoring time exceeded) passivates the module.

Response to faults in the fail-safe system

You should prepare maintenance procedures for your system to assure that returning to operation after a detected fault is controlled and documented.

The following steps must be performed:

1. Diagnosis and repair of the fault
2. Revalidation of the safety function
3. Recording in the service report

Reintegration of a fail-safe module

A channel or module can be reintegrated after successful diagnostics determine that a fault has cleared. The F-TM Count module requires that counting faults such as N-signal, discrepancy, frequency, and A and B signal monitoring must be cleared for at least 10 seconds before allowing reintegration. High and low voltage diagnostics require that the input voltage returns to the allowed range for 60 seconds before reintegration is possible.

The channel to be manually reintegrated must also be acknowledged in your safety program after the fault has cleared. The bits you use for this acknowledgement are referenced in the F-I/O data blocks (under the system blocks).

The "ACK_REQ" bit for that module goes true to indicate that reintegration is possible. After the "ACK_REQ" bit is true, your program can set the "ACK_REI" bit to allow the reintegration of all channels in that module that are ready to be reintegrated.

You can also acknowledge all faults in an F-runtime group using the "ACK_REI_GLOB" input of the "ACK_GL" instruction.

Fatal diagnostic errors require a power cycle with successful diagnostics.

Reintegration after high stress events

High temperature, high voltage, and excessive current stress can damage electronics, reducing the reliability while components continue to work apparently as expected. Passivation does not remove the potentially damaging effects of high ambient temperature or high applied voltage. Solid state switch outputs can be damaged by high currents prior to protective device activations. The reliability calculations assume the fail-safe module is operated within its specified operating parameters. When a module has passivated due to a high stress event, even though it apparently works correctly and passes all diagnostics, the probability of a future failure may be increased.

⚠ WARNING

It is possible to reintegrate a channel or module while some fault is still present that is not readily detected by the module diagnostics.
Reintegration of a faulty system can result in unexpected machine or process operation, which may cause death or serious injury to personnel, and/or damage to equipment.
After any reported fault, the steps outlined in this chapter and in safety standards applicable to your system should be followed to assure that the fault is completely understood and corrected before reintegration.

For an exact list of faults for the module, refer to the Diagnostic messages (Page 66) section.

At reintegration, the following occurs:

- Updated count value, measured value, and the event and status bits are provided to your safety program.
- Control outputs from your safety program are again transferred to the counter module.

Safety repair time

⚠ WARNING

The fail-safe performance characteristics in the technical specifications apply for a mission time life of 20 years and a repair time of 100 hours.
If a repair within 100 hours is not possible, remove the respective module from the BaseUnit or switch off its supply voltage before 100 hours expires. The module switches off independently after the 100 hours have expired.
Follow the repair procedure described in section Diagnostic messages (Page 66).

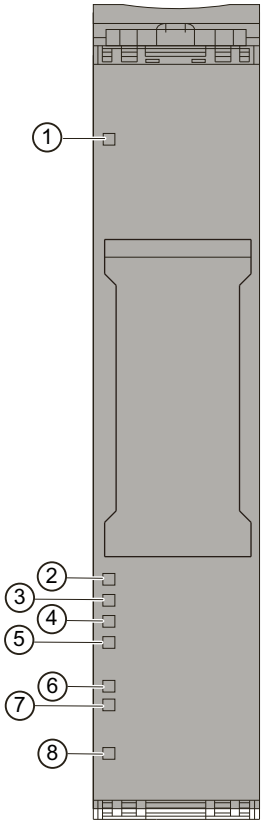
The repair time used for probability of dangerous failure per hour (PFH) and probability of dangerous failure on demand (PFD) calculations is 100 hours.

Passivation is designed to provide the safe state of the safety function in the event of a single fault. While a channel is passivated and energy is still available to the channel, there is a possibility that additional faults can cause a dangerous failure of the safety function. You should respond to passivations by repairing the fault or taking the passivated channel out of service in less than 100 hours to preserve the safety integrity level of your system.

If module or channel passivation persists for 100 hours, the module is taken to a fatal error state and the module's defective buffer diagnostic message is issued. The module is recovered through a power cycle.

If a repair within 100 hours is not possible, passivated fail-safe outputs should be taken out of service by physically disconnecting or opening circuits so that faults in the fail-safe module cannot apply energy to the load. To remove input channels from service in an operating PLC system, references to any passivated fail-safe inputs must be removed from any operating F-CPU Safety program logic that can result in activation of a safety function output.

Do not depend on channel or module passivation to maintain safe state for more than 100 hours.



Additional information on passivation and reintegration

For further information about fail-safe module access, refer to the *SIMATIC Safety - Configuring and Programming* manual (https://support.industry.siemens.com/cs/ww/en/view/54110126).

6.2 Status and error display

LEDs

The following figure shows you the LED displays (status and error displays) of F-TM Count module:

①	DIAG (green/red)	⑤	N (green)
②	A (green)	⑥	UP (green)
③	B (green)	⑦	DN (green)
④	F.0 (red)	⑧	PWR (green)

Figure 1-278 LED displays of the F-TM Count

Meaning of the LED displays

The following tables explain the meaning of the status and error displays. Remedial measures for diagnostic alarms can be found in section Diagnostic messages (Page 66).

DIAG LED

The DIAG LED indicates system and module faults.

Table 1-589 Meaning of the DIAG LED

DIAG	Meaning
Off	Backplane bus supply of the ET 200SP is not OK
Flashes	Module reintegratable diagnostic event has been resolved and the module or channel is awaiting reintegration. This can include the following events: • Reintegratable over-voltage error • Reintegratable under-voltage error • Module detected PROFIsafe CRC error • Module detected PROFIsafe timeout error • Reintegratable channel errors
Flashes	Module parameters are set, and module has active diagnostics (at least one error is present)
Flashes	Module parameters are not configured
On	Module parameters are configured, and module has no active diagnostics

Channel status/channel fault LEDs

The A and B LEDs indicate the current level of the associated input signals. At low counting speeds the A and B LEDs show the actual state of the signals. At higher counting speeds, the A and B LEDs will change at a limited rate to show activity. A and B LEDs flash when setting the profisafe address.

Table 1-590 Meaning of the channel status/channel fault LEDs

A/B Channel	F.0	Meaning
Off	Off	Counter input signal is at 0 level and no active channel diagnostics
On	Off	Counter input signal is at 1 level and no active channel diagnostics
Off	On	Active channel diagnostics
Flashes		Prior diagnostic event has been resolved and the channel is awaiting reintegration

N LED

The N LED indicates the current level of the counter N pulse signal from the encoder. The N LED will show the state of the N signal only when the encoder is configured as A/B with N. The N LED will be in the ON state if the N signal is disconnected (but configured).

Table 1-591 Meaning of the N LED

N	Meaning
Off	Counter N signal is at 0 level
On	Counter N signal is at 1 level

UP/DN LEDs

The UP and DN LEDs indicate the logical counting direction.

Table 1-592 Meaning of the UP and DN LEDs

UP	DN	Meaning
□ Off	□ Off	No count has been detected within the last 0.5 s.
■ On	□ Off	The last count has incremented the counter and took place no more than 0.5 s ago.
□ Off	■ On	The last count has decremented the counter and took place no more than 0.5 s ago.

PWR LED

Table 1-593 Meaning of the PWR LED

PWR	Meaning
□ Off	Supply voltage missing
■ On	Supply voltage is present and OK

6.3 Interrupts

Diagnostic interrupts

The F-module generates a diagnostic interrupt for each diagnostics alarm described in *Diagnostic messages* (Page 66).

The table below provides an overview of the diagnostic interrupts of the F-module. The diagnostic interrupts are assigned either to one channel or the entire F-module:

Table 1-594 Diagnostic interrupts of the F-TM Count module

Diagnostic interrupt	Fault code	Scope of diagnostics interrupt	Configurable
Overtemperature	16#0005	F-module	No
Parameter failure (invalid parameters)	16#0010		
Supply voltage missing	16#0011		
Mismatch of safety destination address (F_Dest_Add)	16#0040		
Safety destination address not valid (F_Dest_Add)	16#0041		
Safety source address not valid (F_Source_Add)	16#0042		
CRC1 fault	16#0047		
Inconsistent iParameters (iParCRC error)	16#004B		
Transmission error: data inconsistent (CRC error)	16#004D		
Transmission error: timeout (watchdog time 1 or 2 elapsed)	16#004E		
Module is defective	16#0100		
Watchdog tripped	16#0103		
Invalid/inconsistent firmware present	16#011B		
Diagnostic queue overflow	16#013E		

Diagnostic interrupt	Fault code	Scope of diagnostics interrupt	Configurable
F-address memory not accessible	16#030D	F-module	No
No valid F-address available	16#030E		
Undertemperature	16#0312		
Supply voltage too high	16#0321		
Supply voltage too low	16#0322		
Load voltage too low	16#0324		
No pulses detected	16#030A	Channel	Yes
Sensor signal flutters	16#0310		No
Failure in the input circuit	16#0313		
Internal discrepancy failure	16#0315		
Illegal A/B signal ratio	16#0500		Yes
Frequency outside specification	16#0501		No

6.4 Diagnostic messages

Diagnostic alarms

The display of diagnostics is in plain text in STEP 7 in the online and diagnostics view. You can evaluate the error codes with your safety program.

NOTE

If you use a GSDML file for configuration, the diagnostic alarm text is only available in the project that installed the GSDML. The fault codes may be different, but the CPU diagnostic buffer will match the diagnostic alarm text in the table below.

NOTE

Some solutions below suggest pulling (removing) and plugging (reinserting) the module. For technology modules such as this one, L+ power must be switched off prior to pulling and plugging the module.

The following diagnostics can be signaled:

Table 1-595 Diagnostics alarms, their meaning and possible remedies

Diagnostics alarm	Fault code	Meaning	Solution
Overtemperature	16#0005	An excessively high temperature was measured in the F-module.	• Operate the F-module within the specified temperature range (see Technical specifications). • Once the temperature has been reduced and returns to the specified range, the F-module must be removed and reinserted or the power switched OFF and ON.
Parameter failure (invalid parameters)	16#0010	On detection of invalid parameters, the module remains present in the system but goes to an unparameterized state and the	Check the i-Parameter CRC, i-parameter, and PROFIsafe parameter assigned to

Diagnostics alarm	Fault code	Meaning	Solution
		module LEDs give an immediate indication of the fault. The module is included in STEP 7 (TIA Portal V17 or later), which includes detailed dependency checks. However, configuration may also be accomplished using the GSDML, which contains limited dependency checking. This error is seen when using the GSDML to configure the module since there is limited dependency checking performed by the GSDML. Possible causes: • i-Parameter CRC error • Invalid i-parameters (for example, invalid selection, parameter out-of-range, unsupported feature selected, and wrong value of reserved field) • Any PROFIsafe parameterization problem detected by the PROFIsafe driver	the F-module in the GSDML configuration.
Supply voltage missing	16#0011	Missing or insufficient supply voltage L+ Possible causes: • Operating the F-module outside the specified supply voltage range • Critical overvoltage range exceeded	• Operate the F-module within the specified supply voltage range. • After a critical over-voltage event, once the voltage returns to the specified range, the F-module must be removed and reinserted or the power switched OFF and ON.
Mismatch of safety destination address (F_Dest_Add)	16#0040	The PROFIsafe driver has detected a different F-destination address. Checked after new parameters received.	• Check the parameter assignment of the PROFIsafe address assigned to the F-module. • Reassign or reinitialize the PROFIsafe F-addresses using STEP 7.
Safety destination address not valid (F_Dest_Add)	16#0041	The PROFIsafe driver has detected an invalid destination address. Checked after new parameters received.	
Safety source address not valid (F_Source_Add)	16#0042	The PROFIsafe driver has detected a source address mismatch or an invalid source address. Checked after new parameters received.	
CRC1 fault	16#0047	The firmware of the F-module has detected a CRC error. Possible causes: • The communication between the F-CPU and F-module is disturbed. • Impermissibly high electromagnetic interference is present.	• Check PROFINET or PROFIBUS communications between the F-module and F-CPU. • Eliminate the electromagnetic interference. • Power switched OFF and ON for station. • Reassign or reinitialize the PROFIsafe F-addresses using STEP 7.
Inconsistent iParameters (iParCRC error)	16#004B		
Transmission error: data inconsistent (CRC error)	16#004D		
Transmission error: timeout (watchdog time 1 or 2 elapsed)	16#004E	The firmware of the F-module has detected a timeout. Possible causes: • The F-monitoring time is set incorrectly. • A bus fault is present.	• Adjust F-monitoring time. • Adjust the F-runtime group cycle time. • Ensure that communication is functioning correctly.

Diagnostics alarm	Fault code	Meaning	Solution
Invalid/inconsistent firmware present	16#011B	The firmware is incomplete and/or firmware added to the F-module is incompatible. This leads to errors or functional limitations when operating the F-module.	• Perform a firmware update for all parts of the F-module and note any error messages. • Use only firmware versions released for this F-module. • Power cycle to restore the module to the firmware versions prior to getting the error.
Diagnostic queue overflow	16#013E	Overflow of the diagnostics memory. It was not possible to send all pending diagnostics. This error can lead to deactivation of the F-module.	Remedy the cause of the diagnostics surge.
No pulses detected	16#030A	The expected number of pulses was not received within a given revolution, where the revolution is determined by the module receiving an active N signal event. Possible causes: • There is a faulty N signal. • The "Pulses per revolution" configuration does not match the encoder's pulses per revolution. • The module is configured to use the N signal, but the encoder does not use an N signal or there is a wire break. • There is noise on the N signal line.	• Check the N signal process wiring. • Check the parameter is set to match the sinusoidal cycles per revolution.
F-address memory not accessible	16#030D	The F-source address and F-destination address stored in the coding element cannot be accessed.	Verify that the coding element is present or replace the coding element.
No valid F-address available	16#030E	The electronic coding element contains an invalid F-address.	Assign a PROFIsafe address to the F-module.
Module is defective	16#0100	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module has detected an internal error and has reacted in a safety-related manner. • Encoder frequencies received above 250kHz. In this situation, the module is not defective.	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON. • Ensure encoder frequencies below 200kHz and reapply power to the module. • Replace defective F-module.
Watchdog tripped	16#0103	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module has detected an internal error and has reacted in a safety-related manner.	
Sensor signal flutters	16#0310	An internal diagnostic has been triggered due to instability of the encoder signals. Possible causes: • Consistent presence of external electrical noise • Placing encoder signal wires in the same tray with AC power wiring or high-energy, rapidly-switching DC wiring • Using unshielded encoder cables or improper shielded encoder cables	• Ensure that you are using proper shielded cables between the encoder and the module to meet noise immunity standards. • Reduce or eliminate the electrical noise influencing the encoder. • Avoid placing encoder signal wires in the same tray with AC power wiring and high-energy, rapidly-switched DC wiring.

Diagnostics alarm	Fault code	Meaning	Solution
Undertemperature	16#0312	The minimum permissible temperature limit has been violated.	• Operate the F-module within the specified temperature range (see Technical Specifications). • Once the temperature has increased and returns to the specified range, the F-module must be removed and reinserted or the power switched OFF and ON.
Failure in the input circuit	16#0313	The F-module has detected an internal error in the input circuits. Possible cause: • F-module is defective	• Replace defective F-module.
Internal discrepancy failure	16#0315	The internal counters of the F-module have resulted in divergent count values. Possible causes: • Impermissibly high electromagnetic interference is present • Encoder failure • Excessive frequency • F-module is defective	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON. • Replace encoder. • Operate within specified frequency range. • Replace defective F-module.
Supply voltage too high	16#0321	The supply voltage is too high.	• Operate the F-module within the specified voltage range (see Technical Specifications). • After a critical over-voltage event, once the voltage returns to the specified range, the F-module must be removed and reinserted or the power switched OFF and ON.
Supply voltage too low	16#0322	The supply voltage is too low.	
Load voltage too low	16#0324	The encoder supply voltage is out of the allowed range. This could be because of an internal module problem or a problem external to the module.	Disconnect the encoder and power cycle the module. • If the error goes away, there could be a problem with the encoder that causes the encoder supply to be out of range. • If the error is still present after a power cycle with no encoder attached, replace defective F-module.
Illegal A/B signal ratio	16#0500	The encoder's A and B signals are outside the allowed phase shift tolerance, or the amplitude (voltage) tolerance. Possible causes: • Encoder faulty • Process wiring faulty • Wire break • F-module is defective	• Check process wiring. • Check encoder. • Replace defective F-module.
Frequency outside specification	16#0501	The maximum frequency for the F-module has been exceeded.	Reduce the frequency of the application (see Technical Specifications).

6.5 Value status (CQ HSC0)

Properties

In addition to the diagnostic messages and the status and error display, the F-module makes available information about the validity of the count and status values in the feedback interface. The value status is available in the process image along with the count and status values for the channel.

Value status for the F-TM Count module

The value status is additional binary information provided in the feedback interface. It is provided in the process image of the inputs (PII) at the same time as the process values. It provides information about the validity of the process inputs.

The value status is influenced by channel and module wide diagnostic results.

- 1_B: Valid process values are provided for the channel.
- 0_B: Fail-safe process values are provided for the channel.

If the F-TM Count module input channel is passivated, the fail-safe system always provides ("0") for the count value, measured value, and event and status bits.

Assignment of inputs for the value status in the PII

The input channel of the F-module is assigned a value status (CQ HSC0) in the process image of the inputs. You can find the assignment in section Address space (Page 52).

Reference

A detailed description of the evaluation and processing of the value status can be found in the *SIMATIC Safety – Configuring and Programming* manual (https://support.industry.siemens.com/cs/ww/en/view/54110126).

Technical specifications

7

7.1 Specifications

	6ES7136-6CB00-0CA0
General information	
Product type designation	F-TM Count, 1x1Vpp sin/cos HF
Firmware version	V1.0
FW update possible	Yes
Product version	V1.0
usable BaseUnits	BU type A0
Color code for module-specific color identification plate	CC01
Product function	
I&M data	Yes; I&M0 to I&M3
Engineering with	
STEP 7 TIA Portal configurable/integrated as of version	Step 7 V17 or higher: use GSDML for prior versions
Supply voltage	
Load voltage L+	
Rated value (DC)	24 V
permissible range, lower limit (DC)	20,4 V
permissible range, upper limit (DC)	28,8 V
Reverse polarity protection	Yes
Input current	
Current consumption, max.	50 mA; Without load, 150 mA with 300 mA Encoder load
Encoder supply	
5 V	Yes; 5.1 V ±3.5 %
Short-circuit protection	Yes; Electronic overload protection; no protection on applying a normal or counter voltage.
Output current, max.	300 mA
Power loss	
Power loss, typ.	1,25 W
Address area	
Address space per module	
Inputs	14 byte; S7-300/400F CPU, 13 byte
Outputs	5 byte; S7-300/400F CPU, 4 byte
Digital inputs	
Number of digital inputs	1; (Counter Input)
Digital inputs, parameterizable	Yes
Digital input functions, parameterizable	
Gate start/stop	Yes

	6ES7136-6CB00-0CA0
Counter for incremental encoder	Yes
Number, max.	1
Input voltage	
Type of input voltage	sin/cos 1 Vpp; monitored to +/- 20% resolution
Input delay (for rated value of input voltage)	
Minimum pulse width for program reactions	2.5 µs for parameterization "none"
for technological functions	
parameterizable	Yes
Cable length	
shielded, max.	150 m
Encoder	
Connectable encoders	
Incremental encoder (symmetrical)	Yes; up to 200 kHz depending on cable type and length
Encoder signals, incremental encoder (symmetrical)	
Input voltage	1 Vpp, centered at 2.5 V offset
Input frequency, max.	200 kHz
Counting frequency, max.	800 kHz; with quadruple evaluation
Cable length, shielded, max.	150 m
Incremental encoder with A/B tracks, 90° phase offset	Yes; sin/cos
Incremental encoder with A/B tracks, 90° phase offset and zero track	Yes; sin/cos/zero
Interrupts/diagnostics/status information	
Diagnostics function	Yes; see chapter "Diagnostic Messages" in the manual
Alarms	
Diagnostic alarm	Yes
Hardware interrupt	No
Diagnoses	
Monitoring the supply voltage	Yes
Wire-break	Yes
Short-circuit	Yes
A/B transition error at incremental encoder	Yes
Diagnostics indication LED	
RUN LED	Yes; green LED
ERROR LED	Yes; red LED
Monitoring of the supply voltage (PWR-LED)	Yes; green LED
Channel status display	Yes; green LED
for channel diagnostics	Yes; red LED
for module diagnostics	Yes; green/red DIAG LED
Integrated Functions	
Number of counters	1
Counting frequency (counter) max.	800 kHz; with quadruple evaluation
Safety monitoring functions	
Safe Operating Stop (SOS)	Yes

	6ES7136-6CB00-0CA0
Safely-Limited Speed (SLS)	Yes
Safe Direction (SDI)	Yes
Safe Speed Monitor (SSM)	Yes
Counting functions	
Continuous counting	Yes
Counter response parameterizable	Yes
Software gate	Yes
Counting range, parameterizable	Yes
Measuring functions	
Measuring range	
Frequency measurement, min.	Hz
Frequency measurement, max.	800 kHz
Cycle duration measurement, min.	1 µs
Cycle duration measurement, max.	25 s
Velocity measurement, min.	0; (user defined units)
Velocity measurement, max.	2147483; +/- (user defined units)
Accuracy	
Frequency measurement	Up to 100 ppm; depending on measuring interval and signal evaluation. At low frequency external noise may have an effect on accuracy (reference the graph in 2.2.3)
Cycle duration measurement	Up to 100 ppm; depending on measuring interval and signal evaluation. At low frequency external noise may have an effect on accuracy (reference the graph in 2.2.3)
Velocity measurement	Up to 100 ppm; depending on measuring interval and signal evaluation. At low frequency external noise may have an effect on accuracy (reference the graph in 2.2.3)
Potential separation	
Potential separation channels	
between the channels	No; Only one channel is available
between the channels and backplane bus	Yes
Between the channels and load voltage L+	No
between the channels and the power supply of the electronics	No
Isolation	
Isolation tested with	707 V DC (type test)
Degree and class of protection	
IP degree of protection	IP20
Standards, approvals, certificates	
Suitable for safety functions	Yes
Highest safety class achievable in safety mode	
Performance level according to ISO 13849-1	Cat. 4, PL e
SIL acc. to IEC 61508	SIL 3
Probability of failure (for service life of 20 years and repair time of 100 hours)	
Low demand mode: PFDavg in accordance with SIL 1	2.00E-03 signal monitoring disabled

	6ES7136-6CB00-0CA0
Low demand mode: PFDavg in accordance with SIL 3	< 3.00E-05
High demand/continuous mode: PFH in accordance with SIL 1	< 3.00E-08 1/h signal monitoring disabled
High demand/continuous mode: PFH in accordance with SIL 3	< 1.00E-09 1/h
Ambient conditions	
Ambient temperature during operation	
horizontal installation, min.	0 °C
horizontal installation, max.	60 °C
vertical installation, min.	0 °C
vertical installation, max.	50 °C
Altitude during operation relating to sea level	
Ambient air temperature-barometric pressure-altitude	On request: Ambient temperatures lower than 0 °C (without condensation) and/or installation altitudes greater than 2 000 m
Dimensions	
Width	15 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	42 g

Response times

A

A.1 Maximum response time of the system

Calculating the maximum response time of the system

You can calculate your maximum system response time using the "SIMATIC STEP 7 Safety Advanced: F-Execution Times, F-Runtimes, F-Monitoring and Reaction Times (https://support.industry.siemens.com/cs/ww/en/view/58856512)" Excel file (RT_calculator). Use your configured individual fail-safe module timing parameters and the module characteristic parameters found in this appendix to determine the maximum response time of your system.

Data transport delays included

The T_{cycle} parameter value in the following paragraph includes an allowance for the fail-safe module to acquire and deliver PROFIsafe messages in transactions with the PLC I/O bus. The execution time of the Safety FB in the fail-safe CPU includes the physical transport delay time for PROFIsafe messages moving between the fail-safe module location and the fail-safe CPU. There are no separate transport delay parameters that you must include in your calculations.

A.2 Response times of the F-TM Count module

Maximum response time of the F-module input values

$T_{WCDT_i} = T_{cycle} * 2$

Where:

T_{cycle} 6 ms	Internal cycle time of the fail-safe module
T_{WCDT_i}	Worst Case Delay Time: Maximum response time from a signal transition at the fail-safe module's counter input to the reliable availability of the safety message frame available for the fail-safe CPU request

Count, status, and event values are reported during each T_{cycle}. In situations where an individual count of a movement is slower than T_{cycle}, the same value can be reported across one or more T_{cycles}.

The response time for counts, status, and event values is essentially a single T_{cycle}. For output image register commands, the response time behavior $T_{cycle} * 2$ applies. The maximum response time is defined as twice the cycle time for simplicity.

Maximum fault response time of the F-module input

$T_{WCDT_i} = (T_{cycle} * 2) + T_{signal}$ (when moving)

$T_{OFDT_i} = (T_{cycle} * 2) + T_{diagrep}$ (when not moving or moving slower than a single count per second)

Where:

T_{cycle} 6 ms	Internal cycle time of the fail-safe module
$T_{diagrep}$ 250 ms	Internal diagnostic repetition rate
T_{OFDT_i}	One Fault Delay Time: Maximum response time for the fail-safe module to report a channel as passivated
T_{signal} 20 ms	Maximum transition time of the signal monitoring error output
T_{WCDT_i}	Worst Case Delay Time: Maximum response time from a signal transition at the fail-safe module's counter input to the reliable availability of the safety message frame available for the fail-safe CPU request

Response times that use measured value

Measured values are calculated and updated by the module to the F-CPU at the rate specified by the configured "Update time". Safety reaction times that use measured values in your safety program (for example, SLS) are therefore dependent on the configured update time. Refer to Measured value determination (Page 13) to calculate measure values.

Parameter data record

B

B.1 Parameter defaults and dependencies when configuring with GSD file

When configuring the module with a GSD file, remember that the setting of some parameters are dependent on each other.

F-TM Count module and encoder

The following are F-TM Count module default parameters:

Channel activation	Count/Pos input	Measuring	Signal monitoring
Enabled	Enabled	Enabled	Enabled

The following are encoder default parameters:

Signal type	Invert direction	Pulses per revolution	Signal evaluation	Reaction to N signal
Sin/Cos	Disabled	1024	Quadruple	No reaction

The following are F-TM Count default parameters using STEP 7 or GSD:

	High limit	Start value	Low limit	Counting violation	Reset upon violation	Reaction to Gate start
STEP 7	2147483647	0	-2147483648	Continue	Start value	Set to start
GSD	2147483647 [1]	0 [1]	0 [1],[2]	Continue	Start value	Set to start

[1] Parameter errors result whenever "Low Limit" >= "High Limit", "High Limit" < "Start Value", or "Start Value" < "Low Limit".

[2] Signed values are not supported using FCT V2.0. Negative values must be entered as their equivalent two's compliment values (for example, 2147483648 = - 2147483648 and 4294967295 = -1).

Measured value

The following are measured value default parameters:

Measured value	Update time	Time base (velocity)	Counts/Unit (velocity)
Frequency	100	0	1
Period	100	0	1
Velocity	100	0	1

Safety monitoring

The following are safety monitoring default parameters:

SOS enable	SDI enable	SLS enable
Disabled	Disabled	Disabled [1]

SOS tolerance	SDI tolerance	SLS speed
0	0	0

[1] When SLS is enabled, a measured value other than velocity will result in a parameter error.

PLC data types

C

C.1 PLC data types for F-TM Count

PLC data types for F-TM Count

Fail-Safe compliant PLC user-defined data types (UDTs) for the F-TM-C module are available from SIOS. These PLC data types define and represent the F-TM-C input image register and the F-TM-C output image register. You can import these PLC data types into your TIA Portal project using "External source files" in the project tree.

Introduction

1

1.1 About SIMATIC Micro-Drive

SIMATIC MICRO-DRIVE

SIMATIC MICRO-DRIVE is the drive system for safety extra-low voltages of 24 V to 48 V. Comprising SIMATIC MICRO-DRIVE, versatile motors and connecting cables from selected product partners, it extends the SIEMENS portfolio in the safety extra-low voltage area.

Suitable controllers from the SIMATIC range round out the motion control functionalities.

SIMATIC MICRO-DRIVE TM Drives

TM Drives is a technology module for SIMATIC ET 200SP. It can be controlled by a SIMATIC S7-1500/1200, including via technology objects (TO). TM Drives can be used in combination with a Distributed Controller or the SIMATIC ET 200SP Open Controller in decentralized system concepts.

1.2 About this information for use

1.2.1 Contents

To illustrate possible application areas for our products, typical use cases are listed in this product documentation and in the online help. These are purely exemplary and do not constitute a statement on the suitability of the respective product for applications in specific individual cases. Unless explicitly contractually agreed, Siemens assumes no liability for such suitability. Suitability for a particular application in specific individual cases must be assessed by the user, taking into account all technical, legal, and other requirements on a case-by-case basis. Always observe the descriptions of the technical properties and the relevant constraints of the respective product contained in the product documentation.

Purpose of the documentation

This Equipment Manual supplements the ET 200SP System Manual (https://support.industry.siemens.com/cs/ww/en/view/58649293).

Functions that generally relate to the system are described in the System Manual.

The information provided in this Equipment Manual and in the System/Function Manuals supports you in commissioning the system.

Firmware versions

This manual is valid for firmware version FW 2.1 and current HSP versions from V18 and for the corresponding GSDML version.

NOTE
The current firmware versions can be found in Industry Online Support (https://support.industry.siemens.com/cs/ww/en/view/109781459).

Conventions

CPU: When the term "CPU" is used in the following, it applies to the central modules of the S7-1500 automation system, the S7-1200 automation system, as well as to the CPUs/interface modules of the ET 200SP distributed I/O system.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Also observe notes marked as follows:

NOTE
A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

This documentation should be kept in a location where it can be easily accessed and made available to the personnel responsible.

Information regarding third-party products

NOTE
Recommendation relating to third-party products
This document contains recommendations relating to third-party products. Siemens accepts the fundamental suitability of these third-party products.
You can use equivalent products from other manufacturers.
Siemens does not accept any warranty for the properties of third-party products.

1.2.2 Target group

The Equipment Manual is intended for:

- Assemblers
- Commissioning engineers
- Operators
- Service personnel
- Project engineers

1.2.3 Standard scope

The functions of the system as delivered can only be found in the order documents.

Further functions may be executable in the system, which are not explained in this documentation. However, there is no entitlement to these functions in the case of a new delivery or service.

This documentation does not contain all detailed information on all types of the product. Furthermore, this documentation cannot take into consideration every conceivable type of installation, operation and service/maintenance.

The machine manufacturer must document any additions or modifications they make to the product themselves.

1.2.4 Use of third-party products in this documentation

This documentation contains recommendations relating to third-party products. Siemens accepts the fundamental suitability of these third-party products. You can use equivalent products from other manufacturers.

Siemens does not accept any warranty for the use of third-party products.

1.2.5 Websites of third-party companies

This document may contain hyperlinks to third-party websites. Siemens is not responsible for and shall not be liable for these websites and their content. Siemens has no control over the information which appears on these websites and is not responsible for the content and information provided there. The user bears the risk for their use.

1.3 SIMATIC documentation

1.3.1 ET 200SP Documentation Guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.

This arrangement enables you to access the specific content you require.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Basic information

The System Manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP distributed I/O system.

The STEP 7 online help supports you in the configuration and programming.

Examples:

- ET 200SP System Manual
- System Manual ET 200SP HA/ET 200SP modules for devices used in a hazardous area
- Online help TIA Portal

Device information

Figure 1-279 Icon for device information

Equipment manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

Examples:

- Equipment Manuals CPUs
- Equipment Manuals Interface Modules
- Equipment Manuals Digital Modules
- Equipment Manuals Analog Modules
- Equipment Manuals Motor Starter
- BaseUnits Equipment Manuals
- Equipment Manual Server Module
- Equipment Manuals Communications Modules
- Equipment Manuals Technology Modules

General information

The function manuals contain detailed descriptions on general topics relating to the SIMATIC ET 200SP distributed I/O system.

Examples:

- Function Manual ET 200AL/ET 200SP Mixed Configuration
- Function Manual Diagnostics
- Function Manual Communication
- PROFINET Function Manual
- PROFIBUS Function Manual
- Function Manual Designing Interference-free Controllers
- MultiFieldbus Function Manual

Product Information

Changes and supplements to the manuals are documented in a Product Information. The Product Information takes precedence over the device and system manuals.

You can find the latest Product Information on the ET 200SP distributed I/O system on the Internet. (https://support.industry.siemens.com/cs/ww/en/view/73021864)

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet.
(https://support.automation.siemens.com/WW/view/en/84133942)

Manual Collection fail-safe modules

The Manual Collection contains the complete documentation on the fail-safe SIMATIC modules, gathered together in one file.

You can find the Manual Collection on the Internet.
(https://support.industry.siemens.com/cs/ww/en/view/109806400)

1.3.2 SIMATIC Technical Documentation

Additional SIMATIC documents will complete your information. You can find these documents and their use at the following links and QR codes.

The Industry Online Support gives you the option to get information on all topics. Application examples support you in solving your automation tasks.

Overview of the SIMATIC Technical Documentation

Here you will find an overview of the SIMATIC documentation available in Siemens Industry Online Support:

Industry Online Support International (https://support.industry.siemens.com/cs/ww/en/view/109742705)

Watch this short video to find out where you can find the overview directly in Siemens Industry Online Support and how to use Siemens Industry Online Support on your mobile device:

Quick introduction to the technical documentation of automation products per video (https://support.industry.siemens.com/cs/us/en/view/109780491)

YouTube video: Siemens Automation Products - Technical Documentation at a Glance (https://youtu.be/TwLSxxRQQsA)

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You can find the application examples on the Internet. (https://support.industry.siemens.com/cs/ww/en/ps/ae)

1.4 Service & Support

1.4.1 FAQ

You will find FAQs on TM Drive on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/26085/faq).

1.4.2 ID link and Siemens Online Support

You can find additional information about the product:

- via ID link
- using the Siemens Industry Online Support
  - Website: SIOS
  - App Industry Online Support (for Apple iOS and Android)

Product-specific information via ID link

The QR code on your product and on the product packaging contains the ID link.

ID link is a globally unique identifier according to IEC 61406-1.

You can use the ID link to access product data, manuals, Declarations of Conformity, certificates and other information about your product.

Figure 1-280 QR code with ID link included

The ID link is characterized by a frame with a black corner at the bottom right.

Content of Siemens Online Support

1.4.3 Spare parts services

The online spare part service "Spares on Web (https://www.sow.siemens.com)" offers spare parts for the product.

1.5 Important product information

1.5.1 Intended use

This equipment is used for the open-loop and closed-loop control of EC motors for safety extra-low voltages up to 48 V DC.

⚠ WARNING

Hazardous Voltage
Can Cause Death, Serious Injury, or Property Damage.
Intended use of hardware products
This equipment is only allowed to be used for the applications described in the catalog and in the technical description, and only in conjunction with non-Siemens equipment and components recommended by Siemens.
Correct transport, storage, installation and assembly, as well as careful operation and maintenance, are required to ensure that the product operates safely and without faults.
EU note: Start-up/commissioning is absolutely prohibited until it has been ensured that the machine in which the component described here is to be installed fulfills the regulations/specifications of Directive 2006/42/EC.

1.6 Safety Evaluation Tool (SET)

You can quickly and easily evaluate the safety functions of your machine using the Safety Evaluation Tool (SET) for the IEC 62061 and ISO 13849-1 standards. You receive the results as a standard-compliant report that can be integrated in the machine documentation as proof of safety.

The free Safety Evaluation Tool is available on the Internet (https://new.siemens.com/global/en/products/automation/topic-areas/safety-integrated/factory-automation/support/safety-evaluation-tool.html).

Fundamental safety instructions 2

2.1 General safety instructions

⚠ WARNING

Electric shock and danger to life due to other energy sources
Touching live components can result in death or severe injury.

- Only work on electrical devices when you are qualified for this job.
- Always observe the country-specific safety rules.

Generally, the following steps apply when establishing safety:

1. Prepare for disconnection. Notify all those who will be affected by the procedure.
2. Isolate the drive system from the power supply and take measures to prevent it being switched back on again.
3. Wait until the discharge time specified on the warning labels has elapsed.
4. Check that there is no voltage between any of the power connections, and between any of the power connections and the protective conductor connection.
5. Check whether the existing auxiliary supply circuits are de-energized.
6. Ensure that the motors cannot move.
7. Identify all other dangerous energy sources, e.g. compressed air, hydraulic systems, or water. Switch the energy sources to a safe state.
8. Check that the correct drive system is completely locked.

After you have completed the work, restore the operational readiness in the inverse sequence.

⚠ WARNING

Risk of electric shock and fire from supply networks with an excessively high impedance
Excessively low short-circuit currents can lead to the protective devices not tripping or tripping too late, and thus causing electric shock or a fire.

- In the case of a conductor-conductor or conductor-ground short-circuit, ensure that the short-circuit current at the point where the converter is connected to the line supply at least meets the minimum requirements for the response of the protective device used.
- You must use an additional residual-current device (RCD) if a conductor-ground short circuit does not reach the short-circuit current required for the protective device to respond. The required short-circuit current can be too low, especially for TT supply systems.

⚠ WARNING

Risk of electric shock and fire from supply networks with an excessively low impedance
Excessively high short-circuit currents can lead to the protective devices not being able to interrupt these short-circuit currents and being destroyed, and thus causing electric shock or a fire.

- Ensure that the prospective short-circuit current at the line terminal of the converter does not exceed the breaking capacity (SCCR or Icc) of the protective device used.

⚠ WARNING

Electric shock if there is no ground connection
For missing or incorrectly implemented protective conductor connection for devices with protection class I, high voltages can be present at open, exposed parts, which when touched, can result in death or severe injury.

- Ground the device in compliance with the applicable regulations.

⚠ WARNING

Electric shock due to connection to an unsuitable power supply
When equipment is connected to an unsuitable power supply, exposed components may carry a hazardous voltage. Contact with hazardous voltage can result in severe injury or death.

- Only use power supplies that provide SELV (Safety Extra Low Voltage) or PELV- (Protective Extra Low Voltage) output voltages for all connections and terminals of the electronics modules.

⚠ WARNING

Electric shock due to equipment damage
Improper handling may cause damage to equipment. For damaged devices, hazardous voltages can be present at the enclosure or at exposed components; if touched, this can result in death or severe injury.

- Ensure compliance with the limit values specified in the technical data during transport, storage and operation.
- Do not use any damaged devices.

⚠ WARNING

Electric shock due to unconnected cable shield
Hazardous touch voltages can occur through capacitive cross-coupling due to unconnected cable shields.

- As a minimum, connect cable shields and the conductors of power cables that are not used (e.g. brake cores) at one end at the grounded housing potential.

⚠ WARNING

Arcing when a plug connection is opened during operation
Opening a plug connection when a system is in operation can result in arcing that may cause serious injury or death.

- Only open plug connections when the equipment is in a voltage-free state, unless it has been explicitly stated that they can be opened in operation.

NOTICE

Material damage caused by an incorrect power connection
An incorrect power connection can result in damage due to fire, device defects or malfunctions.

- Check all power connections at regular intervals, particularly after equipment has been transported.

⚠ WARNING

Electromagnetic interference due to inadequate shield support
A lack of adequate shield support for the power cables can cause malfunctions and impermissibly high levels of interference.

- Use the shield connection plates supplied or recommended.
- Use the shield connection clips recommended.

⚠ WARNING

Active implant malfunctions due to electromagnetic fields
Converters generate electromagnetic fields (EMF) in operation. Electromagnetic fields may interfere with active implants, e.g. pacemakers. People with active implants in the immediate vicinity of an converter are at risk.

- As the operator of an EMF-emitting installation, assess the individual risks of persons with active implants.
- Observe the data on EMF emission provided in the product documentation.

⚠ CAUTION

Symptomatic respiratory and skin reaction to chemicals
A newly purchased product might contain traces of substances that are identified as sensitizers.
Sensitizers are substances which can cause sensitization in the lungs and skin after exposure to them.
Once sensitized, individuals can have severe reactions to further exposure, even in small amounts. In the most extreme cases, individuals might develop asthma or dermatitis respectively.

- If the product has a strong smell, keep it in a well-ventilated area for 14 days.

⚠ WARNING

Unexpected machine movement caused by radio devices or cellphones
Using radio devices, cellphones, or mobile WLAN devices in the immediate vicinity of the components can result in equipment malfunction or faults and damage to the devices. Malfunctions may impair the functional safety of machines and can therefore put people in danger or lead to property damage.

- Avoid operating radio devices, cellphones and mobile WLAN devices in the direct vicinity of converters and operating units.
- Scan the machine readable code, e.g. a QR code, from a greater distance or switch off the converter power supply before scanning.
- Only operate built-in devices with the control cabinet doors closed.
- When control cabinet doors are open, only qualified electrical personnel are allowed to carry out service and maintenance work.

⚠ CAUTION

Radio frequency interference in residential areas
When you operate EMC category C2 devices in residential areas, the devices can cause radio frequency interference.
When you operate EMC category C3 or C4 devices in residential areas, it is to be expected that the devices will cause radio frequency interference.

- Do not operate EMC category C2 devices in residential areas.
- Do not operate EMC category C3 or C4 devices in public low-voltage networks supplying residential buildings.

NOTE

It cannot be guaranteed that EMC emission limits are complied with if the products are connected to an isolated line supply, a line supply grounded through a high ohmic connection or a line supply with a grounded line conductor.

- Draw-up an EMC plan to comply with the EMC requirements of the planned application.

⚠ WARNING

Fire due to inadequate ventilation clearances
Inadequate ventilation clearances can cause overheating of components with subsequent fire and smoke. This can cause severe injury or even death. This can also result in increased downtime and reduced service lives for devices/systems.

- Ensure compliance with the specified minimum clearance as ventilation clearance for the respective component.

NOTICE

Overheating due to inadmissible mounting position
The device may overheat and therefore be damaged if mounted in an inadmissible position.

- Only operate the device in admissible mounting positions.

NOTICE

Device damage caused by incorrect insulation resistance tests
High test voltages can damage the device.

- Measure the insulation resistance of low voltage circuits of machines or systems only with ≤ 500 V DC.
- Measure the insulation resistance of SELV circuits of machines or systems only with ≤ 250 V DC.

NOTICE

Device damage caused by incorrect voltage tests
High test voltages can damage the device. Capacitive leakage currents can distort the test results.

- Disconnect the components before carrying out a voltage test on the machine. [1)]

[1)] The components are voltage tested in accordance with the IEC 61800-5-1 product standard and must be disconnected during testing in accordance with IEC 60204-1:2021 Section 18.4.

⚠ WARNING

Unexpected movement of machines caused by inactive safety functions
Inactive or non-adapted safety functions can trigger unexpected machine movements that may result in serious injury or death.

- Observe the information in the appropriate product documentation before commissioning.
- Carry out a safety inspection for functions relevant to safety on the entire system, including all safety-related components.
- Ensure that the safety functions used in your drives and automation tasks are adjusted and activated through appropriate parameterizing.
- Perform a function test.
- Only put your plant into live operation once you have guaranteed that the functions relevant to safety are running correctly.

⚠ WARNING

Malfunctions of the machine as a result of incorrect or changed parameter settings
As a result of incorrect or changed parameterization, machines can malfunction, which in turn can lead to injuries or death.

- Protect the parameterization against unauthorized access.
- Handle possible malfunctions by taking suitable measures, e.g. emergency stop or emergency off.

2.2 Equipment damage due to electric fields or electrostatic discharge

Electrostatic sensitive devices (ESD) are individual components, integrated circuits, modules or devices that may be damaged by either electric fields or electrostatic discharge.

NOTICE

Equipment damage due to electric fields or electrostatic discharge
Electric fields or electrostatic discharge can cause malfunctions through damaged individual components, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber of aluminum foil.
- Only touch components, modules and devices when you are grounded by one of the following methods:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

2.3 Warranty and liability for application examples

Application examples are not binding and do not claim to be complete regarding configuration, equipment, or any eventuality which may arise. Application examples do not represent customer-specific solutions, but merely serve to provide assistance with typical tasks.

As the user you yourself are responsible for ensuring that the products described are operated correctly. Application examples do not relieve you of your responsibility for safe handling when using, installing, operating and maintaining the equipment.

2.4 Cybersecurity information

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial cybersecurity measures that may be implemented, please visit
https://www.siemens.com/cybersecurity-industry.

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Cybersecurity RSS Feed under
https://new.siemens.com/cert.

Further information is provided on the Internet:
Configuration Manual Industrial Cybersecurity
(https://support.industry.siemens.com/cs/ww/en/view/109975311)

⚠ WARNING

Unsafe operating states resulting from software manipulation
Software manipulations, e.g. viruses, Trojans, or worms, can cause unsafe operating states in your system that may lead to death, serious injury, and property damage.

- Keep the software up to date.
- Incorporate the automation and drive components into a state-of-the-art, integrated industrial cybersecurity concept for the installation or machine.
- Make sure that you include all installed products in the integrated industrial cybersecurity concept.
- Protect files stored on exchangeable storage media from malicious software by with suitable protection measures, e.g. virus scanners.
- Carefully check all cybersecurity-related settings once commissioning has been completed.

2.5 Residual risks of power drive systems

When assessing the machine or system-related risk in accordance with the respective local regulations (e.g. EC Machinery Directive), the machine manufacturer or system integrator must take into account the following residual risks emanating from the control and drive components of a drive system:

1. Unintentional movements of driven machine or system components during commissioning, operation, maintenance, and repairs caused by, for example,
   - Hardware faults and/or software errors in the sensors, control system, actuators, and connections
   - Response times of the control system and of the drive
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - Parameterization, programming, cabling, and installation errors
   - Use of wireless devices/mobile phones in the immediate vicinity of electronic components
   - External influences/damage
   - X-ray, ionizing radiation and cosmic radiation
2. Unusually high temperatures inside and outside the components, including open flames, as well as emissions of light, noise, particles, gases, etc. due to fault conditions, e.g.:
   - Component failure
   - Software errors
   - Operation and/or environmental conditions outside the specification
   - External influences/damage
   - Short circuits or ground faults in the intermediate DC circuit of the converter

3. Hazardous shock voltages caused by, for example:
   - Component failure
   - Influence during electrostatic charging
   - Induction of voltages in moving motors
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - External influences/damage
4. Electrical, magnetic and electromagnetic fields generated in operation that can pose a risk to people with a pacemaker, implants or metal replacement joints, etc., if they are too close
5. Release of environmental pollutants or emissions as a result of improper operation of the system and/or failure to dispose of components safely and correctly
6. Influence of network-connected and wireless communications systems, e.g. ripple-control transmitters or data communication via the network or mobile radio, WLAN or Bluetooth.
7. Motors for use in potentially explosive areas:

   When moving components such as bearings become worn, this can cause enclosure components to exhibit unexpectedly high temperatures during operation, creating a hazard in areas with a potentially explosive atmosphere.

For more information about the residual risks of the drive system components, see the relevant sections in the technical user documentation.

Product overview

3

3.1 Area of application

Broad range of control applications

The SIMATIC ET 200SP distributed I/O system offers the necessary flexibility and performance for a wide range of control applications.

The F-TM ServoDrive ST is a product from the TM Drive range of modules in the ET 200SP network. The term TM Drive is synonymous with the F-TM ServoDrive ST in this manual.

The F-TM ServoDrive ST technology module offers you the following application possibilities:

- Variable speed control
- Positioning tasks in combination with higher-level controller
- In the area of safety extra-low voltage ≤ 60 V DC with integrated hardware Safety function Safe Torque Off (STO)

Areas of application

The F-TM ServoDrive has proven to be an ideal and compact drive in many applications.

Examples of applications:

- Packaging machines
- Automatic assembly machines
- Electronics and battery production
- Printing and labeling machines
- Winders/unwinders, e.g. in the textile, packing and printing and solar industries
- Driving of shuttles for storage and retrieval machines and storage rack systems
- Automated guided vehicle systems
- Battery-powered applications

⑥	LED for supply voltage		
⑦	LED for power		

Figure 1-282 View of the F-TM ServoDrive module

Properties

The F-TM ServoDrive has the following properties:

- Operation on ET 200SP PROFINET IMs as of V4.0
- Operation on CPU 151x as of V2.0, S7-1200, OpenController and CPU 151xSP
- Speed-controlled single-axis drive with PROFIdrive profile
- Rated voltage of the drive module: 24 to 48 V DC (safety extra-low voltage)
- Support of IQ encoder technology
- Support of incremental encoders with (A, B, Z track)
- 24 V digital input
- Support of individually configurable motors (permanent-magnet synchronous motors (PMSM))
- Controller parameter determination possible using HSP
- Thermal monitoring of the motor and the power end stage
- Braking chopper, external braking resistor
- Cyclic overload capability
- Safety function STO hardwired
- Motor holding brake external via the process image
- Integrated engineering in STEP 7 (TIA Portal) via Hardware Support Package HSP0311 as of V16

Accessories

The following accessories that are not included in the module's scope of delivery can be used with the module:

Designation	Article number
Feed BaseUnit (light)*	6ES7193-6BP00-0DU0
Expansion BaseUnit (dark)*	6ES7193-6BP00-0BU0
MCB, B, 6 A	5SY6106-6
MCB, B, 10 A	5SY6110-6
MCB, B, 6 A for UL markets	5SJ4106-6HG40
MCB, B, 10 A for UL markets	5SJ4110-6HG40
Shield connection	6ES7193-6SC00-1AM0

* A BaseUnit of the type U0 (6ES7193-6BP00-0DU0 or 6ES7193-6BP00-0BU0) is needed for operation of the TM Drive. You can find an overview of the BaseUnits that you can use with the technology module in the Equipment Manual SIMATIC ET 200SP BaseUnits (https://support.industry.siemens.com/cs/ww/en/view/109751716).

For additional information on accessories such as:

- Labeling strips
- Color-coded labels
- Reference identification labels

refer to the System Manual SIMATIC ET200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293).

NOTE

Unsuitable electronic fuses

Electronic fuses that disconnect the output voltage briefly in case of an overload and are not capable of power feedback (e.g. SITOP SEL1200) are not suitable for fuse protection.

3.3 Supported functions

System functions

F-TM ServoDrive supports the following PROFINET IO functions:

- Firmware update via PROFINET IO

F-TM ServoDrive supports the function:

- Identification data I&M 0 to 3

PROFIdrive communication types

The TM Drive supports the following communication types:

- Cyclic data exchange via a cyclic data channel

  Motion control systems require cyclically updated data during operation for open-loop and closed-loop control. This data must be sent as setpoints to the drive devices or read as actual values from the drive devices via the communication system. The transfer of this data is normally time-critical.
- Acyclic data exchange via an acyclic data channel

  An acyclic parameter channel for exchange of parameters between the CPU or supervisor and the drive devices is additionally available. Access to this data is not time-critical.
- Alarm channel

  Alarms are output event-triggered and indicate incoming and outgoing error states.

PROFIdrive application classes

The TM Drive supports Application Classes 1 and 4 of the PROFIdrive profile as of V4.2.

- Class 1 (AC1)

  The drive is controlled via a speed setpoint using PROFINET.

  The closed-loop speed control takes place entirely in the drive.

  Typical applications are, for example, simple frequency converters for pump and fan control.

- Class 4 (AC4)

  This PROFIdrive application class defines a speed setpoint interface with the closed-loop speed control taking place in the drive and the closed-loop position control taking place in the CPU, as is required for robot and machine tool applications with coordinated motion sequences on multiple drives.

Wiring

4

4.1 Pin assignment

Specific application

Observe the safety and accident prevention regulations applicable for specific applications, e.g. "Safety of Machinery EN ISO 13849-1".

During wiring and maintenance work, the TM Drive must be disconnected from the power supply.

EMERGENCY OFF equipment

EMERGENCY OFF devices according to IEC 60204 (corresponds to DIN VDE 0113) must remain in effect in all operating modes of the plant or system.

The drive-integrated safety function STO of the TM Drive does not replace the EMERGENCY OFF mechanism of the plant.

Excluding hazardous plant states

Hazardous operating states must not occur when

- The plant restarts up after a voltage dip or voltage failure
- Bus communication resumes after a fault

If necessary, the EMERGENCY OFF must be forced!

An uncontrolled or undefined startup must not occur after the EMERGENCY OFF is unlocked.

You can find a description on how to prevent uncontrolled startup in the section Safety Integrated functions (Page 43).

Potential group

Up to a continuous input current of max. 10 A for each potential group, up to 3 TM Drives can be connected together to form a drive line-up.

No other ET 200SP components may be located within a potential group consisting of one or more TM Drive.

A TM Drive potential group can be supplied as follows:

- With a separate power supply unit
- With a common power supply that also supplies other components. In this case, use a DC line filter (e.g. TDK Electronics 2-wire filter B84113C series) before the TM Drive potential group.

- If you are using a power supply unit with a rated current of more than 10 A or batteries/rechargeable batteries, it is imperative to connect a circuit breaker of characteristic B with max. 10 A rated current, approved for direct current and the corresponding SELV / PELV voltage, upstream of the TM Drive potential group. For a potential group with only one TM Drive, we recommend using an appropriate miniature circuit breaker with 6 A nominal current and characteristic B.
- You must not use voltage sources with low impedance such as supercaps without adequate current-limiting protective measures.

Short circuits

The power outputs of the TM Drive are short-circuit proof. If the module detects a short-circuit, it is still imperative to rectify the fault before switching it on again. Otherwise, the module can be damaged.

Disturbance of radio communication services due to radio-frequency interferences in residential environments

The TM Drive can cause radio frequency interference which requires measures for interference suppression. This system is not designed for liberal use in the first environment (residential area) and must not be used there without appropriate radio interference suppression measures. Have the installation and commissioning performed with appropriate radio interference suppression measures by experts.

Protection from external electrical effects

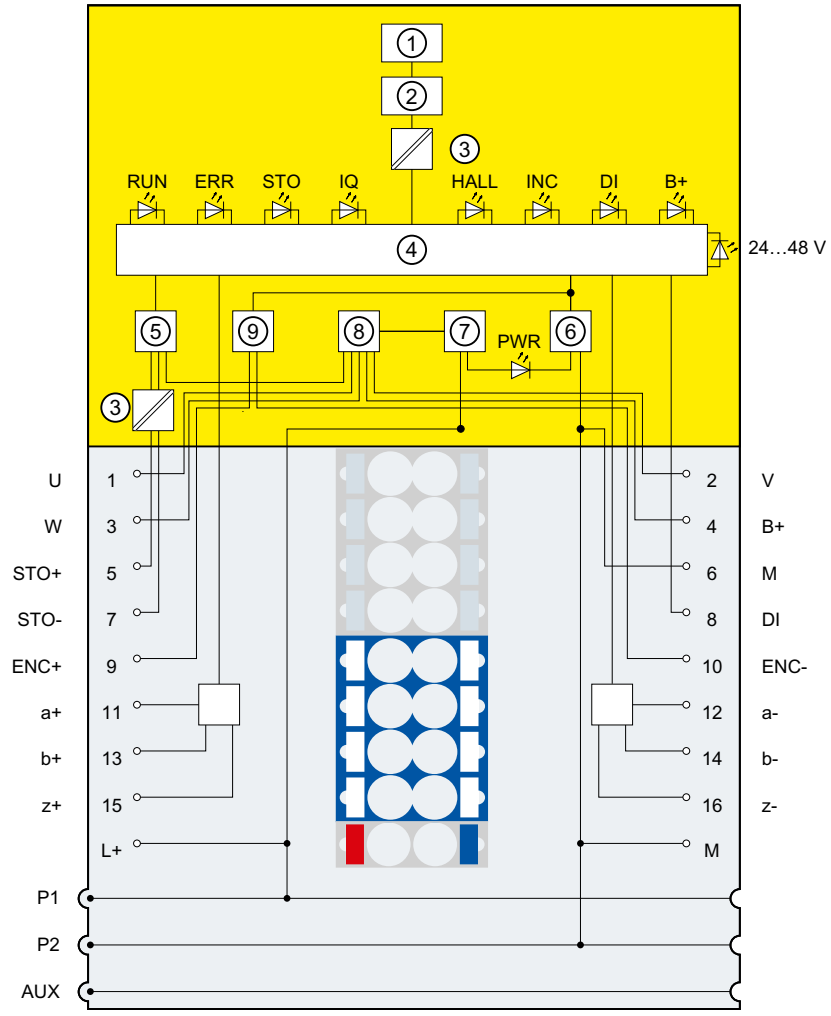
You can find information on interference-proof design in the function manual Designing interference-free controllers
(https://support.industry.siemens.com/cs/ww/en/view/59193566).

Overload

The TM Drive is overload-capable. The load of the power end stage is automatically limited by the drive.

With automatic overload limiting, the output current is automatically reduced on reaching the rated load of the power end stage to effectively prevent an overload of the power unit.

SCCR (short circuit current rating)



Suitable For Use On A Circuit Capable Of Delivering Not More Than 5kA DC Symmetrical Amperes, 48 Volts DC Maximum.

4.2 Block diagram

⚠ WARNING

Fuse for the load circuit
In general, use a suitable overcurrent protection device to protect the F-TM ServoDrive.

Cable lengths and cable types

If you do not use an "all-in-one" plug-in cable, the following cable lengths and cable types are permitted for the interfaces:

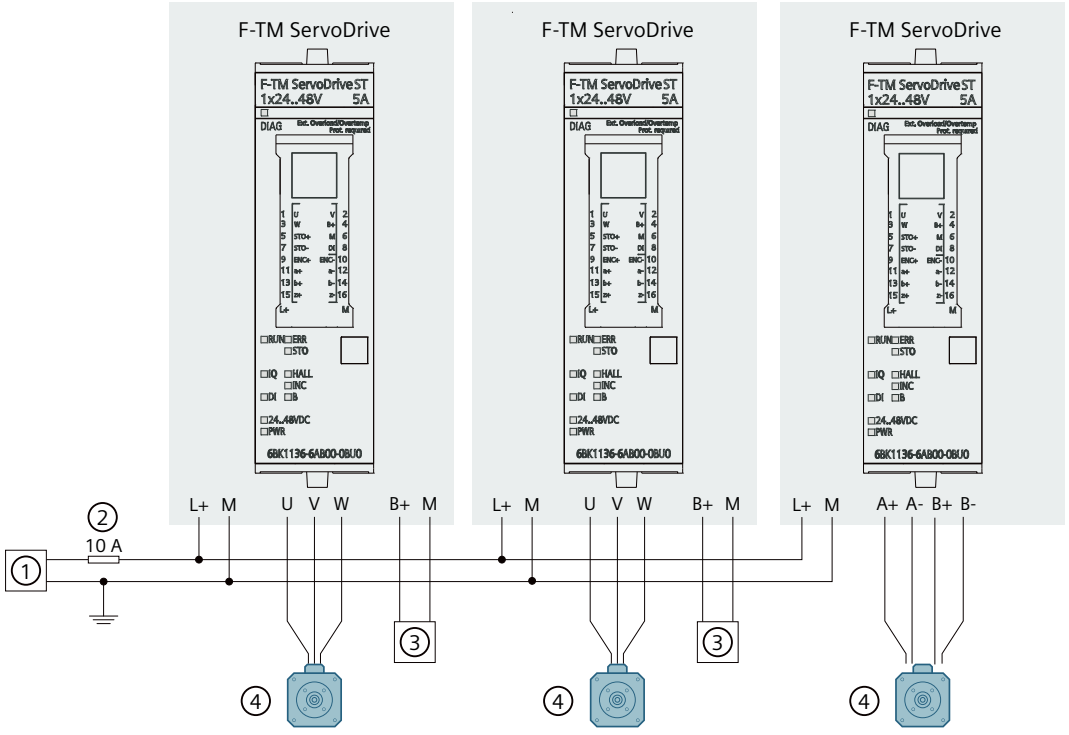
Table 1-596 Wiring rules for the interfaces

Connector	Function	Maximum cable length	Cable type
ENC+/ENC-	Incremental encoder signals and supply	10 m	Shielded For differential wiring, one twisted pair per signal pair
U/V/W	Motor phases	10 m	Shielded
DI, M	Input	10 m	≥ 2 m shielded
	Ground	10 m	-
L+/M	Power supply, power unit	10 m	-
B+	Connection of external braking resistor	2 m	≥ 0.5 m shielded
a, b, z	Encoder connectors	10 m	Shielded For differential wiring, one twisted pair per signal pair
STO	Safe Torque Off	10 m	-

* American Wire Gauge

CABLE SPEC.	Note that connected mains lines must be designed according to the expected minimum and maximum ambient temperature.

NOTE



In addition to the shield connection on the ET 200SP, the cable shield must also be grounded with a suitable fastening, for example, with a metal clip on the control cabinet rear panel. The cable shield must be applied on the motor/encoder side.

4.3 Wiring of multiple F-TM ServoDrive

In a potential group

You can connect multiple TM Drives to form a potential group (drive line-up). The following figure shows you the TM Drive with different motors.

Wiring of multiple TM Drives to form a drive line-up

① Power supply unit
② Protective device
③ Braking resistor
④ Motor

Figure 1-284 Wiring of multiple TM Drives to form a drive line-up

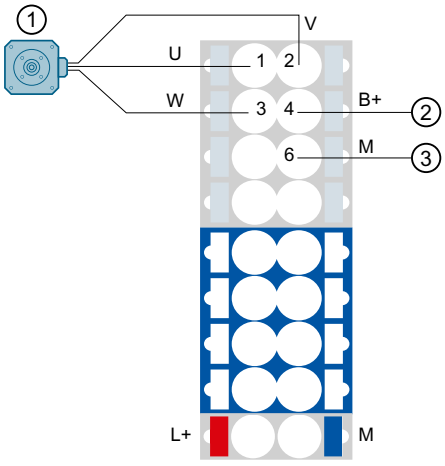
Pin assignment (Page 28)



4.4 Connecting the motor

Overview

The F-TM ServoDrive supports permanent-magnet synchronous motors (PMSM).

Connecting the motor phases (PMSM)

The following figure shows the connection of the motor phases to the BaseUnit:

①	PMSM	②	Braking resistor
U, V, W	Motor phases	③	Negative connection for braking resistor

Figure 1-285 Connecting the motor

NOTE
In addition to the shield connection on the ET 200SP, the cable shield must also be grounded with a suitable fastening, for example, with a metal clip on the control cabinet rear panel. The cable shield must be applied on the motor side.

Pin assignment

Pin	Designation	Function
1	U	Motor phase U
2	V	Motor phase V
3	W	Motor phase W
4	B+	Braking resistor
6	M	Negative connection, e.g. for braking resistor

4.5 Connecting an encoder

4.5.1 Connecting an incremental encoders

You can connect motors with a 3-channel incremental encoder to the TM Drive. The A and B tracks and a reference track Z are required for evaluation. You connect all signals as "single-ended" or "differential".

The following figure shows the connection of an incremental encoder to the BaseUnit.

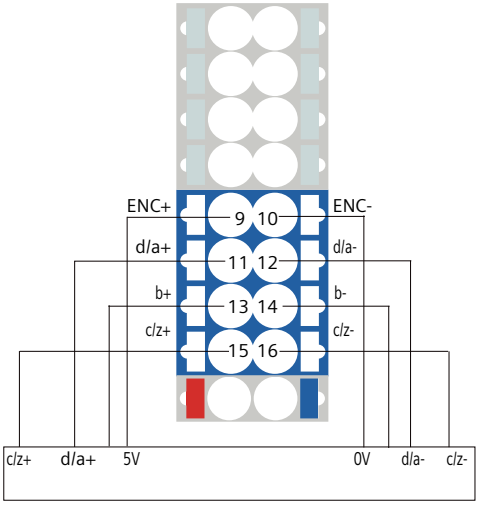


Figure 1-286 Connection of incremental encoder with differential signals

Pin assignment of incremental encoder

Pin	Designation	Function
9	ENC+	Power supply encoder 5 V
10	ENC-	Power supply encoder, negative connection
11	a+	Differential encoder signal a+
12	a-	Differential encoder signal a-
13	b+	Differential encoder signal b+
14	b-	Differential encoder signal b-
15	z+	Differential encoder signal z+
16	z-	Differential encoder signal z-

Table 1-597 Power supply and signal processing conditions of the incremental encoder

Encoder property	Range/Value
TTL bipolar 5 V or differential	High 2 V .. 5.5 V
	Low -5.5 V ... -2 V
TTL unipolar 5 V	High 4 V .. 5.5 V
	Low 0 V .. 1 V
Encoder supply voltage	5 V ... 5.3 V

*The quadrature interface results in a maximum step resolution of 2000 kHz.

Encoder property	Range/Value
Maximum current consumption of the encoder	150 mA
Encoder output	Push Pull
Maximum signal frequency that can be processed (per signal A and B)*	500 kHz

*The quadrature interface results in a maximum step resolution of 2000 kHz.

NOTE

In addition to the shield connection on the ET 200SP, the cable shield must also be grounded with a suitable fastening, for example, with a metal clip on the control cabinet rear panel. The cable shield must be applied on the encoder side.

4.5.2 Connecting IQ-Encoders

Motors from the SIMATIC MICRO-DRIVE Product Partner Program have an IQ encoder.
The following figure shows the connection of IQ encoders to the BaseUnit.

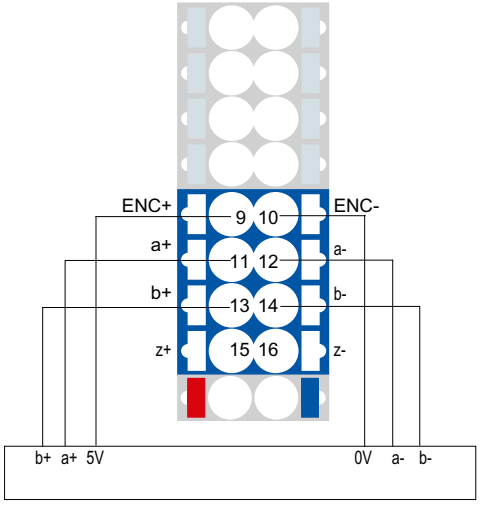

Figure 1-287 IQ encoder connection with differential signals

Pin assignment of IQ encoder

Pin	Designation	Function
9	ENC+	Power supply encoder 5 V
10	ENC-	Power supply encoder, negative connection
11	a+	Differential encoder signal a+
12	a-	Differential encoder signal a-
13	b+	Differential encoder signal b+
14	b-	Differential encoder signal b-
15	z+	-
16	z-	-

Specifying the encoder interface

You connect the IQ encoder to the incremental encoder inputs like a two-channel standard incremental encoder. The polar wheel angle information is also transmitted via the interface (see Technical specifications (Page 133)).

NOTE

In addition to the shield connection on the ET 200SP, the cable shield must also be grounded with a suitable fastening, for example, with a metal clip on the control cabinet rear panel. The cable shield must be applied on the encoder side.

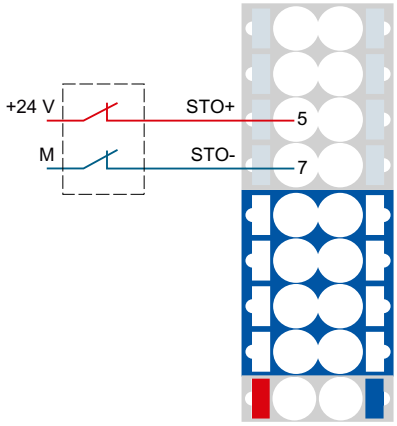
4.5.3 Connecting safe torque off (Hardware STO)

Safe Torque Off (STO)

The safety function Hardware STO is activated via an exclusive safe input (STO+ and STO-). The TM Drive safely switches off the control of the motor. As long as Hardware STO is active, the motor does not generate any torque.

The safe state "Safe Torque Off" corresponds to the de-energized state at STO+/STO- (closed-circuit current principle).

The Hardware STO function meets the specification of a digital input according to EN 61131-2 Type 1 without limitation. In addition, this input has an increased leakage current resistance of 5 mA. That is, at leakage currents below 5 mA, the safe state is always selected.



⚠ WARNING

Danger to life due to coasting down of the drive with STO

The Category 0 stop function according to EN 60204-1 (STO according to Safety Integrated) means that the drives are not braked but instead coast down for an amount of time corresponding to the kinetic energy.

- You must take this behavior into account, for example, in the logic for the protective door interlock.

Wiring the Hardware STO

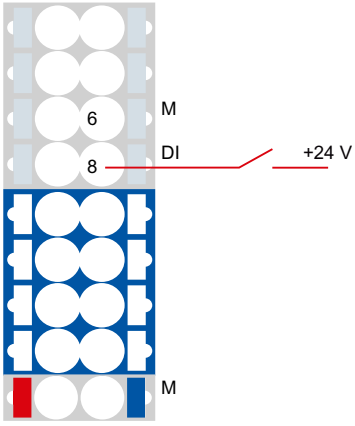
STO+ STO input 24 V
STO- STO input, negative connection

Figure 1-288 Connection of Hardware STO

NOTE
Use different voltage supplies for the STO inputs and for the power supply.

Table 1-598 Pin assignment

Pin	Designation	Function
5	STO+	STO input 24 V
7	STO-	STO input, negative connection



Route the hardware STO (STO+/STO-) cables separately from other cables, especially power cables.

Minimize the risk of crushing and short-circuits in ground connections by using appropriate routing.

Exclude premature aging of the cables due to continuous UV radiation.

4.5.4 Connecting the 24 V digital input

Connecting a 24 V digital input

DI 24 V digital input
M Ground

Figure 1-289 24 V digital input connection

Table 1-599 Pin assignment

Pin	Designation	Function
6	M	Ground, internally connected to ground of 24 - 48 V power supply
8	DI	24 V digital input

4.6 Connecting an external braking resistor

External braking resistor

To ensure high dynamics of the drive due to fast acceleration and braking ramps, you need to connect a braking resistor to the TM Drive.

Recommendation: Use a braking resistor for power supplies with low intrinsic capacitance or an unregulated six-pulse bridge circuit (B6U).

A connected external braking resistor must be activated in the configuration software.

⚠ CAUTION

Risk of burns due to high surface temperature of the braking resistor

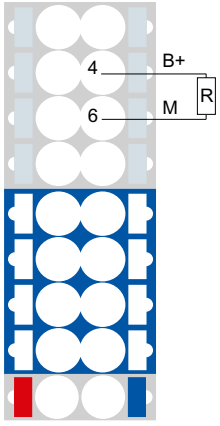
The braking resistor can become very hot. Touching the surface can cause severe burns.

- Mount the braking resistor so that it cannot be touched. In situations in which this is not possible, attach a clearly visible and understandable warning notice in areas at risk.

Wiring a non-Siemens external braking resistor

WARNING

Damage to braking resistor – Risk of fire!
If you use a non-Siemens external braking resistor, connect an overtemperature detection device to a digital input (e.g. a bimetallic switch that opens when the temperature is too high).
Implement fire prevention measures for the external braking resistor (e.g. fire protection housing, temperature fuse). The resistance of the externally connectable braking resistor must be ≥ 5 ohms.
Design the required power as a function of the braking energy to be converted.



Connection for external braking resistor

Table 1-600 Connection of external braking resistor

Function	Maximum cable length	Cable type	Cable cross-section
Connection of external braking resistor	2 m	≥ 0.5 m shielded	Solid and stranded supply cable: AWG: 18 to 14 or 1.0 mm^2 to 2.5 mm^2

Wiring an external braking resistor

The figure below shows the connection of an external braking resistor as an example:

B+ Positive terminal of braking resistor
M Negative terminal of braking resistor

Figure 1-290 Connection of external braking resistor

Pin assignment

Table 1-601 Pin assignment: Wiring an external braking resistor

Pin	Designation	Function
4	B+	Connection of external braking resistor
6	M	

External braking resistor for potential group with multiple TM Drives

If you have connected multiple TM Drives to form a potential group, it may be sufficient to equip only one module with an external braking resistor.

Safety functions integrated in the drive

5

5.1 Basic safety information

5.1.1 General safety information

⚠ WARNING

Danger to life if the safety instructions and residual risks are not taken into consideration

The non-observance of the safety instructions and residual risks stated in the associated F-TM ServoDrive documentation can result in accidents causing severe injuries or death.

- Observe the safety instructions given in the F-TM ServoDrive documentation.
- Consider the residual risks for the risk evaluation.

⚠ WARNING

Malfunctions of the machine as a result of incorrect or changed parameter settings

As a result of incorrect or changed parameter settings, machines can malfunction, which in turn can lead to injuries or death.

- Protect the parameter assignment against unauthorized access.
- Respond to possible malfunctions by implementing suitable measures (e.g. EMERGENCY STOP or EMERGENCY OFF).

⚠ WARNING

Validity of safety features

The safety features of the product are guaranteed only for intended use within the intended ambient conditions (see section Technical specifications (Page 133)).

The safety features only apply when operating with a BaseUnit of the U0 type (6ES7193-6BP00-0DU0 or 6ES7193-6BP00-0BU0).

5.1.2 Warranty and liability for application examples

Application examples are non-binding and do not claim to be complete regarding configuration and equipment as well as all eventualities. Application examples do not represent customer-specific solutions. They are only intended to provide support for typical tasks.

As user, you are responsible for ensuring that the products described are used correctly. Application examples do not relieve you of the responsibility to use safe practices in application, installation, operation and maintenance.

5.1.3 Fundamental safety instructions for Safety Integrated

Additional safety instructions and residual risks are provided outside of this section at the relevant points of this system manual.

⚠ DANGER

Risk minimization through Safety Integrated

Safety Integrated can be used to minimize the risk associated with machines and plants. However, safe operation of the machine or system with Safety Integrated is only possible if the machine manufacturer:

- Knows and complies with this technical user documentation, including the documented constraints, safety instructions and residual risks
- Carefully constructs and configures the machine/plant and verifies it through a carefully implemented and documented acceptance test by qualified personnel
- Implements and validates all the measures required in accordance with the system/machine risk analysis by means of the programmed and configured Safety Integrated functions or by other means

The use of Safety Integrated does not replace the machine/plant risk assessment carried out by the machine manufacturer as required by the CE Machinery Directive.
In addition to using Safety Integrated functions, further risk reduction measures must be implemented.

⚠ WARNING

Danger to life as a result of undesirable motor movement when automatically restarting

An emergency stop must be performed according to Stop Category 0 (STO) (EN 60204-1). The emergency stop must be ensured by external measures.
It is not permissible that the motor automatically restarts after an Emergency Stop, as this represents danger to life as a result of the associated undesirable motor motion.
If individual safety functions are deactivated, an automatic restart is permitted under certain circumstances depending on the risk analysis (except when Emergency Stop is reset). An automatic start is possible when a protective door is closed, for example.

- Ensure that no automatic restart takes place in the indicated cases.

⚠ WARNING

Danger to life as a result of undesirable motor motion when the system powers up and the drives are activated after hardware and/or software is changed or replaced

After hardware and/or software components have been modified or replaced, or after drive parameters are changed or parameter backups are loaded, it is only permissible for the system to run up and the drives to be activated with the protective devices closed. Personnel shall not be present within the danger zone during this time.

- It may be necessary to carry out a partial or complete acceptance test or a simplified functional test after making certain changes or replacements.
- Before personnel may re-enter the hazardous area, all of the drives should be tested to ensure that they exhibit stable control behavior by briefly moving them in both the plus and minus directions (+/-).

5.1.4 Safety Integrated functions

This section gives you a quick insight into the functioning of the safety functions.

The description of the safety functions starts in each case with the definition in IEC/EN 61800-5-2 and simple examples of the use of the function.

The description of the functions is simplified as far as possible so that the essential properties and setting options are made clear.

Response time

You can find additional information on the response time of the listed safety functions in section Response times (Page 139).

Examples of safety devices and 3 F-TM ServoDrive

NOTE
The supply voltage for the STO inputs must be different from that of the power supply.

The following figure shows various safety devices that are connected to 3 F-TM ServoDrive.

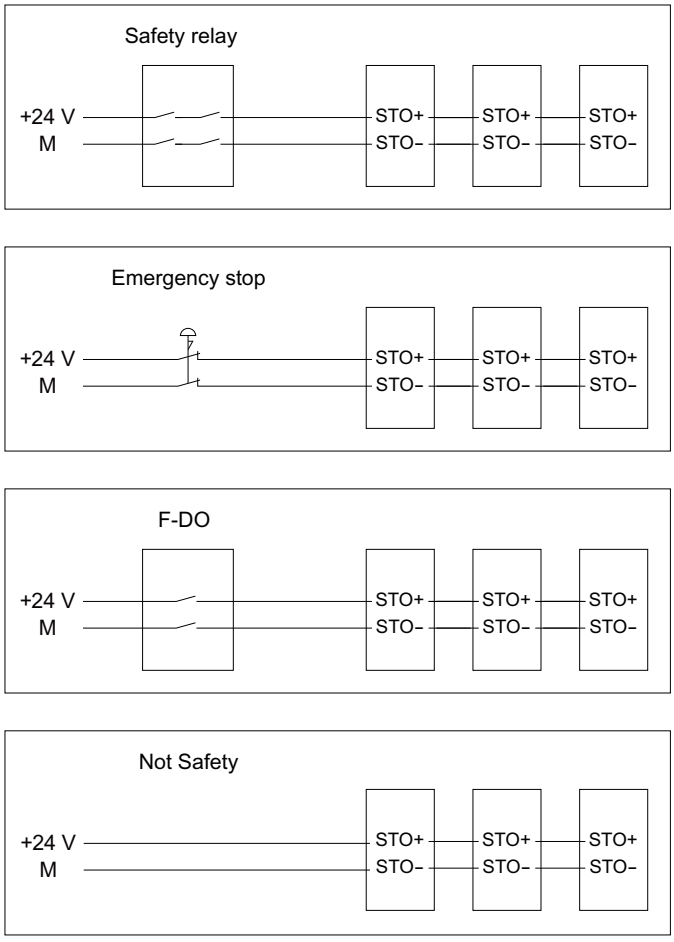


Figure 1-291 Safety devices and 3 F-TM ServoDrive

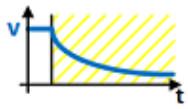

NOTE
The F-TM ServoDrive does not support startup protection.
Measure:
Startup protection via additional safety relay or in higher-level controller, depending on the safety requirements.

Operating voltage range

Operate input STO+ as intended with 19.2 to 28.8 V DC for the active enable or lower 5 V DC for the disable.

Connect the input STO- for enabling or disabling the connection to ground.

5.1.4.1 Safe Torque Off (STO)

Safe Torque Off (STO) is a safety function that directly stops torque- or force-producing energy from being supplied to the motor. This function corresponds to Stop Category 0 according to EN 60204-1.

The F-TM ServoDrive complies with the definition of the STO function in IEC/EN 61800-5-2: "The STO function prevents torque-producing energy from being supplied to the motor."

If the motor is still rotating when STO is selected, the motor will coast to a standstill.

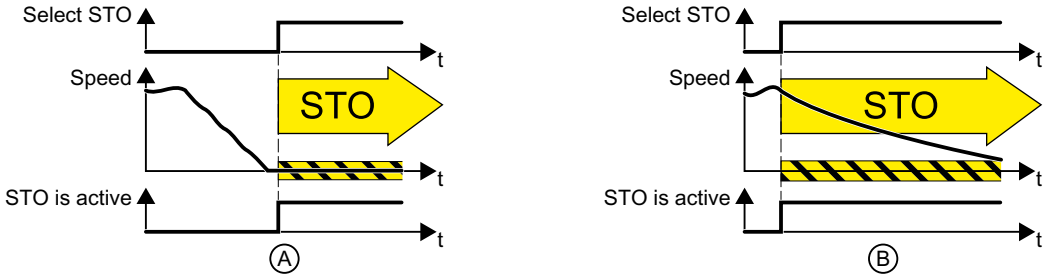

Figure 1-292 Functioning of STO (A) when motor is at stopped and (B) when motor is rotating

Functional characteristics

⚠ WARNING

Danger to life due to coasting down of the drive with STO

The Category 0 stop function according to EN 60204-1 (STO according to Safety Integrated) means that the drives are not braked but instead coast down for an amount of time corresponding to the kinetic energy.

- You must take this behavior into account, for example, in the logic for the protective door interlock.

STO is a drive-specific function and must be wired individually for each drive.

The following applies when the "Safe Torque Off" function is selected:

- An unwanted startup of the motor cannot take place.
- The torque-producing energy supply to the motor is safely interrupted.
- An electrical isolation between the power unit and motor does not occur.

The stop function category 0 (selection of STO according to Safety Integrated) is only active when selected at the STO terminals. In order to meet the requirements of an EMERGENCY STOP in accordance with EN 60204-1, you need to ensure that the STO function at the STO terminals in the system can only be deselected by means of conscious manual operation. This prevents electrically driven machine components from restarting unintentionally.

Selection

The STO safety function is always enabled and cannot be disabled via parameter assignment.

You can select the STO function via the fail-safe digital input at STO+ and STO- terminals. The selection of the STO function is enabled directly as a response to safety messages (e.g. when a defect is detected in a monitoring channel).

Range of application

You can use the STO safety function without restrictions for a PMSM. A special encoder concept suitable for safety is not required.

Applications

Application areas are all machines or systems with moving axes (e.g. conveyor systems, handling systems).

The STO function can be used when the motor is already at a standstill. If the motor is in operation, the STO function causes the drive to coast down.

The STO function enables safe working when the protective door is open. A conventional Emergency Stop with electromechanical unlocking is not required. The converter remains connected to the supply system and has full diagnostics capability.

NOTE

Difference between EMERGENCY OFF and EMERGENCY STOP

EMERGENCY OFF and EMERGENCY STOP are commands that mitigate different risks in the machine or plant. The STO function is suitable for implementing an EMERGENCY STOP, but not an EMERGENCY OFF.

Hardware STO

The F-TM ServoDrive internally monitors the fail-safe digital input at the STO+ and STO- terminals for discrepancies.

Discrepancy monitoring

Due to the design of the Hardware STO circuit, a discrepancy cannot occur at STO+ and STO- terminals. As long as the STO terminal is de-energized, STO is selected. The Hardware STO signal is read in internally via two channels.

To comply with the requirements for timely error detection from EN 61800-5-2, the switch-off signal paths of the end stage in both monitoring channels are also cyclically tested. Errors when testing the shutdown paths trigger STO. A manual forced checking procedure (test stop) for testing the shutdown paths of the F-TM ServoDrive is therefore not needed.

⚠ WARNING

Forced checking procedure

You should nevertheless examine its necessity for diagnosing the utilized sensors or for performing a test stop in the context of the overall system.

5.1.5 Overview of the Safety Integrated functions

Compared to standard drive functions, safety functions have an especially low error rate. Performance Level (PL) and Safety Integrity Level (SIL) of the corresponding standards are a measure of the error rate.

For this reason, safety functions are suitable for use and for risk reduction in safety-related applications. An application is safety-related when the risk analysis of the machine or plant has identified a particular risk potential in the application.

Safety Integrated means that the safety functions are integrated in the drive and can be executed without additional external components.

Conformity of Safety Integrated functions

The Safety Integrated functions comply with:

- Safety Integrity Level (SIL) 2 according to IEC 61508 Part 1-3
- Category 3 according to ISO 13849-1
- Performance Level (PL) d according to ISO 13849-1

The standard IEC 61800-5-2, in which the Safety Integrated functions are defined, applies for the functional safety of variable-speed drives.

Function groups

The safety functions are divided into the following function groups for the F-TM ServoDrive:

- Safety Integrated stop function (hardware STO)

5.1.6 Supported safety functions

The supported safety functions are included in the standard scope of the F-TM ServoDrive and can be used without an additional license.

Stop functions

The stop functions do not pose any special requirements on the utilized encoder and do not need actual value acquisition. The stop functions include the following Safety Integrated functions:

- Safe Torque Off (STO)

  Safe Torque Off is a safety function for prevention of unexpected startup according to EN 60204-1. STO prevents torque-producing energy from being supplied to the motor and corresponds to Stop Category 0.

5.1.7 Examples of using the safety functions

Table 1-602 Examples of using the safety functions

Safety function	Application examples	Possible solution
Safe Torque Off (STO)	It is only permissible to open a protective door if the motor torque has been switched off.	Activate STO in the F-TM ServoDrive via the STO inputs. The pulses are suppressed and the motor coasts to a standstill.
	A central Emergency Stop button ensures that multiple drives cannot start unintentionally.	Evaluate the emergency stop button in a central controller. Use a two-channel connection to the STO inputs on the F-TM ServoDrive.

5.1.8 Safety concept

The safety concept of the drive controller is based on a 2-channel system structure. Each channel has the possibility of bringing about the safe state, and the two channels monitor each other through a corresponding cross-comparison and cyclic diagnostics.

Safe state

The safe state of the system exists when the motor bridge is **de-energized**.

The safe state is reached in the following cases:

- Switch-off or failure of the external power supply to L+/M
- Missing enable signal at STO+ and STO-
- Detection of an internal HW fault

Safe state of Safety Integrated functions

The safe state of the STO input terminal is reached when at least one of the two STO supply terminals is disconnected from the energy supply.

NOTE

The safe state means the absence of torque in the sense of functional safety, but not necessarily the absence of voltage in the sense of electrical safety.

5.2 Acceptance of the safety functions

Responsibilities

The machine manufacturer is responsible for the performance and documentation of the acceptance test. In this section, you will find a recommendation for how to perform and document the acceptance tests for the individual safety functions.

NOTE

The performance and documentation of the acceptance tests are plant-specific and must be adapted appropriately and performed.

5.2.1 General information on acceptance

Why is acceptance required?

The EC Machinery Directive and ISO 13849-1 stipulate:

- You must test safety-relevant functions and machine parts after commissioning.
  See "Acceptance test" below in this section.
  For the F-TM ServoDrive Safety Integrated functions (SI functions), this means:
  The acceptance test is used to check the functionality of the safety functions used in the drive. Correct implementation of the defined safety functions is examined for this.
- You must create an "acceptance report" that describes the test results.
  See "Documentation" further on in this section.

NOTE

Purpose of the acceptance test

The measured values (e.g. speed, time) and the system behavior identified (e.g. initiation of a specific stop) serve to check the plausibility of the configured safety functions. The objective of an acceptance test is to identify potential configuration errors and/or to document the correct function of the configuration. The measured values are typical values (not worst case values). They represent the behavior of the machine at the time of measurement. These measurements cannot serve as the basis for deriving real values (e.g. maximum values for over-travel distances).

Requirements

The requirements for an acceptance test (configuration test) for safety functions of electric drives come from EN 61800-5-2, section 7.1, paragraph f). The acceptance test is called "configuration test" in this standard.

- Description of the application including an image
- Description of the safety-related components (including software versions) that are used in the application
- List of the utilized safety functions of the PDS(SR) [Power Drive System(Safety Related)]
- Results of all tests of these safety functions using the specified test procedure

Necessity of an acceptance test

An acceptance test is required (again) when the Safety Integrated functionality of a machine is commissioned or changed. The acceptance tests must be performed for each individual drive. Safety-related function extensions, transfer of commissioning to other series machines, hardware changes, software upgrades and the like may allow a partial performance test to be performed.

The conditions determining the necessity and recommendations for the test depth required in each case are summarized below.

Requirements for the acceptance test

- The machine is correctly wired.
- All safety equipment (e.g. protective door monitoring devices, light barriers, emergency limit switches) are connected and ready for operation.
- The commissioning of open-loop and closed-loop control must be complete; otherwise, the over-travel distance may be changed due to a changed dynamic response of the drive control, for example. This includes:
  - Settings of the setpoint channel
  - Position control in the higher-level CPU
  - Drive control

Acceptance test

The acceptance test comprises two parts:

- You test whether the safety functions are set correctly in the drive:
  - Does the configured safety function sufficiently reduce the residual risk at the machine/plant?
  - Do the set interfaces, timers and monitoring functions match the configuration of the machine?
- You test whether the safety-relevant functions in the machine or system function correctly.

  This part of the acceptance test goes beyond the acceptance test of the drive:
  - Is all safety equipment, such as protective door monitoring, light barriers and emergency limit switches, connected and ready for operation?
  - Do the drive settings match the configured safety-relevant function in the machine?

Documentation

The documentation consists of the following parts:

- Description of safety-relevant components and functions of the machine or system, including the program versions.
- Report of the acceptance test results.
- Report of the safety function wiring.
- The documentation must be signed off by the person who performed the acceptance test.

Authorized persons

Persons authorized by the **machine manufacturer** who, on account of their technical training and knowledge of the safety-relevant functions, can carry out the acceptance in an appropriate manner are entitled to perform the acceptance.

⚠ WARNING

Unwanted movement due to faulty wiring
Incorrect wiring for Safety Integrated functions can cause unwanted motion resulting in severe injury or death.

- For Safety Integrated functions, always carry out an acceptance test for the affected function after changing the wiring.
- Record the results of the acceptance test in an acceptance report.

⚠ WARNING

Unsafe operating states due to manipulation of the hardware configuration after the acceptance test
Changes to the wiring of the Safety Integrated functions after an acceptance test can cause unwanted motion resulting in severe injury or death.

- To prevent access to your machines and systems by unauthorized persons, implement access restrictions and take the precautions described in the security instructions in the preface.
- To prevent improper wiring of the Safety Integrated functions, take the precautions described in this manual.
- Review the safety change tracking of the drive at regular intervals. Make certain that no changes have been made to the wiring after the last successfully completed acceptance test.
- If intentional changes have been made, repeat the acceptance test for the Safety Integrated functions affected. The purpose of the acceptance test is to ensure and document safe operation of the system. Correct any unintentional changes back to the original values and repeat the acceptance test.

5.2.2 Content of an acceptance test

Documentation

Documentation of the machine including safety functions

- Machine description (with overview image)
- Information on controller (if available)
- Function table:
  - Active monitoring functions depending on operating mode and protective door
  - Additional sensors with protection functions
  - The table is an object or result of the configuration work.
- SI functions for each drive
- Information on the safety equipment

Function test of diagnostic/safety functions

Value-based function check of the SI functions used. You can use trace records of individual parameters, for example, to do this.

- Acceptance test for Safe Torque Off (STO)

Report completion

Reporting of the tested state of commissioning and countersignatures

- Control of the STO function as enable signal of the STO+ and STO- terminals
- Enable to control the motor is removed as soon as a connection (STO+ or STO-) is not connected
- Counter signature

5.2.3 Documentation of acceptance

Machine or system description

Describe your machine or plant using the following table. Insert a diagram of the plant, for example.

Table 1-603 Machine description and overview image

Designation	
Type	
Serial number	
Manufacturer	
End customer	
Overview image of the machine	

Drive data

In the following table, enter information on the drive components used and add additional components as required.

Table 1-604 Hardware components

Component	Designation	Article number	Hardware version	Type
Drive controller				
Motor				
Encoders				
Brake module				
Gearbox				

Utilized Safety Integrated functions

In the following table, describe the use of the Safety Integrated drive functions in relation to your plant or machine.

Table 1-605 Utilized SI functions of the drive

SI function	Status/Description
Safe Torque Off (STO)	

5.2.4 Acceptance test for Safe Torque Off (STO)

Procedure

Test each configured activation of the STO function.

This test consists of the following steps:

Table 1-606 Acceptance test for "Safe Torque Off" (STO) function

No.	Description	Status
1.	**Drive is ready for operation**	
	• No faults	
	• The enable signal is present (STO is deselected).	
2.	**Switch on motor**	

No.	Description		Status
2.	2.1	Set speed setpoint ≠ 0	
	2.2	Switch on motor (ON command)	
	2.3	Check that the intended motor is rotating	
3.	**Select STO**		
	3.1	Selecting STO means interrupting the wire, supplying the STO from STO+ and short-circuiting STO- (if the source is current-limited)	
	3.2	Check the following points:	
		• Motor coasts down to a standstill	
		Message is implemented, but is not safety-relevant	
4.	**Deselect STO**		
	4.1	Deselection of STO (HW STO terminal)	
	4.2	Check the following points:	
		• Enable is active, motor must allow switch-on	

5.2.5 Report completion

SI change tracking (Safety logbook)

Ensure that changes to the safety function (wiring) can be traced.

Countersignatures

Commissioning engineer
Professional execution of the above-stated tests and checks is confirmed.

Table 1-607 Report completion - Countersignature of commissioning engineer

Date	Name	Company/Department	Signature

Machine manufacturer
The correctness of the parameter assignment documented above is confirmed.

Table 1-608 Report completion - Countersignature of machine manufacturer

Date	Name	Company/Department	Signature

5.3 System features

5.3.1 Current information

Important note for maintaining the operational safety of your system:

NOTICE
Operational safety risk from unwanted motions Systems with safety-oriented variants are subject to special operational safety requirements on the part of the operator. If information becomes known in the course of product monitoring indicating insufficient product safety, this information will be disclosed in various ways. For this reason, our website provides information on product developments and features that are (or could be) relevant to operation of systems from a safety perspective.

5.3.2 Certifications

The safety functions of the F-TM ServoDrive drive system meet the following requirements:

- Safety Integrity Level SIL 2 according to IEC 61508 Part 1-3 and IEC 61800-5-2
- Category 3 according to ISO 13849-1
- Performance Level (PL) d according to ISO 13849-1

In addition, the safety functions of the drive are generally certified by independent institutes. A list of the components that are currently already certified in each case is available on request from your Siemens branch.

5.3.3 Failure probability of the safety functions

The probability of failure of safety functions must be specified in the form of a PFH value (Probability of Failure per Hour) according to DIN EN 61800-5-2 and ISO 13849-1. The PFH value of a safety function depends on the safety concept of the drive device, its hardware configuration and the PFH values of the other components used for the safety function. For the F-TM ServoDrive drive system, PFH values are provided as a function of the hardware configuration.

NOTE

PFH values

The PFH value of the integrated safety function STO is 30 FIT (10^{-9}/h) and refers to a service life of 20 years.

The underlying assumption for the calculation is an average operating temperature of 40°C, an average repair time of 8 hours and an average time to recovery of 8 hours. A proof test is not necessary.

5.3.4 Response times

The response time is the time between the detection of an input signal and the change of a linked output signal. Below you will find information on the response times of the F-TM ServoDrive drive system.

NOTE

The actual response time falls between a minimum and maximum response time. You must always assume the maximum response time when configuring your system.

The drive system is the component that provides the safety functions. The description "error-free drive system" means that the component providing the safety functions itself has no defect:

- Maximum response time in error-free drive system
  When the enable is removed at the STO+ or STO- terminals, the maximum response time in an error-free drive system is guaranteed.

Stop function (via terminals)

The following table specifies the response times for the indicated stop functions from the time of activation until occurrence of the response.

Function	Maximum response time
STOP_STO	Max. 20 ms

5.4 Safety Integrated

Important notes on the Safety Integrated system are provided in this section.

Diagnostics hardware fault

If an internally diagnosed hardware fault occurs, you can only reset the module by restarting it. Nevertheless, the replacement of the F-TM ServoDrive is strongly recommended. Unwanted activation of the safety function can be an indication of a hardware fault.

Wiring the F-TM ServoDrive

For information on how to perform the electrical wiring for the F-TM ServoDrive, refer to section Wiring (Page 28)

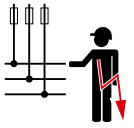
STO inputs

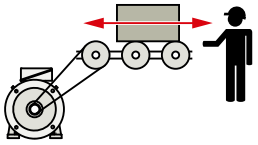
The STO inputs are described in the section Connecting safe torque off (Hardware STO) (Page 36).

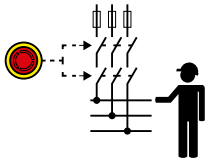
5.5 EMERGENCY OFF and EMERGENCY STOP

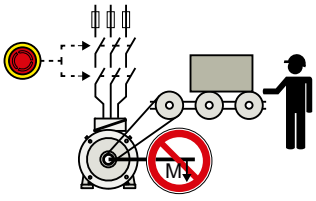
Difference between EMERGENCY OFF and EMERGENCY STOP

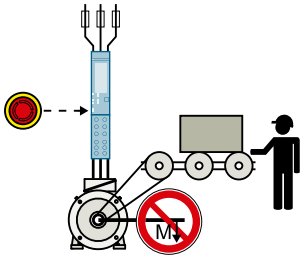
EMERGENCY OFF and EMERGENCY STOP are commands that mitigate different risks in the machine or plant.











EMERGENCY OFF Risk of electric shock	**EMERGENCY STOP** Risk of unexpected movement
	

Table 1-609 Measures and solutions

Command	**EMERGENCY OFF**	**EMERGENCY STOP**
Measure to minimize risk	**Safe switch off** Switching off the electric power supply for the installation, either completely or partially.	**Safely stop and safely prevent restarting** Stopping or preventing the dangerous movement
Classic solution	Switch off the power supply. 	Switch off the drive power supply. 
Solution with the STO safety function integrated in the drive	STO is not suitable for safely switching off a voltage.	Select STO.  You may also switch off the power supply of the drive controller. However, switching off the voltage is not required as a risk-reduction measure.

Configuring

6

Configuration and parameter assignment

STEP 7 (TIA Portal) is available for configuring an ET 200SP TM Drive.

You can perform the following tasks, for example, with STEP 7 (TIA Portal):

- You configure the TM Drive (insert into the project and configure input addresses)
- You specify the desired hardware parameters for operation of the TM Drive.

Requirements

Hardware

- Supported interface modules: See Properties (Page 24)
- You have completed installation and wiring of the hardware. Take the potential group into account, see section Pin assignment (Page 28).
- You have connected the PG/PC via the PROFINET interface of the CPU.

Software

- You have installed the HSP0311. You can find the support packages for the hardware catalog in the TIA Portal (HSP) on the Internet (https://support.industry.siemens.com/cs/ww/en/view/72341852).
- You have installed the HSP0311.

As soon as the configuration and hardware parameter assignment have been successfully completed, you can create your user program and commission the drive.

⚠ WARNING

Safety Integrated

As soon as a safety program has been created, you must perform a complete function test based on your automation task.

For acceptance of the system, you must use the safety summary created according to the above manual.

Configuring a TM Drive (minimum configuration)

To configure a TM Drive, follow these steps:

1. Create a new project.
2. Add a CPU S7-1200 or S7-1500 as a new device.
3. Add a PROFINET interface module to the project under "Devices & networks" from the ET200SP system, e.g. IM 155-6PN ST.
4. Assign the inserted IO device to the configured IO controller.
5. Switch to the device view of the interface module.

6. Add the TM Drive module from the hardware catalog to the IO device.
7. Add a server module.

6.1 Communication telegrams

Selection of a communication telegram

The selection of a communication telegram determines the process data of the drive that will be transmitted between the drive and CPU.

The following table shows the supported telegram types for the drive and sensor assignment.

Table 1-610 Supported communication telegrams

Supported PROFIdrive telegrams	Brief description	User data
Standard telegram 1 PZD-2/2	Speed setpoint 16 bits, without sensor	• Control word STW1, status word ZSW1 • Speed setpoint 16 bits (NSET), actual speed value 16 bits (NACT)
Standard telegram 2 PZD-4/4	Speed setpoint 32 bits, without position encoder	• Control words STW1 and STW2, status words ZSW1 and ZSW2 • Speed setpoint 32 bits (NSET), actual speed value 32 bits (NACT)
Standard telegram 3 PZD-9/5	Speed setpoint, 32 bits with one position encoder	• Control words STW1 and STW2, status words ZSW1 and ZSW2 • Speed setpoint 32 bits (NSET), actual speed value 32 bits (NACT) • Encoder control word 1 (Gx_STW), encoder status word 1 (Gx_ZSW) • Actual encoder position value 1 (Gx_XIST1, Gx_XIST2)
Siemens telegram 102 PZD-10/6	Speed setpoint 32 bits with one position encoder and torque reduction	• Control words STW1 and STW2, status words ZSW1 and ZSW2 • Speed setpoint 32 bits (NSET), actual speed value 32 bits (NACT) • Dynamic torque reduction (MOMRED) • Encoder control word 1 (Gx_STW), encoder status word 1 (Gx_ZSW) • Actual encoder position value 1 (Gx_XIST1, Gx_XIST2)
Extension word	Status bits of the inputs	• Bit 0: DI • Bit 1: STO

A PZD (process data word) corresponds to a 16-bit word.

Selecting a telegram in STEP 7

To select the telegram for the TM Drive in STEP 7, follow these steps:

1. Select the TM Drive in the device view.
2. Navigate to the properties of the module in the "General" tab under "TM Drive" > "Basic parameters".
3. Under "Telegram" in the drop-down list, select the desired telegram, e.g. "Standard telegram 3 (PZD length 9/5 words).
4. If needed, activate the extension word by selecting the "Telegram extension active" check box.

6.2 Structure of the encoder position actual value

Starting with standard telegram 3, the encoder position actual value is transmitted as a 32-bit value via the user data Gx_XIST1 and Gx_XIST2. These values provide the current **incremental and, for absolute encoders, also the absolute actual position** of the measuring system and are read cyclically by the "Positioning axis" technology object, for example, and processed accordingly (see also section 8.3 (Page 122)). The layout of the encoder position actual value mainly depends on the following factors:

- Type of the encoder
- Resolution of the encoder

Regardless of the type of encoder, the position actual value is structured as follows:

- G1_XIST1 is aligned right
- After it is switched on, a 32-bit counter is loaded with the current position value. Depending on the direction of rotation, this value is then only incremented or decremented. After reaching the max. position value, it starts again at 0.
- Shift factor for G1_XIST1 and G1_XIST2 is 2

NOTE

Dependence on the configured encoder resolution
The single-turn value ("increments / revolution") in Gx_XIST1 is directly dependent on the configured encoder resolution (p408).

6.2.1 Incremental encoder

If you are using a motor with an incremental encoder and you have configured this for the type of motor encoder (p404), then the structure of the encoder position actual value is as follows:

Table 1-611 Structure of the encoder position actual value

User data	Contents	
Encoder position actual value 1 (Gx_XIST1)	Increments per revolution	Depends on the parameter assignment of the encoder resolution (p408). You can read them back under "Drive diagnostics encoder" in the section Drive diagnostics (Page 130).
	Bits in Gx_XIST1 "Offset factor"	2
	Encoder type	Rotary incremental

Example of an incremental encoder with 4096 "steps per revolution", this corresponds to 1024 "increments per revolution" with a fine resolution of 2:

Table 1-612 Structure G1_XIST1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	S	S	S	S	S	S	S	S	S	S	F	F

M: Multiturn value (number of distinguishable revolutions)
S: Singleturn value (singleturn "steps per revolution")
F: Fine resolution

Table 1-613 Structure G1_XIST2

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																											error				

Error code: See PROFIdrive specification
(https://mall.industry.siemens.com/mall/en/WW/Catalog/Products/10293158)

6.2.2 IQ encoder

If you are using a motor from the Siemens Product Partner Program with IQ encoder (incremental encoder) and have configured this accordingly for the type of motor encoder (p404), then the structure of the encoder position actual value is as follows:

Table 1-614 Structure of the encoder position actual value

User data	Contents	
Encoder position actual value 1 (Gx_XIST1)	Increments per revolution	Default: 100 Depends on the parameter assignment of the encoder resolution (p408). You can read them back under "Drive diagnostics encoder" in the section Drive diagnostics (Page 130).
	Bits in Gx_XIST1 "Offset factor"	2
	Encoder type	Rotary incremental

Table 1-615 Structure G1_XIST1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	S	S	S	S	S	S	S	F	F

M: Multiturn value (number of distinguishable revolutions)
S: Single-turn value (single-turn "steps per revolution")
F: Fine resolution

Table 1-616 Structure G1_XIST2

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Commissioning the 7

The engineering of the TM Drive drive controller is integrated in STEP 7 (TIA Portal). You install it with the Hardware Support Package HSP0311. The graphic user interface supports you in the configuration, parameter assignment and commissioning of the drive functions of the TM Drive.

Parameter assignment is also possible via data sets (see appendix Data sets (Page 142)).

In this section you will find information on various topics including:

- Check before powering on for the first time
- Commissioning a TM Drive

⚠ CAUTION

Failure to comply with the instructions for Safety Integrated poses a risk of injury
Failure to comply with the instructions may result in serious injuries. Carefully read through the safety instructions in section Safety functions integrated in the drive (Page 41) before commissioning and before operation.

⚠ WARNING

Personal injury and property damage from the collapse of a suspended axis
If the drive system is used as suspended axis, the axis will fall down if the positive and negative poles of the power supply are interchanged during connection. An unexpected collapse of a suspended axis can result in personal injury and property damage.
Before commissioning, you need to ensure that a cross brace is fitted to hold the suspended axis in place and prevent it from collapsing unexpectedly. Also ensure that the power supply is connected properly.

⚠ WARNING

Personal injury and property damage from the collapse of a suspended axis
An unexpected collapse of a suspended axis can result in personal injury and property damage.

- When using the STO function in conjunction with suspended axes, the axis may fall down unexpectedly and cause property damage and personal injury.

NOTE

Performing tests
You must ensure the safety of your plant. You therefore need to perform a complete functional test and the necessary safety checks before the final commissioning of a plant.
Also allow for any possible foreseeable errors in the tests. This avoids endangering persons or equipment during operation.

7.1 Basics

7.1.1 Engineering

You perform parameter assignment as well as diagnostics of a TM Drive with a PG/PC or notebook (commissioning device) using the TIA Portal (Hardware Support Package HSP0311 needed).

The settings can be found in STEP 7 in the device navigation under "Ungrouped devices" > "<Name of the interface module>" > "<Name of the TM Drive>".

Overview

This drive engineering is divided into the following areas:

- Online & diagnostics
- Parameters
- Device configuration

"Device configuration" area

Contents in the "Device configuration" area of the TM Drive engineering.

- Potential group
- Basic parameters
  Define telegram, activate telegram extension
- I/O addresses

"Online & diagnostics" area

Contents in the "Online & diagnostics" area of the TM Drive engineering.

Diagnostics

- General (module information):
  Order number, firmware and hardware version, I&M data
- Diagnostic status (display of status information)
- Active messages:
  Pending faults and alarms
- Drive diagnostics
  Status bits, operating values, encoders, temperatures, inputs

Functions

- Firmware update

"Parameters" area

Contents in the "Parameters" area of the TM Drive TM Engineering.

- Drive:
  Drive data set, General settings, Motor, Motor gear, Thermal model, DC link voltage, Brake module
- Setpoint channel:
  Reference values, application limits, ramp-function generator
- Open-loop/closed-loop control:
  Control type, controller settings, speed controller, current controller
- Messages/monitoring
  Motor (thermal motor type), power output stage (utilization)

NOTE
The F-TM ServoDrive is not able to provide a holding torque for locking the drive.
In the application, especially note that abrupt movement of the axis can occur when lifting and lowering loads.

"Commissioning" area

Contents in the "Commissioning" area of the TM Drive TM Engineering.

- Configuration:
  Link to the parameter dialog
- Identification:
  Identification mode
  Encoder and pole position identification
  Encoder values
- Tuning:
  Calculate speed/current controller values
  Tuning the speed controller
  Transfer controller values to drive parameters

See also

PMSM drive parameters (Page 75)

7.1.2 Drive parameters

Parameter tooltips

In STEP 7 engineering of the TM Drive, all displayed drive parameters are linked with tooltips. You will find detailed information on the parameter in the tooltips, e.g. parameter name, properties, factory setting, value range, descriptions, notes and dependencies.

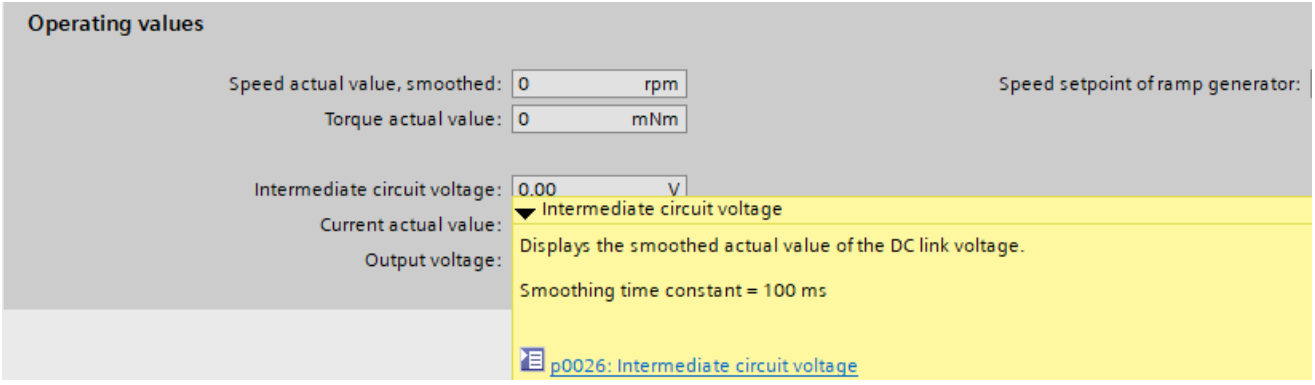

Figure 1-293 DC link voltage tooltip

Changing a parameter

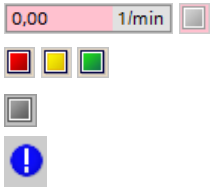
You can directly change the values of the writable adjustable parameters (p-parameters) in STEP 7.

You have the following options for this:

- You overwrite the current parameter value with the new value.
  Or
- You select a value via the drop-down list.

Invalid values are rejected.

NOTE



P-parameters cannot be changed online while the drive is in operation. In this case, the corresponding entry field is automatically disabled.

The following overview shows the display of an entry field, depending on the context and the properties of the drive parameter:

1,0000 Nm	Project (offline)	Parameter value can be changed and stored in the project.
48,0 V	Project (offline)	The parameter value is write-protected.
24,0 V	Project (online)	Parameter value is write-protected or disabled due to the drive status.

Parameter symbols and operator controls

The following overview explains additional symbols and operator controls in the engineering of the TM Drive:

Drive value (online) could not be determined

Bit parameter active (1-signal)

Bit parameter inactive (0-signal)

Binding values to be set by the commissioning engineer

Automatic check of the configured drive parameters

The configured parameters are checked both in STEP 7 and in the drive in order to detect incorrect parameter assignments and possible functional restrictions even before commissioning.

Both warning and error messages are output. In STEP 7, you obtain additional information and corrective measures about the respective message.

The causes of errors in the drive parameterization that prevent the drive from operating are listed below.

Parameter group	Possible causes of error
Motor	Electrical time constants of the connected motor are too low
	Torque constant is not consistent with other motor parameters
Encoders	Motor/encoder combination is not permitted
Speed/current controller	Controller parameters have not yet been set or are not permissible
DC link voltage	DC link volage limits are prohibited
Brake module	Brake chopper settings are not permitted

Loading drive parameters

You can synchronize all p-parameter values of your project (offline) using the "Download to device" function.

Constraints

- When you load parameters into the device, a rotating drive automatically stops.
- After the parameters are loaded, the drive does not restart automatically. You must activate the drive once again using a new drive command.
- If you send an invalid parameter to the TM Drive, the module remains in parameter assignment mode. The drive cannot be activated until valid parameters are loaded.

"Download to device" function for drive parameters

You can use the "Download to device" function to transfer parameter values from your project (offline) to the drive (online).

Procedure

1. Select the drive in the project tree.
2. Click on "Download to device" in the menu bar.

Or

1. Select "Download to device" > "Software" in the shortcut menu.

You have transferred the current parameter values of your project to the drive.

Loading drive parameters

You can synchronize all p-parameter values of your project (offline) using the "Download to device" function.

Conditions

- When you load parameters into the device, a rotating drive automatically stops.
- After the parameters are loaded, the drive does not restart automatically. You need to activate the drive via a new drive command.
- If you send an invalid parameter to the F-TM ServoDrive, the module remains in parameter assignment mode. The drive cannot be activated until valid parameters are loaded.

"Download to device" function for drive parameters

You can use the "Download to device" function to transfer parameter values from your project (offline) to the drive (online).

Procedure

1. Select the drive in the project tree.
2. Click on "Download to device" in the menu bar.

Or

1. Select "Download to device" > "Software" in the shortcut menu.

You have transferred the current parameter values of your project to the drive.

7.1.3 Calling help information

To obtain information on parameters and alarms (messages) of the drive, open the information system via "Help" > "Show help" and search for the article number of the product.

You can also directly open the information system for a parameter or a message. To do so, click the online help link in the tooltip of a parameter or message .

7.2 Requirements for the commissioning

Requirements

- The TM Drive was installed according to the information in the following sections:
  - Wiring (Page 28)
  - Configuring (Page 58)
- The motor is installed in the drive train to be operated in accordance with the plant/device construction planning.

NOTE

Additional information concerning the requirements

You can find additional information relating to technology objects and motion control in the online help of STEP 7 under "Using technology functions" > "Motion Control".

Before powering on for the first time

Before the first power-on, check the installation and the wiring of the TM Drive.

Questions for the check

The following questions provide guidance for checking your TM Drive in the form of a checklist.

Racks

- Is the mounting rail securely mounted to the wall, in the frame or in the cabinet?
- Are the cable ducts correctly installed?
- Have the minimum clearances been observed?

Grounding and chassis concept

- Is the mounting rail connected to the protective conductor?
- Is the connection between the ground reference and ground properly established for the mounting rail?
- Are the required equipotential bonding cables connected with low impedance to the affected plant units?

Module installation and wiring

- Is the TM Drive plugged in / installed and firmly connected or screwed in according to the assembly plan and the configuration with STEP 7?
- Are all connectors wired according to the circuit diagram?
- Is the PROFINET connection to the CPU and the engineering system of the STEP 7 (TIA Portal) connected?
- Is the input for Hardware STO (STO+/STO-) connected?
- Are the cables (motor connection cable, encoder cable) properly connected between the F-TM ServoDrive and the motor?

- Is the digital input connected?
- Was an external braking resistor optionally connected to the F-TM ServoDrive?
- Are the cables from the hardware STO (STO+/STO-) separated from the other cables, in particular from power cables?
- Have you minimized crushing hazards and short-circuits against ground connections by appropriate routing?
- Are the cables fully protected against premature aging due to continuous UV radiation?

Power supply

- Are all power supplies switched off?
- Is the power cable connector correctly wired?
- Has the connection to line voltage been made?

7.3 Procedure for commissioning the ET 200SP TM Drive

Procedure for commissioning with STEP 7

Commissioning is performed according to the steps listed below. The individual commissioning steps are optional and are to be performed as required. We recommend the following procedure for the first commissioning of a TM Drive.

Table 1-617 Commissioning procedure

Step	Procedure	Comments	See section ...
1	Configure drive data set	Use one of the following options in the "Import drive data set" dialog under "Parameters > Drive": • Select pre-configured drive data set from list • Import drive data from file system	Drive data sets (Page 71)
2	Define setpoint channel	Under "Setpoint channel" you configure the following: • Reference values • Application limits • Ramp-function generator	Setpoint channel (Page 85)
3	Set control/closed-loop control	Have the controller parameters automatically calculated using the "Speed/current controller settings" comfort function.	Speed control (cascade) (Page 90)
4	Configure DC link voltage monitoring and optionally the brake module	• Define limits for the DC link voltage • Brake chopper settings • Motor holding brake settings	DC link voltage monitoring (Page 101)
5	Configure messages/monitoring	• Define warning thresholds for thermal monitoring	Messages/monitoring (Page 107)

Step	Procedure	Comments	See section ...
6	Optional: Depending on motor type and encoder, determine commutation angle offset and encoder values	• Perform automatic encoder identification in commissioning under "Encoder identification".	Setting the commutation angle offset and pole position identification (Page 79)
7	Optional: Perform automatic controlled system detection	• Automatic controlled system detection can be performed for setting the current and speed controller in the commissioning under "Controlled system detection".	Automatic controlled system detection
8	Optional: Perform online optimization	• Tuning the speed controller	Section Manual controller tuning Speed controller (cascade)

7.4 Drive data sets

Introduction

So that you can optimally handle the requirements of drive technology, the TM Drive drive system is compatible with motors (Dunkermotoren, ebm-papst) and connecting cables (Harting, KnorrTec) of proven product partners of Siemens. This allows you to optimally combine suitable products from proven product partners for your individual application.

You can find more information about the Siemens Product Partner Program in the Internet (https://new.siemens.com/global/en/products/drives/sinamics/servo-drive-system-simatic-micro-drive.html).

It is possible to connect motors from third-party motor manufacturers, provided that they meet the required conditions regarding motor, encoder system, connection system, electrical safety, EMC, etc., as described in this manual.

Drive data record

The motor or drive configuration of the TM Drive drive system is configured using a drive data set (DDS). A drive data record contains the settings and information for the following drive components:

- Motor
- Motor gear
- Thermal motor model

NOTE

The description "drive" means the combination of motor, encoder and additional built-on accessories such as a gearbox and holding brake.

Motor

You can find the settings for the motor in the "Parameters" > "Drive" > "Motor" area.

The TM Drive system supports PMSM. You specify important basic data and reference data of the motor.

Observe the information and notes in the help or in the tooltips of the individual parameters.

You can also find detailed information and descriptions for the drive parameters in the product information Product Information (https://support.industry.siemens.com/cs/ww/en/view/109773204).

Motor encoder

The motor encoder is used for the closed-loop speed control of the drive. The encoder values are transferred to the CPU in the PROFIdrive telegram of the TM Drive, independent of the encoder type.

The motor encoder (p0404) can be selected based on the motor type (p0300). The following combinations are available:

Motor type: PMSM motor

- (1) Incremental encoder (A, B, Z track)
- (5) IQ encoder (A, B track)

(1) Incremental encoder (A, B, Z track)
When selecting encoder type (1) incremental encoder, a 3-channel encoder with Z-track (often also called I-track) can be connected as an index track to identify the pole position.

(5) IQ encoder
If you are using a motor with IQ encoder, you must select the encoder type IQ encoder.

Thermal model

The motor can be protected from thermal overload. Take section Messages/monitoring (Page 107) into consideration for this.

You define the thermal properties of the motor in the "Parameters" > "Drive" > "Thermal model" area.

7.4.1 Using the drive data set

To configure a drive, you have the following options:

- Download preconfigured drive data sets as a file for selected motors from Siemens Industry Online Support (https://support.industry.siemens.com/cs/ww/en/ps/25460).
- Create a user-defined drive data record and configure your motor manually.

NOTE
In TM Drive engineering, the drive parameters can only be edited in the "Parameters" > "Drive" area if you are using a user-defined drive data record.

NOTICE

After a change of the drive data record, you must adapt or optimize the parameters for the current and speed controllers, if necessary.
See section Speed control (cascade) (Page 90).

7.4.2 Using preconfigured drive data sets

You have the option of using preconfigured drive data sets for configuring your motor. You can obtain preconfigured drive data sets for selected motors from Siemens Industry Online Support or product partners.

Installing the drive data record

Pre-configured drive data sets are provided as a file (tms *.mpk) and must be installed in STEP 7 engineering. A drive data record file can contain the configuration of one or more motors.

Expand the list of drives by installing new drive data sets from the file system:

1. Open "Parameters" > "Drive" in the context of the drive.
2. Start the configuration wizard with the "Configure drive data record..." button in the "Drive data record" area.
3. Select the "Select drive from list" option.
4. Click "Install the drive data record"  and select one or more drive data record files that you want to install.
5. Confirm the disclaimer by clicking on "I agree".
   If you do not agree to the disclaimer, close the dialog with "Cancel". In this case, no drive data record file will be installed.

You have installed a drive data record and can now use it.

NOTE

An installed drive data record is installed locally on the PG/PC only for the current STEP 7 version. To open the local installation folder, click the "Locally installed drives" link in the "Configure drive data record" wizard.

Using a preconfigured drive data record

You can search for the desired drive in the list of all locally installed drives.

1. Open "Parameters" > "Drive" in the context of the drive.
2. Start the configuration wizard with the "Configure drive data record..." button in the "Drive data record" area.
3. Select the "Select drive from list" option.
4. Select the desired drive from the list under "Search here for drive or enter filter".
5. The selected drive data record is displayed in the report area and you can check the data.
6. Accept the configuration with "Yes".

You have selected and set up a preconfigured drive data record.

NOTE
You can pass on a saved engineering project with preconfigured drive data record or use it on a different PG/PC on which the utilized drive is not installed. In this case, no optional additional information on the drive is displayed, e.g. manufacturer or order number. This is displayed as soon as you have installed the utilized drive.

7.4.3 Drive data export / import

In addition to the pre-defined drive data sets, custom drive data sets can also be exported and imported.

The standard CSV format with ',' (comma) as column separator including a line header is used.

The data is stored according to the file header and also read in again on the basis of this line.

The formatting of decimal numbers is region-independent using a '.' (dot) as the decimal separator.

For negative values, the value must be preceded by a '-' (minus).

UTF-8 is defined as the character coding.

The header line is defined as follows:

##PNU(mandatory)##,##name##,##value(mandatory)##,##unit##,##dataType##, ##group##,##ECLASS number##

- Motor
- Motor gear
- Encoders
- Thermal model
- Motor holding brake

All parameters contained in the CSV file are included in an import. The CSV file can be customized and, for example, unused parameters can be removed. For example, only one parameter can be imported.

The parameters are assigned via the PNU, where the value must be present. Name, unit, data type and ECLASS number are used for better readability and are ignored during import.

Quotation marks and spaces are hidden during import, which is why no further commas are supported except for column separation.

Export drive data

The existing drive parameter assignments can be exported and saved as a file (*.csv) from STEP 7 Engineering.

1. Open "Parameters" > "Drive".
2. Start the export via the "Export drive data set..." button in the "Drive data set" area.
3. In the "Save" dialog, select a folder and the file name and confirm with "Save".

Import drive data

The drive parameter assignment can be imported as a file (*.csv) in STEP 7 Engineering. A drive data set may contain all or part of the parameters supported by the TM Drive used.

NOTE
Importing the drive parameter assignments overwrites all parameters with the values contained in the csv file.
Parameters not contained in the drive data set are not changed and retain their value.
The "Undo" function is not possible for the "Import drive data set" function.
Save your parameter assignments before importing a drive data set.

1. Open "Parameters" > "Drive".
2. Start the configuration wizard via the "Import drive data set..." button in the "Drive data set" area.
3. Select the "Import drive data set from file system" option.
4. Select the drive data set (*.csv) via the file folder button.
5. The drive data set is displayed in the log area and you can check the data.
6. Apply the configuration with "Yes".

Status messages about the import are displayed in the Inspector window in the General tab.

7.4.4 Using a user-defined drive data set

Create a user-defined drive data set and configure your motor manually.

You can freely configure the current drive data at any time, even if it was imported via a pre-defined drive data set or a parameter table.

⚠ WARNING
Avoiding incorrect parameter assignments
Note that incorrect or modified parameter assignments can result in drive malfunctions and damage to the drive.

Motor (Page 108)
PI DS ServoDrive (https://support.industry.siemens.com/cs/ww/en/view/109773204)

7.4.5 PMSM drive parameters

Parameter number	Name	Description	Unit
Motor			
p0300	Motor type	Selection of the motor type	
p0304	Nominal voltage	Refer to the motor data sheet for the nominal voltage of the motor. The nominal data of the motor are based on this voltage.	V

p0305	Nominal current	The nominal motor current is the current value at which the motor delivers its nominal power and nominal torque under nominal conditions. The nominal current value refers to the ambient conditions specified by the motor manufacturer. If, for example, the motor ambient temperature differs from that of the motor manufacturer, the nominal current must be adjusted according to the manufacturer's specifications.	A
p0311	Nominal speed	Nominal motor speed is the speed at which the nominal values of the motor are valid.	rpm
p0312	Nominal torque	Nominal torque is the torque at the nominal operating point of the machine.	Nm
p0322	Maximum speed	Maximum speed is the mechanically permissible speed of the machine. If the speed is exceeded, the motor may be damaged.	rpm
p0323	Maximum current	The maximum current is the maximum motor current permitted for a short time. The motor can be operated briefly up to this current without resulting in damage, but continuous operation is only permissible up to the maximum nominal current. The maximum current can flow until the limitation of the thermal model intervenes. Specifications such as permissible motor peak currents, e.g: for the duration of 1 s, are not to be entered here.	A
p0316	Torque constant	The torque constant of the motor is the proportionality factor between the RMS current of the q current and the internal torque of the motor. The motor torque is calculated from this constant.	mNm/A
p0314	Number of pole pairs	Number of pole pairs of the motor. For example, an 8-pole motor has 4 pole pairs	-
p0372	Connection resistance (= internal resistance)	Connection resistance of the motor between two motor phases.	Ohm
p0376	Connection inductance q component (=winding inductance q)	Connection inductance between two motor phases in the q axis. When only the value of the rotating field inductance is specified, this value can be used for d and q inductance.	mH
p0377	Motor connection inductance d component (=winding inductance d)	Connection inductance between two motor phases in the d axis. If only the value of the rotating field inductance is specified, this value can be used for d and q inductance.	mH

p0341	Rotor moment of inertia	The rotor moment of inertia is the mass moment of inertia of the rotor with the connecting shaft.	kgcm²
p0318	Standstill current (= holding current)	The standstill current of the motor corresponds to the current value with which the motor can be permanently loaded at standstill under the ambient conditions specified by the motor manufacturer.	A
Motor gear			
p2725	Motor gear moment of inertia	Sets the motor gear moment of inertia in relation to the motor axis.	kgcm²
Thermal model			
p0611[1]	Time constant winding - environment	Setting of the thermal time constant between the winding and the environment. In nominal operation (nominal load and the ambient temperatures and installation elevation specified by the manufacturer) the limit temperature of the motor is reached after five times the time constant. Note: If the ambient conditions of the motor do not correspond to the values specified by the manufacturer, the motor must be derated. See 7.7.1 Thermal motor monitoring	s
Motor connection			
p0352	Motor cable line resistance	Input of the motor cable resistance value for outgoing and return conductor.	Ohm
p0353	Motor series inductance (=motor cable inductance)	Input of the line inductance of the outgoing and return conductor. The value can be neglected for motor connection cables < 10 m. If a series reactor is also connected between the motor and the inverter, you need to enter the inductance value as an additive to the line inductance.	mH

7.4.6 Motor encoder

7.4.6.1 Motor encoder

Under Encoder type configuration, select the appropriate encoder type for the motor.

Parameter number	Name	Description	Unit
Encoder type configuration			
p0404	Motor encoder selection	Selection of the motor encoder	-

Depending on the motor type, you can select the following encoders:

Motor type: PMSM motor

- (1) Incremental encoder (A, B, Z track)
- (5) IQ encoder (A, B track)

7.4.6.2 Encoder parameters incremental encoder and IQ encoder

The encoder types incremental encoder and IQ encoder use the same settings.

Parameter number	Name	Description	Unit
p0408	Increments per revolution	Setting of the increments per revolution or the pulses per revolution (PPR) of the motor encoder.	-
p0409	Steps per revolution	Display of the steps per revolution or counts per revolution (CPR) of the encoder. The value cannot be edited, results from the quadrature interface and is four times the value of increments per revolution (p0408).	-

Incremental encoder, IQ encoder

The increments per revolution must be set for the incremental encoder and the IQ encoder. The increments can be independently detected at the incremental encoder by the automatic encoder detection of the TM Drive.

7.4.6.3 Assign encoder counting direction parameters

For encoder type (1) incremental encoder, it may be necessary to invert the counting direction of the encoder by setting parameter p0410, Invert encoder counting direction. With incremental encoders, this may be necessary, for example, if the A and B tracks were swapped when the encoder was connected.

The following is defined as the positive direction of rotation of the encoder.

Incremental encoder:

The positive direction of rotation for an incremental encoder is defined as follows.

If the positive A edge comes before the positive B edge in terms of time, the motor with a view of the motor shaft rotates clockwise in the positive direction of rotation.

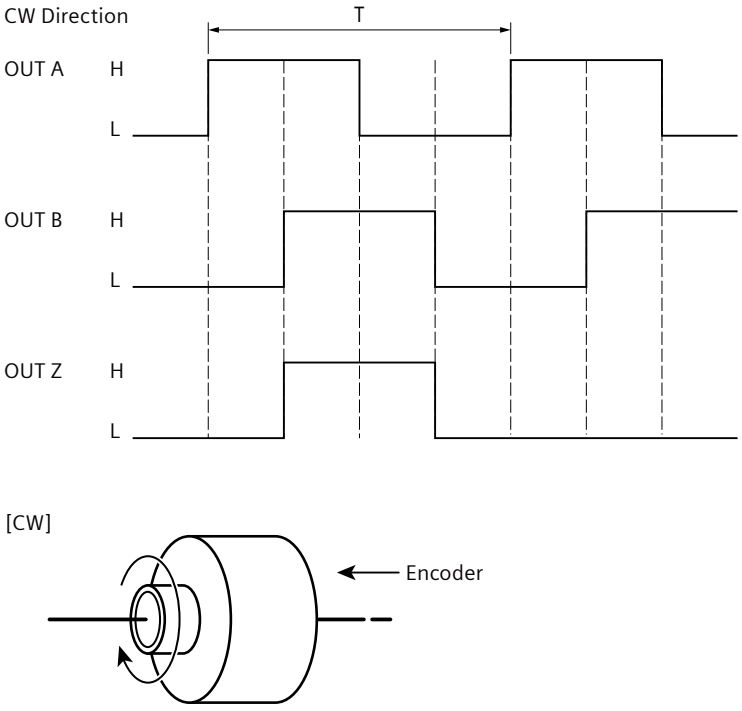

Figure 1-294 Direction of rotation for the incremental encoder

Definition:
A positive speed in TM Drive is defined as follows:
The motor rotates clockwise looking down on the motor shaft. The encoder value increments during this process.

Table 1-618 **Additional encoder values**

Parameter number	Name	Description	Unit
p0410	Reverse encoder counting direction	This setting negates the counting direction of the encoder.	-

7.4.6.4 Setting the commutation angle offset and pole position identification

For the commutation of a PMSM with the encoder type

- [1] Incremental encoder (A, B, Z track)

it is necessary to know the commutation angle offset or to determine it.
The commutation angle offset is the angle offset between a reference (Z-track for incremental encoders and the rotor / pole position).

Encoder calibration at each start (p1990)
If the parameter (p1990) "Encoder calibration at each start" is set, the determination of the commutation offset angle is repeated, for example, by voltage interruption at each restart or after each configuration of the drive.
If the parameter (p1990) is not selected, the value entered in the commutation angle offset (p0431) is used for commutation. If the offset angle is known, this can either be entered or

automatically determined by TM Drive (see section Automatic encoder / pole position identification (Page 83)).

NOTE

Incremental encoder

After a new configuration or after switching off the power supply, the pole position is unknown when using an incremental encoder. If the parameter (p1990) "Encoder calibration at each start" is not set, the motor control is speed controlled with a fixed motor (running) current depending on the motor current parameters until there is synchronization of the pole position.

If synchronization with the Z-track is not possible, the control is aborted.

If the rotor position has not yet been synchronized, the drive may be twisted by an external load. If you want to prevent the drive from rotating directly after drive activation, you can use the Additional torque parameter (p1511) to ensure that a corresponding hold torque is applied to the motor (see section Speed control (cascade) (Page 90)).

NOTE

Motor replacement

When replacing the motor, remember that the motor encoder in a motor series is not always calibrated in the same way.

If the encoder calibration is selected at every start, no further action is required.

If this is not the case, the commutation angle offset must be determined again in the encoder / pole position identification (see section Automatic encoder / pole position identification (Page 83)).

⚠ WARNING

Incorrectly set commutation offset angle

It must always be ensured that the commutation offset angle is set correctly.

Otherwise, there will be insufficient control of the drive and it will not achieve its full performance or it will proceed in an uncontrolled manner.

Table 1-619 Additional encoder values

Parameter number	Name	Description	Unit
p1990	Encoder calibration at each start	If this option is selected, the commutation angle offset is determined again at every restart (new configuration or switching off the supply voltage). It is recommended to determine the commutation angle offset once during commissioning. Calibration is then no longer necessary, except when replacing the motor.	-
p0431	Commutation angle offset	Setting of the commutation angle offset. The commutation angle offset is the angle between the rotor pole position and the 0° degree pulse of the encoder. If the angle offset is not known, it can be determined by the module during commissioning. The offset angle is defined as follows. Incremental encoder:	-

Parameter number	Name	Description	Unit
		0° offset is present if the Z pulse is applied at least at one alignment point (depending on number of pole pairs) when the phase U is positive and V, W are negative. Absolute encoder: 0° offset is present if the angle value is 0 at least at one alignment point (depending on number of pole pairs) when the phase U is positive and V, W are negative. **Warning:** **An incorrectly set commutation angle offset can lead to uncontrolled behavior of the drive!**	

7.4.6.5 Calibration process of the commutation angle offset

When selecting parameter p1990 "Encoder calibration at each start", the TM Drive restarts the calibration process of the motor pole angle after:

- Every initial enable of the drive
- Every time the power supply is switched on again
- After re-configuration
- If certain malfunctions of the module occur

After that, the TM Drive references with the determined offset angle over the Z-track.

The motor is energized for the calibration process and thereby generates torque.

The motor current is limited by:

- Prospective locked rotor current (p0318)
- Equivalent current from the nominal torque of the motor (p0312)
- The equivalent current from the torque limitation (p1520)
- The maximum converter current

The smaller limitation in each case takes effect.

A possibly existing motor holding brake must be opened, so that a rotation of the motor is possible. If the motor holding brake is configured via the TM Drive and connected accordingly, the task of opening the holding brake is assumed by the TM Drive.

NOTE

If you have selected (p1990) "Encoder calibration at each start", the drive must retrain itself at initial commissioning and each time the power supply is switched back on or a new project download is performed. This process can take between 1 - 4 seconds. The motor can move by a maximum of 180° / number of pole pairs. Such movement must be possible in the application.

The following constraints must be observed:

- The motor must be able to rotate freely in both directions of rotation and the axis must not be loaded with a static load.
- With suspended loads, the option (p1900) "Encoder calibration at every start" must not be used.
- It is recommended to use a TM Drive with absolute encoder function and corresponding motor especially for suspended loads.
- The calibration process cannot be performed when the axis is rotating, or the speed must be below the standstill detection p1226.

NOTICE

Open motor holding brake

The motor holding brake is opened during calibration of the commutation angle offset. Especially with suspended axes, it is therefore important to ensure that it is possible to open the motor holding brake.

An unexpected collapse of a suspended axis can result in personal injury and property damage.

Before commissioning, you must ensure that a cross brace is fitted to hold the suspended axis in position and prevent it from collapsing unexpectedly. Also ensure that the power supply is connected properly.

⚠ WARNING

Motor movement by measurement on unbraked motors

The measurement can be used to trigger a rotation or movement of the motor via the specified current on unbraked motors. The magnitude of the movement depends on the specified current as well as on the moment of inertia of motor and load.

7.4.6.6 Automatic encoder / pole position identification

Automatic encoder pole position identification is found in the Commissioning submenu of the configured TM Drive. This function is only possible with the PMSM motor type. Incremental encoders can be detected. Depending on the encoder type, the following encoder / motor parameters are automatically detected:

Incremental encoder (1)

- Commutation angle offset (p0431)
- Number of pole pairs (p0314)
- Increments per revolution (p0408)
- Invert encoder counting direction (p0410)

For automatic encoder / pole position identification please proceed as follows:

Preconditions

- Motor type PMSM
- The motor parameters are known and the calculation of the controller parameters under open-loop/closed-loop control has been performed and transferred to the drive.
- The device is in RUN state and the drive is at standstill.
- The drive is not enabled in any other way (e.g. by a technology object or a user program).
- The motor can rotate freely in both directions of rotation and is not loaded with a static load (example: suspended load)

NOTE

If the motor is loaded with a static load during encoder detection, the commutation offset angle may not be correctly detected. The motor can then only deliver a reduced torque.

Step 1:

Go online and enable commissioning mode under Commissioning, Identification with the 'Start' button and select the encoder / pole position identifier.

NOTE

In this operating mode, the drive can only be controlled by the TM Drive. A control of the drive by the S7 control via PROFIdrive is not possible in this mode and is locked. This is also signaled by resetting ZSW1 bit 9.

Step 2:
The configured motor type and motor encoder is displayed under Commissioning encoder / Pole position identification. Insert the identification current allowed for the test. This is always automatically set to the rated motor current. However, it can be adjusted if required.

NOTE
If the motor is already installed in an application, you may need to increase the identification current in steps. The motor maximum current p0323 must not be exceeded. If necessary, observe idle times between the identification cycles to avoid overheating the motor. Especially for motors with an increased cogging torque, it may be necessary to increase the identification current so that the encoder and pole position information can be accurately detected.

Step 3:
Start the encoder / pole position identification with the selection button "Start encoder detection".

A configured motor holding brake is opened during encoder / pole position identification. This is signaled via ZSW1 bit 12 both in the process image and in data set 209.

NOTICE

Open motor holding brake
The motor holding brake is opened during encoder / pole position identification. Especially with suspended axes, you must ensure that it is possible to open the motor holding brake. An unexpected collapse of a suspended axis can result in personal injury and property damage.

Step 4:
If the drive is still in operation, execution of the identification commands is rejected. Stop the operation of the drive before the encoder / pole position identification. Then continue with step 3.

When all conditions are fulfilled, the TM Drive starts the identification after the confirmation of the safety prompt. It is necessary that the drive can be turned safely in both directions.

Step 5:
If the encoder / pole position identification is successfully executed, the determined values are displayed.

NOTE
Before you apply the determined values, you need to check them for plausibility.

Step 6:
You can now select which of the determined values you want to transfer to the offline project. By clicking the "Transfer determined values to offline project" button, the selected values are transferred to the offline project.

NOTE
The determined settings are stored only temporarily on the module. They are replaced by the permanently stored parameters on the next restart.
If you want to store the settings permanently on the module, change the drive parameters offline and download them again with "Download to device".

Step 7:
When you have transferred the parameters to the offline project, disable commissioning mode under Commissioning, Identification with the 'Exit' button. You must then load the parameters onto the module using "Download to device".

Encoder / pole position identification is completed. The option "Encoder calibration at each start" (p1990) is no longer required and should be deselected.

7.5 Setpoint channel

Overview

Setpoints from the respective setpoint source are prepared for the motor control in the setpoint channel of the drive.

You specify the setpoints via the drive telegrams to PROFIdrive.

You can find the settings for the setpoint channel in the context of the drive under "Parameters" > "Setpoint channel".

Under "Setpoint channel" you configure the following:

- Reference values (Page 86)
- Application limits (Page 86)
- Ramp-function generator and speed setpoint filter (Page 88)

The figure below shows the processing of the speed setpoint in the drive controller.

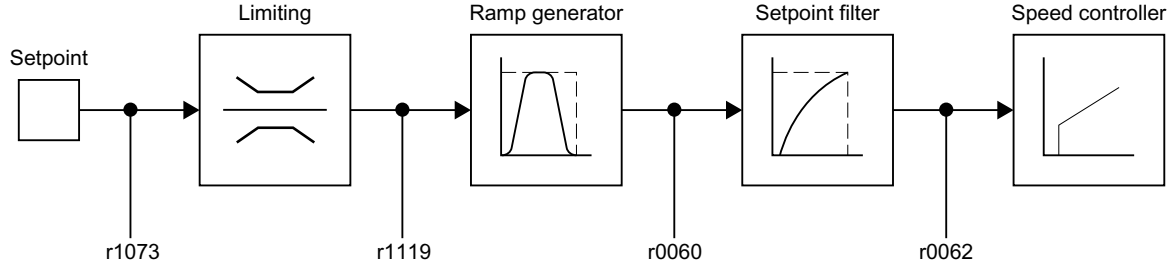

Figure 1-295 Setpoint channel

The speed setpoint from the drive telegram is limited in the setpoint channel according to the specified values, see section Reference values (Page 86).

The limited speed setpoint is fed to the ramp generator as an input signal, see section Application limits (Page 86).

The output of the ramp generator is fed to the speed controller via the speed setpoint filter, see section Ramp-function generator and speed setpoint filter (Page 88).

7.5.1 Reference values

The physical variable speed is transmitted in the drive telegrams as a reference values.

- Speeds are normalized to the reference speed (p2000) in the drive telegram.
- Torques are normalized to the reference torque (p2003) in the drive telegram.

Parameters p2000 and p2003 are definitive as reference values (telegram content = 4000 hex or 4000 0000 hex for double words, if the input value has the value p2000 or p2003).

Example of the normalization of the speed:

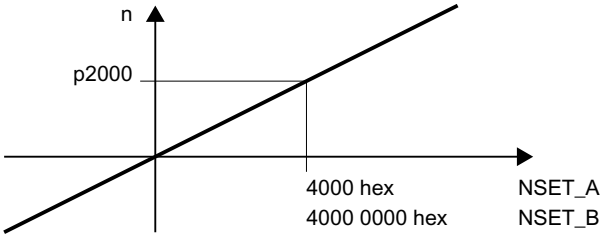

Figure 1-296 Example of normalization of the speed

NOTE

The speed and torque are specified in the drive telegram as a percentage of the reference speed in the range -200% to 200%.
Therefore, set the reference variables in such a way that the desired maximum value falls within the value range of the control from -200% to +200%.

Procedure

1. Configure the reference value in the context of the drive under:
   "Parameters" > "Setpoint channel" > "Reference values".

⚠ WARNING

Uncontrolled drive behavior
Note that the specification of reference values in the CPU and the drive must always match. Otherwise, uncontrolled drive behavior and rotating of the motor might occur. We therefore recommend that commissioning of the drive and thus specification of the references values be completed first before you commission the CPU and, for example, a technology object.

7.5.2 Application limits

In the "Parameters" > "Setpoint channel" > "Application values" area, you can configure limitations for the speed and torque of the drive if required and adapt them to the requirements of your mechanical system.

Speed limiting

If you need a direction-dependent limiting of the speed p1083 and p1086, you can define speed limits for each direction.

Torque limiting

You can specify the torque limitation p1520 as an absolute value. The limiting acts both when motoring as well as generating.

⚠ WARNING

Accuracy of torque limitation
The function of the torque limitation is not safe torque limiting in the sense of functional safety. The torque limitation refers to the calculated internal (air gap) torque of the motor.
The internal torque is a calculated value from the internal motor constant and motor current. The torque output at the shaft is the internal torque minus friction and iron losses.
Due to the following influencing factors, the deviation of the torque calculation can be in the two-digit percentage range:

- Internal motor constant p0316
- Current measurement accuracy
- Temperature dependence
- Speed and load dependence on friction, iron and additional losses

⚠ WARNING

Danger to life due to uncontrolled movement of the drive as a result of incorrect parameter assignment
Incorrect parameterization of the torque limiting can result in uncontrolled movement of the drives if there is no counter-torque, and cause death or serious injury.
Ensure the correct parameterization.

Zero speed detection

Set the speed threshold for the motor standstill detection (p1226). For braking with OFF1 or OFF3, the zero speed is detected when this threshold is fallen below.

NOTE

A zero point calibration is only started if the speed falls below the speed threshold for standstill detection (p1226).

NOTE

A switch-on process of the drive via STW1 is always delayed until the speed has fallen below the speed threshold for standstill detection (p1226).
As long as the speed is still above this speed threshold, warning 2007 is issued. This can be the case, for example, if the motor shaft is driven externally.
If the switch-on command is still set despite this warning, the drive is switched on and the specified setpoint speed is adopted
as soon as the it falls below the speed threshold for the standstill detection.

Speed threshold values for message

Also specify the speed threshold values for the following messages of the drive status word:

- "Speed threshold 1" (p2141)
  If the speed exceeds the threshold value, bit 10 is set as feedback in ZSW 1
- "Speed threshold 4" (p2163)
  As long as the speed deviation lies within the tolerance range, bit 8 in ZSW1 is set as feedback
- "On delay time" (p2167)
  Setting the switch-on delay time for the message "Speed setpoint/actual deviation within tolerance" (see also p2163)

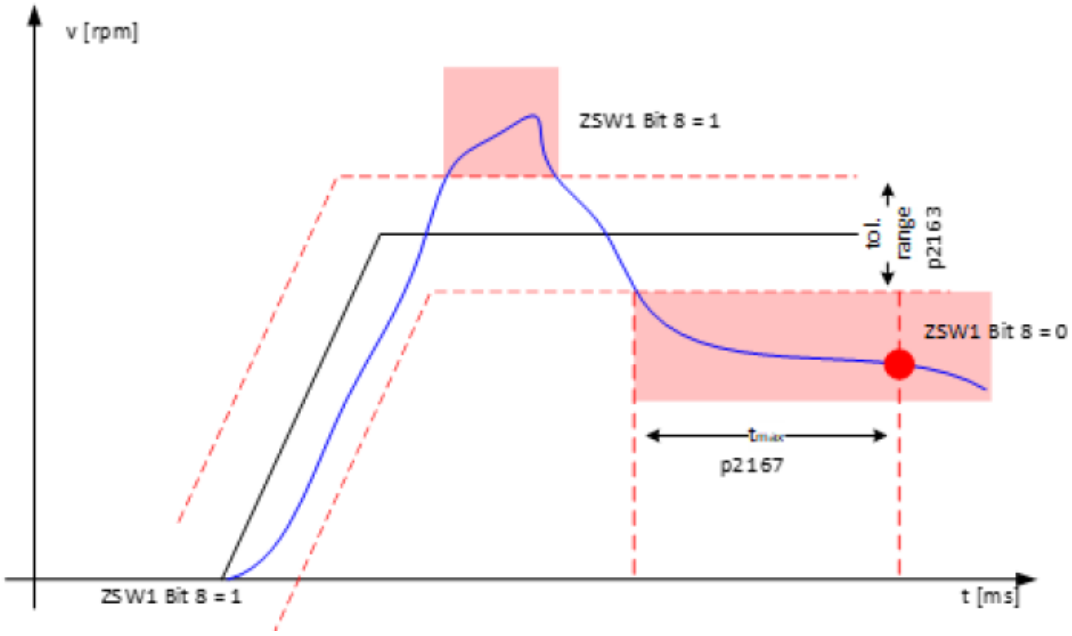

Figure 1-297 Speed setpoint - actual value deviation within tolerance

7.5.3 Ramp-function generator and speed setpoint filter

Speed ramp-function generator

The TM Drive uses the speed ramp-function generator type "Basic ramp-function generator" p1115[0].

The ramp-function generator can be switched off with the setting "No ramp-function generator".

The speed ramp-function generator is used to limit the acceleration at sudden setpoint changes and helps to prevent drive train shock loads.

An acceleration ramp and a deceleration ramp can be set independently with the ramp-up time and ramp-down time. This enables a controlled transition at setpoint changes.

NOTE
On principle, the ramp-up and ramp-down times of the ramp-function generator in the setpoint channel of the drive should be set only so fast that, in case of accelerations and decelerations, the motor speed can track the setpoint without damaging the machine. This ensures optimal functioning of the speed controller precontrol.

Procedure

You enter the settings for the speed ramp-function generator under "Parameters" > "Parameters" > "Ramp-function generator":

- Rampup time
- Ramp-down time
- Speed

NOTE
The TM Drive uses the three values entered to form the values relative to 10,000 rpm "Speed ramp-function generator ramp-up time" (p1120) and "Speed ramp-function generator ramp-down time" (p1121).
When using the GSD file, directly enter the values relative to 10,000 rpm.

Speed setpoint filter

The drive has a first-order time-delay element (low pass PT1) as a speed setpoint filter. The filter time constant can be set with p1416.

The speed setpoint filter is able to attenuate harmonic components of the setpoint and thus to prevent any overshooting of the higher-level controller.

The speed setpoint filter has no effect on the stability of the speed controller because it is in the setpoint channel before the control loop. The dynamics of the response to setpoint changes is reduced by smoothing.

As a rule, set the speed setpoint filter to a low value, since the upstream ramp-function generator ensures sufficient limitation of the setpoint signal.

7.6 Controller settings

7.6.1 Controller settings

Under "Parameters" > "Open-loop/closed-loop control", you specify the type of control, the general controller settings and the settings for speed and current controllers.

Control type

The open-loop / closed-loop control type can be selected depending on the motor type. The following combinations are available:

Motor type: PMSM motor

- [100] Closed-loop speed control (cascade)

7.6.2 Speed control (cascade)

In Speed controller (cascade) mode, the speed difference between the actual and the nominal speed is detected using an encoder and the speed deviation is controlled accordingly. Since the speed controller is followed by a current controller, this speed control method is referred to as cascade control.

General controller settings

Speed and current controllers can be optimally tuned if the properties of the load mechanics of your machine and the electrical properties of the drive are specified as correctly as possible.

Enter the general controller settings under "Parameters" > "Control/closed-loop control" > "Controller settings".

- Moment of inertia load p1398
- Precontrol p1496
- Viscous friction p1399
- Additional torque p1511
- Speed actual value filter p1441

Speed stability can be improved using the actual speed filter, depending on the encoder resolution.

Constant loads can be compensated using additional torque p1511. This reduces compensation processes when the drive is switched on using motor holding brakes.

Additional important settings

The values for speed and current controllers can be determined in the best possible way if, in addition to the properties of the electric motor, you also specify the properties of the gearbox and the connecting cable.

- Motor cable line resistance p0352
- Motor cable/series inductance p0353
- Motor gear moment of inertia p2725

Precontrol p1496

Using the precontrol (p1496), the precontrol of the moments of inertia, consisting of Motor (p0341), Motor gear (p2725) and Moment of inertia load (p1496), can be specified as a percentage value. The precontrol allows the drive to be moved more dynamically. The precontrol is switched off with a preset of 0%. The precontrol is preset by the automatic controlled system detection (see section Automatic controlled system detection (Page 93)) depending on the controller dynamics.

To use this function, the setpoint speed must be preset by a ramp. For this, you can either use the internal ramp-function generator (see section Ramp-function generator and speed setpoint filter) or corresponding acceleration/deceleration functions in technology objects.

Viscous friction p1399

The friction of the system is precontrolled using Viscous friction (p1399). This is specified as a linear friction torque as a function of the speed and is detected during automatic controlled system detection.

Additional torque p1511

Constant loads can be compensated using additional torque (p1511). This reduces compensation processes when the drive is switched on using motor holding brakes.

Speed actual value filter p1441

The drive has a first-order time-delay element (low pass PT1) as a speed actual value filter. The filter time constant can be set via (p1441).

The parameter is preset depending on the parameter "Increments per revolution" p0408 in the HSP. If you configure the device using a GSDML, you can use the following table as a guide.

Table 1-620 Actual speed filter times as a function of the encoder resolution

Encoder resolution (Steps per revolution p0409 or [2]Single-turn resolution p0423)	**Speed actual value filter p1441 in ms**
400	11
512	10
1024	8
2048	6
4096	4
6000	2
10000	1
16000	0

Speed controller and current controller

You can either have the speed and current controller parameters calculated via the controller settings of STEP 7 or you can perform the automatic controlled system detection (7.6.2). It is also possible to set the controller settings manually.

Having controller settings calculated
To have the controller settings of STEP 7 calculated, proceed as follows:

1. Click the "Calculate speed number/current controller settings" button in the area for the controller settings.
   The "Controller calculation" window opens. The window displays the appropriate controller parameters.
2. If needed, you can re-adjust the controller settings via the "Controller behavior" and "Load fluctuation" sliders.
   – "Controller behavior": If the value is increased, the controllers react more strongly to controller differences. At the same time, the controller tends to overshoot.
   The default setting here is 70%.
   – "Load fluctuation": A larger value allows more oscillation in the stable state. The speed deviations are greater during a load step.
   The default setting here is 30%.

NOTE
There is no guarantee that readjustment of the controller calculation will always result in a stable system.
Change the settings for "Controller behavior" and "Load fluctuation" incrementally. Always check the settings with low speed and load profiles.

3. Apply the controller settings by clicking the "Apply" button.

You can then continue to change the calculated controller settings manually.

Setting the controller settings manually
Enter the settings for the speed controller under "Parameters" > "Control/closed-loop control" > "Speed controller".

- Prop. gain
- Integral action time
- Speed setpoint filter
- Speed actual value filter

Enter the settings for the current controller under "Parameters" > "Control/closed-loop control" > "Current controller".

- Iq proportional gain
- Iq integral action time
- Id proportional gain
- Id integral action time

NOTE

If you manually set the controller parameters to inappropriate values, the drive system can be damaged.
Make changes to the controller settings in small steps. Keep checking the behavior of the drive system until you have found a satisfactory setting.

7.6.3 Automatic controlled system detection

You can find the automatic controlled system detection in the Commissioning submenu of the configured TM Drive. This function is only possible with the cascade control mode (p1300).

During the measurement run, the system is measured using test signals. The drive is moved in the process. Configured torque (p1520) and speed limits (p1083 and p1086) are taken into account and can also be used to protect the drive or the application.

The drive accelerates to the test setpoint speed, stops and executes the same travel profile in the reverse direction of rotation. The motor is thereby approximately at the starting position again after the measurement run.

The "Reversal of direction of rotation" checkbox can be used to specify the direction of rotation for the measurement run. If the check box is selected, the motor rotates counterclockwise when viewing the motor shaft, otherwise the motor shaft rotates clockwise. By specifying the number of motor revolutions, it is possible to limit the maximum rotation of the drive. The input of the number of revolutions limits the test setpoint speed if necessary.

The following parameters are automatically determined during controlled system detection:

- Motor connection resistance including motor cable line resistance
- Current control parameters
  - Iq proportional gain p1715
  - Iq integral action time p1717
  - Id proportional gain p1735
  - Id integral action time p1736
- Speed controller parameters
  - Prop.gain p1460
  - Integral action time p1462
- Moment of inertia load p1398
- Precontrol p1496
- Viscous friction p1399

The controlled system detection function automatically provides you with the controller parameters specific to your application and motor.

The controlled system detection function can be adapted to different system requirements.

The connection resistance of the system is detected during the controlled system detection. The determined resistance is divided between the connection resistance (p0372) and the resistance of the motor supply line (p0352).

- If the measured resistance is greater than the connection resistance (p0372), the additional portion is allocated to the motor cable line resistance (p0352).
- If the measured resistance is less than the connection resistance (p0372), this is adjusted and the portion of the motor cable line resistance (p0352) is set to 0.

⚠ WARNING

Unplanned movement of the motor during speed controller tuning
Speed controller tuning causes movement of the drive which can result in death, serious injury or material damage.

- Ensure that nobody is present in the hazardous zone and that the mechanical system can move freely.

NOTE

Directions of rotation and permissible motor rotation range
In the application, the motor must be able to move at least in the specified motor rotation range (p8991). The machine may be damaged if the traversing range is not accordingly limited.
If this is not permissible due to your plant conditions, it is prohibited to perform controlled system detection.
Before commissioning, ensure that the motor and application parameters are correct.

Procedure

Preconditions

- Cascade control mode
- The motor and application parameters are known and transferred to the drive.
- Speed and torque limitation are configured and transferred to the drive.
- The device is in RUN mode and the drive is at standstill
- The drive is not enabled in any other way (e.g. by a technology object or a user program).
- The motor can rotate freely in both directions of rotation and is not loaded with a static load (example: suspended load)

NOTE

If the motor is loaded with a static load during the controlled system detection, this may result in the speed and current controller parameters not being detected correctly.

Step 1:
Go online and enable commissioning mode under Commissioning, Identification with the 'Start' button and select the controlled system detection.

You can abort controlled system detection at any time by pressing the "Exit" button. The drive coasts to a stop and the motor holding brake closes. The drive may have to be returned to its start position before a new measurement run.

NOTE
In this operating mode, the drive can only be controlled by the TM Drive. A control of the drive by the S7 control via PROFIdrive is not possible in this mode and is locked. This is also signaled by resetting ZSW1 bit 9.

Step 2:
Make the settings for controlled system detection.

- Measurement run dynamics p8990

  The acceleration gradient of the rotating measurement run can be influenced using the measurement run dynamics factor.

  A high value is suitable for torsionally stiff systems and low mass inertias and a low value for elastic systems or systems with high mass moment of inertia.

  Generally, a high measurement run dynamic factor provides better results for the rotating controlled system detection. However, too high a measurement run dynamics factor can possibly lead to twisting, bending or other damage to the machine.

  Recommendation: Start with a low measurement run dynamics factor and, if necessary, repeat the controlled system detection with an increased measurement run dynamics factor.

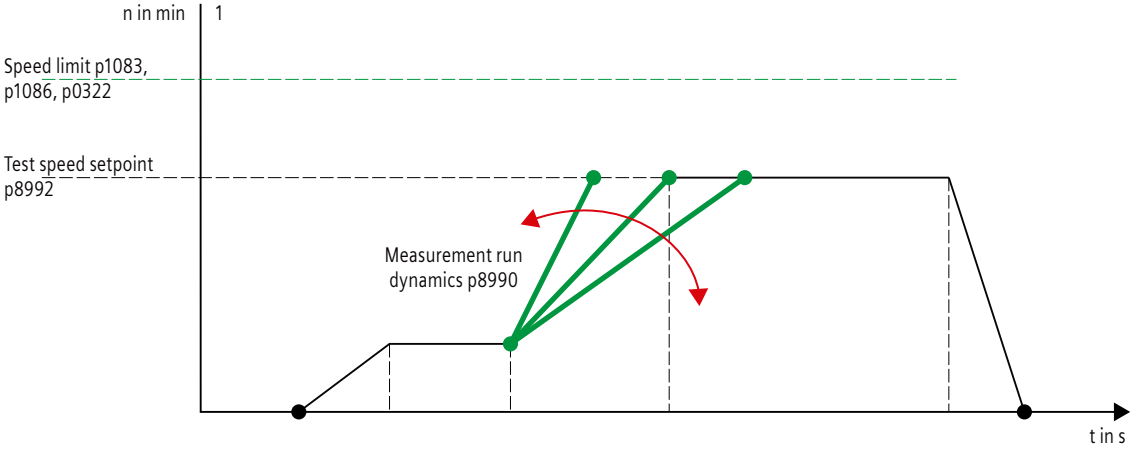

Figure 1-298 Measurement run dynamics

- Max. number of motor revolutions p8991

  Specifies how many revolutions the motor may cover during the measurement. Ensure that a rotation with the configured number of motor revolutions is possible in the direction in which the motor is moved (specified via the "Reversal of direction of rotation" check box).

- Test speed setpoint p8992

  If possible, enter a typical speed value for the test speed setpoint at which the drive is to be operated later.

  If the measurement run is not possible due to the entry from max. number of motor revolutions (p8991) in combination with the test speed setpoint (p8992), this is displayed and a maximum possible test speed setpoint (p8992) is suggested in the text box.

- Torque limitation p1520
  The torque limitation is displayed as a parameter (read only). The setting must be made in the "Application limits" mask and the parameter must be loaded into the module.
- Controller dynamic factor
  Using the controller dynamic factor, you can set how the speed controller should be set up.
  – Conservative: Slow control – low mechanical load. (60% precontrol)
  – Default: Optimum between fast speed control and load of the mechanics. (80% precontrol)
  – Dynamic: Fast speed control – high mechanical load. (100% precontrol)

  A parameter check is performed automatically. This ensures that the drive can perform the measurement run with the configured dynamics within the configured max. number of revolutions. If the measurement run with the configured values is not possible, a warning is displayed and a reduced value for the test speed setpoint is entered.

Step 3:
Start the controlled system detection with the "Start controlled system detection" selection button.

A configured motor holding brake is opened during controlled system detection. This is signaled via ZSW1 bit 12.

NOTICE
Open motor holding brake The motor holding brake is opened during controlled system detection. Especially with suspended axes, you must ensure that it is possible to open the motor holding brake. An unexpected collapse of a hanging axis can result in personal injury and property damage.

Step 4:
If the drive is still in operation, execution of the controlled system detection is rejected. Stop the operation of the drive before the controlled system detection. Then continue with step 3.

When all conditions are fulfilled, the TM Drive starts the controlled system detection after the confirmation of the safety prompt. The drive is moved several revolutions for this.

Step 5:
After successful controlled system detection, the system variables and suitable controller values determined are displayed.

Depending on the application, it may be advantageous to perform the controlled system detection several times in succession and, if needed, to adjust the measurement run dynamics p8900.

NOTE
Before you apply the determined values, you need to check them for plausibility. If necessary, the control can be tested for stable behavior by traveling briefly in both directions (+/-).

Step 6:
You can now select which of the determined values you want to transfer to the offline project. The selected values are transferred to the offline project using the "Transfer determined values to offline project" button.

Step 7:
Once you have transferred the parameters to the offline project, disable commissioning mode under Commissioning, Identification with the 'Exit' button. You must then load the parameters onto the module using "Download to device". Otherwise, the parameters will be lost after switching the module off and on.

Automatic controller tuning is now complete.

Check the settings automatically found using a measurement run with your application. For additional optimization of the controller settings, you can use manual controller tuning from the section Manual controller tuning Speed controller (cascade).

NOTE
If the automatic controlled system detection could not determine any controller parameters, a new measurement run can be initiated by entering a higher moment of inertia of the load under control/closed-loop control parameters and repeating the controlled system detection. The controller parameters can thus be adapted for the machine. The measurement run is thus set to the increased inertia of the load.
You can save the measurement run to a csv file using the "Export measurement data" button.

Faults during controlled system detection

Faults during controlled system detection are displayed directly in the commissioning screen and can be acknowledged.

Table 1-621 Causes of faults and errors

Fault number	Description	Cause / Solution
1055	Motor resistance detection could not be performed	If the motor phases are not connected correctly or insufficiently contacted, or if there is an asymmetry between the individual winding resistors, the error "Unable to successfully perform motor resistance detection" is set. Check the motor connections or the motor for defects and breaks.
1056	Following error during controlled system detection	If the drive is not able to follow the setpoint travel curve, this error is displayed. In this case, it is likely that the Measurement run dynamics p8990 was selected too large. Reduce the Measurement run dynamics p8990 and repeat the controlled system detection. It is also possible that the drive is blocked or the motor holding brake has not been configured or connected correctly.
1057	Position error during controlled system detection	If the maximum number of revolutions is exceeded, e.g. by an external load acting on the drive, this error is set and the drive is switched off. Either the controlled system detection is not possible in the application or reduce the external force on the drive train.

7.6.4 Manual controller tuning Speed controller (cascade)

You can find the manual controller tuning in STEP 7 under Commissioning. Here, you can optimize the control parameters according to your application and thereby fine-tune the drive.

Procedure

You can find the manual controller tuning in STEP 7 under Commissioning. Here, you can optimize the control parameters according to your application and thereby fine-tune the drive.

Procedure
For manual controller tuning, proceed as follows:

Step 1:
Go online to the module with TIA Portal by clicking on the "Connect online" selection button.

Step 2:
If you have not already calculated the controller parameters under Control/closed-loop control, you can do this again here. First, enter the mass moment of inertia of the load.
Use the "Calculate" selection button to calculate the controller parameters.

Step 3:
The calculated controller values are displayed. The online values, i.e. the currently active values, are also displayed on the module.

Step 4:
With the selection "Apply online" button, the new controller values are directly transferred and take effective.

NOTE
When the axis is in operation, the enable is automatically canceled and the new parameters are applied.

Step 5:
You can now put the drive into operation with a speed or positioning TO, for example, and evaluate the control behavior using a trace recording.
If the control behavior is satisfactory, continue with step 7.

Step 6:
If additional optimization is required, there are 2 options to better adjust the control parameters.

1. You can calculate the controller parameters again as described in step 2 and readjust the parameters accordingly using the sliders. (See section Control/closed-loop control under Speed controller and current controller)
2. You set the controller parameters manually. You can orientate yourself on the old values and change the proportional gain and/or the integral action time as well as the precontrol step-by-step.

Perform the steps starting with step 4 again.

Step 7:
After you have performed the optimization, you still need to transfer the detected controller parameters to the drive parameters using the selection button "Apply controller values".

Now you must disconnect the online connection ("Go offline" selection button) and then reload the project onto the module using "Download to device". This ensures that the parameters are still active in the project and on the module after a restart.

Controller tuning is now completed.

7.7 OFF responses

OFF1 (Switch off)

By resetting bit 0 in STW1 (On), you activate OFF1 and the drive is braked to 0 in a speed-controlled manner according to the ramp-function generator ramp-down (p1120, p1121).

If the actual speed falls below the value of the "Standstill detection" parameter (p1226) or a timeout is detected, the pulses are inhibited after the motor brake closing time p1217 has elapsed. "Switching on inhibited" is activated.

Timeout
With OFF1, the time is calculated in which the drive should normally stop from twice the reference speed. If the drive does not stop within 2 times of this time, the drive is de-energized and it coasts down.

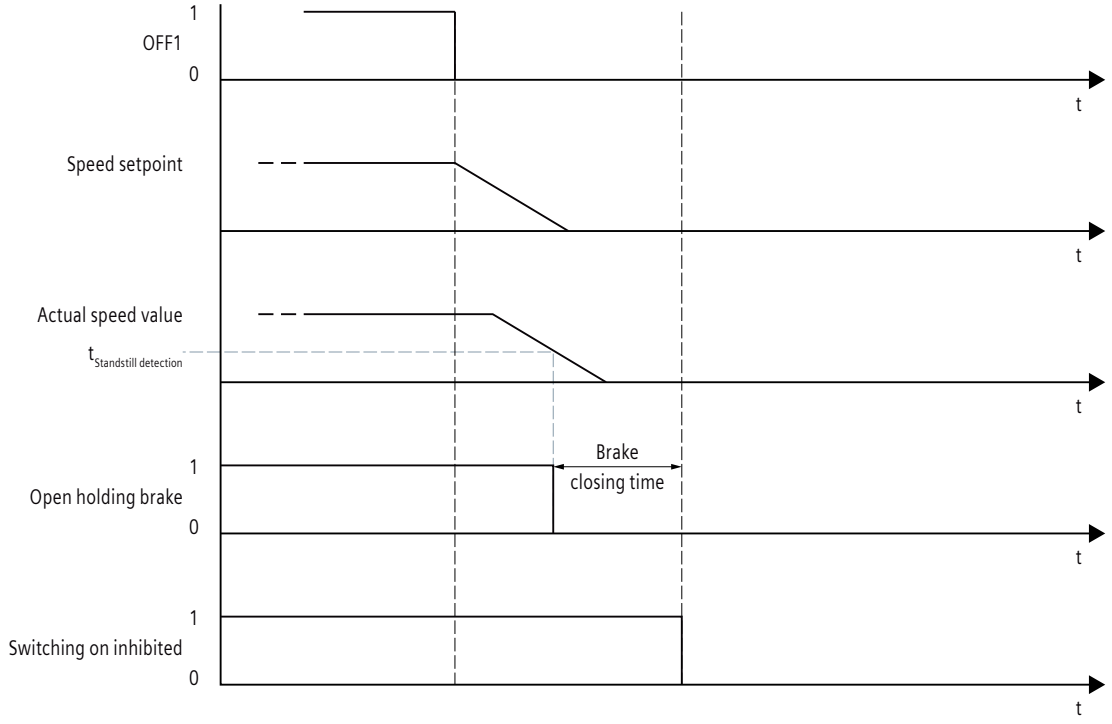

Figure 1-299 OFF1 sequence diagram when standstill detection is reached p1226

OFF2 (Coast down)

You activate OFF2 by resetting bit 1 in STW1 (NoCoastStop). Immediate pulse cancellation occurs, any configured motor holding brake is closed. The drive coasts to a stop without a motor holding brake. "Switching on inhibited" is activated.

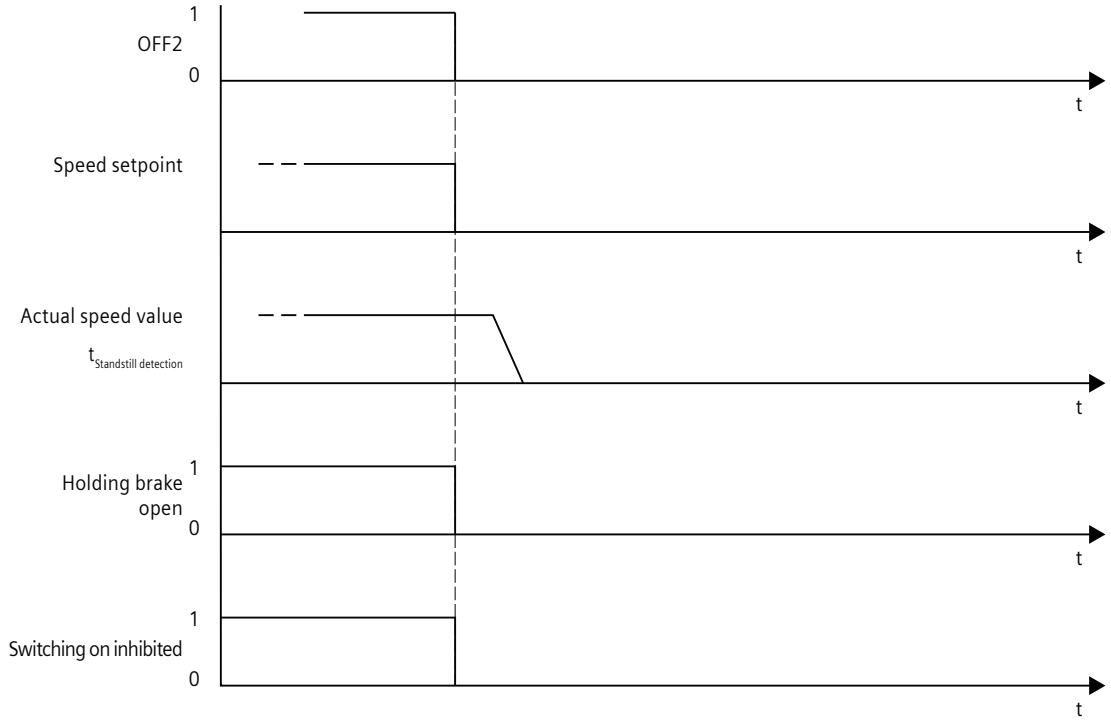

Figure 1-300 OFF2 sequence diagram

OFF3 (QuickStop)

You trigger a quick stop (OFF3) by resetting bit 2 in STW1 (NoQuickStop). The rapid stop takes into account the ramp-down time configured in the HSP ("Parameter" > "Setpoint channel" > "Speed – Ramp-function generator"). After the standstill is detected or the monitoring time has elapsed, any configured motor holding brake is closed and the pulses are deleted after the motor holding brake closing time p1217 has expired. "Switching on inhibited" is activated.

NOTE

NOTE on rapid stop (OFF3)
You trigger a quick stop (OFF3) by resetting bit 2 in STW1 (NoQuickStop). The rapid stop takes into account the ramp-down time configured in the HSP ("Parameter" > "Setpoint channel" > "Speed – Ramp-function generator").

Timeout
The rapid stop is monitored for time and causes the motor to be energized after 6 seconds at the latest.

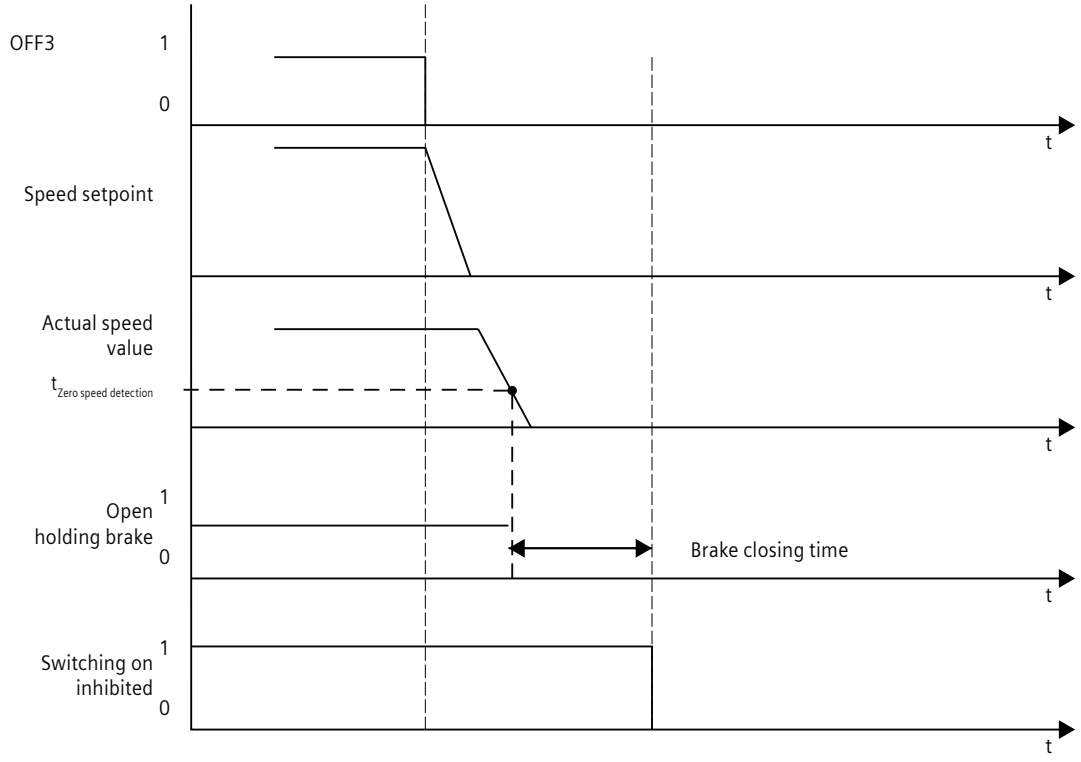

Figure 1-301 OFF3 sequence diagram

Prioritization

The OFF responses are prioritized as follows:

- OFF2 (coast down) > OFF1 (switch off)
- OFF3 (QuickStop) > OFF1 (Switch off)
- OFF2 (coast down) > OFF3 (quick stop)

7.8 DC-link voltage

The TM Drive system cyclically monitors the DC link voltage. The limits can be set under "Drive/Monitoring".

The regenerative feedback into the DC power supply cannot be suppressed. This has several advantages.

When the drive is braked and the brake chopper is not connected and configured, energy is fed back, which results in an increase in the DC link voltage. For this reason, the DC link voltage is monitored by the module.

You can freely set the DC link voltage monitoring limits within the permissible range.

If the limits are exceeded, the module switches off. Before the module switches off, it issues a warning (limit ∓ 5%) stating that the limit is almost exceeded.

Procedure

1. Open the "DC link voltage" area in the context of the drive under "Parameters" > "Drive/monitoring".
2. Configure:
   – Minimum value of the DC link voltage p0390
   – Maximum value of the DC link voltage p0391

⚠ WARNING

Operation above the voltage setting range
Under the given application conditions, ensure that the motor is not operated above the voltage setting range by selecting the appropriate motor and motor gear. Otherwise, the DC link voltage may increase when the control is inactive via 60 V DC.

7.9 Brake module

7.9.1 Brake module

The TM Drive system has a brake chopper for connection of an external brake resistor and can control a motor holding brake externally via the process image using a DQ or relay module. These functions can be activated individually or in parallel.

You can select the following options for the PMSM motor type under "Brake module":

- [0] No function
- [2] Brake chopper
- [3] Brake chopper and motor holding brake external via the process image
- [4] Motor holding brake externally via the process image

7.9.2 Brake chopper

If the brake chopper function is enabled, you need to configure the following parameters in the "Parameters" > "Drive" > "Brake module" area.

Set the following values for the brake chopper:

- Chopper switch-on voltage
- Chopper switch-off voltage
- Thermal resistance of the braking resistor
- Time constant of the brake resistor
- Maximum temperature
- Ambient temperature
- Response to max. temperature

The switch-on and switch-off voltage of the brake chopper must be set correctly according to the DC voltage supply. The chopper switch-off voltage p6011 must be higher than the supply voltage (example UDC = 48 V à p6011 = 50 V; chopper switch-on voltage p6010 = 52 V).

The voltage thresholds of the brake chopper should be adjusted accordingly with the parameters of the DC link voltage monitoring (7.7).

The TM Drive is not designed to be operated permanently as a brake axis. The circuit of the brake chopper monitors itself and protects itself against overload by switching off.

NOTICE
Risk of fire The switch-off voltage must not be lower than the DC supply voltage, otherwise the brake chopper will not switch off after activation and it may lead to an overload of the brake resistor and/or the module.

Capacity of the braking chopper output
The TM Drive is not designed to be operated permanently as a brake axis. The circuit of the brake chopper monitors itself and protects itself against overload by switching off.

You can find information about power calculation and resistor design in the appendix Braking resistor and brake chopper power (Page 140).

Monitoring of the braking resistor
The specific values of the braking resistor, such as heat resistance and time constant, can be obtained from the manufacturer of the braking resistor (data sheet). Typical values are stored as default values in the TIA Portal. The default values must be checked and adjusted if necessary.

- The thermal resistance describes how large the temperature difference between the resistor and the environment must be in order for a heat flow (power) of one watt to be emitted.
- The time constant indicates the time after which the resistance, at constant power input, has approached approx. 63% of its thermal equilibrium. After five times the time constant, the resistor is in its thermal steady state.

You use the maximum temperature to define the switch-off temperature for the resistor. The switch-off temperature is calculated in a thermal model based on the ambient temperature.

You use "Response to max. temperature" to define the behavior that is triggered when the maximum temperature is reached.

- Shutdown when temperature is exceeded Brake chopper operation is stopped and a warning is generated.
- No shutdown when temperature is exceeded Brake chopper operation is still possible.
- The thermal resistance describes how large the temperature difference between the resistor and the environment must be in order for a heat flow (power) of one watt to be emitted.
- The time constant indicates the time after which the resistance, at constant power input, has approached approx. 63% of its thermal equilibrium. After five times the time constant, the resistor is in its thermal steady state.

NOTICE
Risk of fire If braking chopper operation continues despite reaching the maximum operating temperature, this can result in a sharp increase in the temperature at the braking resistor. This can damage surrounding components or even result in fires in the worst case. In addition, always ensure that the minimum distances between the braking resistor and other modules are maintained.

⚠ CAUTION

Risk of burns due to hot surfaces
The braking resistor heats up during operation. Touching the hot braking resistor can result in personal injury and burns.
Avoid contact with the hot braking resistor.

7.9.3 External motor holding brake

The motor holding brake can be used when the drive system is disabled (e.g. when the power supply to the drive system is switched off) to prevent unwanted movements of the motor shaft (e.g. falling due to gravity). The motor can move by its own weight or an external force even if the motor power supply is interrupted.

NOTE

- Use this brake only for "holding", which means to maintain the standstill. Do not use it for "braking", which means to stop the moving load. Use the holding brake only to hold a motor at a standstill.
- The holding brake is enabled when the motor is switched off.

If the motor holding brake function is enabled, you must configure the following settings in the "Parameters" > "Drive" > "Brake module" area.

Adjust the opening and closing times of the motor holding brake:

- Motor holding brake opening time (p1216)
- Motor holding brake closing time (p1217)

For the closing and opening times, delay times of relays may have to be taken into account and added to the times of the motor holding brake.

p1216 = motor brake opening time + relay opening time

p1217 = motor brake closing time + relay closing time

If the motor holding brake is configured, the drive takes the delay times into account and accordingly sets bit 12 in the process image ZSW1. This bit can be used to control a motor holding brake, for example, with a DQ module or relay module.

NOTE

When selecting the additional module, make sure that the current carrying capacity is suitable. This must be dimensionless depending on the current consumption of the motor holding brake.

RC circuit of a TM Drive with DQ module and motor holding brake

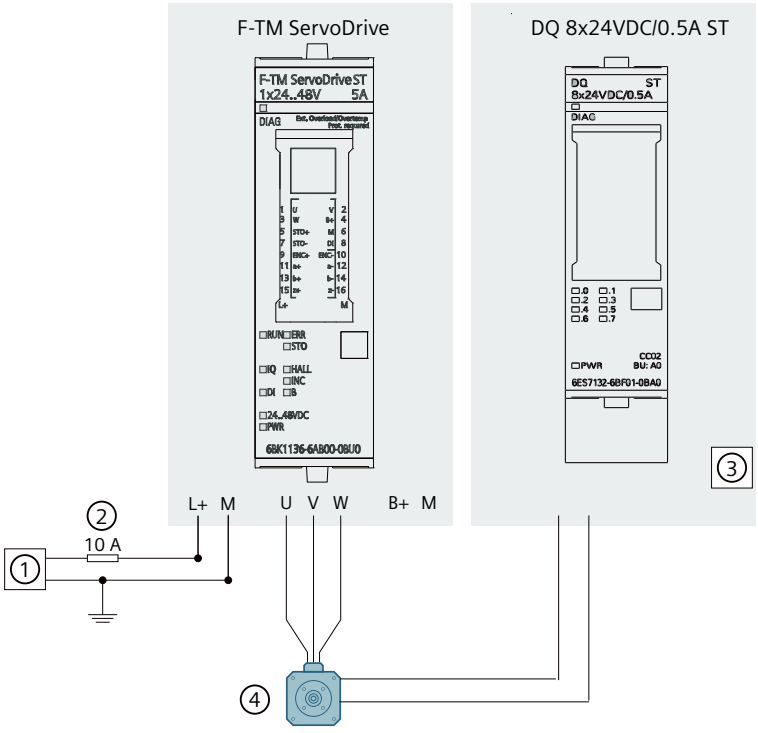

Figure 1-302 RC circuit of a TM Drive with DQ module and motor holding brake

Suspended axes

The additional torque p1511 is used to set an additional load torque.

To prevent a suspended axis without mechanical weight compensation from sagging after the holding brake is released, you can set up an electronic weight compensation via a supplementary torque p1511, section 7.8.1.

This reduces the compensation action after the release of a holding brake and specifies the holding torque directly after switch-on of the motor.

The option (p1900) "Encoder calibration at every start" must not be used with suspended loads.

NOTE

Suspended load with incremental encoder

For motors with incremental encoders where the commutation offset angle has not yet been synchronized, the axis may drop. This can be counteracted using the additional torque p1511, although a slight movement of the axis cannot be ruled out even then.

- It is recommended to use an absolute encoder especially for suspended loads.

Braking sequence

The sequence diagram shows an example of the behavior of the drive with OFF1.

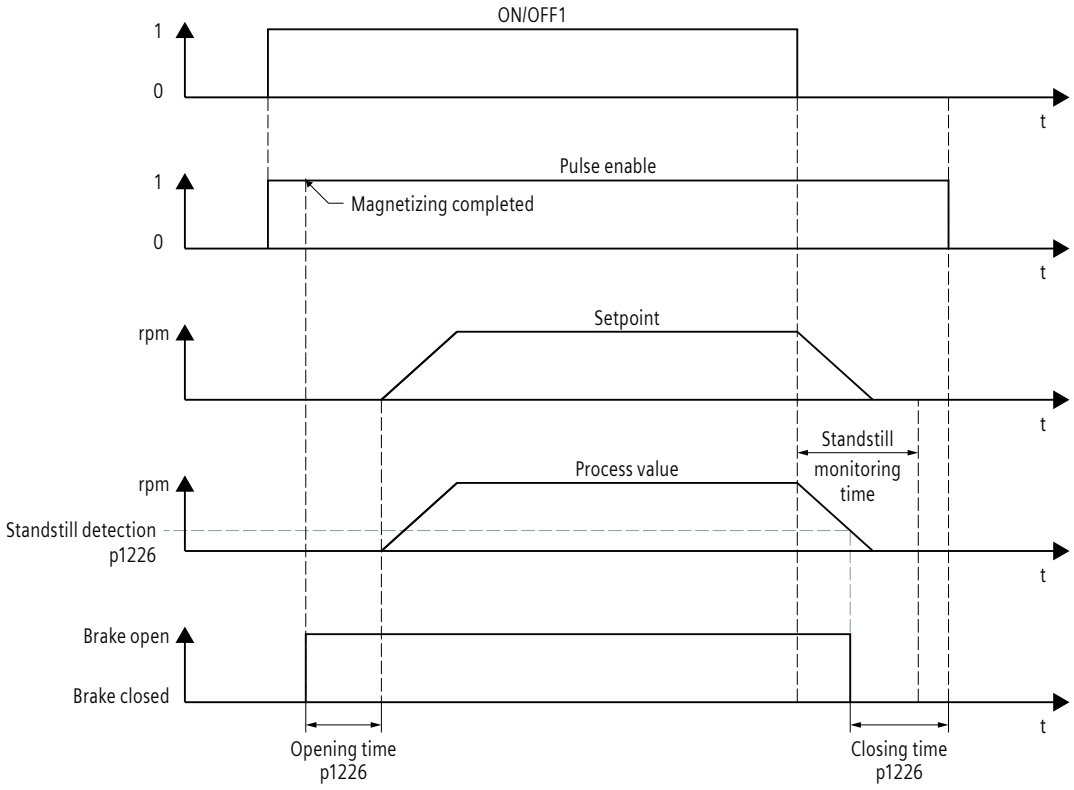

Figure 1-303 Braking sequence

The magnetizing time is calculated automatically depending on the motor parameters.

The influence of the motor holding brake on the OFF reactions is described in section 7.6.4 OFF reaction.

NOTICE
Improper use Improper use of the motor brake will shorten its service life. The motor brake is only intended for holding purposes. Frequent emergency stops with the motor brake shorten its service life. Unless absolutely necessary, do not use the motor brake as emergency stop.

7.10 Messages/monitoring

Thermal monitoring

The purpose of thermal monitoring is to detect critical states. Parameterizable warning thresholds are available that allow further operation of the drive (e.g. with reduced power) and prevent an immediate shutdown. However, the parameter assignment options are only interventions below the shutdown thresholds.

The following thermal monitoring options are available:

- Motor
  - Motor I^2t model
- Braking resistor
  - Temperature model
- Power end stage
  - Overload protection
  - Temperature sensor

When an overload is detected by one of these monitoring functions, a warning is output first. The respective warning thresholds (p0291) are parameterizable. The current status of the monitoring functions is displayed. If an alarm or fault limit is exceeded, the "Temperature monitoring" message is sent.

NOTE

All alarm and fault limits are provided with a corresponding hysteresis. The corresponding alarm or fault messages therefore remain until the threshold including hysteresis has been fallen below.

NOTE

Motor and brake resistance values

The thermal motor and braking resistor utilization are calculated quantities. The values are not saved.

After a power reset, the values only match again after a sufficiently long cooling time.

Operating temperature

Note that the specified ambient temperature range for the drive must always be adhered to, see section Technical specifications (Page 133).

7.10.1 Motor

Thermal motor monitoring

The thermal motor monitoring is performed using a configurable I^2t temperature model.

⚠ WARNING

Thermal motor utilization cannot be immediately determined after initialization
The thermal model is reinitialized after changing the drive data set and when switching on the device.
After initialization, the thermal motor utilization cannot be immediately determined as the model must first settle. As a consequence, an initial utilization of 50 % is used as basis. The settling phase duration depends on the given thermal time constants; the accuracy depends on to what extent the specific installation situation deviates from the model.
During the settling time it is possible that the set alarm and/or fault threshold is reached with some delay. For the installation situation simulated in the model, a comparatively unfavorable installation was selected so that generally deviations occur on the safe side.

You can define the warning threshold under Parameters > Messages/monitoring > Motor relative to the respective shutdown threshold.

Procedure

1. Open the "Motor" area in the context of the drive under "Parameters" > "Messages/monitoring".
2. Configure the warning threshold p0291[1].

Motor I^2t model
The I2t monitoring operates with the relative motor power loss, and in addition to the nominal motor current (p0305) as reference value, only requires the thermal time constant winding - environment (p0611[0]) to calculate the limiting integral. The 100 % shutdown threshold corresponds to the maximum continuous power loss of the motor, i.e. to the square of the nominal motor current (p0305).

Motor type PMSM
If the PMSM reaches the 100% threshold, the motor current is limited to the rated motor current to prevent overheating.

⚠ WARNING

Compliance with the ambient conditions specified by the motor manufacturer
The motor may only be operated in ambient conditions such as ambient temperature, installation elevation, etc. as specified by the manufacturer.
If the ambient conditions of the motor do not correspond to the values specified by the manufacturer, the motor must be derated. The derating behavior and the resulting lower motor performance data must be obtained from the motor manufacturer and adjusted accordingly in the motor parameters of the TM Drive.
If the motor is used outside its specification, the thermal model does not provide sufficient protection.

7.10.2 Braking resistor

Thermal monitoring of braking resistor

The braking resistor is monitored by a temperature model. You can specify the warning threshold (p0291[2]) relative to the shutdown threshold "Braking resistance maximum temperature" (p6023).

Procedure

1. Open the "Braking resistor" area in the context of the drive under "Parameters" > "Messages/monitoring".
2. Configure the warning threshold p0291[2].

⚠ WARNING

Thermal braking resistance load cannot be determined immediately after initialization
The thermal model is reinitialized after changing the drive data record and when switching on the device.
The thermal braking resistance load cannot be determined immediately after initialization because the model must settle. As a consequence, an initial utilization of 50 % is used as basis. The settling phase duration depends on the given thermal parameters; the accuracy depends on to what extent the specific installation situation deviates from the model. During the settling time it is possible that the set alarm and/or fault threshold is reached with some delay.
The installation situation should be taken into account for the thermal parameters of the braking resistor and, if necessary, less favorable parameters should be selected, for example, for the heat transfer resistance, so that deviations will generally occur towards the safe side.

7.10.3 Power end stage

Thermal monitoring of power end stage

The power end stage is monitored with a temperature sensor. You can specify the warning threshold (p0291[1]) relative to the shutdown threshold "System maximum temperature power end stage".

Procedure

1. Open the "Power end stage" area in the context of the drive under "Parameters" > "Messages/monitoring".
2. Configure the warning threshold p0291[1].

Besides the temperature monitoring, the current load is also monitored. The current load of the power unit is decisive for the temperature rise. The relative load of the power end stage is calculated based on the square of the output current according to the I^2t method.

Automatic overload limiting

The TM Drive is overload-capable. The load of the power end stage is automatically limited by the drive.

The maximum overload time $t_{overload}$ is calculated depending on the temperature of the power end stage TPU. When operating with cyclic overload, the rated power is not exceeded by the time-averaged power (rms).

PMSM

With a PMSM, a double overload of the rated current In cyclic for a duration of $t_{overload}$ = 3 s and a subsequent recovery time of 17 s at T_{PU} = 20 °C is possible. At T_{PU} = 80 °C, the overload time $t_{overload} \approx 0.75$ s.

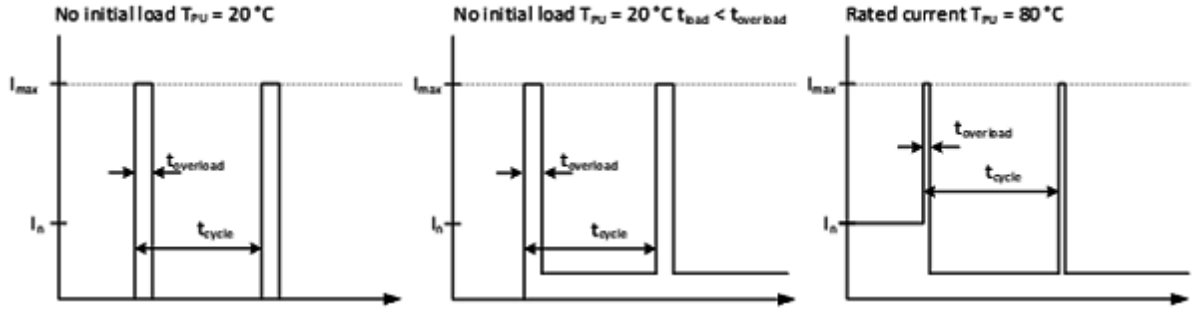

Figure 1-304 Overload behavior of TM Drive

Observe the information on derating depending on the ambient conditions (e.g. temperature, mounting position) in the section Derating of the F-TM ServoDrive ST (Page 137)

NOTE

Overload capability of the power unit

Operation with a peak current of 10 A is possible temporarily if the average RMS value of the output current does not exceed the rated current of the power unit up to 5 A.

7.11 Dynamic torque reduction

If dynamic torque reduction is required, this can be realized using the MOMRED signal via drive telegram 102. The torque limit currently in effect in the drive is reduced via this setpoint. MOMRED is used to specify the percentage by which the torque limit is to be reduced.

$$M_{limit.actual} = M_{reference} \bullet \left(1 - \frac{MOMRED}{16384}\right)$$

NOTE

The MOMRED signal is normalized to 4000 hex (16384 dec). The value 4000 hex (16384 dec) in the MOMRED control word corresponds to a 100% reduction of the configured reference torque p2003.

The dynamic torque limit is set to the respective minimum of the configured torque limitation (p1520), the limitation via MOMRED or the limitation by the max. permissible torque-forming current value.

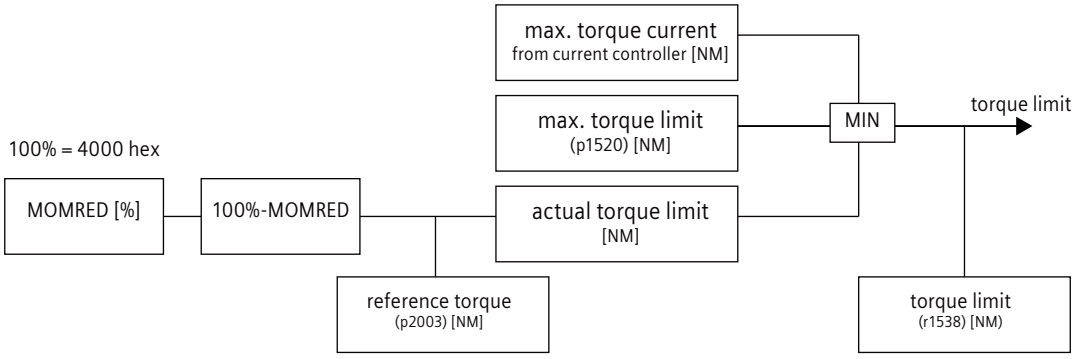

Figure 1-305 Dynamic torque limitation (MOMRED)

The torque values that are output by the drive and the torque limitation currently in effect can be viewed under "Online & Diagnostics" > "Diagnostics" > "Drive Diagnostics" > "Operating Values" if an online connection to the drive is established.

The following actual values are available:

- Torque setpoint (at the output of the speed controller) (r0079)
- Torque actual value (r0080)
- Torque limit (r1538)

Programming

8

The TM Drive does not have its own control panel. A user program is required to control the motion sequences.

You have the following options for controlling the motion sequences in the user program:

- Control via the process image (Page 112)
- Control via the SINA_SPEED (Page 121) instruction
- Control with a technology object (Page 122)

8.1 Controlling TM Drive via the process image

Structure of the I/O addresses

The structure of the input addresses of the TM Drive depends on the configured communication telegram and the telegram extension.

The telegrams can be set in the "Properties" area under "General" and further via "Basic parameters". Set the Telegram extension active option to make the status available via the digital input and the status of the STO input via the process image.

NOTE

The telegram extension option is not available for telegram 102.

The structure of the output addresses of the TM Drive depends on the configured communication telegram.

Basic procedure in STEP 7

1. In the project tree, create PLC data types in the CPU 2 with the appropriate structure for your configuration:
   - PLC data type for the structure of the input data (depending on PROFIdrive telegram type and telegram extension)
   - PLC data type for the structure of the output data (depending on PROFIdrive telegram type and telegram extension)
2. Create a tag from each type of the PLC data type in a tag table.
3. Assign the addresses for the tag according to the configured I/O addresses of the F-TM ServoDrive.
4. Control the F-TM ServoDrive by setting outputs bit-by-bit. You can find a description on how to set the outputs to control the F-TM ServoDrive in the PROFIdrive standard. You can find the current PROFIdrive specification under (https://www.profibus.com/).

8.2 Controlling a TM Drive via the instruction SINA_SPEED

Control with the SINA_SPEED instruction

For controlling the F-TM ServoDrive, you can also use the SINA-SPEED instruction from the "DriveLib" block library.

The SINA_SPEED block only works with the standard telegram 1. The telegram extension may have to be disabled. See Communication telegrams (Page 59).

The "DriveLib" block library can be downloaded from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109475044).

8.3 Controlling TM Drive with a technology object

Control with a technology object

You can also use a technology object, for example "Speed-controlled axis" or "Positioning axis", to control the TM Drive.

Note that the TM Drive itself does not have integrated positioning functionality and only supports speed operation.

Procedure

1. Create, for example, a "Speed axis" technology object in the CPU in the project tree in STEP 7.
2. Open the technology object.
3. Select the "TM Drive" under "Configuration" > "Hardware interface" > "Drive".
4. Reference the technology object in the user program using the Motion Control technology instructions, e.g. "MC-Power".

NOTE

We do not recommend using the "Encoder calibration at every startup" option in conjunction with positioning technology objects (positioning axis). The calibration process can lead to undesired behavior of the drive axis.

Additional information

You can find more information about the technology objects and technology instructions in the online help of STEP 7.

Maintenance

9

9.1 Firmware update

Firmware update

A firmware update is possible via PROFINET.

See SIMATIC ET200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293).

9.2 Stop responses

Overview of the stop responses

Faults with safety functions and violation of limits can trigger the following stop responses:

- "Hardware STO"

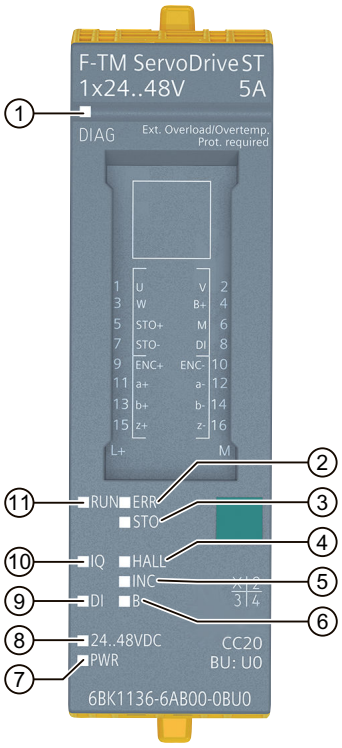
  "Safe Torque Off" (STO) corresponds to Stop Category 0 in accordance with EN 60204-1. With "Safe Torque Off" (STO), the motor is switched directly to zero torque. A motor at standstill cannot be started again accidentally. A moving motor coasts to standstill.

Table 1-622 Overview of stop responses

Stop response	Triggered ...	Action	Effect
STO	At least one signal STO+/STO- is interrupted.	Motor controllers interrupted	Drive coasts down

After the drive has been stopped, restart it with PROFIdrive.

The faults and warnings are described in the appendix Active messages (Page 128).



Interrupts, error messages and diagnostics and system alarms

10

10.1 Status and error displays

LED display

The figure below shows the LEDs on the F-TM ServoDrive.

①	DIAG (red/green)	⑦	PWR (green)
②	ERR (red)	⑧	24..48V (green)
③	STO (yellow) Display not safety-related	⑨	DI (green)
④	HALL (green)	⑩	IQ (green)
⑤	INC (green)	⑪	RUN (green)
⑥	B (green)		

Figure 1-306 LED display on F-TM ServoDrive

Meaning of the LED displays

The following tables contain the meanings of the status and error displays.

DIAG LED

Table 1-623 DIAG status and error display

DIAG LED	Meaning	
Off	Backplane bus supply of the ET 200SP not OK	
Flashing	Module parameters not assigned	
On	Module parameters assigned and no module diagnostics	
Flashing	0.5 Hz (slow)	Module parameters assigned and module diagnostics There is a fault. You can find detailed information via "Online & Diagnostics" > "Diagnostics" > "Active messages" or in the section Active messages (Page 128).
	1 Hz (normal)	
	2 Hz (fast)	

RUN LED

Table 1-624 RUN status and error display

RUN LED	Meaning	
Off	Device is not yet ready for operation	
On	Device is ready for operation and error-free	
Flashing	0.5 Hz (slow)	Device is performing self-test during power-up
	1 Hz (normal)	Device performs a firmware update
	2 Hz (fast)	Device has detected a parameterization error

ERR LED

Table 1-625 ERR status and error display

ERR LED	Meaning
Off	No fault
On	Device has a fault and needs to be restarted. This corresponds to a critical device fault.

DI LED

Table 1-626 DI status and error display

DI LED	Meaning
Off	Input is faulty/inactive
On	Input is error-free/active

B LED

Table 1-627 B status and error display

B LED	Meaning
■ On	The motor holding brake is open / information about the process image was set

STO LED

Table 1-628 STO status and error display

STO LED	Meaning
■ On	Safety sensor is connected and has not tripped
☼ flashes (0.5 Hz)	Safety sensor has tripped (motor is disconnected from power)

IQ LED

Table 1-629 Status and error display IQ (encoder)

IQ LED	Meaning
■ On	IQ speed encoder was assigned parameters/activated
Flashes (2 Hz)	IQ speed encoder could not be initialized IQ speed encoder has a connection problem (A/B track not connected)

Hall LED

Table 1-630 Status and error display Hall (encoder)

Hall LED	Meaning
■ On	Hall speed encoder was assigned parameters/activated

INC LED

Table 1-631 Status and error display INC (encoder)

INC LED	Meaning
■ On	Incremental speed encoder was assigned parameters/activated
☼ Flashes (2 Hz)	Incremental speed encoder has a connection problem (A/B and/or Z track not connected)

24..48V LED

Table 1-632 24..48V status and error display

24..48V LED	Meaning
□ Off	DC link voltage outside the configured limits
■ On	DC link voltage within the configured limits (is OK)
flashes (0.5 Hz)	DC link voltage shortly before the interference threshold

PWR LED

Table 1-633 PWR status and error display

PWR LED	Meaning
□ Off	Logic component supply of the converter is missing
■ On	Logic component supply of the converter is OK

10.2 Diagnostics

10.2.1 Diagnostics overview of the F-TM ServoDrive

Diagnostic view of the CPU and its associated I/O

If you go online to the CPU and establish an online connection via the CPU to the TM Drive, this occurs within the project context.

Procedure

To display the diagnostic information for the TM Drive, follow these steps.

1. Select the TM Drive in the project tree, for example under "Ungrouped devices".
2. Double-click "Online & diagnostics".
   The "Diagnostics - General" window appears.
3. Navigate to the required information.

The diagnostic window is divided into the following diagnostic groups:

- **General**
  The general diagnostic information is displayed for:
  - Module
  - Module information
  - Manufacturer information
- **Diagnostics status**
  "Diagnostics status" shows the current diagnostics status of the TM Drive.

- **Active messages**
  "Active messages" displays the currently pending alarms and faults in the TM Drive module.
- **Drive diagnostics**
  The current diagnostic information of the drive is displayed for:
  - Status bits
  - Operating values
  - Encoders
  - Temperatures
  - Inputs

10.2.2 Active messages

Pending faults and alarms

"Active messages" shows the currently pending faults and alarms in the TM Drive. Faults must be acknowledged after the cause has been corrected.

Procedure

To display the active messages, follow these steps:

1. Select the TM Drive in the project tree and go to "Online & diagnostics".
2. In the "Diagnostics" folder, select the "Active messages" area.

Faults and alarms

NOTE
In open-loop control operation, no diagnostics of the encoder signals is performed (see fault numbers 1045 and 1046)

The TM Drive supports the following faults.

Fault number	Description	S7 diagnostics alarm
1000	Overvoltage in the DC link	Undervoltage
1001	Undervoltage in the DC link	Overvoltage
1003	Shutdown due to overcurrent switch-off of a phase	Overload
1006	Braking resistor short-circuit	Overload
1019	External braking resistor/motor holding brake of the 4th phase interrupted	Wire break
1032	Temperature measured values implausible	Error
1035	Permitted temperature at the motor end stage exceeded	Overtemperature
1036	Permitted temperature at the motor winding exceeded	Overtemperature

Fault number	Description	S7 diagnostics alarm
1037	Permissible temperature of the braking resistor exceeded	Overtemperature
1039	Connection to IQ encoder interrupted	Wire break
1042	Fail-safe shutdown path (STO) defective	Safety-related shutdown
1043	Permissible temperature of the control electronics exceeded	Overtemperature
1044	Permissible temperature of the braking resistor exceeded The drive is switched off.	Overtemperature
1045	The connection to the A/B track of the incremental speed encoder is interrupted.	Wire break
1046	The connection to the Z track of the incremental speed encoder is interrupted.	Wire break
1047	An unsupported PROFIdrive speed encoder function was requested.	-
1049	Zero point calibration could not be performed. The rotor may be blocked. The motor holding brake may not be open.	External error
1050	A ramp/quick stop (OFF1/OFF3) could not be performed due to a timeout.	External error
1051	Zero point calibration could not be performed due to a timeout. The system may be oscillating too much.	External error
1053	Overload of the brake chopper control	Overload
1054	Permissible temperature at the motor winding when stepper motor exceeded	Overload
1055	Motor resistance detection could not be performed	Wire break
1056	Following error during controlled system detection	Overload
1057	Position error during controlled system detection	Overload
1200	CRC checksum error in absolute encoder	Error in actuator/sensor
1201	Internal encoder error in the absolute encoder	Error in actuator/sensor
1202	No communication with absolute encoder possible or communication establishment failed.	Wire break
1203	Internal error in encoder interface	Error
1300	There is an error in the parameter assignment of the motor type.	Parameterization error
1301	Electrical time constant of the q axis is too low.	Parameterization error
1302	Electrical time constant of the d axis is too low.	Parameterization error
1303	Torque constant inconsistent	Parameterization error
1340	There is an error in the parameter assignment of the encoder.	Parameterization error
1360	There is an error in the parameter assignment of the controller.	Parameterization error
1380	There is an error in the parameter assignment of the braking function.	Parameterization error
1999	General error	Error

Acknowledge faults

To acknowledge all active faults, click the "Acknowledge faults" button.

Alarms

Column	Description
Alarm number	Number of the warning
Description	Description of the warning

The F-TM ServoDrive supports the following warnings.

Alarm number	Description
2000	Voltage in the DC link shortly before shutdown
2001	STO shutdown active
2002	Warning threshold when motor end stage temperature is exceeded
2003	Warning threshold when motor winding temperature is exceeded
2004	Thermal overload of the motor end stage
2005	Thermal overload of the braking resistor
2007	Switch-on delay because axis is still rotating.

10.2.3 Drive diagnostics

You can find online information on important current drive diagnostics data and drive service data in the "Drive diagnostics" area under "Online & diagnostics" in the context of the drive.

NOTE
All drive diagnostics are only available online. They are automatically updated in the user interface.

You will find diagnostic information on the following points in the "Drive diagnostics" area:

- Status bits
- Operating values
- Encoders
- Temperatures
- Inputs

Properties of drive diagnostics

Drive diagnostics

- Show the current values of various parameters
- Are cyclically updated
- Are read-only.

Drive diagnostics: Status bits

"Online & diagnostics" > "Diagnostics" > "Drive diagnostics" > "Status bits"

Table 1-634 Drive diagnostics - status bits

Number	Parameter	Display/unit
Status word		
r0899	Status bits **Note**: Signal corresponds to status word 1 PROFIdrive (r0968).	• Ready for switching on • Ready for operation • Operation • Fault active • Coasting active • Rapid stop active • Switching on inhibited active • Alarm active • Speed setpoint - actual value deviation • Control by controller • n comparison value reached • Control of the motor holding brake is active **Note:** • Status word 1 is sent cyclically by the drive to the higher-level controller.

Drive diagnostics: Operating values

"Online & diagnostics" > "Diagnostics" > "Drive diagnostics" > "Operating values"

Table 1-635 Drive diagnostics - operating values

Number	Parameter	Display/unit
r0063	Speed actual value smoothed	rpm
r1045	Speed setpoint in front of the ramp-function generator	rpm
r0080	Torque actual value	Nm
r0079	Torque setpoint	Nm
r1538	Torque limit	Nm
r0026	DC link voltage	V
r0027	Current actual value	A_{eff}
r0072	Output voltage	V

Drive diagnostics: Encoders

"Online & diagnostics" > "Diagnostics" > "Drive diagnostics" > "Encoder"

Table 1-636 Drive diagnostics - encoder

Number	Parameter	Display/unit
r7811	Position	°
r7810[0]	Steps	-
p979[2]	Increments per revolution	-

Number	Parameter	Display/unit
P979[5]	Number of revolutions	-
p979[3]	Fine resolution bits in actual value Gx_XIST1	Bits
P979[4]	Fine resolution bits in actual value Gx_XIST2	Bits

Drive diagnostics: Temperatures

"Online & diagnostics" > "Diagnostics" > "Drive diagnostics" > "Temperatures"

Table 1-637 Drive diagnostics -temperatures

Number	Parameter	Display/unit
r0037[0]	Current microcontroller	°C
r0037[1]	Microcontroller max.	
r0037[4]	Power end stage	
r0037[5]	Power end stage max.	

Drive diagnostics: Inputs

"Online & diagnostics" > "Diagnostics" > "Drive diagnostics" > "Inputs"

Table 1-638 Drive diagnostics - inputs

Number	Parameter	Display/unit
-	Inputs	• Digital input • STO active

Reference

All displayed parameters have a tooltip that provides you with information and descriptions relating to the parameter as well as access to the online help.

You can find additional information on the parameters in the Product Information (https://support.industry.siemens.com/cs/ww/en/view/109773204).

Technical specifications

11

11.1 Technical specifications

Technical specifications of the TM Drive

Article number	6BK1136-6AB00-0BU0
General information	
Product type designation	F-TM ServoDrive ST
HW functional status	V1.0
Firmware version	V1.3
• FW update possible	Yes
Product description	Control of EC motors
usable BaseUnits	BU type U0
Product function	
• I&M data	Yes
• Isochronous mode	No
• Four-quadrant operation	Yes
• Speed control with encoder	Yes
• Speed control without encoder	No
• Safety Functions	Yes; Drive controller with hardwired STO
Protection function	
• Undervoltage protection	Yes
• Overvoltage protection	Yes
• Overload protection	Yes
• Ground-fault protection	No
• Short-circuit protection	Yes
Installation type/mounting	
Type of ventilation	Convection cooling
Supply voltage	
Design of the power supply	24 ... 48 V DC, SELV / PELV
permissible range, lower limit (DC)	16.8 V
permissible range, upper limit (DC)	57.6 V
Input current	
Current consumption (rated value)	6 A
Current consumption, max.	10 A
Current consumption for the electronics, max.	0.1 A
Inrush current, max.	25 A; at 24 V
output voltage / header	
Rated value, min.	24 V
Rated value, max.	48 V

Article number	**6BK1136-6AB00-0BU0**
Output current	
Current output (rated value)	5 A
Output current, max.	10 A
Output frequency	599 Hz
Encoder supply	
Number of outputs	1
5 V encoder supply	
• 5 V	Yes
• Short-circuit protection	Yes
• Output current, max.	150 mA
Power	
DC power consumption	300 W; At 50 V
Power loss	
Power loss, typ.	3.5 W
Digital inputs	
Number of digital inputs	1; input for message signal
Number of safety inputs	1; For STO, antivalent (2-pin) - 24 V DC
Encoder	
Connectable encoders	
• Incremental encoder (symmetrical)	Yes; up to 500 Hz per channel
Interrupts/diagnostics/status information	
Alarms	
• Diagnostic alarm	Yes
• Hardware interrupt	No
Diagnoses	
• Monitoring the supply voltage	Yes
• Wire-break	Yes
• Short-circuit	Yes
• Group error	Yes
Diagnostics indication LED	
• RUN LED	Yes
• ERROR LED	Yes
Integrated Functions	
Position detection	
• Incremental acquisition	Yes
• Absolute acquisition	No
• Suitable for S7-1500 Motion Control	Yes
Potential separation	
Potential separation channels	
• between the channels and backplane bus	Yes
Isolation	
Isolation tested with	DC 850 V, type test (between backplane bus, DC input and functional grounding)
Overvoltage category	III
Degree of pollution	2 according to EN 61800-5-1

Article number	6BK1136-6AB00-0BU0
Degree and class of protection	
IP degree of protection	IP20
Standards, approvals, certificates	
CE mark	Yes
UKCA mark	Yes
cULus	Yes
RCM (formerly C-TICK)	Yes
KC approval	Yes
EAC (formerly Gost-R)	Yes
RoHS conformity	Yes
China RoHS compliance	Yes
Standard for EMC according to EN 61800-3	Yes
Standard for drive acc. to EN 61800-5-1	Yes
Standard for drive acc. to EN 61800-5-2	Yes
Highest safety class achievable in safety mode	
• Performance level according to ISO 13849-1	Category 3, performance level d, according to EN ISO 13849-1:2015
• SIL acc. to IEC 61508	2
• SIL according to DIN EN 61800-5-2	2
Ambient conditions	
Pollution degree during storage and transport	2
Ambient temperature during operation	
• horizontal installation, min.	-30 °C; No condensation, splash water, icing, salt spray or oil mist permitted.
• horizontal installation, max.	60 °C; No condensation, splash water, icing, salt spray or oil mist permitted. Note the derating data!
• vertical installation, min.	-30 °C; No condensation, splash water, icing, salt spray or oil mist permitted.
• vertical installation, max.	50 °C; No condensation, splash water, icing, salt spray or oil mist permitted. Note the derating data!
Ambient temperature during storage/transportation	
• Storage, min.	-30 °C
• Storage, max.	70 °C
Altitude during operation relating to sea level	
• Installation altitude above sea level, max.	3 000 m
Cables	
Cable length for motor, shielded, max.	10 m
Dimensions	
Width	20 mm
Height	73 mm
Depth	58 mm
Weights	
Weight, approx.	55 g
Other	
Brake design	holding brake control via the process image
Braking chopper	Yes

Technical specifications of the IQ encoder

Type	IQ encoder
Output signals	2 square wave signals (A, B), 2 square wave signals inverse (nA, nB) Output differential or single ended TTL compatible, phase shifted
Number of pulses per revolution	100 (default)
Limit frequency	5 kHz
Supply voltage	+ 5 V (+/- 10 %)
Current consumption	Typ. 40 mA max. 100 mA
Permissible output current	Max. 20 mA
Permissible deviation of the pulse width from electrical 180°	+/- 90 °
Phase shift of channel A and B	Typ. 90 ° (+/- 30 °)
Output voltage (low level)	Typ. 0.25 V, max. 0.8 V (I = 20 mA at 5 V)
Output voltage (high level)	Typ. 4.25 V, max. 3.8 V (I = 20 mA at 5 V)
Permissible ambient temperature range (TU)	-25 °C ... +105 °C
Reverse polarity protection	Occurs due to a short-circuit of the supply voltage via a protective diode, max. 200 mA continuous current permissible

Climatic and mechanical environmental conditions

You can find the climatic and mechanical ambient conditions here SIMATIC ET200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293).

If there are discrepancies between the statements in this document and the system manual, the statements in the this document take priority.

Biological environmental conditions

The standards DIN EN IEC 60721-3-1:2018, DIN EN IEC 60721-3-2:2018, IEC 60721-3-3: Edition 3.0, with the classes 1B1, 2B1 and 3B1 apply for the biological environmental conditions during operation, long-term storage and transport.

Conductive dust and sand

The TM Drive must not be exposed to conductive dust or sand during operation, long-term storage and transport.

Chemical environmental conditions

The standards DIN EN IEC 60721-3-1:2018, DIN EN IEC 60721-3-2:2018, DIN EN 60721-3-3:1995, with the classes 1C2, 2C2 and 3C2 apply for the chemical environmental conditions during operation, long-term storage and transport.

11.2 Derating of the ET 200SP TM Drive

Maximum permitted output current as a function of installation altitude and ambient temperature

You must take into account the dependency on the ambient temperature and installation altitude.

Derating of the TM Drive depends on the installation elevation
For all permissible mounting types, starting from an installation altitude of 1000 m, a derating of 10% current per additional 1000 m elevation gain applies. The motor current and the output current of the outputs must be reduced.

All other functions do not have to be reduced up to the maximum installation altitude.

The figure below shows the maximum permitted output current as a function of the ambient air temperature for the derating.

Derating of the TM Drive depends on the ambient temperature (horizontal/vertical mounting position)
When installed horizontally (DIN rail horizontal), the TM Drive can be operated up to the maximum ambient temperature (60 °C). Note the derating curve.

With vertical mounting (vertical mounting rail), the TM Drive may be operated up to a maximum of 50 °C. Note the derating curve.

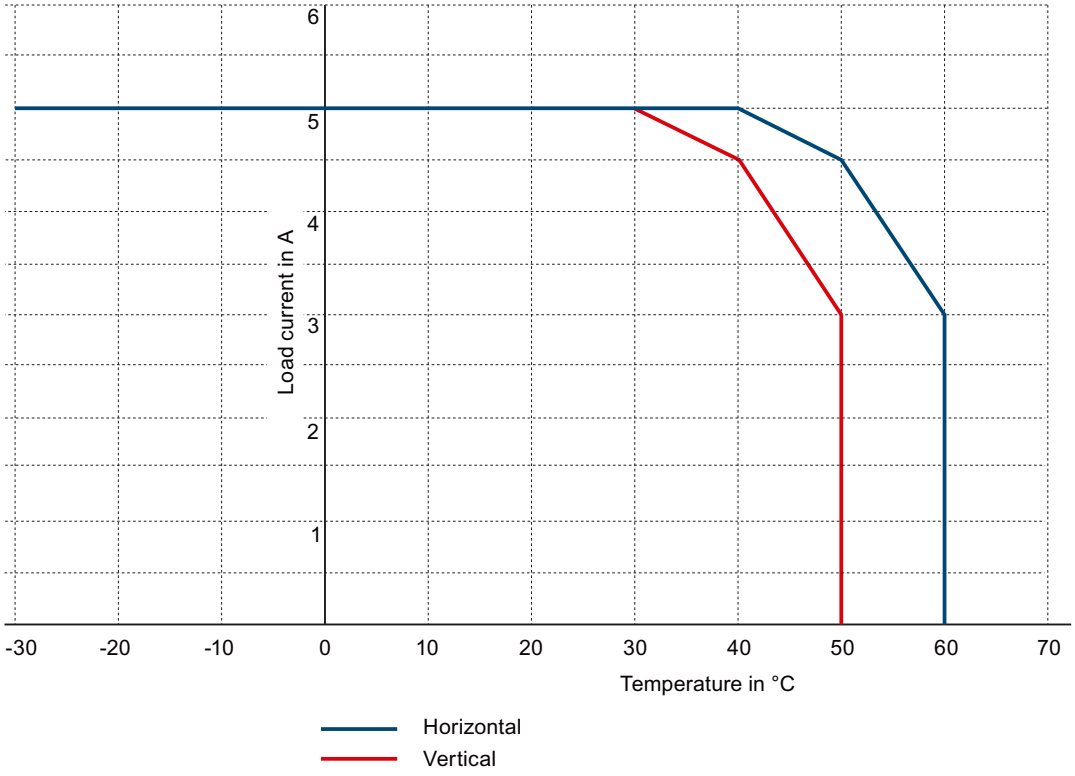


Figure 1-307 Derating of the TM Drive

Test signal suppression

The STO inputs can be dark tested. The dark test time is up to 1 ms.

Appendix

A

A.1 Response times

Introduction

Below you can find the response time of the TM Drive in STEP 7. The response times of the TM Drive are included in the calculation of the response time of the F-system.

The drive system is the component that provides the safety functions.

Definition of response time

The response time is the time between the detection of an input signal and the change of a linked output signal.

Definition of process safety time of a process

The process safety time of a process is the time between the occurrence of an error within which a process can be left unattended without risk to life and limb of the operating personnel or damage to the environment and the time of the completed reaction.

Any type of F-system control is tolerated within this process safety time, i.e. the F-system can control its processes incorrectly or even not at all. The process safety time of a process depends on the type of process and must be determined on a case-by-case basis.

Check that the process safety time of the process is not exceeded. You may need to reduce the specific monitoring times of the F-system.

Fluctuation width

The actual response time falls between a minimum and maximum response time. You must always assume the maximum response time when configuring your system.

Definition of maximum response time in an error-free scenario (worst case delay time, WCDT)

In the event of errors outside the drive system (e.g. incorrect setpoint setting by a controller, limit violations due to behavior of the motor, closed-loop control, load, etc.), the "maximum response time in an error-free scenario" is guaranteed.

Definition of maximum response time when an error is present (one fault delay time, OFDT)

In the event of a single error within the drive system (e.g. defect in a shutdown path of the power unit), the "maximum reaction time in the event of error" is guaranteed.

Times required for the calculation

Function	Maximum response time
STOP_STO via terminal	20 ms

STOP_STO:
With a STOP_STO, the drive safely switches off the torque of the connected motor immediately.

A.2 Braking resistor and brake chopper power

The maximum continuous current of the brake chopper end stage is 5 A. The end stage can be overloaded, so that higher currents / powers are possible for a short time.

The average braking current of 5 A is monitored using an I2t model. Once the end stage has fully cooled down, a braking current of 10 A is possible for approx. 15 s, for example.

Related to 60 s, this results in a load cycle of 25%. For other current values, the load cycle can be estimated using the following figure.

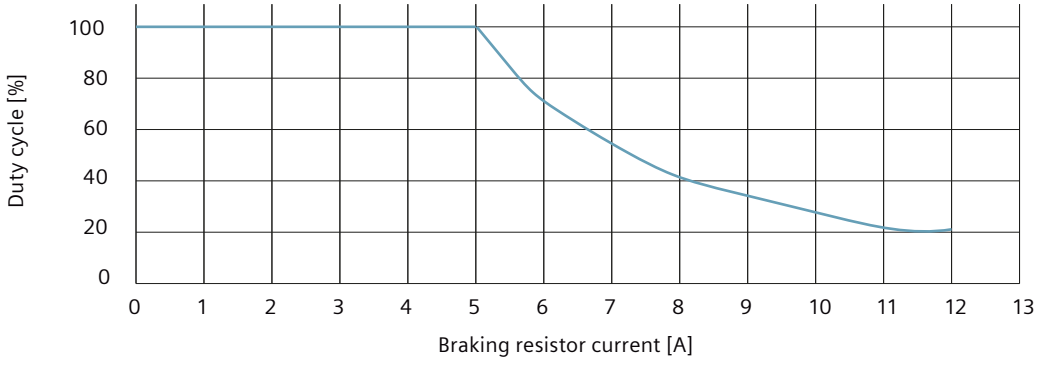

Figure 1-308 Load cycle as a function of the braking resistor current

NOTE
The resistance of the externally connectable braking resistor must be ≥ 5 ohms.

Calculation of the continuous braking power of the end stage

The continuous power of the end stage can be estimated using the following formula.

$$P_{chopper_{rated}} = 0.5 \bullet (U_{on} + U_{off}) \bullet 5A$$

Table 1-639 Examples of continuous power of the end stage

Average DC link voltage	Continuous power
26 V	130 W
50 V	250 W

Calculation of the continuous braking power as a function of the braking resistor
The average braking power of the braking resistor depends on the braking resistance value and the DC link voltage or the switch-on and switch-off values of the brake chopper (U_{on} p6010 and U_{off} p6011). It can be estimated with the following formula.

$$P_{brake\ resistor} = \frac{(0.5 \bullet (U_{on} + U_{off}))^2}{R_{brake\ resistor}}$$

Table 1-640 Examples for braking resistor line

Average DC link voltage	Braking resistor value	Braking resistor power
26 V	5 Ω	135.2 W
	10 Ω	67.6 W
50 V	5 Ω	500 W
	10 Ω	250 W

Determination of the braking resistor peak power
In order to calculate the short-time peak power of the resistor, the configured switch-on voltage U_{on} p6010 of the brake chopper must be used.

$$P_{brake\ resistor\ max\ peak} = \frac{U_{on}^{\ 2}}{R_{brake\ resistor}}$$

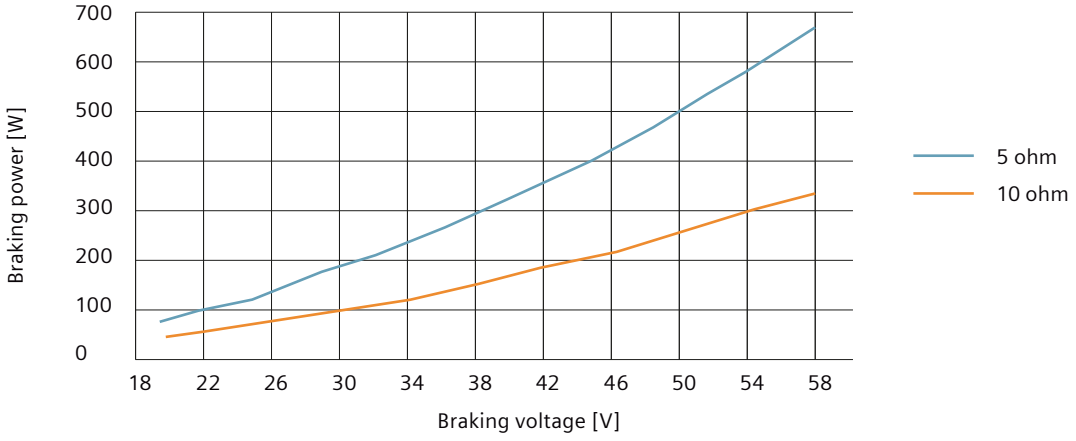

Figure 1-309 Maximum peak power of the braking resistor

It must be checked whether the braking resistor can absorb the peak power and, if needed, the continuous power expected.

A.3 Data sets

You can find an overview of the data sets for the TM Drive and the structure of the data sets in the Product Information (https://support.industry.siemens.com/cs/ww/en/view/109773204).

A.4 Device disposal

Recycling and disposal

For environmentally-friendly recycling and disposal of your old device, please contact a company certified for the disposal of waste electrical and electronic equipment, and dispose of the old device as prescribed in the respective country of use.

NOTE
The device does not have its own memory. Neither personal data nor project-specific data are stored on it. It is not necessary to reset the memory for data security reasons.

A.5 Directives and standards

Directives and standards that are complied with

TM Drive complies with the requirements of the following directives and standards:

CE

European Machinery Directive
TM Drive meets the requirements of the Machinery Directive, 2006/42/EU through compliance with EN 61800-5-2, insofar as the equipment is used within the area of application of this directive.

TM Drive has been fully evaluated for compliance with the material provisions relating to health and safety in the directive when used in a typical machine application.

European EMC Directive
The compliance of TM Drive with the regulations of Directive 2014/30/EU has been verified through full compliance with EN 61800-3.

Safety Integrated
TM Drive complies with the requirements for functional safety/machine safety.

RoHS
TM Drive complies with Directive 2011/65/EU on the restriction of the use of certain hazardous substances.

Underwriters Laboratories (North American market)
TM Drive equipment bearing any of the test symbols shown to the left complies with the requirements for the North American market as a component of drive applications and is listed accordingly.

- UL file number for DC mains connection: E229808

Eurasian conformity
TM Drive complies with the requirements of the Eurasian Customs Union (EAC).

Australia and New Zealand (RCM formerly C-Tick)
TM Drive equipment bearing the symbol shown complies with the EMC requirements for Australia and New Zealand.

EMC requirements for South Korea
TM Drive equipment bearing the KC symbol on the rating plate complies with the EMC requirements for South Korea.

Certificates for download

- EC declaration of conformity:
- Certificates for the relevant directives, prototype test certificates, manufacturers declarations and test certificates for functions relating to functional safety ("Safety Integrated"): (https://support.industry.siemens.com/cs/ww/en/ps/26085/cert)
- Certificates of products that were certified by UL: (https://iq.ulprospector.com)

Standards that are not relevant

China Compulsory Certification
TM Drive does not fall within the scope of China Compulsory Certification (CCC).

UKCA - United Kingdom Conformity Assessed

The TM Drive series complies with the conformity requirements for England, Scotland and Wales.

China RoHS

The TM Drive drive series complies with the China RoHS.
You will find more information at:
China RoHS (https://support.industry.siemens.com/cs/ww/en/ps/26085/cert)

Introduction

1

1.1 About SIMATIC Micro-Drive

SIMATIC MICRO-DRIVE

SIMATIC MICRO-DRIVE is the drive system for safety extra-low voltages of 24 V to 48 V. Comprising SIMATIC MICRO-DRIVE, versatile motors and connecting cables from selected product partners, it extends the SIEMENS portfolio in the safety extra-low voltage area.

Suitable controllers from the SIMATIC range round out the motion control functionalities.

SIMATIC MICRO-DRIVE TM Drives

TM Drives is a technology module for SIMATIC ET 200SP. It can be controlled by a SIMATIC S7-1500/1200, including via technology objects (TO). TM Drives can be used in combination with a Distributed Controller or the SIMATIC ET 200SP Open Controller in decentralized system concepts.

1.2 About this information for use

1.2.1 Contents

To illustrate possible application areas for our products, typical use cases are listed in this product documentation and in the online help. These are purely exemplary and do not constitute a statement on the suitability of the respective product for applications in specific individual cases. Unless explicitly contractually agreed, Siemens assumes no liability for such suitability. Suitability for a particular application in specific individual cases must be assessed by the user, taking into account all technical, legal, and other requirements on a case-by-case basis. Always observe the descriptions of the technical properties and the relevant constraints of the respective product contained in the product documentation.

Content of the Equipment Manual

This Equipment Manual supplements the ET 200SP System Manual (https://support.industry.siemens.com/cs/ww/en/view/58649293).

Functions that generally relate to the system are described in the System Manual.

The information provided in this Equipment Manual and in the System/Function Manuals supports you in commissioning the system.

Firmware versions

This manual is valid for firmware version FW 2.1 and current HSP versions from V18 and for the corresponding GSDML version.

NOTE
The current firmware versions can be found in Industry Online Support (https://support.industry.siemens.com/cs/ww/en/view/109801314).

Conventions

CPU: When the term "CPU" is used in the following, it applies to the central modules of the S7-1500 automation system, the S7-1200 automation system, as well as to the CPUs/interface modules of the ET 200SP distributed I/O system.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Also observe notes marked as follows:

NOTE
A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

This documentation should be kept in a location where it can be easily accessed and made available to the personnel responsible.

Information regarding third-party products

NOTE
Recommendation relating to third-party products
This document contains recommendations relating to third-party products. Siemens accepts the fundamental suitability of these third-party products.
You can use equivalent products from other manufacturers.
Siemens does not accept any warranty for the properties of third-party products.

1.2.2 Target group

The Equipment Manual is intended for:

- Assemblers
- Commissioning engineers
- Operators
- Service personnel
- Project engineers

1.2.3 Standard scope

The functions of the system as delivered can only be found in the order documents.

Further functions may be executable in the system, which are not explained in this documentation. However, there is no entitlement to these functions in the case of a new delivery or service.

This documentation does not contain all detailed information on all types of the product. Furthermore, this documentation cannot take into consideration every conceivable type of installation, operation and service/maintenance.

The machine manufacturer must document any additions or modifications they make to the product themselves.

1.2.4 Use of third-party products in this documentation

This documentation contains recommendations relating to third-party products. Siemens accepts the fundamental suitability of these third-party products. You can use equivalent products from other manufacturers.

Siemens does not accept any warranty for the use of third-party products.

1.2.5 Websites of third-party companies

This document may contain hyperlinks to third-party websites. Siemens is not responsible for and shall not be liable for these websites and their content. Siemens has no control over the information which appears on these websites and is not responsible for the content and information provided there. The user bears the risk for their use.

1.3 SIMATIC documentation

1.3.1 ET 200SP Documentation Guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.

This arrangement enables you to access the specific content you require.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Basic information

The System Manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP distributed I/O system.

The STEP 7 online help supports you in the configuration and programming.

Examples:

- ET 200SP System Manual
- System Manual ET 200SP HA/ET 200SP modules for devices used in a hazardous area
- Online help TIA Portal

Device information

Figure 1-310 Icon for device information

Equipment manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

Examples:

- Equipment Manuals CPUs
- Equipment Manuals Interface Modules
- Equipment Manuals Digital Modules
- Equipment Manuals Analog Modules
- Equipment Manuals Motor Starter
- BaseUnits Equipment Manuals
- Equipment Manual Server Module
- Equipment Manuals Communications Modules
- Equipment Manuals Technology Modules

General information

The function manuals contain detailed descriptions on general topics relating to the SIMATIC ET 200SP distributed I/O system.

Examples:

- Function Manual ET 200AL/ET 200SP Mixed Configuration
- Function Manual Diagnostics
- Function Manual Communication
- PROFINET Function Manual
- PROFIBUS Function Manual
- Function Manual Designing Interference-free Controllers
- MultiFieldbus Function Manual

Product Information

Changes and supplements to the manuals are documented in a Product Information. The Product Information takes precedence over the device and system manuals.

You can find the latest Product Information on the ET 200SP distributed I/O system on the Internet. (https://support.industry.siemens.com/cs/ww/en/view/73021864)

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet.
(https://support.automation.siemens.com/WW/view/en/84133942)

Manual Collection fail-safe modules

The Manual Collection contains the complete documentation on the fail-safe SIMATIC modules, gathered together in one file.

You can find the Manual Collection on the Internet.
(https://support.industry.siemens.com/cs/ww/en/view/109806400)

1.3.2 SIMATIC Technical Documentation

Additional SIMATIC documents will complete your information. You can find these documents and their use at the following links and QR codes.

The Industry Online Support gives you the option to get information on all topics. Application examples support you in solving your automation tasks.

Overview of the SIMATIC Technical Documentation

Here you will find an overview of the SIMATIC documentation available in Siemens Industry Online Support:

Industry Online Support International (https://support.industry.siemens.com/cs/ww/en/view/109742705)

Watch this short video to find out where you can find the overview directly in Siemens Industry Online Support and how to use Siemens Industry Online Support on your mobile device:

Quick introduction to the technical documentation of automation products per video (https://support.industry.siemens.com/cs/us/en/view/109780491)

YouTube video: Siemens Automation Products - Technical Documentation at a Glance (https://youtu.be/TwLSxxRQQsA)

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You can find the application examples on the Internet. (https://support.industry.siemens.com/cs/ww/en/ps/ae)

1.4 Service & Support

1.4.1 ID link and Siemens Online Support

You can find additional information about the product:

- via ID link
- using the Siemens Industry Online Support
  - Website: SIOS
  - App Industry Online Support (for Apple iOS and Android)

Product-specific information via ID link

The QR code on your product and on the product packaging contains the ID link.

ID link is a globally unique identifier according to IEC 61406-1.

You can use the ID link to access product data, manuals, Declarations of Conformity, certificates and other information about your product.

Figure 1-311 QR code with ID link included

The ID link is characterized by a frame with a black corner at the bottom right.

Content of Siemens Online Support

- Product support
- Global forum for information and best practice sharing between users and specialists
- Local contact persons via the contact person database (→ Contact)

1.4.2 Spare parts services

The online spare part service "Spares on Web (https://www.sow.siemens.com)" offers spare parts for the product.

1.4.3 FAQ

You will find FAQs on TM Drive on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/26085/faq).

1.5 Important product information

1.5.1 Intended use

This equipment is used for the open-loop and closed-loop control of EC and stepper motors for safety extra-low voltages up to 48 V DC.

⚠ WARNING

Hazardous Voltage
Can Cause Death, Serious Injury, or Property Damage.
Intended use of hardware products
This equipment is only allowed to be used for the applications described in the catalog and in the technical description, and only in conjunction with non-Siemens equipment and components recommended by Siemens.
Correct transport, storage, installation and assembly, as well as careful operation and maintenance, are required to ensure that the product operates safely and without faults.
EU note: Start-up/commissioning is absolutely prohibited until it has been ensured that the machine in which the component described here is to be installed fulfills the regulations/specifications of Directive 2006/42/EC.

1.6 Safety Evaluation Tool (SET)

You can quickly and easily evaluate the safety functions of your machine using the Safety Evaluation Tool (SET) for the IEC 62061 and ISO 13849-1 standards. You receive the results as a standard-compliant report that can be integrated in the machine documentation as proof of safety.

The free Safety Evaluation Tool is available on the Internet (https://new.siemens.com/global/en/products/automation/topic-areas/safety-integrated/factory-automation/support/safety-evaluation-tool.html).

Fundamental safety instructions 2

2.1 General safety instructions

⚠ WARNING

Electric shock and danger to life due to other energy sources

Touching live components can result in death or severe injury.

- Only work on electrical devices when you are qualified for this job.
- Always observe the country-specific safety rules.

Generally, the following steps apply when establishing safety:

1. Prepare for disconnection. Notify all those who will be affected by the procedure.
2. Isolate the drive system from the power supply and take measures to prevent it being switched back on again.
3. Wait until the discharge time specified on the warning labels has elapsed.
4. Check that there is no voltage between any of the power connections, and between any of the power connections and the protective conductor connection.
5. Check whether the existing auxiliary supply circuits are de-energized.
6. Ensure that the motors cannot move.
7. Identify all other dangerous energy sources, e.g. compressed air, hydraulic systems, or water. Switch the energy sources to a safe state.
8. Check that the correct drive system is completely locked.

After you have completed the work, restore the operational readiness in the inverse sequence.

⚠ WARNING

Risk of electric shock and fire from supply networks with an excessively high impedance

Excessively low short-circuit currents can lead to the protective devices not tripping or tripping too late, and thus causing electric shock or a fire.

- In the case of a conductor-conductor or conductor-ground short-circuit, ensure that the short-circuit current at the point where the converter is connected to the line supply at least meets the minimum requirements for the response of the protective device used.
- You must use an additional residual-current device (RCD) if a conductor-ground short circuit does not reach the short-circuit current required for the protective device to respond. The required short-circuit current can be too low, especially for TT supply systems.

⚠ WARNING

Risk of electric shock and fire from supply networks with an excessively low impedance
Excessively high short-circuit currents can lead to the protective devices not being able to interrupt these short-circuit currents and being destroyed, and thus causing electric shock or a fire.

- Ensure that the prospective short-circuit current at the line terminal of the converter does not exceed the breaking capacity (SCCR or Icc) of the protective device used.

⚠ WARNING

Electric shock if there is no ground connection
For missing or incorrectly implemented protective conductor connection for devices with protection class I, high voltages can be present at open, exposed parts, which when touched, can result in death or severe injury.

- Ground the device in compliance with the applicable regulations.

⚠ WARNING

Electric shock due to connection to an unsuitable power supply
When equipment is connected to an unsuitable power supply, exposed components may carry a hazardous voltage. Contact with hazardous voltage can result in severe injury or death.

- Only use power supplies that provide SELV (Safety Extra Low Voltage) or PELV- (Protective Extra Low Voltage) output voltages for all connections and terminals of the electronics modules.

⚠ WARNING

Electric shock due to equipment damage
Improper handling may cause damage to equipment. For damaged devices, hazardous voltages can be present at the enclosure or at exposed components; if touched, this can result in death or severe injury.

- Ensure compliance with the limit values specified in the technical data during transport, storage and operation.
- Do not use any damaged devices.

⚠ WARNING

Electric shock due to unconnected cable shield
Hazardous touch voltages can occur through capacitive cross-coupling due to unconnected cable shields.

- As a minimum, connect cable shields and the conductors of power cables that are not used (e.g. brake cores) at one end at the grounded housing potential.

⚠ WARNING

Arcing when a plug connection is opened during operation
Opening a plug connection when a system is in operation can result in arcing that may cause serious injury or death.

- Only open plug connections when the equipment is in a voltage-free state, unless it has been explicitly stated that they can be opened in operation.

NOTICE

Material damage caused by an incorrect power connection
An incorrect power connection can result in damage due to fire, device defects or malfunctions.

- Check all power connections at regular intervals, particularly after equipment has been transported.

⚠ WARNING

Electromagnetic interference due to inadequate shield support
A lack of adequate shield support for the power cables can cause malfunctions and impermissibly high levels of interference.

- Use the shield connection plates supplied or recommended.
- Use the shield connection clips recommended.

⚠ WARNING

Active implant malfunctions due to electromagnetic fields
Converters generate electromagnetic fields (EMF) in operation. Electromagnetic fields may interfere with active implants, e.g. pacemakers. People with active implants in the immediate vicinity of an converter are at risk.

- As the operator of an EMF-emitting installation, assess the individual risks of persons with active implants.
- Observe the data on EMF emission provided in the product documentation.

⚠ CAUTION

Symptomatic respiratory and skin reaction to chemicals
A newly purchased product might contain traces of substances that are identified as sensitizers.
Sensitizers are substances which can cause sensitization in the lungs and skin after exposure to them.
Once sensitized, individuals can have severe reactions to further exposure, even in small amounts. In the most extreme cases, individuals might develop asthma or dermatitis respectively.

- If the product has a strong smell, keep it in a well-ventilated area for 14 days.

⚠ WARNING

Unexpected machine movement caused by radio devices or cellphones
Using radio devices, cellphones, or mobile WLAN devices in the immediate vicinity of the components can result in equipment malfunction or faults and damage to the devices. Malfunctions may impair the functional safety of machines and can therefore put people in danger or lead to property damage.

- Avoid operating radio devices, cellphones and mobile WLAN devices in the direct vicinity of converters and operating units.
- Scan the machine readable code, e.g. a QR code, from a greater distance or switch off the converter power supply before scanning.
- Only operate built-in devices with the control cabinet doors closed.
- When control cabinet doors are open, only qualified electrical personnel are allowed to carry out service and maintenance work.

⚠ CAUTION

Radio frequency interference in residential areas
When you operate EMC category C2 devices in residential areas, the devices can cause radio frequency interference.
When you operate EMC category C3 or C4 devices in residential areas, it is to be expected that the devices will cause radio frequency interference.

- Do not operate EMC category C2 devices in residential areas.
- Do not operate EMC category C3 or C4 devices in public low-voltage networks supplying residential buildings.

NOTE

It cannot be guaranteed that EMC emission limits are complied with if the products are connected to an isolated line supply, a line supply grounded through a high ohmic connection or a line supply with a grounded line conductor.

- Draw-up an EMC plan to comply with the EMC requirements of the planned application.

⚠ WARNING

Fire due to inadequate ventilation clearances
Inadequate ventilation clearances can cause overheating of components with subsequent fire and smoke. This can cause severe injury or even death. This can also result in increased downtime and reduced service lives for devices/systems.

- Ensure compliance with the specified minimum clearance as ventilation clearance for the respective component.

NOTICE

Overheating due to inadmissible mounting position
The device may overheat and therefore be damaged if mounted in an inadmissible position.

- Only operate the device in admissible mounting positions.

NOTICE

Device damage caused by incorrect insulation resistance tests
High test voltages can damage the device.

- Measure the insulation resistance of low voltage circuits of machines or systems only with ≤ 500 V DC.
- Measure the insulation resistance of SELV circuits of machines or systems only with ≤ 250 V DC.

NOTICE

Device damage caused by incorrect voltage tests
High test voltages can damage the device. Capacitive leakage currents can distort the test results.

- Disconnect the components before carrying out a voltage test on the machine. [1)]

[1)] The components are voltage tested in accordance with the IEC 61800-5-1 product standard and must be disconnected during testing in accordance with IEC 60204-1:2021 Section 18.4.

⚠ WARNING

Unexpected movement of machines caused by inactive safety functions
Inactive or non-adapted safety functions can trigger unexpected machine movements that may result in serious injury or death.

- Observe the information in the appropriate product documentation before commissioning.
- Carry out a safety inspection for functions relevant to safety on the entire system, including all safety-related components.
- Ensure that the safety functions used in your drives and automation tasks are adjusted and activated through appropriate parameterizing.
- Perform a function test.
- Only put your plant into live operation once you have guaranteed that the functions relevant to safety are running correctly.

⚠ WARNING

Malfunctions of the machine as a result of incorrect or changed parameter settings
As a result of incorrect or changed parameterization, machines can malfunction, which in turn can lead to injuries or death.

- Protect the parameterization against unauthorized access.
- Handle possible malfunctions by taking suitable measures, e.g. emergency stop or emergency off.

2.2 Equipment damage due to electric fields or electrostatic discharge

Electrostatic sensitive devices (ESD) are individual components, integrated circuits, modules or devices that may be damaged by either electric fields or electrostatic discharge.

NOTICE

Equipment damage due to electric fields or electrostatic discharge
Electric fields or electrostatic discharge can cause malfunctions through damaged individual components, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber of aluminum foil.
- Only touch components, modules and devices when you are grounded by one of the following methods:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

2.3 Warranty and liability for application examples

Application examples are not binding and do not claim to be complete regarding configuration, equipment, or any eventuality which may arise. Application examples do not represent customer-specific solutions, but merely serve to provide assistance with typical tasks.

As the user you yourself are responsible for ensuring that the products described are operated correctly. Application examples do not relieve you of your responsibility for safe handling when using, installing, operating and maintaining the equipment.

2.4 Cybersecurity information

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial cybersecurity measures that may be implemented, please visit
https://www.siemens.com/cybersecurity-industry.

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Cybersecurity RSS Feed under
https://new.siemens.com/cert.

Further information is provided on the Internet:
Configuration Manual Industrial Cybersecurity
(https://support.industry.siemens.com/cs/ww/en/view/109975311)

⚠ WARNING

Unsafe operating states resulting from software manipulation
Software manipulations, e.g. viruses, Trojans, or worms, can cause unsafe operating states in your system that may lead to death, serious injury, and property damage.

- Keep the software up to date.
- Incorporate the automation and drive components into a state-of-the-art, integrated industrial cybersecurity concept for the installation or machine.
- Make sure that you include all installed products in the integrated industrial cybersecurity concept.
- Protect files stored on exchangeable storage media from malicious software by with suitable protection measures, e.g. virus scanners.
- Carefully check all cybersecurity-related settings once commissioning has been completed.

2.5 Residual risks of power drive systems

When assessing the machine or system-related risk in accordance with the respective local regulations (e.g. EC Machinery Directive), the machine manufacturer or system integrator must take into account the following residual risks emanating from the control and drive components of a drive system:

1. Unintentional movements of driven machine or system components during commissioning, operation, maintenance, and repairs caused by, for example,
   - Hardware faults and/or software errors in the sensors, control system, actuators, and connections
   - Response times of the control system and of the drive
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - Parameterization, programming, cabling, and installation errors
   - Use of wireless devices/mobile phones in the immediate vicinity of electronic components
   - External influences/damage
   - X-ray, ionizing radiation and cosmic radiation
2. Unusually high temperatures inside and outside the components, including open flames, as well as emissions of light, noise, particles, gases, etc. due to fault conditions, e.g.:
   - Component failure
   - Software errors
   - Operation and/or environmental conditions outside the specification
   - External influences/damage
   - Short circuits or ground faults in the intermediate DC circuit of the converter

3. Hazardous shock voltages caused by, for example:
   - Component failure
   - Influence during electrostatic charging
   - Induction of voltages in moving motors
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - External influences/damage
4. Electrical, magnetic and electromagnetic fields generated in operation that can pose a risk to people with a pacemaker, implants or metal replacement joints, etc., if they are too close
5. Release of environmental pollutants or emissions as a result of improper operation of the system and/or failure to dispose of components safely and correctly
6. Influence of network-connected and wireless communications systems, e.g. ripple-control transmitters or data communication via the network or mobile radio, WLAN or Bluetooth.
7. Motors for use in potentially explosive areas:

   When moving components such as bearings become worn, this can cause enclosure components to exhibit unexpectedly high temperatures during operation, creating a hazard in areas with a potentially explosive atmosphere.

For more information about the residual risks of the drive system components, see the relevant sections in the technical user documentation.

Product overview

3

3.1 Area of application

Broad range of control applications

The SIMATIC ET 200SP distributed I/O system offers the necessary flexibility and performance for a wide range of control applications.

The F-TM ServoDrive HF is a product from the TM Drive range of modules in the ET 200SP network. The term TM Drive is synonymous with the F-TM ServoDrive HF in this manual.

The F-TM ServoDrive HF technology module offers you the following application possibilities:

- Variable speed control
- Positioning tasks in combination with higher-level controller
- In the area of safety extra-low voltage ≤ 60 V DC with integrated hardware Safety function Safe Torque Off (STO)

Areas of application

TM Drives have proven to be an ideal and compact drive in many applications.

Examples of applications:

- Packaging machines
- Automatic assembly machines
- Electronics and battery production
- Printing and labeling machines
- Winders/unwinders, e.g. in the textile, packing and printing and solar industries
- Driving of shuttles for storage and retrieval machines and storage rack systems
- Automated guided vehicle systems
- Battery-powered applications

Figure 1-313 View of the F-TM ServoDrive HF module

Properties

The F-TM ServoDrive HF has the following properties:

- Operation on ET 200SP PROFINET IMs as of V4.0
- Operation on CPU 151x as of V2.0, S7-1200, OpenController and CPU 151xSP
- Speed-controlled single-axis drive with PROFIdrive profile
- Rated voltage of the drive module: 24 to 48 V DC (safety extra-low voltage)
- Support of IQ encoder technology
- Support of incremental encoders with (A, B, Z track)
- Support of BiSS-C absolute encoders
- 24 V digital input
- Support of individually configurable motors (permanent-magnet synchronous motor (PMSM) and bipolar stepper motors)
- Controller parameter determination possible using HSP
- Thermal monitoring of the motor and the power end stage
- Braking chopper, external braking resistor
- Thermal monitoring of the braking resistor
- Cyclic overload capability
- Safety function STO hardwired
- Motor holding brake external via the process image
- Integrated engineering in STEP 7 (TIA Portal) via Hardware Support Package HSP0311 as of V16

Accessories

The following accessories that are not included in the module's scope of delivery can be used with the module:

Designation	Article number
Feed BaseUnit (light)*	6ES7193-6BP00-0DU0
Expansion BaseUnit (dark)*	6ES7193-6BP00-0BU0
MCB, B, 6 A	5SY6106-6
MCB, B, 10 A	5SY6110-6
MCB, B, 6 A for UL markets	5SJ4106-6HG40
MCB, B, 10 A for UL markets	5SJ4110-6HG40
Shield connection	6ES7193-6SC00-1AM0

* A BaseUnit of the type U0 (6ES7193-6BP00-0DU0 or 6ES7193-6BP00-0BU0) is needed for operation of the TM Drive. You can find an overview of the BaseUnits that you can use with the technology module in the Equipment Manual SIMATIC ET 200SP BaseUnits (https://support.industry.siemens.com/cs/ww/en/view/109751716).

For additional information on accessories such as:

- Labeling strips
- Color-coded labels
- Reference identification labels

refer to the System Manual SIMATIC ET200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293).

NOTE

Unsuitable electronic fuses

Electronic fuses that disconnect the output voltage briefly in case of an overload and are not capable of power feedback (e.g. SITOP SEL1200) are not suitable for fuse protection.

3.3 Supported functions

System functions

The TM Drive supports the following PROFINET IO functions:

- Firmware update via PROFINET IO

The TM Drive supports the function:

- Identification data I&M 0 to 3

PROFIdrive communication types

TheTM Drive supports the following types of communication:

- Cyclic data exchange via a cyclic data channel

  Motion control systems require cyclically updated data during operation for open-loop and closed-loop control. This data must be sent as setpoints to the drive devices or read as actual values from the drive devices via the communication system. The transfer of this data is normally time-critical.
- Acyclic data exchange via an acyclic data channel

  An acyclic parameter channel for exchange of parameters between the CPU or supervisor and the drive devices is additionally available. Access to this data is not time-critical.
- Alarm channel

  Alarms are output event-triggered and indicate incoming and outgoing error states.

PROFIdrive application classes

The TM Drive supports Application Classes 1 and 4 of the PROFIdrive profile as of V4.2.

- Class 1 (AC1)

  The drive is controlled via a speed setpoint using PROFINET.

  The closed-loop speed control takes place entirely in the drive.

  Typical applications are, for example, simple frequency converters for pump and fan control.

- Class 4 (AC4)

  This PROFIdrive application class defines a speed setpoint interface with the closed-loop speed control taking place in the drive and the closed-loop position control taking place in the CPU, as is required for robot and machine tool applications with coordinated motion sequences on multiple drives.

Wiring

4

4.1 Pin assignment

Specific application

Observe the safety and accident prevention regulations applicable for specific applications, e.g. "Safety of Machinery EN ISO 13849-1".

During wiring and maintenance work, the TM Drive must be disconnected from the power supply.

EMERGENCY OFF equipment

EMERGENCY OFF devices according to IEC 60204 (corresponds to DIN VDE 0113) must remain in effect in all operating modes of the plant or system.

The drive-integrated safety function STO of the TM Drive does not replace the EMERGENCY OFF mechanism of the plant.

Excluding hazardous plant states

Hazardous operating states must not occur when

- The plant restarts up after a voltage dip or voltage failure
- Bus communication resumes after a fault

If necessary, the EMERGENCY OFF must be forced!

An uncontrolled or undefined startup must not occur after the EMERGENCY OFF is unlocked.

You can find a description on how to prevent uncontrolled startup in the section Safety Integrated functions (Page 45).

Potential group

Up to a continuous input current of max. 10 A for each potential group, up to 3 TM Drives can be connected together to form a drive line-up.

No other ET 200SP components may be located within a potential group consisting of one or more TM Drive.

A TM Drive potential group can be supplied as follows:

- With a separate power supply unit
- With a common power supply that also supplies other components. In this case, use a DC line filter (e.g. TDK Electronics 2-wire filter B84113C series) before the TM Drive potential group.

- If you are using a power supply unit with a rated current of more than 10 A or batteries/rechargeable batteries, it is imperative to connect a circuit breaker of characteristic B with max. 10 A rated current, approved for direct current and the corresponding SELV / PELV voltage, upstream of the TM Drive potential group. For a potential group with only one TM Drive, we recommend using an appropriate miniature circuit breaker with 6 A nominal current and characteristic B.
- You must not use voltage sources with low impedance such as supercaps without adequate current-limiting protective measures.

Short circuits

The power outputs of the TM Drive are short-circuit proof. If the module detects a short-circuit, it is still imperative to rectify the fault before switching it on again. Otherwise the module can be damaged.

Disturbance of radio communication services due to radio-frequency interferences in residential environments

The TM Drive can cause radio frequency interference which requires measures for interference suppression. This system is not designed for liberal use in the first environment (residential area) and must not be used there without appropriate radio interference suppression measures. Have the installation and commissioning performed with appropriate radio interference suppression measures by experts.

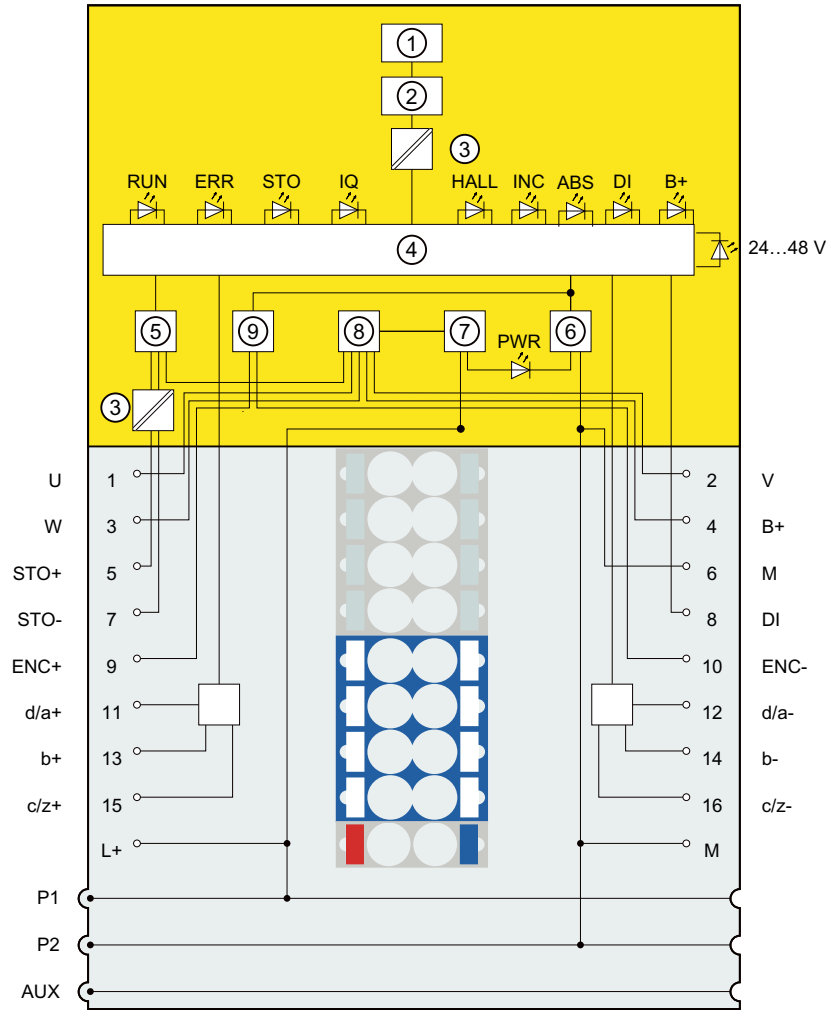
Protection from external electrical effects

You can find information on interference-proof design in the function manual Designing interference-free controllers
(https://support.industry.siemens.com/cs/ww/en/view/59193566).

Overload

The TM Drive is overload-capable. The load of the power end stage is automatically limited by the drive.

With automatic overload limiting, the output current is automatically reduced on reaching the rated load of the power end stage to effectively prevent an overload of the power unit.



SCCR (short circuit current rating)

Suitable For Use On A Circuit Capable Of Delivering Not More Than 5kA DC Symmetrical Amperes, 48 Volts DC Maximum.

Cable lengths and cable types

If you do not use an "all-in-one" plug-in cable, the following cable lengths and cable types are permitted for the interfaces:

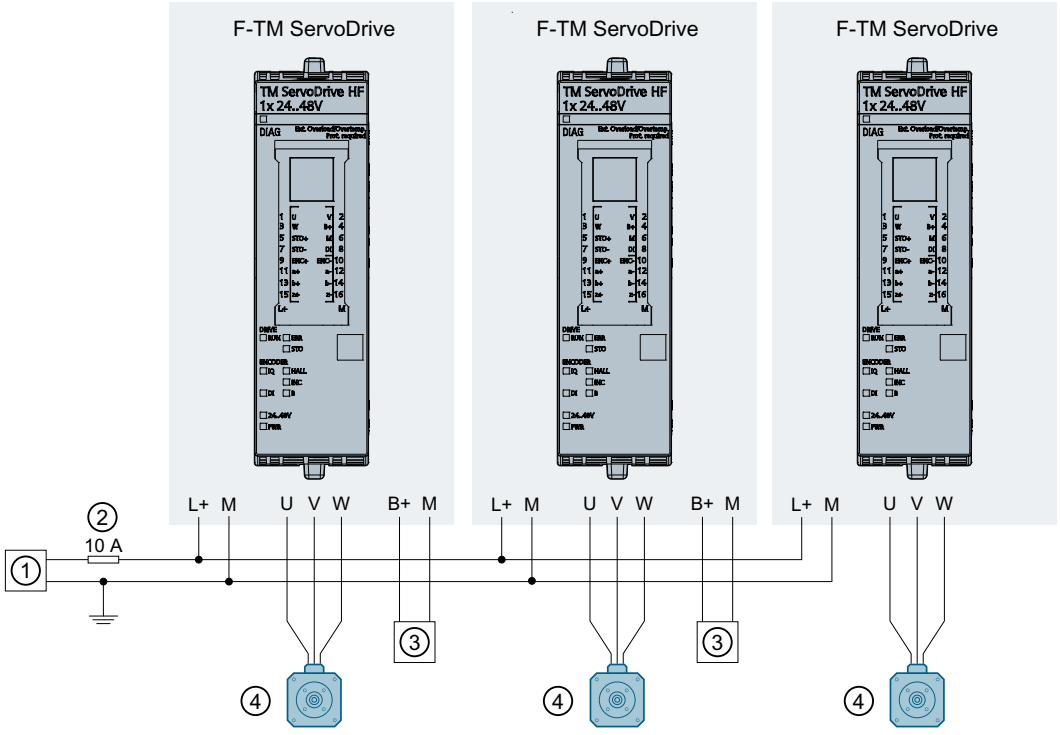
Table 1-641 Wiring rules for the interfaces

Pins	Function	Maximum cable length	Cable type
ENC+/ENC-	Incremental encoder signals and supply	10 m	Shielded For differential wiring, one twisted pair per signal pair
U/V/W or A+/A-/B+/B-	Motor phases	10 m	Shielded
DI, M	Input	10 m	≥ 2 m shielded
	Ground	10 m	-
L+/M	Power supply, power unit	10 m	-
B+	Connection of external braking resistor	2 m	≥ 0.5 m shielded
d/a, b, c/z	Encoder connectors	10 m	Shielded For differential wiring, one twisted pair per signal pair In order to achieve higher transmission frequencies, it is recommended to shield the clock and data signal lines separately for a BiSS-C encoder.
STO	Safe Torque Off	10 m	-

Permissible cable cross-sections depend on the BaseUnit used. See ET 200SP BaseUnits (https://support.industry.siemens.com/cs/ww/en/view/59753521) equipment manual.

 CABLE SPEC.	Note that the electrical connections must be designed according to the expected current value at maximum ambient temperature and installation type in accordance with applicable standards.

NOTE



In addition to the shield connection on the ET 200SP the cable shield must also be grounded with a suitable fastening, for example, with a metal clip on the control cabinet rear panel. The cable shield must be applied on the motor/encoder side.

4.3 Wiring of multiple TM Drive

In a potential group

You can connect multiple TM Drives to form a potential group (drive line-up). The following figure shows you the TM Drive with different motors.

Wiring of multiple TM Drive to form a drive line-up

① Power supply unit
② Protective device
③ Braking resistor
④ Motor

4.4 Connecting the motor

Overview

F-TM ServoDrive supports permanent magnet synchronous motors (PMSM) with suitable encoders and bipolar interconnected stepper motors.

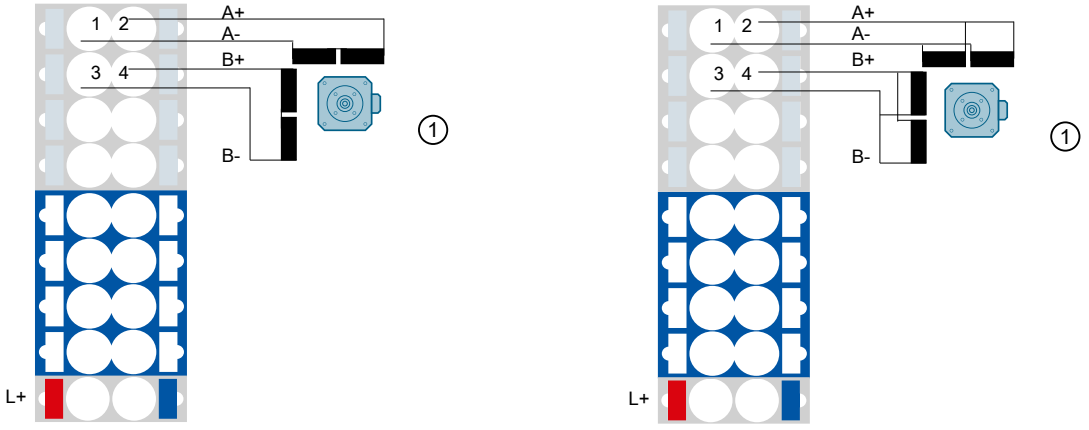
4.4.1 Connecting the motor phases (PMSM)

The following figure shows the connection of the motor phases to the BaseUnit:

①	PMSM	②	Braking resistor
U, V, W	Motor phases	③	Negative connection for braking resistor

Figure 1-316 Connecting the motor

NOTE



In addition to the shield connection on the ET 200SP the cable shield must also be grounded with a suitable fastening, for example with a metal clip on the control cabinet rear panel. The cable shield must be applied on the motor side.

Pin assignment

Pin	Designation	Function
1	U	Motor phase U
2	V	Motor phase V
3	W	Motor phase W
4	B+	Braking resistor
6	M	Negative connection, e.g. for braking resistor

4.4.2 Wiring the motor phases (stepper motor)

The following figure shows the connection of the motor phases to the BaseUnit:

①	Stepper motor
A+, A-, B+, B-	Motor phases

Figure 1-317 Connecting the motor

NOTE

In addition to the shield connection on the ET 200SP, the cable shield must also be grounded with a suitable fastening, for example with a metal clip on the control cabinet rear panel. The cable shield must be applied on the motor side.

Pin assignment

Pin	Designation	Function
1	A-	Motor phase A-
2	A+	Motor phase A+
3	B-	Motor phase B-
4	B+	Motor phase B+

4.5 Connecting an encoder

4.5.1 Connecting an incremental encoders

You can connect motors with a 3-channel incremental encoder to the TM Drive. The A and B tracks and a reference track Z are required for evaluation. You connect all signals as "single-ended" or "differential".

The following figure shows the connection of an incremental encoder to the BaseUnit.

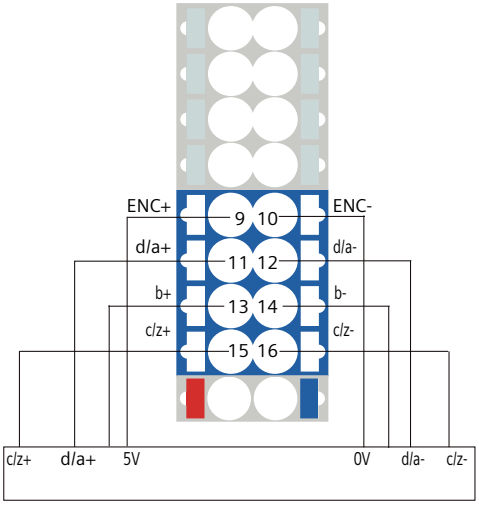


Figure 1-318 Connection of incremental encoder with differential signals

Pin assignment of incremental encoder

Pin	Designation	Function
9	ENC+	Power supply encoder 5 V
10	ENC-	Power supply encoder, negative connection
11	a+	Differential encoder signal a+
12	a-	Differential encoder signal a-
13	b+	Differential encoder signal b+
14	b-	Differential encoder signal b-
15	z+	Differential encoder signal z+
16	z-	Differential encoder signal z-

Table 1-642 Power supply and signal processing conditions of the incremental encoder

Encoder property	Range/Value
TTL bipolar 5 V or differential	High 2 V .. 5.5 V
	Low -5.5 V ... -2 V
TTL unipolar 5 V	High 4 V .. 5.5 V
	Low 0 V .. 1 V
Encoder supply voltage	5 V ... 5.3 V

*The quadrature interface results in a maximum step resolution of 2000 kHz.

Encoder property	Range/Value
Maximum current consumption of the encoder	150 mA
Encoder output	Push Pull
Maximum signal frequency that can be processed (per signal A and B)*	500 kHz

*The quadrature interface results in a maximum step resolution of 2000 kHz.

NOTE

In addition to the shield connection on the ET 200SP the cable shield must also be grounded with a suitable fastening, for example, with a metal clip on the control cabinet rear panel. The cable shield must be applied on the encoder side.

4.5.2 Connecting IQ-Encoders

Motors from the SIMATIC MICRO-DRIVE Product Partner Program have an IQ encoder.
The following figure shows the connection of IQ encoders to the BaseUnit.

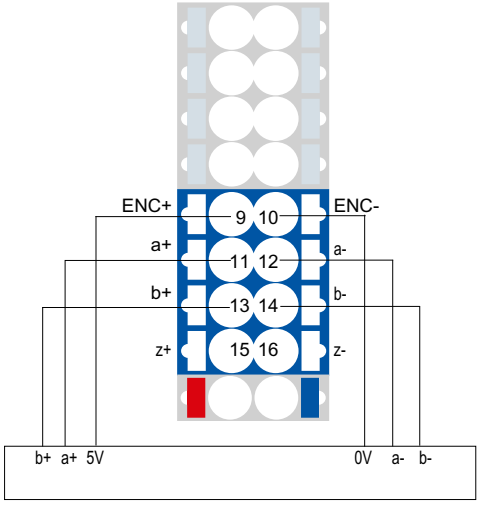

Figure 1-319 IQ encoder connection with differential signals

Pin assignment of IQ encoder

Pin	Designation	Function
9	ENC+	Power supply encoder 5 V
10	ENC-	Power supply encoder, negative connection
11	a+	Differential encoder signal a+
12	a-	Differential encoder signal a-
13	b+	Differential encoder signal b+
14	b-	Differential encoder signal b-
15	z+	-
16	z-	-

Specifying the encoder interface

You connect the IQ encoder to the incremental encoder inputs like a two-channel standard incremental encoder. The polar wheel angle information is also transmitted via the interface (see Technical specifications (Page 143)).

NOTE

In addition to the shield connection on the ET 200SP the cable shield must also be grounded with a suitable fastening, for example with a metal clip on the control cabinet rear panel. The cable shield must be applied on the encoder side.

4.5.3 Connecting a BiSS-C encoder

You can connect motors with a BiSS-C interface to the TM Drive .

The following figure shows the connection of a BiSS encoder to the BaseUnit.

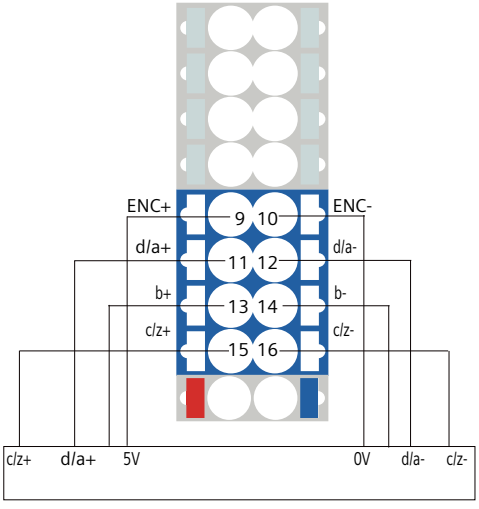

Figure 1-320 Absolute encoder connection

Pin assignment of BiSS encoder

Pin	Designation	Function
9	ENC+	Power supply encoder 5 V
10	ENC-	Power supply encoder, negative connection
11	d/a+	Dat+
12	d/a-	Dat-
15	c/z+	Clk+
16	c/z-	Clk-

Table 1-643 Power supply and signal processing conditions of the absolute encoder

Encoder property	Range/Value
Encoder supply voltage	5 V ... 5.3 V
Maximum current consumption of the encoder	150 mA
Maximum transmission frequency	2.8 MHz
CRC (Cyclic Redundancy Check)	43 hex

NOTE
In addition to the shield connection on the ET 200SP the cable shield must also be grounded with a suitable fastening, for example, with a metal clip on the control cabinet rear panel. The cable shield must be applied on the encoder side.

Requirement of the BiSS-C interface

In addition to the electrical specification from Table 4-3, the BiSS-C interface must meet the following requirements:

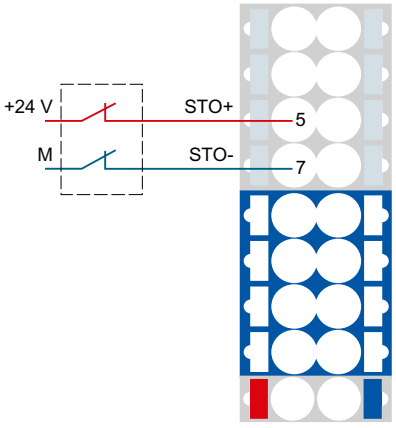
- Unidirectional communication according to BiSS-C standard
- Transfer code: Dual
- CRC (Cyclic Redundancy Check) polynomial 43 hex
- Evaluation of the warning / alarm bits
- Sum of single-turn, multiturn and number of bits before position value <= 56
- See Table 4-1 for the cable and shielding requirements.

4.5.4 Connecting safe torque off (Hardware STO)

Safe Torque Off (STO)

The safety function Hardware STO is activated via an exclusive safe input (STO+ and STO-). The TM Drive safely switches off the control of the motor. As long as Hardware STO is active, the motor does not generate any torque.

The safe state "Safe Torque Off" corresponds to the de-energized state at STO+/STO- (closed-circuit current principle).



The Hardware STO function meets the specification of a digital input according to EN 61131-2 Type 1 without limitation. In addition, this input has an increased leakage current resistance of 5 mA. That is, at leakage currents below 5 mA, the safe state is always selected.

⚠ WARNING

Danger to life due to coasting down of the drive with STO
The Category 0 stop function according to EN 60204-1 (STO according to Safety Integrated) means that the drives are not braked but instead coast down for an amount of time corresponding to the kinetic energy.

- You must take this behavior into account, for example, in the logic for the protective door interlock.

Wiring the Hardware STO

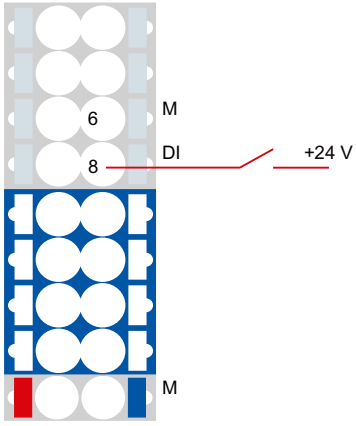
STO+ STO input 24 V
STO- STO input, negative connection

Figure 1-321 Connection of Hardware STO

NOTE
Use different voltage supplies for the STO inputs and for the power supply.

Table 1-644 Pin assignment

Pin	Designation	Function
5	STO+	STO input 24 V
7	STO-	STO input, negative connection



Route the hardware STO (STO+/STO-) cables separately from other cables, especially power cables.

Minimize the risk of crushing and short-circuits in ground connections by using appropriate routing.

Exclude premature aging of the cables due to continuous UV radiation.

4.5.5 Connecting the 24 V digital input

Connecting a 24 V digital input

DI 24 V digital input
M Ground

Figure 1-322 24 V digital input connection

Table 1-645 Pin assignment

Pin	Designation	Function
6	M	Ground, internally connected to ground of 24 - 48 V power supply
8	DI	24 V digital input

4.6 Connecting an external braking resistor

External braking resistor

To ensure high dynamics of the drive due to fast acceleration and braking ramps, you need to connect a braking resistor to the TM Drive.

Recommendation: Use a braking resistor for power supplies with low intrinsic capacitance or an unregulated six-pulse bridge circuit (B6U).

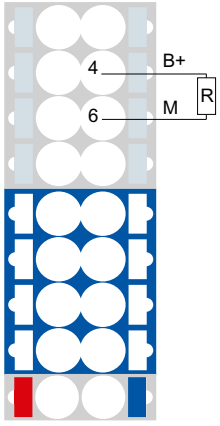
A connected external braking resistor must be activated in the configuration software.

⚠ CAUTION

Risk of burns due to high surface temperature of the braking resistor

The braking resistor can become very hot. Touching the surface can cause severe burns.

- Mount the braking resistor so that it cannot be touched. In situations in which this is not possible, attach a clearly visible and understandable warning notice in areas at risk.



Wiring a non-Siemens external braking resistor

⚠ WARNING

Damage to braking resistor – Risk of fire!
If you use a non-Siemens external braking resistor, connect an overtemperature detection device to a digital input (e.g. a bimetallic switch that opens when the temperature is too high).
Implement fire prevention measures for the external braking resistor (e.g. fire protection housing, temperature fuse). The resistance of the externally connectable braking resistor must be ≥ 5 ohms.
Design the required power as a function of the braking energy to be converted.

Wiring an external braking resistor

The figure below shows the connection of an external braking resistor as an example:

B+ Positive terminal of braking resistor
M Negative terminal of braking resistor

Figure 1-323 Connection of external braking resistor

Pin assignment

Table 1-646 Pin assignment: Wiring an external braking resistor

Pin	Designation	Function
4	B+	Connection of external braking resistor
6	M	

External braking resistor for potential group with several TM Drive

If you have connected multiple TM Drive to form a potential group, it may be sufficient to equip only one module with an external braking resistor.

Safety functions integrated in the drive

5

5.1 Basic safety information

5.1.1 General safety information

⚠ WARNING

Danger to life if the safety instructions and residual risks are not taken into consideration

The non-observance of the safety instructions and residual risks stated in the associated F-TM ServoDrive documentation can result in accidents causing severe injuries or death.

- Observe the safety instructions given in the F-TM ServoDrive documentation.
- Consider the residual risks for the risk evaluation.

⚠ WARNING

Malfunctions of the machine as a result of incorrect or changed parameter settings

As a result of incorrect or changed parameter settings, machines can malfunction, which in turn can lead to injuries or death.

- Protect the parameter assignment against unauthorized access.
- Respond to possible malfunctions by implementing suitable measures (e.g. EMERGENCY STOP or EMERGENCY OFF).

⚠ WARNING

Validity of safety features

The safety features of the product are guaranteed only for intended use within the intended ambient conditions (see section Technical specifications (Page 143)).

The safety features only apply when operating with a BaseUnit of the U0 type (6ES7193-6BP00-0DU0 or 6ES7193-6BP00-0BU0).

5.1.2 Warranty and liability for application examples

Application examples are non-binding and do not claim to be complete regarding configuration and equipment as well as all eventualities. Application examples do not represent customer-specific solutions. They are only intended to provide support for typical tasks.

As user, you are responsible for ensuring that the products described are used correctly. Application examples do not relieve you of the responsibility to use safe practices in application, installation, operation and maintenance.

5.1.3 Fundamental safety instructions for Safety Integrated

Additional safety instructions and residual risks are provided outside of this section at the relevant points of this system manual.

⚠ DANGER

Risk minimization through Safety Integrated

Safety Integrated can be used to minimize the risk associated with machines and plants. However, safe operation of the machine or system with Safety Integrated is only possible if the machine manufacturer:

- Knows and complies with this technical user documentation, including the documented constraints, safety instructions and residual risks
- Carefully constructs and configures the machine/plant and verifies it through a carefully implemented and documented acceptance test by qualified personnel
- Implements and validates all the measures required in accordance with the system/machine risk analysis by means of the programmed and configured Safety Integrated functions or by other means

The use of Safety Integrated does not replace the machine/plant risk assessment carried out by the machine manufacturer as required by the CE Machinery Directive.
In addition to using Safety Integrated functions, further risk reduction measures must be implemented.

⚠ WARNING

Danger to life as a result of undesirable motor movement when automatically restarting

An emergency stop must be performed according to Stop Category 0 (STO) (EN 60204-1). The emergency stop must be ensured by external measures.
It is not permissible that the motor automatically restarts after an Emergency Stop, as this represents danger to life as a result of the associated undesirable motor motion.
If individual safety functions are deactivated, an automatic restart is permitted under certain circumstances depending on the risk analysis (except when Emergency Stop is reset). An automatic start is possible when a protective door is closed, for example.

- Ensure that no automatic restart takes place in the indicated cases.

⚠ WARNING

Danger to life as a result of undesirable motor motion when the system powers up and the drives are activated after hardware and/or software is changed or replaced

After hardware and/or software components have been modified or replaced, or after drive parameters are changed or parameter backups are loaded, it is only permissible for the system to run up and the drives to be activated with the protective devices closed. Personnel shall not be present within the danger zone during this time.

- It may be necessary to carry out a partial or complete acceptance test or a simplified functional test after making certain changes or replacements.
- Before personnel may re-enter the hazardous area, all of the drives should be tested to ensure that they exhibit stable control behavior by briefly moving them in both the plus and minus directions (+/-).

5.1.4 Safety Integrated functions

This section gives you a quick insight into the functioning of the safety functions.

The description of the safety functions starts in each case with the definition in IEC/EN 61800-5-2 and simple examples of the use of the function.

The description of the functions is simplified as far as possible so that the essential properties and setting options are made clear.

Response time

You can find additional information on the response time of the listed safety functions in section Response times (Page 149).

Examples of safety devices and 3 F-TM ServoDrive

NOTE
Use different voltage supplies for the STO inputs and for the power supply.

The following figure shows various safety devices that are connected to 3 F-TM ServoDrive.

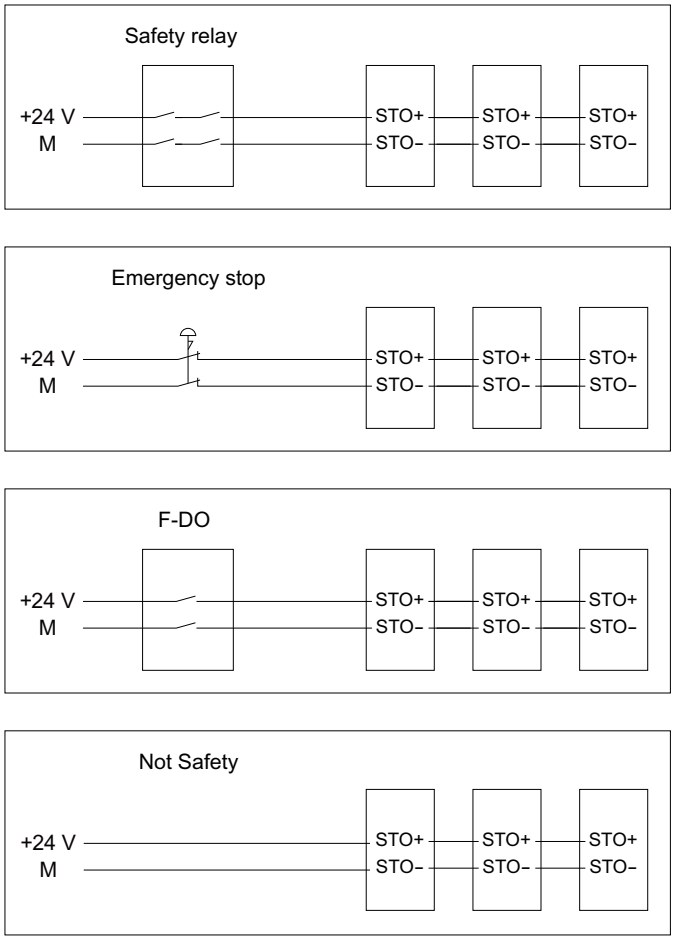


Figure 1-324 Safety devices and 3 F-TM ServoDrive

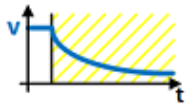
NOTE
The F-TM ServoDrive does not support startup protection.
Measure:
Configure startup protection with an additional safety relay or in the higher-level controller, depending on the safety requirements.

Operating voltage range



Operate input STO+ as intended with 19.2 to 28.8 V DC for the active enable or lower 5 V DC for the disable.

Connect the input STO- for enabling or disabling the connection to ground.

Switching on again after power off

An On delay of more than 2 s must be observed between tripping and restarting the module, for example switching the power supply off and on. Otherwise the module can register an internal STO error and the module switches off in a safety-oriented manner.

5.1.4.1 Safe Torque Off (STO)

Safe Torque Off (STO) is a safety function that directly stops torque- or force-producing energy from being supplied to the motor. This function corresponds to Stop Category 0 according to EN 60204-1.

The F-TM ServoDrive complies with the definition of the STO function in IEC/EN 61800-5-2: "The STO function prevents torque-producing energy from being supplied to the motor."

If the motor is still rotating when STO is selected, the motor will coast to a standstill.

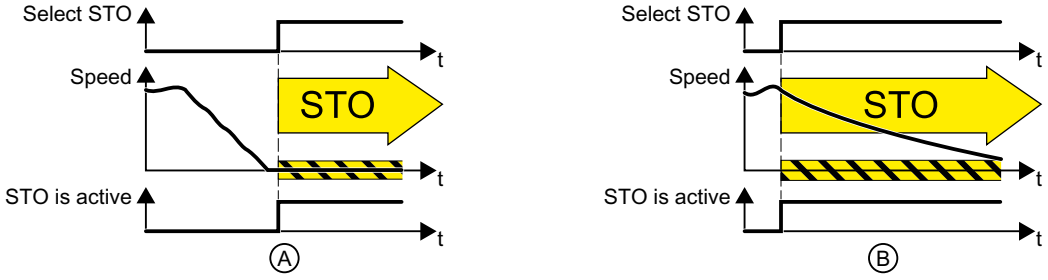


Figure 1-325 Functioning of STO (A) when motor is at stopped and (B) when motor is rotating

Functional characteristics

⚠ WARNING

Danger to life due to coasting down of the drive with STO

The Category 0 stop function according to EN 60204-1 (STO according to Safety Integrated) means that the drives are not braked but instead coast down for an amount of time corresponding to the kinetic energy.

- You must take this behavior into account, for example, in the logic for the protective door interlock.

STO is a drive-specific function and must be wired individually for each drive.

The following applies when the "Safe Torque Off" function is selected:

- An unwanted startup of the motor cannot take place.
- The torque-producing energy supply to the motor is safely interrupted.
- An electrical isolation between the power unit and motor does not occur.

The stop function category 0 (selection of STO according to Safety Integrated) is only active when selected at the STO terminals. In order to meet the requirements of an EMERGENCY STOP in accordance with EN 60204-1, you need to ensure that the STO function at the STO terminals in the system can only be deselected by means of conscious manual operation. This prevents electrically driven machine components from restarting unintentionally.

Selection

The STO safety function is always enabled and cannot be disabled via parameter assignment.

You can select the STO function via the fail-safe digital input at STO+ and STO- terminals. The selection of the STO function is enabled directly as a response to safety messages (e.g. when a defect is detected in a monitoring channel).

Range of application

You can use the STO safety function without restrictions for a PMSM or bipolar connected two-phase stepper motor. A special encoder concept suitable for safety is not required.

Applications

Application areas are all machines or systems with moving axes (e.g. conveyor systems, handling systems).

The STO function can be used when the motor is already at a standstill. If the motor is in operation, the STO function causes the drive to coast down.

The STO function enables safe working when the protective door is open. A conventional Emergency Stop with electromechanical unlocking is not required. The converter remains connected to the supply system and has full diagnostics capability.

NOTE

Difference between EMERGENCY OFF and EMERGENCY STOP

EMERGENCY OFF and EMERGENCY STOP are commands that mitigate different risks in the machine or plant. The STO function is suitable for implementing an EMERGENCY STOP, but not an EMERGENCY OFF.

Hardware STO

The F-TM ServoDrive internally monitors the fail-safe digital input at STO+ and STO- terminals for discrepancies.

Discrepancy monitoring

Due to the design of the Hardware STO circuit, a discrepancy cannot occur at STO+ and STO- terminals. As long as the STO terminal is de-energized, STO is selected. The Hardware STO signal is read in internally via two channels.

To comply with the requirements for timely error detection from EN 61800-5-2, the switch-off signal paths of the end stage in both monitoring channels are also cyclically tested. Errors when testing the shutdown paths trigger STO. A manual forced checking procedure (test stop) for testing the shutdown paths of the F-TM ServoDrive is therefore not needed.

⚠ WARNING

Forced checking procedure

You should nevertheless examine its necessity for diagnosing the utilized sensors or for performing a test stop in the context of the overall system.

5.1.5 Overview of the Safety Integrated functions

Compared to standard drive functions, safety functions have an especially low error rate. Performance Level (PL) and Safety Integrity Level (SIL) as defined in the corresponding standards are a measure for the error rate.

For this reason, safety functions are suitable for use and for risk reduction in safety-related applications. An application is safety-related when the risk analysis of the machine or plant has identified a particular risk potential in the application.

Safety Integrated means that the safety functions are integrated in the drive and can be executed without additional external components.

Conformity of Safety Integrated functions

The Safety Integrated functions comply with:

- Safety Integrity Level (SIL) 3 according to IEC 61508 Part 1-3
- Category 3 according to ISO 13849-1
- Performance Level (PL) d according to ISO 13849-1

For functional safety of variable-speed drives, the standard IEC 61800-5-2, in which the Safety Integrated functions are defined, applies.

Function groups

The safety functions are divided into the following function groups for the F-TM ServoDrive:

- Safety Integrated stop function (hardware STO)

5.1.6 Supported safety functions

The supported safety functions are included in the standard scope of the F-TM ServoDrive and can be used without an additional license.

Stop functions

The stop functions do not pose any special requirements on the utilized encoder and do not need actual value acquisition. The stop functions include the following Safety Integrated functions:

- Safe Torque Off (STO)

  Safe Torque Off is a safety function for prevention of unexpected startup according to EN 60204-1. STO prevents torque-producing energy from being supplied to the motor and corresponds to Stop Category 0.

5.1.7 Examples of using the safety functions

Table 1-647 Examples of using the safety functions

Safety function	Application examples	Possible solution
Safe Torque Off (STO)	It is only permissible to open a protective door if the motor torque has been switched off.	Activate STO in the F-TM ServoDrive via the STO inputs. The pulses are suppressed and the motor coasts to a standstill.
	A central Emergency Stop button ensures that multiple drives cannot start unintentionally.	Evaluate the emergency stop button in a central controller. Use a two-channel connection to the STO inputs on the F-TM ServoDrive.

5.1.8 Safety concept

The safety concept of the drive controller is based on a 2-channel system structure. Each channel has the possibility of bringing about the safe state, and the two channels monitor each other through a corresponding cross-comparison and cyclic diagnostics.

Safe state

The safe state of the system exists when the motor bridge is **de-energized**.

The safe state is reached in the following cases:

- Switch-off or failure of the external power supply to L+/M
- Missing enable signal at STO+ and STO-
- Detection of an internal hardware fault

Safe state of Safety Integrated functions

The safe state of the STO input terminal is reached when at least one of the two STO supply terminals is disconnected from the energy supply.

NOTE

The safe state means the absence of torque in the sense of functional safety, but not necessarily the absence of voltage in the sense of electrical safety.

5.2 Acceptance of the safety functions

Responsibilities

The machine manufacturer is responsible for the performance and documentation of the acceptance test. In this section, you will find a recommendation for how to perform and document the acceptance tests for the individual safety functions.

NOTE

The performance and documentation of the acceptance tests are plant-specific and must be adapted appropriately and performed.

5.2.1 General information on acceptance

Why is acceptance required?

The EU machinery directive and ISO 13849-1 stipulate:

- You must test safety-relevant functions and machine parts after commissioning.
  See "Acceptance test" below in this section.
  For the F-TM ServoDrive Safety Integrated functions (SI functions), this means:
  The acceptance test is used to check the functionality of the safety functions used in the drive. Correct implementation of the defined safety functions is examined for this.
- You must create an "acceptance report" that describes the test results.
  See "Documentation" further on in this section.

NOTE

Purpose of the acceptance test

The measured values (e.g. speed, time) and the system behavior identified (e.g. initiation of a specific stop) serve to check the plausibility of the configured safety functions. The objective of an acceptance test is to identify potential configuration errors and/or to document the correct function of the configuration. The measured values are typical values (not worst case values). They represent the behavior of the machine at the time of measurement. These measurements cannot serve as the basis for deriving real values (e.g. maximum values for over-travel distances).

Requirements

The requirements for an acceptance test (configuration test) for safety functions of electric drives come from EN 61800-5-2, section 7.1, paragraph f). The acceptance test is called "configuration test" in this standard.

- Description of the application including an image
- Description of the safety-related components (including software versions) that are used in the application
- List of the utilized safety functions of the PDS(SR) [Power Drive System(Safety Related)]
- Results of all tests of these safety functions using the specified test procedure

Necessity of an acceptance test

An acceptance test is required (again) when the Safety Integrated functionality of a machine is commissioned or changed. The acceptance tests must be performed for each individual drive. Safety-related function extensions, transfer of commissioning to other series machines, hardware changes, software upgrades and the like may allow a partial performance test to be performed.

The conditions determining the necessity and recommendations for the test depth required in each case are summarized below.

Requirements for the acceptance test

- The machine is correctly wired.
- All safety equipment (e.g. protective door monitoring devices, light barriers, emergency limit switches) are connected and ready for operation.
- The commissioning of open-loop and closed-loop control must be complete; otherwise, the over-travel distance may be changed due to a changed dynamic response of the drive control, for example. This includes:
  - Settings of the setpoint channel
  - Position control in the higher-level CPU
  - Drive control

Acceptance test

The acceptance test comprises two parts:

- You test whether the safety functions are set correctly in the drive:
  - Does the configured safety function sufficiently reduce the residual risk at the machine/plant?
  - Do the set interfaces, timers and monitoring functions match the configuration of the machine?
- You test whether the safety-relevant functions in the machine or system function correctly.

  This part of the acceptance test goes beyond the acceptance test of the drive:
  - Is all safety equipment, such as protective door monitoring, light barriers and emergency limit switches, connected and ready for operation?
  - Do the drive settings match the configured safety-relevant function in the machine?

Documentation

The documentation consists of the following parts:

- Description of safety-relevant components and functions of the machine or system, including the program versions.
- Report of the acceptance test results.
- Report of the safety function wiring.
- The documentation must be signed off by the person who performed the acceptance test.

Authorized persons

Persons authorized by the **machine manufacturer** who, on account of their technical training and knowledge of the safety-relevant functions, can carry out the acceptance in an appropriate manner are entitled to perform the acceptance.

⚠ WARNING

Unwanted movement due to faulty wiring
Incorrect wiring for Safety Integrated functions can cause unwanted motion resulting in severe injury or death.

- For Safety Integrated functions, always carry out an acceptance test for the affected function after changing the wiring.
- Record the results of the acceptance test in an acceptance report.

⚠ WARNING

Unsafe operating states due to manipulation of the hardware configuration after the acceptance test
Changes to the wiring of the Safety Integrated functions after an acceptance test can cause unwanted motion resulting in severe injury or death.

- To prevent access to your machines and systems by unauthorized persons, implement access restrictions and take the precautions described in the security instructions in the preface.
- To prevent improper wiring of the Safety Integrated functions, take the precautions described in this manual.
- Review the safety change tracking of the drive at regular intervals. Make certain that no changes have been made to the wiring after the last successfully completed acceptance test.
- If intentional changes have been made, repeat the acceptance test for the Safety Integrated functions affected. The purpose of the acceptance test is to ensure and document safe operation of the system. Correct any unintentional changes back to the original values and repeat the acceptance test.

5.2.2 Content of an acceptance test

Documentation

Documentation of the machine including safety functions

- Machine description (with overview image)
- Information on controller (if available)
- Function table:
  - Active monitoring functions depending on operating mode and protective door
  - Additional sensors with protection functions
  - The table is an object or result of the configuration work.
- SI functions for each drive
- Information on the safety equipment

Function test of diagnostic/safety functions

Value-based function check of the SI functions used. You can use trace records of individual parameters, for example, to do this.

- Acceptance test for Safe Torque Off (STO)

Report completion

Reporting of the tested state of commissioning and countersignatures

- Control of the STO function as enable signal of the STO+ and STO- terminals
- Enable to control the motor is removed as soon as a connection (STO+ or STO-) is not connected
- Counter signature

5.2.3 Documentation of acceptance

Machine or system description

Describe your machine or plant using the following table. Insert a diagram of the plant, for example.

Table 1-648 Machine description and overview image

Designation	
Type	
Serial number	
Manufacturer	
End customer	
Overview image of the machine	

Drive data

In the following table, enter information on the drive components used and add additional components as required.

Table 1-649 Hardware components

Component	Designation	Article number	Hardware version	Type
Drive controller				
Motor				
Encoders				
Brake module				
Gearbox				

Utilized Safety Integrated functions

In the following table, describe the use of the Safety Integrated drive functions in relation to your plant or machine.

Table 1-650 Utilized SI functions of the drive

SI function	Status/Description
Safe Torque Off (STO)	

5.2.4 Acceptance test for Safe Torque Off (STO)

Procedure

Test each configured activation of the STO function.

This test consists of the following steps:

Table 1-651 Acceptance test for "Safe Torque Off" (STO) function

No.	Description	Status
1.	**Drive is ready for operation**	
	• No faults	
	• The enable signal is present (STO is deselected).	
2.	**Switch on motor**	

No.	Description		Status
2.	2.1	Set speed setpoint ≠ 0	
	2.2	Switch on motor (ON command)	
	2.3	Check that the intended motor is rotating	
3.	**Select STO**		
	3.1	Selecting STO means interrupting the wire, supplying the STO from STO+ and short-circuiting STO- (if the source is current-limited)	
	3.2	Check the following points:	
		• Motor coasts down to a standstill	
		Message is implemented, but is not safety-relevant	
4.	**Deselect STO**		
	4.1	Deselection of STO (HW STO terminal)	
	4.2	Check the following points:	
		• Enable is active, motor must allow switch-on	

5.2.5 Report completion

SI change tracking (Safety logbook)

Ensure that changes to the safety function (wiring) can be traced.

Countersignatures

Commissioning engineer
Professional execution of the above-stated tests and checks is confirmed.

Table 1-652 Report completion - Countersignature of commissioning engineer

Date	Name	Company/Department	Signature

Machine manufacturer
The correctness of the parameter assignment documented above is confirmed.

Table 1-653 Report completion - Countersignature of machine manufacturer

Date	Name	Company/Department	Signature

5.3 System features

5.3.1 Current information

Important note for maintaining the operational safety of your system:

NOTICE
Operational safety risk from unwanted motions Systems with safety-oriented variants are subject to special operational safety requirements on the part of the operator. If information becomes known in the course of product monitoring indicating insufficient product safety, this information will be disclosed in various ways. For this reason, our website provides information on product developments and features that are (or could be) relevant to operation of systems from a safety perspective.

5.3.2 Certifications

The safety functions of the F-TM ServoDrive drive system meet the following requirements:

- Safety integrity level SIL3 according to IEC 61508 Part 1-3 and IEC 61800-5-2
- Category 3 according to ISO 13849-1
- Performance Level (PL) d according to ISO 13849-1

In addition, the safety functions of the drive are generally certified by independent institutes. A list of the components that are currently already certified in each case is available on request from your Siemens branch.

5.3.3 Failure probability of the safety functions

The probability of failure of safety functions must be specified in the form of a PFH value (Probability of Failure per Hour) according to DIN EN 61800-5-2 and ISO 13849-1. The PFH value of a safety function depends on the safety concept of the drive device, its hardware configuration and the PFH values of the other components used for the safety function. For the F-TM ServoDrive drive system, PFH values are provided as a function of the hardware configuration.

NOTE

PFH values

The PFH value of the integrated safety function STO is 30 FIT (10^{-9}/h) and refers to a service life of 20 years.

The underlying assumption for the calculation is an average operating temperature of 40°C, an average repair time of 8 hours and an average time to recovery of 8 hours. A proof test is not necessary.

5.3.4 Response times

The response time is the time between the detection of an input signal and the change of a linked output signal. Below you will find information on the response times of the F-TM ServoDrive drive system.

NOTE

The actual response time falls between a minimum and maximum response time. You must always assume the maximum response time when configuring your system.

The drive system is the component that provides the safety functions. The description "error-free drive system" means that the component providing the safety functions itself has no defect:

- Maximum response time in error-free drive system
  When the enable is removed at the STO+ or STO- terminals, the maximum response time in an error-free drive system is guaranteed.

Stop function (via terminals)

The following table specifies the response times for the indicated stop functions from the time of activation until occurrence of the response.

Function	Maximum response time
STOP_STO	Max. 20 ms

5.4 Safety Integrated

Important notes on the Safety Integrated system are provided in this section.

Diagnostics hardware fault

If an internally diagnosed hardware fault occurs, you can only reset the module by restarting it. Nevertheless, the replacement of the F-TM ServoDrive is strongly recommended. Unwanted activation of the safety function can be an indication of a hardware fault.

Wiring the F-TM ServoDrive

For information on how to perform the electrical wiring for the F-TM ServoDrive, refer to section Wiring (Page 28)

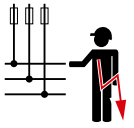
STO inputs

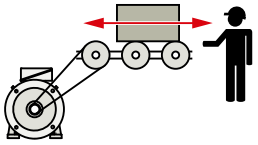
The STO inputs are described in the section Connecting safe torque off (Hardware STO) (Page 39).

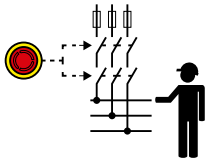
5.5 EMERGENCY OFF and EMERGENCY STOP

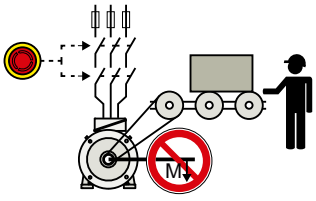
Difference between EMERGENCY OFF and EMERGENCY STOP

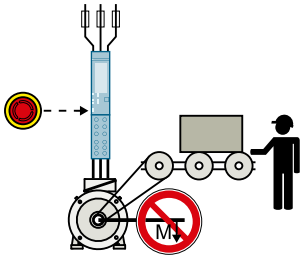
EMERGENCY OFF and EMERGENCY STOP are commands that mitigate different risks in the machine or plant.











EMERGENCY OFF Risk of electric shock	**EMERGENCY STOP** Risk of unexpected movement
	

Table 1-654 Measures and solutions

Command	**EMERGENCY OFF**	**EMERGENCY STOP**
Measure to minimize risk	**Safe switch off** Switching off the electric power supply for the installation, either completely or partially.	**Safely stop and safely prevent restarting** Stopping or preventing the dangerous movement
Classic solution	Switch off the power supply. 	Switch off the drive power supply. 
Solution with the STO safety function integrated in the drive	STO is not suitable for safely switching off a voltage.	Select STO.  You may also switch off the power supply of the drive controller. However, switching off the voltage is not required as a risk-reduction measure.

Configuring

6

Configuration and parameter assignment

STEP 7 (TIA Portal) is available for configuring a ET 200SP TM Drive.

You perform the following tasks with STEP 7 (TIA Portal), for example:

- You configure the TM Drive (insertion into the project and setting the input addresses).
- You specify the desired hardware parameters for operation of the TM Drive.

Requirements

Hardware

- Supported interface modules: See Properties (Page 24)
- You have completed installation and wiring of the hardware. Take the potential group into account, see section Pin assignment (Page 28).
- You have connected the PG/PC via the PROFINET interface of the CPU.

Software

- You have installed the HSP0311. You can find the support packages for the hardware catalog in the TIA Portal (HSP) on the Internet (https://support.industry.siemens.com/cs/ww/en/view/72341852).
- You have installed the HSP0311.

As soon as the configuration and hardware parameter assignment have been successfully completed, you can create your user program and commission the drive.

⚠ WARNING

Safety Integrated

As soon as a safety program has been created, you must perform a complete function test based on your automation task.

To accept the plant, you must use the safety summary created in accordance with this manual.

Configuring a TM Drive (minimal configuration)

To configure a TM Drive , follow these steps:

1. Create a new project.
2. Add a CPU S7-1200 or S7-1500 as a new device.
3. Add a PROFINET interface module to the project under "Devices & networks" from the ET200SP system, e.g. IM 155-6PN ST.
4. Assign the inserted IO device to the configured IO controller.
5. Switch to the device view of the interface module.

6. Add the TM Drive module from the hardware catalog to the IO device.
7. Add a server module.

6.1 Communication telegrams

Selection of a communication telegram

The selection of a communication telegram determines the process data of the drive that will be transmitted between the drive and CPU.

The following table shows the supported telegram types for the drive and sensor assignment.

Table 1-655 Supported communication telegrams

Supported PROFIdrive telegrams	Brief description	User data
Standard telegram 1 PZD-2/2	Speed setpoint 16 bits, without sensor	• Control word STW1, status word ZSW1 • Speed setpoint 16 bits (NSET), actual speed value 16 bits (NACT)
Standard telegram 2 PZD-4/4	Speed setpoint 32 bits, without position encoder	• Control words STW1 and STW2, status words ZSW1 and ZSW2 • Speed setpoint 32 bits (NSET), actual speed value 32 bits (NACT)
Standard telegram 3 PZD-9/5	Speed setpoint, 32 bits with one position encoder	• Control words STW1 and STW2, status words ZSW1 and ZSW2 • Speed setpoint 32 bits (NSET), actual speed value 32 bits (NACT) • Encoder control word 1 (Gx_STW), encoder status word 1 (Gx_ZSW) • Actual encoder position value 1 (Gx_XIST1, Gx_XIST2)
Siemens telegram 102 PZD-10/6	Speed setpoint 32 bits with one position encoder and torque reduction	• Control words STW1 and STW2, status words ZSW1 and ZSW2 • Speed setpoint 32 bits (NSET), actual speed value 32 bits (NACT) • Dynamic torque reduction (MOMRED) • Encoder control word 1 (Gx_STW), encoder status word 1 (Gx_ZSW) • Actual encoder position value 1 (Gx_XIST1, Gx_XIST2)
Extension word	Status bits of the inputs	• Bit 0: DI • Bit 1: STO

A PZD (process data word) corresponds to a 16-bit word.

Selecting a telegram in STEP 7

To select the telegram for the TM Drive in STEP 7, follow these steps:

1. Select the TM Drive module in the device view.
2. Navigate to the properties of the module in the "General" tab under "TM Drive" > "Basic parameters".
3. Under "Telegram" in the drop-down list, select the desired telegram, e.g. "Standard telegram 3 (PZD length 9/5 words).
4. If needed, activate the extension word by selecting the "Telegram extension active" check box.

6.2 Structure of the encoder position actual value

Starting with standard telegram 3, the encoder position actual value is transmitted as a 32-bit value via the user data Gx_XIST1 and Gx_XIST2. These values provide the current **incremental and, for absolute encoders, also the absolute actual position** of the measuring system and are read cyclically by the "Positioning axis" technology object, for example, and processed accordingly (see also section 8.3 (Page 131)). The layout of the encoder position actual value mainly depends on the following factors:

- Type of the encoder
- Resolution of the encoder

Regardless of the type of encoder, the position actual value is structured as follows:

- Gx_XIST1 and Gx_XIST2 are right-aligned
- After it is switched on, a 32-bit counter is loaded with the current position value. Depending on the direction of rotation, this value is then only incremented or decremented. After reaching the max. position value, it starts again at 0.

NOTE

Dependence on the configured encoder resolution
The single-turn value ("increments / revolution") in Gx_XIST1 is directly dependent on the configured encoder resolution (p408).

6.2.1 Incremental encoder

If you are using a motor with an incremental encoder and you have configured this for the type of motor encoder (p404), then the structure of the encoder position actual value is as follows:

Table 1-656 Structure of the encoder position actual value

User data	Contents	
Encoder position actual value 1 (Gx_XIST1)	Increments per revolution	Depends on the parameter assignment of the encoder resolution (p408). You can read them back under "Drive diagnostics encoder" in the section Drive diagnostics (Page 140).
	Bits in Gx_XIST1 "Offset factor"	2
	Encoder type	Rotary incremental

Example of an incremental encoder with 4096 "steps per revolution", this corresponds to 1024 "steps per revolution" with a fine resolution of 2:

Table 1-657 Structure Gx_XIST1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	S	S	S	S	S	S	S	S	S	S	F	F

M: Multiturn value (number of distinguishable revolutions)
S: Singleturn value (singleturn "steps per revolution")
F: Fine resolution

Table 1-658 Structure Gx_XIST2

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																											error				

Error code: See PROFIdrive specification
(https://mall.industry.siemens.com/mall/en/WW/Catalog/Products/10293158)

6.2.2 IQ encoder

If you are using a motor from the Siemens Product Partner Program with IQ encoder (incremental encoder) and have configured this accordingly for the type of motor encoder (p404), then the structure of the encoder position actual value is as follows:

Table 1-659 Structure of the encoder position actual value

User data	Contents	
Encoder position actual value 1 (Gx_XIST1)	Increments per revolution	Default: 100 Depends on the parameter assignment of the encoder resolution (p408). You can read them back under "Drive diagnostics encoder" in the section Drive diagnostics (Page 140).
	Bits in Gx_XIST1 "Offset factor"	2
	Encoder type	Rotary incremental

Table 1-660 Structure Gx_XIST1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	S	S	S	S	S	S	S	F	F

M: Multiturn value (number of distinguishable revolutions)
S: Single-turn value (single-turn "steps per revolution")
F: Fine resolution

Table 1-661 Structure Gx_XIST2

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																											error				

Error code: See PROFIdrive specification
(https://mall.industry.siemens.com/mall/en/WW/Catalog/Products/10293158)

6.2.3 Encoderless / calculated

If you have set encoder (0) encoderless / calculated as encoder type, the encoder position actual value is calculated. Actual encoder position value is structured as follows.

Table 1-662 Structure of the encoder position actual value

User data	**Contents**	
Encoder position actual value 1 (Gx_XIST1)	Increments per revolution	Depends on the parameter assignment of the encoder resolution. You can read them back under "Drive diagnostics encoder" in the section Drive diagnostics (Page 140).
	Bits in Gx_XIST1 "Offset factor"	2
	Encoder type	Rotary incremental

Example of a "simulated encoder" with 4096 "steps per revolution", this corresponds to 1024 "increments per revolution" with a offset factor of 2:

Table 1-663 Structure Gx_XIST1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	S	S	S	S	S	S	S	S	S	S	F	F

M: Multiturn value (number of distinguishable revolutions)
S: Single-turn value (single-turn "steps per revolution")
F: Fine resolution

Table 1-664 Structure Gx_XIST2

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																											error				

Error code: See PROFIdrive specification
(https://mall.industry.siemens.com/mall/en/WW/Catalog/Products/10293158)

6.2.4 Absolute encoder BiSS

If you are using a motor with an BiSS encoder and you have configured this for the type of motor encoder (p404), the structure of the encoder position actual value is as follows:

Table 1-665 Structure of the encoder position actual value

User data	Contents	
Encoder position actual value 1 (Gx_XIST1)	Increments per revolution	Depends on the parameter assignment of the encoder resolution. You can read them back under "Drive diagnostics encoder" in the section Drive diagnostics (Page 140).
	Number of revolutions	
	Bits in Gx_XIST1 "Offset factor"	S* <= 16: Gx_XIST1 = 0 S* > 16: Bits in Gx_XIST1 = S - 16
Encoder position actual value 2 (Gx_XIST2)	Increments per revolution	Depends on the parameter assignment of the encoder resolution. You can read them back under "Drive diagnostics encoder" in the section Drive diagnostics (Page 140).
	Number of revolutions	
	Bits in Gx_XIST2 "Offset factor"	S* <= 16: Bit in Gx_XIST2 = 0 S* + M* <= 32 and S > 16: Bit in Gx_XIST2 = S - 16 S* + M* > 32 and S > 16: Bits in Gx_XIST2 = 16 - M; Minimum 0.
	Encoder type	Absolute

*S = Bits_Singleturn_resolution, M = Bits_Multiturn_resolution

For some absolute encoders, the total length of single-turn and multiturn bits can be greater than 32 bits (e.g. encoders with 17-bit single-turn resolution and 16-bit multiturn resolution). However, since only 32 bits are available in the actual position value Gx_XISTx, the following strategy is then used:

- For the actual position value in G1_XIST1, all single-turn bits are included if possible and higher-order bits of the multiturn value are truncated.
- For the actual position value in G1_XIST2, all multiturn bits are included if possible and lower-order bits of the single-turn value are truncated.

The values calculated automatically by the device are displayed in the Drive Diagnostics 10.2.3 in online mode and can be transferred directly from there to the configuration of the technology object or you can also take the offset factors from the following tables.

	Bits_Singleturn																		
Offset factor Gx_XIST1	1	...	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	32
	0	...	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16

Offset factor Gx_XIST2		**Bits_Singleturn**																	
		1	**...**	**16**	**17**	**18**	**19**	**20**	**21**	**22**	**23**	**24**	**25**	**26**	**27**	**28**	**29**	**30**	**31**	**32**
Bits_Multi-	**0**	0	...	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16

turn	**1**	0	...	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	15

Commissioning the 7

The engineering of the TM Drive drive controller is integrated in STEP 7 (TIA Portal). You install it with the Hardware Support Package HSP0311. The graphic user interface supports you in the configuration, parameter assignment and commissioning of the drive functions of the TM Drive.

Parameter assignment is also possible via data sets (see appendix Data sets).

In this section you will find information on various topics including:

- Check before powering on for the first time
- Commissioning an TM Drive drive

⚠ CAUTION

Failure to comply with the instructions for Safety Integrated poses a risk of injury
Failure to comply with the instructions may result in serious injuries. Carefully read through the safety instructions in section Safety functions integrated in the drive (Page 43) before commissioning and before operation.

⚠ WARNING

Personal injury and property damage from the falling down of a suspended axis
If the drive system is used as suspended axis, the axis will fall down if the positive and negative poles of the power supply are interchanged during connection. An unexpected falling down of a hanging axis can result in personal injury and property damage.
Before commissioning, you need to ensure that a cross brace is fitted to hold the suspended axis in place and prevent it from collapsing unexpectedly. Also ensure that the power supply is connected properly.

⚠ WARNING

Personal injury and property damage from the collapse of a suspended axis
An unexpected collapse of a suspended axis can result in personal injury and property damage

.

- When using the STO function in conjunction with suspended axes, the axis may fall down unexpectedly and cause property damage and personal injury.

NOTE

Performing tests
You must ensure the safety of your plant. You therefore need to perform a complete functional test and the necessary safety checks before the final commissioning of a plant.
Also allow for any possible foreseeable errors in the tests. This avoids endangering persons or equipment during operation.

7.1 Basics

7.1.1 Engineering

You perform configuration as well as diagnostics of a TM Drive with a PG/PC or notebook (commissioning device) using the TIA Portal (Hardware Support Package HSP0311 needed).

The settings can be found in STEP 7 in the device navigation under "Ungrouped devices" > "<Name of the interface module>" > "<Name of the TM Drive>".

Overview

This drive engineering is divided into the following areas:

- Online & diagnostics
- Parameters
- Device configuration

"Device configuration" area

Contents in the "Device configuration" area of the TM Drive engineering.

- Potential group
- Basic parameters
  Set telegram, activate telegram extension
- I/O addresses

"Online & diagnostics" area

Contents in the "Online & diagnostics" area of the TM Drive engineering.

Diagnostics

- General (module information):
  Order number, firmware and hardware version, I&M data
- Diagnostic status (display of status information)
- Active messages:
  Pending faults and alarms
- Drive diagnostics
  Status bits, operating values, encoders, temperatures, inputs

Functions

- Firmware update

"Parameters" area

Contents in the "Parameters" area of the TM Drive TM engineering.

- Drive:
  Drive data set, General settings, Motor, Motor gear, Thermal model, Intermediate circuit voltage, Brake module
- Setpoint channel:
  Reference values, application limits, speed-ramp sensor
- Open-loop/closed-loop control:
  Control type, controller settings, speed controller, current controller
- Messages/monitoring:
  Motor (thermal motor type), power output stage (utilization)

"Commissioning" area

Contents in the "Commissioning" area of the TM Drive TM Engineering.

- Configuration:
  Link to the parameter dialog
- Identification:
  Identification mode
  Encoder and pole position identification
  Encoder values
- Tuning:
  Calculate speed/current controller values
  Tuning the speed controller
  Transfer controller values to drive parameters

See also

PMSM drive parameters (Page 79)
Drive parameters stepper motor (Page 81)

7.1.2 Drive parameters

Parameter tooltips

In STEP 7 engineering of the TM Drive, all displayed drive parameters are linked with tooltips. You will find detailed information on the parameter in the tooltips, e.g. parameter name, properties, factory setting, value range, descriptions, notes and dependencies.

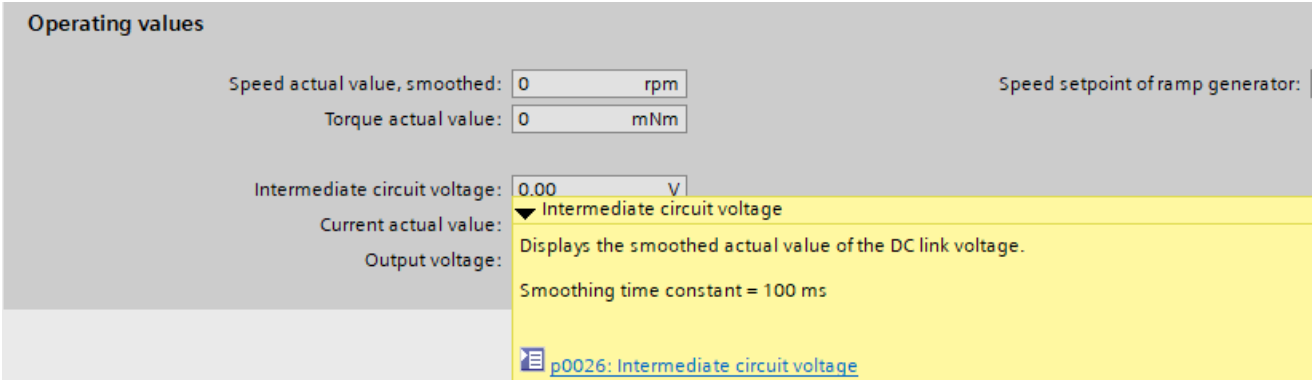

Figure 1-326 Intermediate circuit voltage tooltip

Changing a parameter

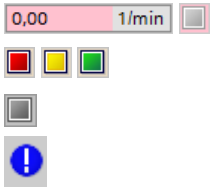
You can directly change the values of the writable adjustable parameters (p-parameters) in STEP 7.

You have the following options for this:

- You overwrite the current parameter value with the new value.
  Or
- You select a value via the drop-down list.

Invalid values are rejected.

NOTE



P-parameters cannot be changed online while the drive is in operation. In this case, the corresponding entry field is automatically disabled.

The following overview shows the display of an entry field, depending on the context and the properties of the drive parameter:

1,0000 Nm	Project (offline)	Parameter value can be changed and stored in the project.
48,0 V	Project (offline)	The parameter value is write-protected.
24,0 V	Project (online)	Parameter value is write-protected or disabled due to the drive status.

Parameter symbols and operator controls

The following overview explains additional symbols and operator controls in the TM Drive engineering:

Drive value (online) could not be determined

Bit parameter active (1-signal)

Bit parameter inactive (0-signal)

Binding values to be set by the commissioning engineer

Automatic check of the configured drive parameters

The configured parameters are checked both in STEP 7 and in the drive in order to detect incorrect parameter assignments and possible functional restrictions even before commissioning.

Both warning and error messages are output. In STEP 7, you obtain additional information and corrective measures about the respective message.

The causes of errors in the drive parameter assignments that prevent the drive from operating are listed below.

Parameter group	Possible causes of error
Motor	Electrical time constants of the connected motor are too low
	Torque constant is not consistent with other motor parameters
Encoders	Motor/encoder combination is not permitted
Speed/current controller	Controller parameters have not yet been set or are not permissible
Intermediate circuit voltage	Intermediate circuit limits are prohibited
Brake module	Brake chopper settings are not permitted

Loading drive parameters

You can synchronize all p-parameter values of your project (offline) using the "Download to device" function.

Constraints

- When you load parameters into the device, a rotating drive automatically stops.
- After the parameters are loaded, the drive does not restart automatically. You must activate the drive once again using a new drive command.
- If you send an invalid parameter to the TM Drive, the module remains in parameter assignment mode. The drive cannot be activated until valid parameters are loaded.

"Download to device" function for drive parameters

You can use the "Download to device" function to transfer parameter values from your project (offline) to the drive (online).

Procedure

1. Select the drive in the project tree.
2. Click on "Download to device" in the menu bar.

Or

1. Select "Download to device" > "Software" in the shortcut menu.

You have transferred the current parameter values of your project to the drive.

7.1.3 Calling help information

To obtain information on parameters and alarms (messages) of the drive, open the information system via "Help" > "Show help" and search for the article number of the product.

You can also directly open the information system for a parameter or a message. To do so, click the online help link in the tooltip of a parameter or message .

7.2 Requirements for the commissioning

Requirements

- The TM Drive was installed according to the information in the following sections:
  - Wiring (Page 28)
  - Configuring (Page 60)
- The motor is installed in the drive train to be operated in accordance with the plant/device construction planning.

NOTE

Additional information concerning the requirements

You can find additional information relating to technology objects and motion control in the online help of STEP 7 under "Using technology functions" > "Motion Control".

Before powering on for the first time

Before the first power-on, check the installation and the wiring of the TM Drive.

Questions for the check

The following questions provide guidance for checking your TM Drive in the form of a checklist.

Racks

- Is the mounting rail securely mounted to the wall, in the frame or in the cabinet?
- Are the cable ducts correctly installed?
- Have the minimum clearances been observed?

Grounding and chassis concept

- Is the mounting rail connected to the protective conductor?
- Is the connection between the ground reference and ground properly established for the mounting rail?
- Has the shielding of the motor/encoder cable been applied over a large area on the device and on the motor/encoder?
- Are the required equipotential bonding cables connected with low impedance to the affected plant units?
- Are the grounding terminals correctly attached and is the motor/encoder cable correctly connected?

Module installation and wiring

- Is the TM ServDrive plugged in / installed and firmly connected or screwed according to the assembly plan and configuration with STEP 7?
- Are all connectors wired according to the circuit diagram?
- Is the PROFINET connection to the CPU and the engineering system of the STEP 7 (TIA Portal) connected?
- Is the input for Hardware STO (STO+/STO-) connected?
- Are the cables (motor connection cable, encoder cable) properly connected between the TM Drive and the motor and installed according to the guidelines?
- Is the digital input connected?
- Was an external braking resistor optionally connected to the TM Drive?
- Are the cables from the hardware STO (STO+/STO-) separated from the other cables, in particular from power cables?
- Have you minimized crushing hazards and short-circuits against ground connections by appropriate routing?
- Are the cables fully protected against premature aging due to continuous UV radiation?

Power supply

- Are all power supplies switched off?
- Is the power cable connector correctly wired?
- Has the connection to line voltage been made?

7.3 Procedure for commissioning the ET 200SP TM Drive

Procedure for commissioning with STEP 7

Commissioning is performed according to the steps listed below. The individual commissioning steps are optional and are to be performed as required. We recommend the following procedure for the first commissioning of a TM Drive .

Table 1-668 Commissioning procedure

Step	Procedure	Comments	See section ...
1	Configure drive data set	Use one of the following options in the "Import drive data set" dialog under "Parameters > Drive": • Select pre-configured drive data set from list • Import drive data from file system	Drive data sets (Page 75)
2	Define setpoint channel	Under "Setpoint channel" you configure the following: • Reference values • Application limits • Ramp generator	Setpoint channel (Page 91)
3	Set control/closed-loop control	Have the controller parameters automatically calculated using the "Speed/current controller settings" comfort function.	Speed control (cascade) (Page 96)
4	Configure intermediate circuit voltage monitoring and optionally the brake control module	• Define limits for intermediate circuit voltage • Brake chopper settings • Motor holding brake settings	Intermediate circuit voltage
5	Configure messages/monitoring	• Define warning thresholds for thermal monitoring	Messages/monitoring (Page 116)
6	Optional: Depending on motor type and encoder, determine commutation angle offset and encoder values	• Perform automatic encoder identification in commissioning under "Encoder identification".	Setting the commutation angle offset and pole position identification (Page 86)
7	Optional: Perform automatic controlled system detection	• Automatic controlled system detection can be performed for setting the current and speed controller in the commissioning under "Controlled system detection".	Automatic controlled system detection (Page 99)
8	Optional: Perform online optimization	• Tuning the speed controller	Section Manual controller tuning Speed controller (cascade) (Page 104)

7.4 Drive data sets

Introduction

So that you can optimally handle the requirements of drive technology, the TM Drive drive system is compatible with motors (Dunkermotoren, ebm-papst) and connecting cables (Harting, KnorrTec) of proven product partners of Siemens. This allows you to optimally combine suitable products from proven product partners for your individual application.

You can find more information about the Siemens Product Partner Program in theInternet (https://new.siemens.com/global/en/products/drives/sinamics/servo-drive-system-simatic-micro-drive.html).

It is possible to connect motors from third-party motor manufacturers, provided that they meet the required conditions regarding motor, encoder system, connection system, electrical safety, EMC, etc., as described in this manual.

For the F-TM ServoDrive HF this also includes stepper motors which can be connected bipolar, and which meet the constraints explained in this manual.

Drive data set

The motor or drive of the TM Drive drive system is configured using a drive data set (DDS). A drive data set contains the settings and information for the following drive components:

- Motor
- Gearbox
- Thermal motor model

NOTE

The description "drive" means the combination of motor, encoder and additional built-on accessories such as a gearbox and holding brake.

Motor

You can find the settings for the motor in the "Parameters" > "Drive" > "Motor" area.

The TM Drive drive system supports PMSM and stepper motors. You specify important basic data and reference data of the motor.

Observe the information and notes in the help or in the tooltips of the individual parameters.

You can also find detailed information and descriptions for the drive parameters in the Product Information (https://support.industry.siemens.com/cs/ww/en/view/109773204).

Motor encoder

The motor encoder is used for the closed-loop speed control of the drive. The encoder values are transferred to the CPU in the PROFIdrive telegram of the TM Drive, independent of the encoder type.

The motor encoder (p0404) can be selected based on the motor type (p0300). The following combinations are available:

Motor type: Stepper motor

- (0) No encoder / calculated
- (1) Incremental encoder (A, B, Z track)

Motor type: PMSM motor

- (1) Incremental encoder (A, B, Z track)
- (5) IQ encoder (A, B track)
- (6) Absolute encoder BiSS-C

(0) No encoder / calculated
The setting (0) encoderless / calculated is only supported in connection with a stepper motor. In this case, the rotor position is calculated and transferred to the control depending on the increments per revolution (p0408) or the steps per revolution (p0409).

(1) Incremental encoder (A, B, Z track)
When selecting encoder type (1) incremental encoder, a 3-channel encoder with Z-track (often also called I-track) can be connected as an index track to identify the pole position.

(5) IQ encoder
If you are using a motor with IQ encoder, you must select the encoder type IQ encoder.

(6) Absolute encoder BiSS-C
A BiSS-C encoder transmits encoder value digitally and checks the data for transmission errors. Absolute encoders with multiturn and single-turn values as well as pure single-turn encoders with dual coding can be used.

Thermal model

The motor can be protected from thermal overload. Take section Messages/monitoring (Page 116) into consideration for this.

You define the thermal properties of the motor in the "Parameters" > "Drive" > "Thermal model" area.

7.4.1 Using the drive data set

To configure a drive, you have the following options:

- Download preconfigured drive data sets as a file for selected motors from Siemens Industry Online Support (https://support.industry.siemens.com/cs/ww/en/ps/25460).
- Create a user-defined drive data set and configure your motor manually.

NOTICE
After a change of the drive data set, you must adapt or optimize the parameters for the current and speed controllers, if necessary. See section Speed control (cascade) (Page 96).

7.4.2 Drive data export / import

In addition to the pre-defined drive data sets, custom drive data sets can also be exported and imported.

The standard CSV format with ',' (comma) as column separator including a line header is used.

The data is stored according to the file header and also read in again on the basis of this line.

The formatting of decimal numbers is region-independent using a '.' (dot) as the decimal separator.

For negative values, the value must be preceded by a '-' (minus).

UTF-8 is defined as the character coding.

The header line is defined as follows:

##PNU(mandatory)##,##name##,##value(mandatory)##,##unit##,##dataType##, ##group##,##ECLASS number##

- Motor
- Motor gear
- Encoders
- Thermal model
- Motor holding brake

All parameters contained in the CSV file are included in an import. The CSV file can be customized and, for example, unused parameters can be removed. For example, only one parameter can be imported.

The parameters are assigned via the PNU, where the value must be present. Name, unit, data type and ECLASS number are used for better readability and are ignored during import.

Quotation marks and spaces are hidden during import, which is why no further commas are supported except for column separation.

Export drive data

The existing drive parameter assignments can be exported and saved as a file (*.csv) from STEP 7 Engineering.

1. Open "Parameters" > "Drive".
2. Start the export via the "Export drive data set..." button in the "Drive data set" area.
3. In the "Save" dialog, select a folder and the file name and confirm with "Save".

Import drive data

The drive parameter assignment can be imported as a file (*.csv) in STEP 7 Engineering. A drive data set may contain all or part of the parameters supported by the TM Drive used.

NOTE

Importing the drive parameter assignments overwrites all parameters with the values contained in the csv file.
Parameters not contained in the drive data set are not changed and retain their value.
The "Undo" function is not possible for the "Import drive data set" function.
Save your parameter assignments before importing a drive data set.

1. Open "Parameters" > "Drive".
2. Start the configuration wizard via the "Import drive data set..." button in the "Drive data set" area.
3. Select the "Import drive data set from file system" option.
4. Select the drive data set (*.csv) via the file folder button.
5. The drive data set is displayed in the log area and you can check the data.
6. Apply the configuration with "Yes".

Status messages about the import are displayed in the Inspector window in the General tab.

7.4.3 Using preconfigured drive data sets

You have the option of using preconfigured drive data sets for configuring your motor. You can obtain preconfigured drive data sets for selected motors from Siemens Industry Online Support (https://support.industry.siemens.com/cs/ww/en/ps/25460) or product partners.

Installing the drive data record

Pre-configured drive data sets are provided as a file (tms *.mpk) and must be installed in STEP 7 engineering. A drive data record file can contain the configuration of one or more motors.

Expand the list of drives by installing new drive data sets from the file system:

1. Open "Parameters" > "Drive" in the context of the drive.
2. Start the configuration wizard with the "Configure drive data record..." button in the "Drive data record" area.
3. Select the "Select drive from list" option.
4. Click "Install the drive data record" and select one or more drive data record files that you want to install.
5. Confirm the disclaimer by clicking on "I agree".
   If you do not agree to the disclaimer, close the dialog with "Cancel". In this case, no drive data record file will be installed.

You have installed a drive data record and can now use it.

NOTE

An installed drive data record is installed locally on the PG/PC only for the current STEP 7 version. To open the local installation folder, click the "Locally installed drives" link in the "Configure drive data record" wizard.

Using a preconfigured drive data record

You can search for the desired drive in the list of all locally installed drives.

1. Open "Parameters" > "Drive" in the context of the drive.
2. Start the configuration wizard with the "Configure drive data record..." button in the "Drive data record" area.
3. Select the "Select drive from list" option.
4. Select the desired drive from the list under "Search here for drive or enter filter".

5. The selected drive data record is displayed in the report area and you can check the data.
6. Accept the configuration with "Yes".

You have selected and set up a preconfigured drive data record.

NOTE

You can pass on a saved engineering project with preconfigured drive data record or use it on a different PG/PC on which the utilized drive is not installed. In this case, no optional additional information on the drive is displayed, e.g. manufacturer or order number. This is displayed as soon as you have installed the utilized drive.

7.4.4 Using a user-defined drive data set

Create a user-defined drive data set and configure your motor manually.

You can freely configure the current drive data at any time, even if it was imported via a predefined drive data set or a parameter table.

⚠ WARNING

Avoiding incorrect parameter assignments

Note that incorrect or modified parameter assignments can result in drive malfunctions and damage to the drive.

7.4.5 PMSM drive parameters

Parameter number	Name	Description	Unit
Motor			
p0300	Motor type	Selection of the motor type	
p0304	Nominal voltage	Refer to the motor data sheet for the nominal voltage of the motor. The nominal data of the motor are based on this voltage.	V
p0305	Nominal current	The nominal motor current is the current value at which the motor delivers its nominal power and nominal torque under nominal conditions. The nominal current value refers to the ambient conditions specified by the motor manufacturer. If, for example, the motor ambient temperature differs from that of the motor manufacturer, the nominal current must be adjusted according to the manufacturer's specifications.	A
p0311	Nominal speed	Nominal motor speed is the speed at which the nominal values of the motor are valid.	rpm
p0312	Nominal torque	Nominal torque is the torque at the nominal operating point of the machine.	Nm
p0322	Maximum speed	Maximum speed is the mechanically permissible speed of the machine. If the speed is exceeded, the motor may be damaged.	rpm

Parameter number	Name	Description	Unit
p0323	Maximum current	The maximum current is the maximum motor current permitted for a short time. The motor can be operated briefly up to this current without resulting in damage, but continuous operation is only permissible up to the maximum nominal current. The maximum current can flow until the limitation of the thermal model intervenes. Specifications such as permissible motor peak currents, e.g: for the duration of 1 s, are not to be entered here.	A
p0316	Torque constant	The torque constant of the motor is the proportionality factor between the RMS current of the q current and the internal torque of the motor. The motor torque is calculated from this constant.	mNm/A
p0314	Number of pole pairs	Number of pole pairs of the motor. For example, an 8-pole motor has 4 pole pairs	-
p0372	Connection resistance (= internal resistance)	Connection resistance of the motor between two motor phases.	Ohm
p0376	Connection inductance q component (=winding inductance q)	Connection inductance between two motor phases in the q axis. When only the value of the rotating field inductance is specified, this value can be used for d and q inductance.	mH
p0377	Motor connection inductance d component (=winding inductance d)	Connection inductance between two motor phases in the d axis. If only the value of the rotating field inductance is specified, this value can be used for d and q inductance.	mH
p0341	Rotor moment of inertia	The rotor moment of inertia is the mass moment of inertia of the rotor with the connecting shaft.	kgcm²
p0318	Standstill current (= holding current)	The standstill current of the motor corresponds to the current value with which the motor can be permanently loaded at standstill under the ambient conditions specified by the motor manufacturer.	A
Motor gear			
p2725	Motor gear moment of inertia	Sets the motor gear moment of inertia in relation to the motor axis.	kgcm²
Thermal model			
p0611[1]	Time constant winding - environment	Setting of the thermal time constant between the winding and the environment. In nominal operation (nominal load and the ambient temperatures and installation elevation specified by the manufacturer) the limit temperature of the motor is reached after five times the time constant. Note: If the ambient conditions of the motor do not correspond to the values specified by the manufacturer, the motor must be derated. See 7.7.1 Thermal motor monitoring	s

Parameter number	Name	Description	Unit
Motor connection			
p0352	Motor cable line resistance	Input of the motor cable resistance value for outgoing and return conductor.	Ohm
p0353	Motor series inductance (=motor cable inductance)	Input of the line inductance of the outgoing and return conductor. The value can be neglected for motor connection cables < 10 m. If a series reactor is also connected between the motor and the inverter, you need to enter the inductance value as an additive to the line inductance.	mH

7.4.6 Drive parameters stepper motor

Parameter number	Name	Description	Unit
Motor			
p0300	Motor type	Selection of the motor type	
p0305	Nominal current	Nominal current per coil in full step mode.	A
p0312	Hold torque	Hold torque of the stepper motor in full step mode and nominal current.	Nm
p0322	Maximum speed	Maximum speed is the mechanically permissible speed of the machine. If the speed is exceeded, the motor may be damaged.	rpm
p0372	Connection resistance	Connection resistance of a phase	Ohm
p0376	Connection inductance	Connection inductance one phase	mH
p0341	Rotor moment of inertia	The rotor moment of inertia is the mass moment of inertia of the rotor with the connecting shaft.	kgcm²
p30000	Step angle	Step angle of the stepper motor in full step mode.	°
p30001	Number of steps	The number of steps indicates the number of steps per mechanical revolution in full step mode. The value cannot be edited and is calculated from the step angle. Number of steps = 360° / step angle	-
p0014	Number of pole pairs	The number of pole pairs indicates the number of pole pairs in the motor. The value cannot be edited and is calculated from the step angle. Number of pole pairs = step angle / 4.	-
Motor gear			
p2725	Motor gear moment of inertia	Sets the motor gear moment of inertia in relation to the motor axis.	kgcm²
Thermal model			
p0611[1]	Time constant winding - environment	Setting of the thermal time constant between the winding and the environment. In nominal operation (nominal load and the ambient temperatures and installation elevation specified by the manufacturer) the limit temperature of the	s

Parameter number	Name	Description	Unit
		motor is reached after five times the time constant. Note: If the ambient conditions of the motor do not correspond to the values specified by the manufacturer, the motor must be derated. See 7.7.1 Thermal motor monitoring	
Motor connection			
p0352	Motor cable line resistance	Input of the motor cable resistance value for outgoing and return conductor.	Ohm
p0353	Motor series inductance (=motor cable inductance)	Input of the line inductance of the outgoing and return conductor. The value can be neglected for motor connection cables < 10 m. If a series reactor is also connected between the motor and the inverter, you need to enter the inductance value as an additive to the line inductance.	mH

7.4.7 Motor encoder

Under Encoder type configuration, select the appropriate encoder type for the motor.

Parameter number	Name	Description	Unit
Encoder type configuration			
p0404	Motor encoder selection	Selection of the motor encoder	-

Depending on the motor type, you can select the following encoders:

Motor type: PMSM motor

- (1) Incremental encoder (A, B, Z track)
- (5) IQ encoder (A, B track)
- (6) Absolute encoder BiSS-C

Motor type: Stepper motor

- (0) No encoder / calculated
- (1) Incremental encoder (A, B, Z track)

7.4.7.1 Encoder parameters, incremental encoder, IQ encoder and encoderless/calculated

The encoder types incremental encoder, IQ encoder and encoderless/calculated use the same settings.

Parameter number	Name	Description	Unit
p0408	Increments per revolution	Setting of the increments per revolution or the pulses per revolution (PPR) of the motor encoder.	-
p0409	Steps per revolution	Display of the steps per revolution or counts per revolution (CPR) of the encoder. The value cannot be edited, results from the quadrature interface and is four times the value of increments per revolution (p0408).	-

Incremental encoder, IQ encoder

The increments per revolution must be set for the incremental encoder and the IQ encoder. The increments can be independently detected at the incremental encoder by the automatic encoder detection of the TM Drive.

Encoderless / calculated with stepper motor

With the setting encoderless / calculated, the motor moves at low speeds in the set encoder resolution steps p0408 or p0409. The encoder resolution (increments per revolution (p0408)) must be at least 4 times or a multiple of the number of pole pairs of the motor. If the values are too high, the positioning accuracy can fluctuate depending on the motor quality (ripple).

It is recommended to set every integer multiple of the motor full step angle (p30001); a step division into partial steps (1/2, 1/4, 1/8, etc.) is not necessary but can improve the positioning accuracy, especially with multi-pole stepper motors. The following table shows how the corresponding step subdivisions are determined for this.

Step resolution	**Steps per revolution (p0409)**	**Increments per revolution (p0408)**	**Example: Step angle = 1.8°; Number of steps = 200; Number of pole pairs = 50**	
			Steps per revolution (p0409)	**Increments per revolution (p0408)**
Full step	1 x number of steps (p30001)	1/4 x number of steps (p30001)	200	50
1/2 half step	2 x number of steps (p30001)	2/4 x number of steps (p30001)	400	100
1/4 fourth step	4 x number of steps (p30001)	4/4 x number of steps (p30001)	800	200
1/8 eighth step	8 x number of steps (p30001)	8/4 x number of steps (p30001)	1600	400
.	.	.	.	.
1/64 sixty-fourth of a step	64 x number of steps (p30001)	64/4 x number of steps (p30001)	12800	3200

7.4.7.2 Encoder parameters for absolute encoder BiSS-C

A BiSS-C encoder transmits absolute encoder position as single-turn and optionally as multiturn values. The transmission occurs according to the specified BiSS-C protocol. The following figure shows the structure of the protocol. Using the BiSS-C protocol, in addition to the encoder position values single-turn (ST) and multiturn values (MT), an encoder-side alarm bit and a warning bit can also be transmitted. Transmission errors are detected using a CRC (Cyclic Redundancy Check).

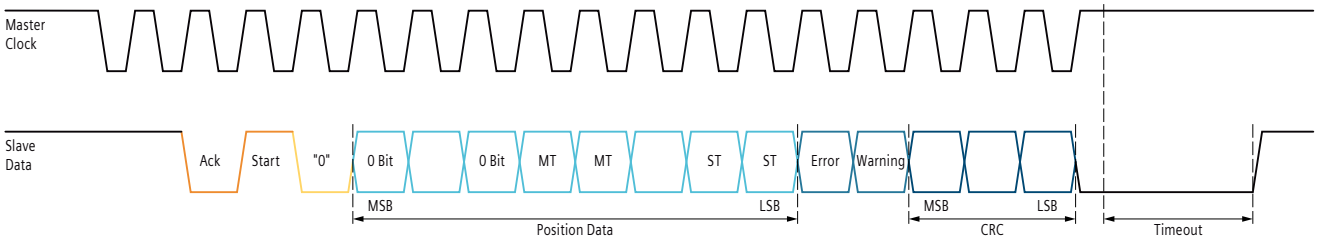


Figure 1-327 BiSS-C protocol

Table 1-669 **Encoder values**

Additional absolute encoder BiSS-C			
Parameter number	**Name**	**Description**	**Unit**
p0423	Single-turn resolution	Number of bits of the single-turn resolution The resolution of the single-turn value (ST) is calculated as follows 2^(p0423[0]). The sum of single-turn, multiturn and number of bits before position value must be <= 56.	Bits
p0421	Multiturn resolution	Number of bits of the multiturn resolution The resolution of the multiturn value (MT) is calculated as follows 2^(p0421[1]). The sum of single-turn, multiturn and number of bits before position value must be <= 56.	Bits
p0449	Number of bits before position value	Number of bits before the position value In some telegrams, so-called empty bits (0-bit) are inserted before the position bits. The sum of single-turn, multiturn and number of bits before position value must be <= 56.	Bits
p0429:0..1	Transfer code	Selection of the transmission code Valid values: [1] Dual	-
p0427	Transmission frequency	Selection of the transmission frequency between the module and the encoder. The following values can be set: [0] 350 kHz [1] 700 kHz [2] 1.4 MHz [3] 2.8 MHz The maximum transmission speed depends on the cable length and its shielding as well as the technical specifications of the absolute encoder.	kHz

Additional absolute encoder BiSS-C			
p0429:2	Encoder diagnostics	Selection whether the encoder diagnostic bits are to be evaluated or ignored. If diagnostics are not selected, warnings and errors of the encoder are ignored.	-
p0450	CRC polynomial	Input of the polynomial length of the cyclic redundancy check (CRC). Note: Only the recommended CRC value for BiSS-C encoders with 43 hex is supported.	-

7.4.7.3 Assign encoder counting direction parameters

For encoder type (1) incremental encoder, it may be necessary to invert the counting direction of the encoder by setting parameter p0410, Invert encoder counting direction. With incremental encoders, this may be necessary, for example, if the A and B tracks were swapped when the encoder was connected.

The following is defined as the positive direction of rotation of the encoder.

Incremental encoder:

The positive direction of rotation for an incremental encoder is defined as follows.

If the positive A edge comes before the positive B edge in terms of time, the motor with a view of the motor shaft rotates clockwise in the positive direction of rotation.

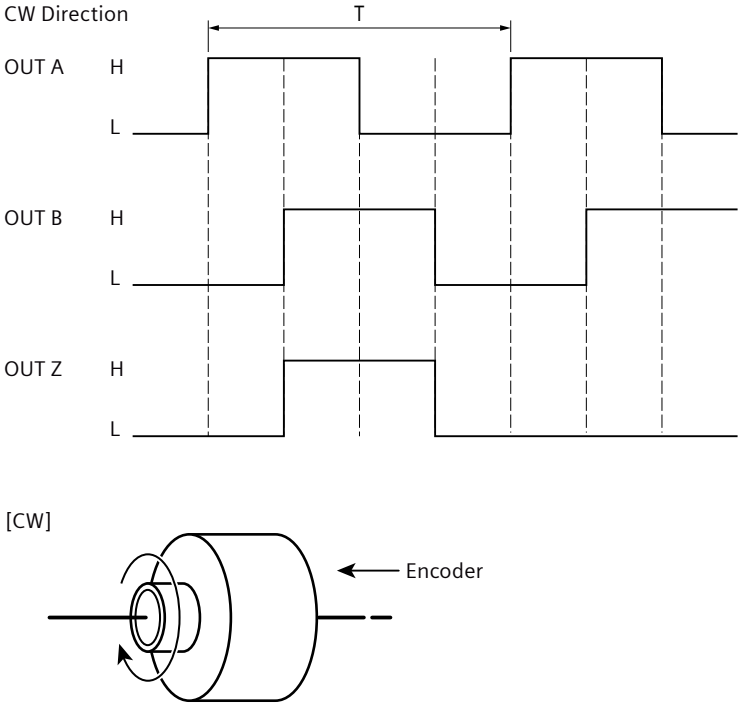

Figure 1-328 Direction of rotation for the incremental encoder

Definition:
A positive speed in TM Drive is defined as follows:

The motor rotates clockwise looking down on the motor shaft. The encoder value increments during this process.

Table 1-670 **Encoder values**

Parameter number	Name	Description	Unit
p0410	Reverse encoder counting direction	This setting negates the counting direction of the encoder.	-

7.4.7.4 Setting the commutation angle offset and pole position identification

For the commutation of a PMSM with the encoder type

- [1] Incremental encoder (A, B, Z track)
- [6] Absolute encoder BiSS-C

it is necessary to know the commutation angle offset or to determine it.

The commutation angle offset is the angle offset between a reference (Z-track for incremental encoders or the (single-turn) value "0" for absolute encoders) and the rotor / pole position.

Encoder calibration at each start (p1990)

If the parameter (p1990) "Encoder calibration at each start" is set, the determination of the commutation offset angle is repeated, for example, by voltage interruption at each restart or after each configuration of the drive.

If the parameter (p1990) is not selected, the value entered in the commutation angle offset (p0431) is used for commutation. If the offset angle is known, this can either be entered or automatically determined by TM Drive (see section Automatic encoder / pole position identification (Page 89)).

NOTE

Incremental encoder

After a new configuration or after switching off the power supply, the pole position is unknown when using an incremental encoder. If the parameter (p1990) "Encoder calibration at each start" is not set, the motor control is speed controlled with a fixed motor (running) current depending on the motor current parameters until there is synchronization of the pole position.

If synchronization with the Z-track is not possible, the control is aborted.

If the rotor position has not yet been synchronized, the drive may be twisted by an external load. If you want to prevent the drive from rotating directly after drive activation, you can use the Additional torque parameter (p1511) to ensure that a corresponding hold torque is applied to the motor (see section Speed control (cascade) (Page 96)).

NOTE

Motor replacement

When replacing the motor, remember that the motor encoder in a motor series is not always calibrated in the same way.

If the encoder calibration is selected at every start, no further action is required.

If this is not the case, the commutation angle offset must be determined again in the encoder / pole position identification (see section Automatic encoder / pole position identification (Page 89)).

⚠ WARNING

Incorrectly set commutation offset angle
It must always be ensured that the commutation offset angle is set correctly.
Otherwise, there will be insufficient control of the drive and it will not achieve its full performance or it will proceed in an uncontrolled manner.

Table 1-671 Encoder values

Parameter number	Name	Description	Unit
p1990	Encoder calibration at each start	If this option is selected, the commutation angle offset is determined again at every restart (new configuration or switching off the supply voltage). It is recommended to determine the commutation angle offset once during commissioning. Calibration is then no longer necessary, except when replacing the motor.	-
p0431	Commutation angle offset	Setting the commutation angle offset The commutation angle offset is the angle between the rotor pole position and the 0° degree pulse of the encoder. If the angle offset is not known, it can be determined by the module during commissioning. The offset angle is defined as follows. Incremental encoder: 0° offset is present if the Z pulse is applied at least at one alignment point (depending on number of pole pairs) when the phase U is positive and V, W are negative. Absolute encoder: 0° offset is present if the angle value is 0 at least at one alignment point (depending on number of pole pairs) when the phase U is positive and V, W are negative. **Warning:** **An incorrectly set commutation angle offset can lead to uncontrolled behavior of the drive!**	-

7.4.7.5 Calibration process of the commutation angle offset

When selecting parameter p1990 "Encoder calibration at each start", the TM Drive restarts the calibration process of the motor pole angle after:

- Every initial enable of the drive
- Every time the power supply is switched on again
- After re-configuration
- If certain malfunctions of the module occur

After that, the TM Drive references with the determined offset angle over the Z-track or the encoder steps of the absolute encoder.

The motor is energized for the calibration process and thereby generates torque.

The motor current is limited by the:

- Prospective locked rotor current (p0318)
- Equivalent current from the nominal torque of the motor (p0312)
- The equivalent current from the torque limitation (p1520)
- The maximum converter current

The smaller limitation in each case takes effect.

A possibly existing motor holding brake must be opened, so that a rotation of the motor is possible. If the motor holding brake is configured via the TM Drive and connected accordingly, the task of opening the holding brake is assumed by the TM Drive.

NOTE

If you have selected (p1990) "Encoder calibration at each start", the drive must retrain itself at initial commissioning and each time the power supply is switched back on or a new project download is performed. This process can take between 1 - 4 seconds. The motor can move by a maximum of 180° / number of pole pairs. Such movement must be possible in the application.

The following constraints must be observed:

- The motor must be able to rotate freely in both directions of rotation and the axis must not be loaded with a static load.
- With suspended loads, the option (p1900) "Encoder calibration at every start" must not be used.
- It is recommended to use an absolute encoder especially for suspended loads.
- The calibration process cannot be performed when the axis is rotating, or the speed must be below the standstill detection p1226.

NOTICE

Open motor holding brake

The motor holding brake is opened during calibration of the commutation angle offset. Especially with suspended axes, it is therefore important to ensure that it is possible to open the motor holding brake.

An unexpected collapse of a hanging axis can result in personal injury and property damage.

Before commissioning, you must ensure that a cross brace is fitted to hold the suspended axis in position and prevent it from collapsing unexpectedly. Also ensure that the power supply is connected properly.

⚠ WARNING

Motor movement by measurement on unbraked motors

The measurement can be used to trigger a rotation or movement of the motor via the specified current on unbraked motors. The magnitude of the movement depends on the specified current as well as on the moment of inertia of motor and load.

7.4.7.6 Automatic encoder / pole position identification

Automatic encoder pole position identification is found in the Commissioning submenu of the configured TM Drive. This function is only possible with the PMSM motor type. Incremental encoders and absolute encoders can be detected. Depending on the encoder type, the following encoder / motor parameters are automatically detected:

Incremental encoder (1) and absolute encoder (6)

- Commutation angle offset (p0431)
- Number of pole pairs (p0314)

Incremental encoder only (1)

- Increments per revolution (p0408)
- Invert encoder counting direction (p0410)

For automatic encoder / pole position identification please proceed as follows:

Preconditions

- Motor type PMSM
- The motor parameters are known and the calculation of the controller parameters under open-loop/closed-loop control has been performed and transferred to the drive.
- The device is in RUN state and the drive is at standstill.
- The drive is not enabled in any other way (e.g. by a technology object or a user program).
- The motor can rotate freely in both directions of rotation and is not loaded with a static load (example: suspended load)

NOTE

If the motor is loaded with a static load during encoder detection, the commutation offset angle may not be correctly detected. The motor can then only deliver a reduced torque.

Step 1:

Go online and enable commissioning mode under Commissioning, Identification with the 'Start' button and select the encoder / pole position identifier.

NOTE

In this operating mode, the drive can only be controlled by the TM Drive. A control of the drive by the S7 control via PROFIdrive is not possible in this mode and is locked. This is also signaled by resetting ZSW1 bit 9.

Step 2:
The configured motor type and motor encoder is displayed under Commissioning encoder / Pole position identification. Insert the identification current allowed for the test. This is always automatically set to the rated motor current. However, it can be adjusted if required.

NOTE
If the motor is already installed in an application, you may need to increase the identification current in steps. The motor maximum current p0323 must not be exceeded. If necessary, observe idle times between the identification cycles to avoid overheating the motor. Especially for motors with an increased cogging torque, it may be necessary to increase the identification current so that the encoder and pole position information can be accurately detected.

Step 3:
Start the encoder / pole position identification with the selection button "Start encoder detection".

A configured motor holding brake is opened during encoder / pole position identification. This is signaled via ZSW1 bit 12.

NOTICE

Open motor holding brake
The motor holding brake is opened during encoder / pole position identification. Especially with suspended axes, you must ensure that it is possible to open the motor holding brake. An unexpected collapse of a suspended axis can result in personal injury and property damage.

Step 4:
If the drive is still in operation, execution of the identification commands is rejected. Stop the operation of the drive before the encoder / pole position identification. Then continue with step 3.

When all conditions are fulfilled, the TM Drive starts the identification after the confirmation of the safety prompt. It is necessary that the drive can be turned safely in both directions.

Step 5:
If the encoder / pole position identification is successfully executed, the determined values are displayed.

NOTE
Before you apply the determined values, you need to check them for plausibility.

Step 6:
You can now select which of the determined values you want to transfer to the offline project. By clicking the "Transfer determined values to offline project" button, the selected values are transferred to the offline project.

NOTE
The determined settings are stored only temporarily on the module. They are replaced by the permanently stored parameters on the next restart.
If you want to store the settings permanently on the module, change the drive parameters offline and download them again with "Download to device".

Step 7:
When you have transferred the parameters to the offline project, disable commissioning mode under Commissioning, Identification with the 'Exit' button. You must then load the parameters onto the module using "Download to device".

Encoder / pole position identification is completed. The option "Encoder calibration at each start" (p1990) is no longer required and should be deselected.

7.5 Setpoint channel

Overview

Setpoints from the respective setpoint source are prepared for the motor control in the setpoint channel of the drive.

You specify the setpoints via the drive telegrams to PROFIdrive.

You can find the settings for the setpoint channel in the context of the drive under "Parameters" > "Setpoint channel".

Under "Setpoint channel" you configure the following:

- Reference values (Page 92)
- Application limits (Page 92)
- Ramp generator and speed setpoint filter (Page 95)

The figure below shows the processing of the speed setpoint in the drive controller.

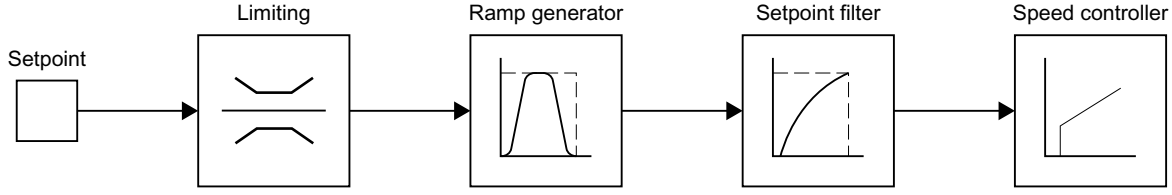

Figure 1-329 Setpoint channel

The speed setpoint from the drive telegram is limited in the setpoint channel according to the specified values, see section Reference values (Page 92).

The limited speed setpoint is fed to the ramp generator as an input signal, see section Application limits (Page 92).

The output of the ramp generator is fed to the speed controller via the speed setpoint filter, see section Ramp generator and speed setpoint filter (Page 95).

7.5.1 Reference values

The physical variable speed is transmitted in the drive telegrams as a reference values.

- Speeds are normalized to the reference speed (p2000) in the drive telegram.
- Torques are normalized to the reference torque (p2003) in the drive telegram.

Parameters p2000 and p2003 are definitive as reference values (telegram content = 4000 hex or 4000 0000 hex for double words, if the input value has the value p2000 or p2003).

Example of the normalization of the speed:

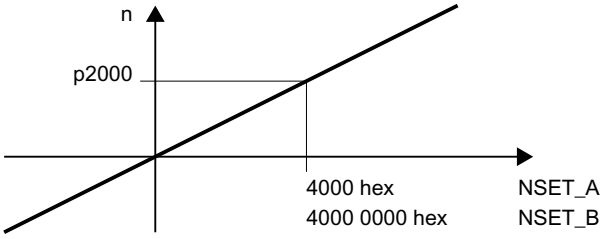

Figure 1-330 Example of normalization of the speed

NOTE

The speed and torque are specified in the drive telegram as a percentage of the reference speed in the range -200% to 200%.
Therefore, set the reference variables in such a way that the desired maximum value falls within the value range of the control from -200% to +200%.

Procedure

1. Configure the reference value in the context of the drive under:
   "Parameters" > "Setpoint channel" > "Reference values".

⚠ WARNING

Uncontrolled drive behavior
Note that the specification of reference values in the CPU and the drive must always match. Otherwise, uncontrolled drive behavior and rotating of the motor might occur.
Recommendation: First, complete the commissioning of the drive and thereby the definition of the reference values before you start up the CPU and a technology object, for example.

7.5.2 Application limits

In the "Parameters" > "Setpoint channel" > "Application values" area, you can configure limitations for the speed and torque of the drive if required and adapt them to the requirements of your mechanical system.

Speed limiting

If you need a direction-dependent limiting of the speed p1083 and p1086, you can define speed limits for each direction.

Torque limiting

You can specify the torque limitation p1520 as an absolute value. The limiting acts both when motoring as well as generating.

⚠ WARNING

Accuracy of torque limitation
The function of the torque limitation is not safe torque limiting in the sense of functional safety. The torque limitation refers to the calculated internal (air gap) torque of the motor.
The internal torque is a calculated value from the internal motor constant and motor current. The torque output at the shaft is the internal torque minus friction and iron losses.
Due to the following influencing factors, the deviation of the torque calculation can be in the two-digit percentage range:

- Internal motor constant p0316
- Current measurement accuracy
- Temperature dependence
- Speed and load dependence on friction, iron and additional losses of the motor

⚠ WARNING

Danger to life due to uncontrolled movement of the drive as a result of incorrect parameter assignment
Incorrect parameterization of the torque limiting can result in uncontrolled movement of the drives if there is no counter-torque, and cause death or serious injury.
Ensure the correct parameterization.

Zero speed detection

Set the speed threshold for the motor standstill detection (p1226). For braking with OFF1 or OFF3, the zero speed is detected when this threshold is fallen below.

NOTE

A zero point calibration is only started if the speed falls below the speed threshold for standstill detection (p1226).

NOTE

A switch-on process of the drive via STW1 is always delayed until the speed has fallen below the speed threshold for standstill detection (p1226).
As long as the speed is still above this speed threshold, warning 2007 is issued. This can be the case, for example, if the motor shaft is driven externally.
If the switch-on command is still set despite this warning, the drive is switched on and the specified setpoint speed is adopted as soon as the speed threshold for standstill detection has been undershot.

Speed threshold values for message

Also specify the speed threshold values for the following messages of the drive status word:

- "Speed threshold 1" (p2141)
  If the speed exceeds the threshold value, bit 10 is set as feedback in ZSW 1
- "Speed threshold 4" (p2163)
  As long as the speed deviation lies within the tolerance range, bit 8 in ZSW1 is set as feedback
- "On delay time" (p2167)
  Setting the switch-on delay time for the message "Speed setpoint/actual deviation within tolerance" (see also p2163)

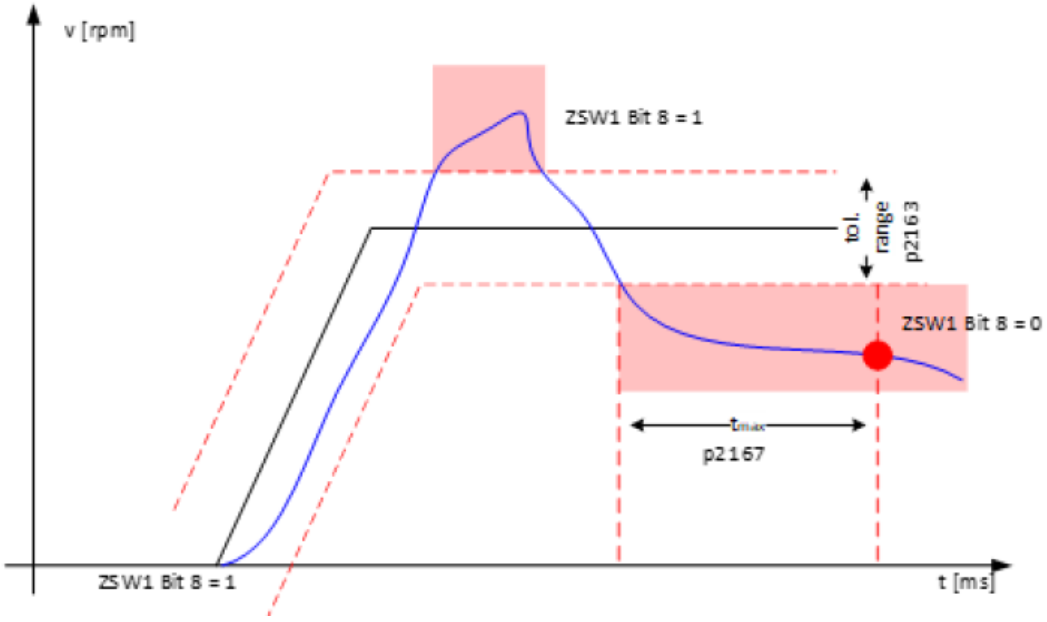

Figure 1-331 Sets the ON-delay time (p2167) and the speed threshold value 4 (p2163)

End stop detection and step loss detection with the stepper motor

When an incremental encoder and the control type [103] controlled (I = const.) are used with a stepper motor, end stop detection or step loss detection can be implemented using bit 8 in the ZSW1. The parameters "speed threshold value 4" (p2163) and "On delay" (p2167) can be used to set the detection tolerance range.

7.5.3 Ramp generator and speed setpoint filter

Speed ramp generator

The TM Drive uses the speed ramp generator type "Basic ramp-function generator" p1115[0].

The ramp generator can be switched off with the setting "No ramp generator".

The speed ramp generator is used to limit the acceleration at sudden setpoint changes and helps to prevent drive train shock loads.

An acceleration ramp and a deceleration ramp can be set independently with the ramp-up time and ramp-down time. This enables a controlled transition at setpoint changes.

NOTE

On principle, the ramp-up and ramp-down times of the ramp generator in the setpoint channel of the drive should be set only so fast that, in case of accelerations and decelerations, the motor speed can track the setpoint without damaging the machine. This ensures optimal functioning of the speed controller precontrol.
Especially with the control type [103] controlled (I = const.), the ramp-up and ramp-down times must not be set too steep, as otherwise the rotor cannot follow the controlled rotating field.

Procedure

You enter the settings for the speed ramp generator under "Parameters" > "Parameters" > "Ramp generator":

- Rampup time
- Ramp-down time
- Speed

NOTE

The TM Drive uses the three values entered to form the values relative to 10,000 rpm "Speed ramp generator ramp-up time" (p1120) and "Speed ramp generator ramp-down time" (p1121).
When using the GSD file, directly enter the values relative to 10,000 rpm.

Speed setpoint filter

The drive has a first-order time-delay element (low pass PT1) as a speed setpoint filter. The filter time constant can be set with p1416.

The speed setpoint filter is able to attenuate harmonic components of the setpoint and thus to prevent any overshooting of the higher-level controller.

The speed setpoint filter has no effect on the stability of the speed controller because it is in the setpoint channel before the control loop. The dynamics of the response to setpoint changes is reduced by smoothing.

As a rule, set the speed setpoint filter to a low value, since the upstream ramp generator ensures sufficient limitation of the setpoint signal.

7.6 Controller settings

Under "Parameters" > "Open-loop/closed-loop control", you specify the type of control, the general controller settings and the settings for speed and current controllers.

Control type

The open-loop / closed-loop control type can be selected depending on the motor type. The following combinations are available:

Motor type: PMSM motor

- [100] Closed-loop speed control (cascade)

Motor type: Stepper motor

- [103] Controlled (I = constant)

7.6.1 Speed control (cascade)

In Speed controller (cascade) mode, the speed difference between the actual and the nominal speed is detected using an encoder and the speed deviation is controlled accordingly. Since the speed controller is followed by a current controller, this speed control method is referred to as cascade control.

General controller settings

Speed and current controllers can be optimally tuned if the properties of the load mechanics of your machine and the electrical properties of the drive are specified as correctly as possible.

Enter the general controller settings under "Parameters" > "Control/closed-loop control" > "Controller settings".

- Moment of inertia load p1398
- Precontrol p1496
- Viscous friction p1399
- Additional torque p1511
- Speed actual value filter p1441

Speed stability can be improved using the actual speed filter, depending on the encoder resolution.

Constant loads can be compensated using additional torque p1511. This reduces compensation processes when the drive is switched on using motor holding brakes.

Additional important settings

The values for speed and current controllers can be determined in the best possible way if, in addition to the properties of the electric motor, you also specify the properties of the gearbox and the connecting cable.

- Motor cable line resistance p0352
- Motor cable/series inductance p0353
- Motor gear moment of inertia p2725

Precontrol p1496

Using the precontrol (p1496), the precontrol of the moments of inertia, consisting of Motor (p0341), Motor gear (p2725) and Moment of inertia load (p1496), can be specified as a percentage value. The precontrol allows the drive to be moved more dynamically. The precontrol is switched off with a preset of 0%. The precontrol is preset by the automatic controlled system detection (see section Automatic controlled system detection (Page 99)) depending on the controller dynamics.

To use this function, the setpoint speed must be preset by a ramp. For this, you can either use the internal ramp generator (see section Ramp generator and speed setpoint filter (Page 95)) or corresponding acceleration/deceleration functions in technology objects.

Viscous friction p1399

The friction of the system is precontrolled using Viscous friction (p1399). This is specified as a linear friction torque as a function of the speed and is detected during automatic controlled system detection.

Additional torque p1511

Constant loads can be compensated using additional torque (p1511). This reduces compensation processes when the drive is switched on using motor holding brakes.

Speed actual value filter p1441

The drive has a first-order time-delay element (low pass PT1) as a speed actual value filter. The filter time constant can be set via (p1441).

The parameter is preset depending on the parameter "Increments per revolution" p0408 in the HSP. If you configure the device using a GSDML, you can use the following table as a guide.

Table 1-672 Actual speed filter times as a function of the encoder resolution

Encoder resolution (Steps per revolution p0409 or [2]Single-turn resolution p0423)	**Speed actual value filter p1441 in ms**
400	11
512	10
1024	8
2048	6
4096	4
6000	2
10000	1
16000	0

Speed controller and current controller

You can either have the speed and current controller parameters calculated via the controller settings of STEP 7 or you can perform the automatic controlled system detection (7.6.2). It is also possible to set the controller settings manually.

Having controller settings calculated
To have the controller settings of STEP 7 calculated, proceed as follows:

1. Click the "Calculate speed number/current controller settings" button in the area for the controller settings.
   The "Controller calculation" window opens. The window displays the appropriate controller parameters.
2. If needed, you can re-adjust the controller settings via the "Controller behavior" and "Load fluctuation" sliders.
   – "Controller behavior": If the value is increased, the controllers react more strongly to controller differences. At the same time, the controller tends to overshoot.
   The default setting here is 70%.
   – "Load fluctuation": A larger value allows more oscillation in the stable state. The speed deviations are greater during a load step.
   The default setting here is 30%.

NOTE
There is no guarantee that readjustment of the controller calculation will always result in a stable system.
Change the settings for "Controller behavior" and "Load fluctuation" incrementally. Always check the settings with low speed and load profiles.

3. Apply the controller settings by clicking the "Apply" button.

You can then continue to change the calculated controller settings manually.

Setting the controller settings manually
Enter the settings for the speed controller under "Parameters" > "Control/closed-loop control" > "Speed controller".

- Prop. gain
- Integral action time
- Speed actual value filter

Enter the settings for the current controller under "Parameters" > "Control/closed-loop control" > "Current controller".

- Iq proportional gain
- Iq integral action time
- Id proportional gain
- Id integral action time

NOTE
If you manually set the controller parameters to inappropriate values, the drive system can be damaged.
Make changes to the controller settings in small steps. Keep checking the behavior of the drive system until you have found a satisfactory setting.

7.6.2 Automatic controlled system detection

You can find the automatic controlled system detection in the Commissioning submenu of the configured TM Drive. This function is only possible with the cascade control mode (p1300).

During the measurement run, the system is measured using test signals. The drive is moved in the process. Configured torque (p1520) and speed limits (p1083 and p1086) are taken into account and can also be used to protect the drive or the application.

The drive accelerates to the test setpoint speed, stops and executes the same travel profile in the reverse direction of rotation. The motor is thereby approximately at the starting position again after the measurement run.

The "Reversal of direction of rotation" checkbox can be used to specify the direction of rotation for the measurement run. If the check box is selected, the motor rotates counterclockwise when viewing the motor shaft, otherwise the motor shaft rotates clockwise. By specifying the number of motor revolutions, it is possible to limit the maximum rotation of the drive. The input of the number of revolutions limits the test setpoint speed if necessary.

The following parameters are automatically determined during controlled system detection:

- Motor connection resistance including motor cable line resistance
- Current control parameters
  - Iq proportional gain p1715
  - Iq integral action time p1717
  - Id proportional gain p1735
  - Id integral action time p1736
- Speed controller parameters
  - Prop.gain p1460
  - Integral action time p1462
- Moment of inertia load p1398
- Precontrol p1496
- Viscous friction p1399

The controlled system detection function automatically provides you with the controller parameters specific to your application and motor.

The controlled system detection function can be adapted to different system requirements.

The connection resistance of the system is detected during the controlled system detection. The determined resistance is divided between the connection resistance (p0372) and the resistance of the motor supply line (p0352).

- If the measured resistance is greater than the connection resistance (p0372), the additional portion is allocated to the motor cable line resistance (p0352).
- If the measured resistance is less than the connection resistance (p0372), this is adjusted and the portion of the motor cable line resistance (p0352) is set to 0.

⚠ WARNING

Unplanned movement of the motor during speed controller tuning
Speed controller tuning causes movement of the drive which can result in death, serious injury or material damage.

- Ensure that nobody is present in the hazardous zone and that the mechanical system can move freely.

NOTE

Directions of rotation and permissible motor rotation range
In the application, the motor must be able to move at least in the specified motor rotation range (p8991). The machine may be damaged if the traversing range is not accordingly limited.
If this is not permissible due to your plant conditions, it is prohibited to perform controlled system detection.
Before commissioning, ensure that the motor and application parameters are correct.

Procedure

Preconditions

- Cascade control mode
- The motor and application parameters are known and transferred to the drive.
- Speed and torque limitation are configured and transferred to the drive.
- The device is in RUN mode and the drive is at standstill
- The drive is not enabled in any other way (e.g. by a technology object or a user program).
- The motor can rotate freely in both directions of rotation and is not loaded with a static load (example: suspended load)

NOTE

If the motor is loaded with a static load during the controlled system detection, this may result in the speed and current controller parameters not being detected correctly.

Step 1:
Go online and enable commissioning mode under Commissioning, Identification with the 'Start' button and select the controlled system detection.

You can abort controlled system detection at any time by pressing the "Exit" button. The drive coasts to a stop and the motor holding brake closes. The drive may have to be returned to its start position before a new measurement run.

NOTE
In this operating mode, the drive can only be controlled by the TM Drive. A control of the drive by the S7 control via PROFIdrive is not possible in this mode and is locked. This is also signaled by resetting ZSW1 bit 9.

Step 2:
Make the settings for controlled system detection.

- Measurement run dynamics p8990

  The acceleration gradient of the rotating measurement run can be influenced using the measurement run dynamics factor.

  A high value is suitable for torsionally stiff systems and low mass inertias and a low value for elastic systems or systems with high mass moment of inertia.

  Generally, a high measurement run dynamic factor provides better results for the rotating controlled system detection. However, too high a measurement run dynamics factor can possibly lead to twisting, bending or other damage to the machine.

  Recommendation: Start with a low measurement run dynamics factor and, if necessary, repeat the controlled system detection with an increased measurement run dynamics factor.

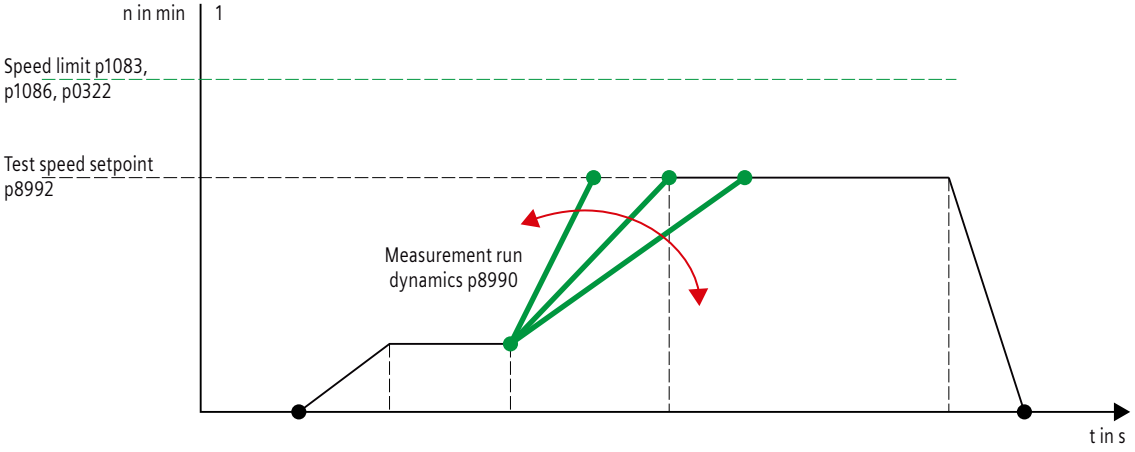

Figure 1-332 Measurement run dynamics

- Max. number of motor revolutions p8991

  Specifies how many revolutions the motor may cover during the measurement. Ensure that a rotation with the configured number of motor revolutions is possible in the direction in which the motor is moved (specified via the "Reversal of direction of rotation" check box).

- Test speed setpoint p8992

  If possible, enter a typical speed value for the test speed setpoint at which the drive is to be operated later.

  If the measurement run is not possible due to the entry from max. number of motor revolutions (p8991) in combination with the test speed setpoint (p8992), this is displayed and a maximum possible test speed setpoint (p8992) is suggested in the text box.

- Torque limitation p1520
  The torque limitation is displayed as a parameter (read only). The setting must be made in the "Application limits" mask and the parameter must be loaded into the module.
- Controller dynamic factor
  Using the controller dynamic factor, you can set how the speed controller should be set up.
  – Conservative: Slow control – low mechanical load. (60% precontrol)
  – Default: Optimum between fast speed control and load of the mechanics. (80% precontrol)
  – Dynamic: Fast speed control – high mechanical load. (100% precontrol)

  A parameter check is performed automatically. This ensures that the drive can perform the measurement run with the configured dynamics within the configured max. number of revolutions. If the measurement run with the configured values is not possible, a warning is displayed and a reduced value for the test speed setpoint is entered.

Step 3:
Start the controlled system detection with the "Start controlled system detection" selection button.

A configured motor holding brake is opened during controlled system detection. This is signaled via ZSW1 bit 12.

NOTICE
Open motor holding brake The motor holding brake is opened during controlled system detection. Especially with suspended axes, you must ensure that it is possible to open the motor holding brake. An unexpected collapse of a hanging axis can result in personal injury and property damage.

Step 4:
If the drive is still in operation, execution of the controlled system detection is rejected. Stop the operation of the drive before the controlled system detection. Then continue with step 3.

When all conditions are fulfilled, the TM Drive starts the controlled system detection after the confirmation of the safety prompt. The drive is moved several revolutions for this.

Step 5:
After successful controlled system detection, the system variables and suitable controller values determined are displayed.

Depending on the application, it may be advantageous to perform the controlled system detection several times in succession and, if needed, to adjust the measurement run dynamics p8900.

NOTE
Before you apply the determined values, you need to check them for plausibility. If necessary, the control can be tested for stable behavior by traveling briefly in both directions (+/-).

Step 6:
You can now select which of the determined values you want to transfer to the offline project. The selected values are transferred to the offline project using the "Transfer determined values to offline project" button.

Step 7:
Once you have transferred the parameters to the offline project, disable commissioning mode under Commissioning, Identification with the 'Exit' button. You must then load the parameters onto the module using "Download to device". Otherwise, the parameters will be lost after switching the module off and on.

Automatic controller tuning is now complete.

Check the settings automatically found using a measurement run with your application. For additional optimization of the controller settings, you can use manual controller tuning from the section Manual controller tuning Speed controller (cascade) (Page 104).

NOTE
If the automatic controlled system detection could not determine any controller parameters, a new measurement run can be initiated by entering a higher moment of inertia of the load under control/closed-loop control parameters and repeating the controlled system detection. The controller parameters can thus be adapted for the machine. The measurement run is thus set to the increased inertia of the load.
You can save the measurement run to a csv file using the "Export measurement data" button.

Faults during controlled system detection

Faults during controlled system detection are displayed directly in the commissioning screen and can be acknowledged.

Table 1-673 Causes of faults and errors

Fault number	Description	Cause / Solution
1055	Motor resistance detection could not be performed	If the motor phases are not connected correctly or insufficiently contacted, or if there is an asymmetry between the individual winding resistors, the error "Unable to successfully perform motor resistance detection" is set. Check the motor connections or the motor for defects and breaks.
1056	Following error during controlled system detection	If the drive is not able to follow the setpoint travel curve, this error is displayed. In this case, it is likely that the Measurement run dynamics p8990 was selected too large. Reduce the Measurement run dynamics p8990 and repeat the controlled system detection. It is also possible that the drive is blocked or the motor holding brake has not been configured or connected correctly.
1057	Position error during controlled system detection	If the maximum number of revolutions is exceeded, e.g. by an external load acting on the drive, this error is set and the drive is switched off. Either the controlled system detection is not possible in the application or reduce the external force on the drive train.

7.6.3 Manual controller tuning Speed controller (cascade)

You can find the manual controller tuning in STEP 7 under Commissioning. Here, you can optimize the control parameters according to your application and thereby fine-tune the drive.

Procedure

For manual controller tuning, proceed as follows:

Step 1:
Go online to the module with TIA Portal by clicking on the "Connect online" selection button.

Step 2:
If you have not already calculated the controller parameters under Control/closed-loop control, you can do this again here. First, enter the mass moment of inertia of the load.
Use the "Calculate" selection button to calculate the controller parameters.

Step 3:
The calculated controller values are displayed. The online values, i.e. the currently active values, are also displayed on the module.

Step 4:
With the selection "Apply online" button, the new controller values are directly transferred and take effect.

NOTE
When the axis is in operation, the enable is automatically canceled and the new parameters are applied.

Step 5:
You can now put the drive into operation with a speed or positioning TO, for example, and evaluate the control behavior using a trace recording.
If the control behavior is satisfactory, continue with step 7.

Step 6:
If additional tuning is required, there are 2 options to better adjust the control parameters.

1. You can calculate the controller parameters again as described in step 2 and readjust the parameters accordingly using the sliders. (See section Control/closed-loop control (Page 96) under Speed controller and current controller)
2. You set the controller parameters manually. You can orientate yourself on the old values and change the proportional gain and/or the integral action time as well as the precontrol step-by-step.

Perform the steps starting with step 4 again.

Step 7:
Once you have performed the tuning, you need to transfer the detected controller parameters to the drive parameters using the selection button "Apply controller values".
Terminate the online connection ("Go offline" selection button) and then reload the project onto the module using "Download to device". This ensures that the parameters are still active in the project and on the module after a restart.
Controller tuning is now completed.

7.6.4 Controlled (I = const.)

General controller settings

In the controlled control mode (I = const.), the speed is controlled by an angle adjuster. Depending on the respective speed, the control angle of the motor is switched faster or slower in quantified steps in the desired direction of rotation.

Speed controller
Recommendation: Specify speed changes along an acceleration and deceleration ramp, otherwise it is not possible for the drive to follow the speed specification.

The internal ramp-function generator (section 7.5.3) can be used as speed ramp.

Current controller
With the control mode controlled (I = const.), the current controller applies a constant current value to the motor. The motor current is specified using two current values for travel mode (p1738 run current) and standstill mode (p1739 stop current). The current values are effective values.

- Run current p1738
- Stop current p1739

The stop current is impressed on the motor while it is at a standstill and ensures a corresponding holding torque. If a speed not equal to 0 1/min is specified, the current setpoint is switched from stop current to run current. If the motor comes to a standstill from a movement, the setpoint current is switched from run current to stop current after 1 s.

In many applications, the stop current can be reduced during standstill. As a result, energy can be saved during the stop phases and the motor is subjected to less thermal stress.

For reasons of protection, the run and stop current may not be greater than 1.5 times the rated motor current (p0305).

Enter the general controller settings under "Parameters" > "Control/closed-loop control" > "Controller settings".

- Moment of inertia load p1398

Additional important settings
The speed and current controllers can be determined in the best possible way if, in addition to the properties of the electric motor, you also specify the properties of the gearbox and the connecting cable.

- Motor cable line resistance p0352
- Motor cable/series inductance p0353
- Motor gear moment of inertia p2725

Current controller

You can either set the current controller manually or have the controller settings calculated by STEP 7.

Having controller settings calculated
To have the controller settings of STEP 7 calculated, proceed as follows:

1. Click on the "Calculate current controller settings" button in the Controller settings area. The "Controller calculation" window opens. The window displays the appropriate controller parameters.
2. Apply the controller settings by clicking the "Apply" button.

You can then continue to change the calculated controller settings manually.

Setting the controller settings manually

Enter the settings for the current controller under "Parameters" > "Control/closed-loop control" > "Current controller".

- I proportional gain
- I integral action time

NOTE
If you manually set the controller parameters to inappropriate values, the drive system can be damaged.
Make changes to the controller settings in small steps. Keep checking the behavior of the drive system until you have found a satisfactory setting.

7.7 OFF responses

OFF1 (Switch off)

By resetting bit 0 in STW1 (On), you activate OFF1 and the drive is braked to 0 in a speed-controlled manner according to the ramp generator ramp-down (p1120, p1121).

If the actual speed falls below the value of the "Standstill detection" parameter (p1226) or a timeout is detected, the pulses are inhibited after the motor brake closing time p1217 has elapsed. "Switching on inhibited" is activated.

Timeout
With OFF1, the time is calculated in which the drive should normally stop from twice the reference speed. If the drive does not stop within twice this time, the drive is deenergized and coasts to a stop.

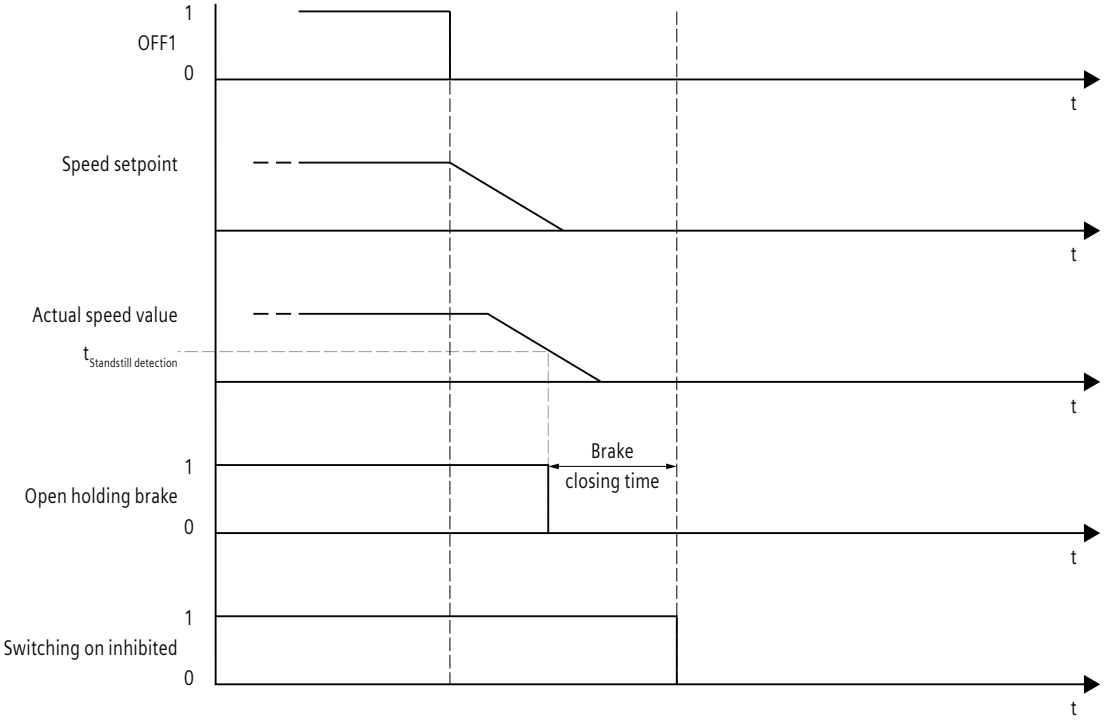

Figure 1-333 OFF1 sequence diagram when standstill detection is reached p1226

OFF2 (Coast down)

You activate OFF2 by resetting bit 1 in STW1 (NoCoastStop). Immediate pulse cancellation occurs, any configured motor holding brake is closed. The drive coasts to a stop without a motor holding brake. "Switching on inhibited" is activated.

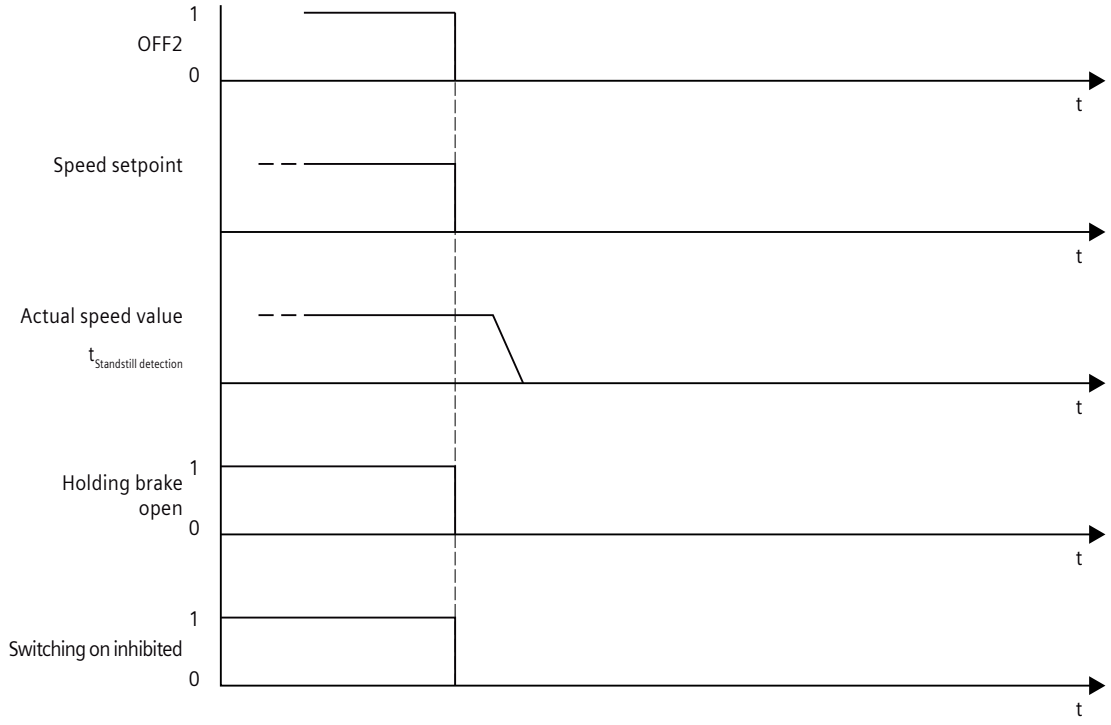

Figure 1-334 OFF2 sequence diagram

OFF3 (QuickStop)

You trigger a quick stop (OFF3) by resetting bit 2 in STW1 (NoQuickStop). The rapid stop takes into account the ramp-down time configured in the HSP ("Parameter" > "Setpoint channel" > "Speed – Ramp generator"). After the standstill is detected or the monitoring time has elapsed, any configured motor holding brake is closed and the pulses are deleted after the motor holding brake closing time p1217 has expired. "Switching on inhibited" is activated.

NOTE

NOTE on rapid stop (OFF3)

You trigger a quick stop (OFF3) by resetting bit 2 in STW1 (NoQuickStop). The rapid stop takes into account the ramp-down time configured in the HSP ("Parameter" > "Setpoint channel" > "Speed – Ramp generator").

Timeout
The rapid stop is monitored for time and causes the motor to be energized after 6 seconds at the latest.

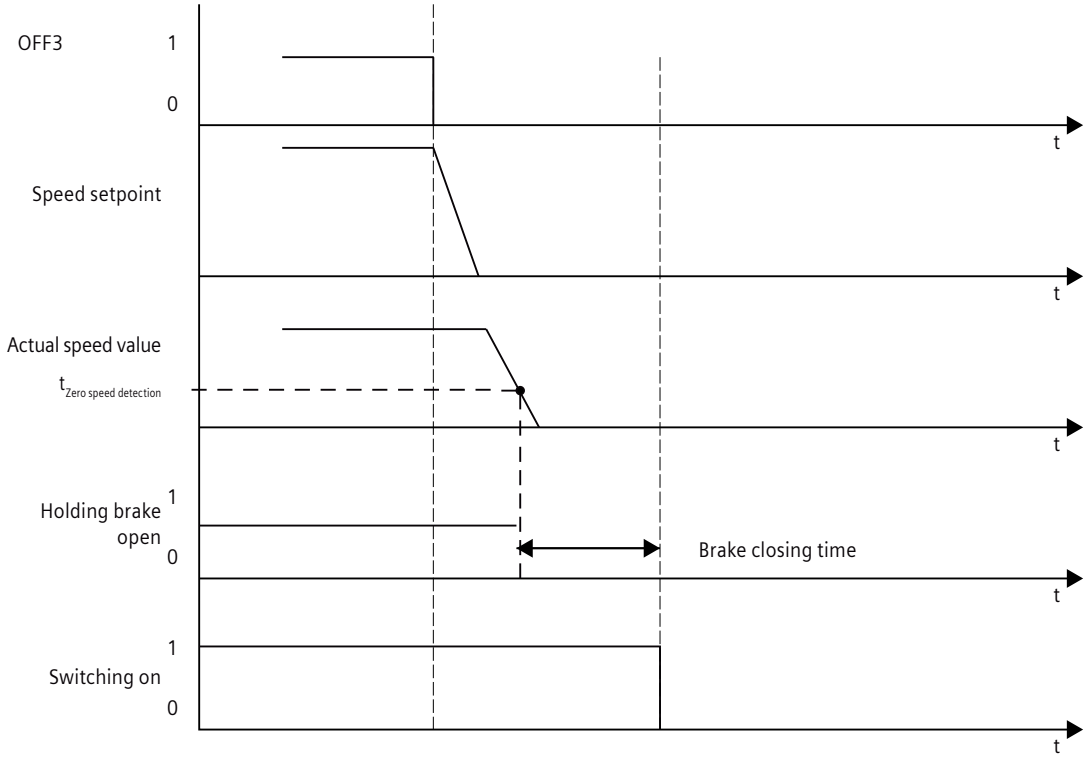

Figure 1-335 OFF3 sequence diagram

Prioritization

The OFF responses are prioritized as follows:

- OFF2 (coast down) > OFF1 (switch off)
- OFF3 (QuickStop) > OFF1 (Switch off)
- OFF2 (coast down) > OFF3 (quick stop)

7.8 DC-link voltage

The TM Drive system cyclically monitors the intermediate circuit voltage. The limits can be set under "Drive/Monitoring".

The regenerative feedback into the DC power supply cannot be suppressed. This has several advantages.

When the drive is braked and the brake chopper is not connected and configured, energy is fed back, which results in an increase in the interemeidate circuit voltage. For this reason the intermediate circuit voltage is monitored by the module.

You can freely set the intermediate circuit voltage monitoring limits within the permissible range.

If the limits are exceeded, the module switches off. Before the module switches off, it issues a warning (limit ∓ 5%) stating that the limit is almost exceeded.

Procedure

1. Open the "Intermediate circuit voltage" area in the context of the drive under "Parameters" > "Drive/monitoring".
2. Configure:
   – Minimum value of the intermediate circuit voltage p0390
   – Maximum value of the intermediate circuit voltage p0391

⚠ WARNING

Operation above the voltage setting range
Under the given application conditions, ensure that the motor is not operated above the voltage setting range by selecting the appropriate motor and motor gear. Otherwise, the intermediate circuit voltage may increase when the control is inactive via 60 V DC.

7.9 Brake module

The TM Drive system has a brake chopper for connection of an external brake resistor and can control a motor holding brake externally via the process image using a DQ or relay module. These functions can be activated individually or in parallel.

You can select the following options for the PMSM motor type under "Brake module":

- [0] No function
- [2] Brake chopper
- [3] Brake chopper and motor holding brake external via the process image
- [4] Motor holding brake externally via the process image

You can select the following options for the stepper motor type under "Brake module":

- [0] No function
- [4] Motor holding brake externally via the process image

If stepper motors are selected, the brake chopper function cannot be used. If a brake chopper is required nevertheless, you can install another TM Drive module (except StepDrive) in the same potential group, connect the brake resistor there and configure the brake chopper as well. If no motor is connected to this module select a motor type (p0300) "[0] no motor".

7.9.1 Brake chopper

If the brake chopper function is enabled, you need to configure the following parameters in the "Parameters" > "Drive" > "Brake module" area.

Set the following values for the brake chopper:

- Chopper switch-on voltage
- Chopper switch-off voltage
- Thermal resistance of the braking resistor
- Time constant of the brake resistor
- Maximum temperature
- Ambient temperature
- Response to max. temperature

The switch-on and switch-off voltage of the brake chopper must be set correctly according to the DC voltage supply. The chopper switch-off voltage p6011 must be higher than the supply voltage (example U_{DC} = 48 V à p6011 = 50 V; chopper switch-on voltage p6010 = 52 V).

The voltage thresholds of the brake chopper should be adjusted accordingly with the parameters of the intermediate circuit voltage monitoring (7.7).

The TM Drive is not designed to be operated permanently as a brake axis. The circuit of the brake chopper monitors itself and protects itself against overload by switching off.

NOTICE
Risk of fire The switch-off voltage must not be lower than the DC supply voltage, otherwise the brake chopper will not switch off after activation and it may lead to an overload of the brake resistor and/or the module.

Capacity of the braking chopper output

The TM Drive is not designed to be operated permanently as a brake axis. The circuit of the brake chopper monitors itself and protects itself against overload by switching off.

You can find information about power calculation and resistor design in the appendix Braking resistor and brake chopper power (Page 150).

Monitoring of the braking resistor

The specific values of the braking resistor, such as heat resistance and time constant, can be obtained from the manufacturer of the braking resistor (data sheet). Typical values are stored as default values in the TIA Portal. The default values must be checked and adjusted if necessary.

- The thermal resistance describes how large the temperature difference between the resistor and the environment must be in order for a heat flow (power) of one watt to be emitted.
- The time constant indicates the time after which the resistance, at constant power input, has approached approx. 63% of its thermal equilibrium. After five times the time constant, the resistor is in its thermal steady state.

You use the maximum temperature to define the switch-off temperature for the resistor. The switch-off temperature is calculated in a thermal model based on the ambient temperature.

You use "Response to max. temperature" to define the behavior that is triggered when the maximum temperature is reached.

- Shutdown when temperature is exceeded Brake chopper operation is stopped and a warning is generated.
- No shutdown when temperature is exceeded Brake chopper operation is still possible.
- The thermal resistance describes how large the temperature difference between the resistor and the environment must be in order for a heat flow (power) of one watt to be emitted.
- The time constant indicates the time after which the resistance, at constant power input, has approached approx. 63% of its thermal equilibrium. After five times the time constant, the resistor is in its thermal steady state.

NOTICE

Risk of fire
If braking chopper operation continues despite reaching the maximum operating temperature, this can result in a sharp increase in the temperature at the braking resistor. This can damage surrounding components or even result in fires in the worst case.
In addition, always ensure that the minimum distances between the braking resistor and other modules are maintained.

⚠ CAUTION

Risk of burns due to hot surfaces
The braking resistor heats up during operation. Touching the hot braking resistor can result in personal injury and burns.
Avoid contact with the hot braking resistor.

NOTE

Brake chopper operation with STO selected
When STO is selected, the brake chopper of the respective module is inactive. This means that when STO is active, no braking energy of either the own or other axes can be dissipated by the braking resistor.
If the brake chopper function is mandatory despite STO release, you can install another TM Drive module (except F-TM StepDrive) into the same potential group, connect the brake resistor there and configure the brake chopper as well. If no motor is connected to this module, select the "[0] no motor" for motor type (p0300).

7.9.2 External motor holding brake

The motor holding brake can be used when the drive system is disabled (e.g. when the power supply to the drive system is switched off) to prevent unwanted movements of the motor shaft (e.g. falling due to gravity). The motor can move by its own weight or an external force even if the motor power supply is interrupted.

NOTE

- Use this brake only for "holding", which means to maintain the standstill. Do not use it for "braking", which means to stop the moving load. Use the holding brake only to hold a motor at a standstill.
- The holding brake is enabled when the motor is switched off.

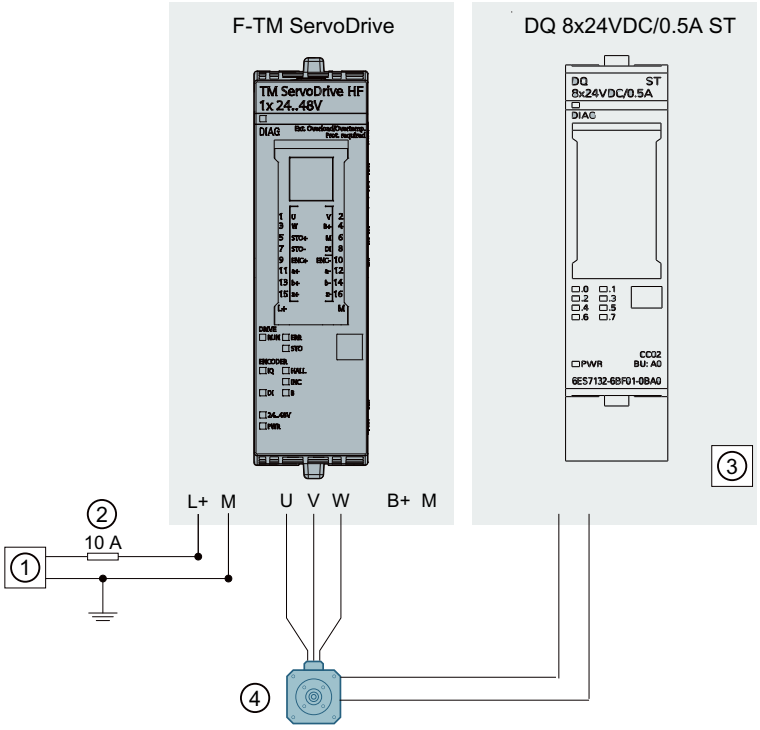
If the motor holding brake function is enabled, you must configure the following settings in the "Parameters" > "Drive" > "Brake module" area.

Adjust the opening and closing times of the motor holding brake:

- Motor holding brake opening time (p1216)
- Motor holding brake closing time (p1217)

For the closing and opening times, delay times of relays may have to be taken into account and added to the times of the motor holding brake.

p1216 = motor brake opening time + relay opening time



p1217 = motor brake closing time + relay closing time

If the motor holding brake is configured, the drive takes the delay times into account and accordingly sets bit 12 in the process image ZSW1. This bit can be used to control a motor holding brake, for example, with a DQ module or relay module.

NOTE

When selecting the additional module, make sure that the current carrying capacity is suitable. This must be dimensionless depending on the current consumption of the motor holding brake.

RC circuit of a TM Drive with DQ module and motor holding brake

① Power supply unit
② Protective device
③ DQ module
④ Motor with holding brake

Figure 1-336 RC circuit of a TM Drive with DQ module and motor holding brake

Suspended axes

The additional torque p1511 is used to set an additional load torque.

To prevent the axis from sagging after the holding brake has been released, you can set an electronic counterweight via an additional torque p1511, section 7.8.1, for a suspended axis without mechanical weight compensation.

This reduces the compensation action after the release of a holding brake and specifies the holding torque directly after switch-on of the motor.

The option (p1900) "Encoder calibration at every start" must not be used with suspended loads.

NOTE

Suspended load with incremental encoder

For motors with incremental encoders where the commutation offset angle has not yet been synchronized, the axis may drop. This can be counteracted using the additional torque p1511, although a slight movement of the axis cannot be ruled out even then.

- It is recommended to use an absolute encoder especially for suspended loads.

Braking sequence

The sequence diagram shows an example of the behavior of the drive with OFF1.

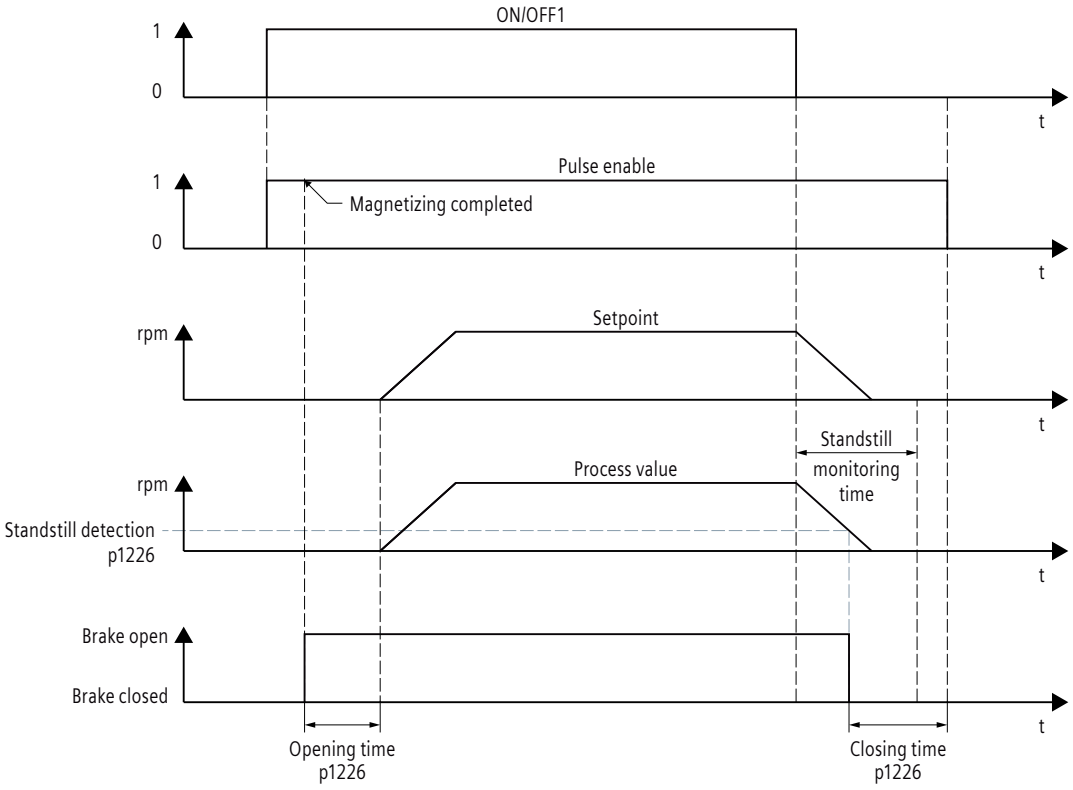


Figure 1-337 Braking sequence

The magnetizing time is calculated automatically depending on the motor parameters.

The influence of the motor holding brake on the OFF reactions is described in section 7.6.4 (Page 106) OFF reaction.

NOTICE
Improper use Improper use of the motor brake will shorten its service life. The motor brake is only intended for holding purposes. Frequent emergency stops with the motor brake shorten its service life. Unless absolutely necessary, do not use the motor brake as emergency stop.

7.10 Messages/monitoring

Thermal monitoring

The purpose of thermal monitoring is to detect critical states. Parameterizable warning thresholds are available that allow further operation of the drive (e.g. with reduced power) and prevent an immediate shutdown. However, the parameter assignment options are only interventions below the shutdown thresholds.

The following thermal monitoring options are available:

- Motor
  - Motor I^2t model
- Braking resistor
  - Temperature model
- Power end stage
  - Overload protection
  - Temperature sensor

When an overload is detected by one of these monitoring functions, a warning is output first. The respective warning thresholds (p0291) are parameterizable. The current status of the monitoring functions is displayed. If an alarm or fault limit is exceeded, the "Temperature monitoring" message is sent.

NOTE

All alarm and fault limits are provided with a corresponding hysteresis. The corresponding alarm or fault messages therefore remain until the threshold including hysteresis has been fallen below.

NOTE

Motor and brake resistance values

The thermal motor and braking resistor utilization are calculated quantities. The values are not saved.

After a power reset, the values only match again after a sufficiently long cooling time.

Operating temperature

Note that the specified ambient temperature range for the drive must always be adhered to, see section Technical specifications (Page 143).

7.10.1 Motor

Thermal motor monitoring

The thermal motor monitoring is performed using a configurable I^2t temperature model.

⚠ WARNING

Thermal motor utilization cannot be immediately determined after initialization
The thermal model is reinitialized after changing the drive data set and when switching on the device.
After initialization, the thermal motor utilization cannot be immediately determined as the model must first settle. As a consequence, an initial utilization of 50 % is used as basis. The settling phase duration depends on the given thermal time constants; the accuracy depends on to what extent the specific installation situation deviates from the model.
During the settling time it is possible that the set alarm and/or fault threshold is reached with some delay. For the installation situation simulated in the model, a comparatively unfavorable installation was selected so that generally deviations occur on the safe side.

You can define the warning threshold under Parameters > Messages/monitoring > Motor relative to the respective shutdown threshold.

Procedure

1. Open the "Motor" area in the context of the drive under "Parameters" > "Messages/monitoring".
2. Configure the warning threshold p0291[1].

Motor I^2t model
The I^2t monitoring operates with the relative motor power loss, and in addition to the nominal motor current (p0305) as reference value, only requires the thermal time constant winding - environment (p0611[0]) to calculate the limiting integral. The 100 % shutdown threshold corresponds to the maximum continuous power loss of the motor, i.e. to the square of the nominal motor current (p0305).

Motor type PMSM
If the PMSM reaches the 100% threshold, the motor current is limited to the rated motor current to prevent overheating.

Motor type stepper motor
When the stepper motor reaches the 100% utilization threshold, the drive is switched off and an error is set.

⚠ WARNING

Compliance with the ambient conditions specified by the motor manufacturer
The motor may only be operated in ambient conditions such as ambient temperature, installation elevation, etc. as specified by the manufacturer.
If the ambient conditions of the motor do not correspond to the values specified by the manufacturer, the motor must be derated. The derating behavior and the resulting lower motor performance data must be obtained from the motor manufacturer and adjusted accordingly in the motor parameters of the TM Drive.
If the motor is used outside its specification, the thermal model does not provide sufficient protection.

7.10.2 Braking resistor

Thermal monitoring of braking resistor

The braking resistor is monitored by a temperature model. You can specify the warning threshold (p0291[2]) relative to the shutdown threshold "Braking resistance maximum temperature" (p6023).

Procedure

1. Open the "Braking resistor" area in the context of the drive under "Parameters"" > "Messages/monitoring".
2. Configure the warning threshold p0291[2].

⚠ WARNING

Thermal braking resistance load cannot be determined immediately after initialization
The thermal model is reinitialized after changing the drive data record and when switching on the device.
The thermal braking resistance load cannot be determined immediately after initialization because the model must settle. As a consequence, an initial utilization of 50 % is used as basis. The settling phase duration depends on the given thermal parameters; the accuracy depends on to what extent the specific installation situation deviates from the model. During the settling time it is possible that the set alarm and/or fault threshold is reached with some delay.
The installation situation should be taken into account for the thermal parameters of the braking resistor and, if necessary, less favorable parameters should be selected, for example, for the heat transfer resistance, so that deviations will generally occur towards the safe side.

7.10.3 Power end stage

Thermal monitoring of power end stage

The power end stage is monitored with a temperature sensor. You can specify the warning threshold (p0291[1]) relative to the shutdown threshold "System maximum temperature power end stage".

Procedure

1. Open the "Power end stage" area in the context of the drive under "Parameters" > "Messages/monitoring".
2. Configure the warning threshold p0291[1].

Besides the temperature monitoring, the current load is also monitored. The current load of the power unit is decisive for the temperature rise. The relative load of the power end stage is calculated based on the square of the output current according to the I^2t method.

Automatic overload limiting

The TM Drive is overload-capable. The load of the power end stage is automatically limited by the drive.

The maximum overload time $t_{overload}$ is calculated depending on the temperature of the power end stage T_{PU}. When operating with cyclic overload, the rated power is not exceeded the by the time-averaged power (rms).

PMSM

With a PMSM, a 3-fold overload of the rated current I_n is possible cyclically for a duration of $t_{overload}$ = 1.5 s and a subsequent recovery time of 12.5 s at T_{PU} = 20 °C. At T_{PU} = 80 °C, the overload time $t_{overload} \approx 0.35$ s.

Stepper motor

With a stepper motor, a double overload of the rated current I_n cyclic for a duration of $t_{overload}$ = 3 s with a subsequent recovery time of 17 s at T_{PU} = 20 °C is possible. At T_{PU} = 80 °C, the overload time $t_{overload} \approx 0.75$ s.

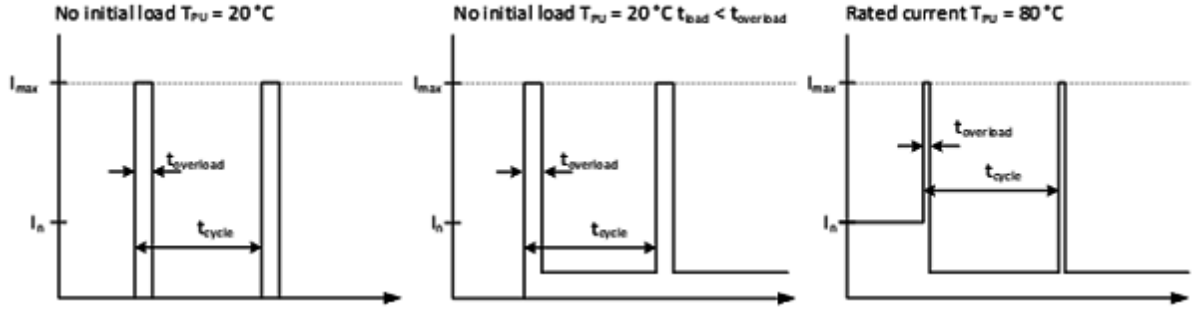

Figure 1-338 Overload behavior of TM Drive

Observe the information on derating depending on the ambient conditions (e.g. temperature, mounting position) in the section Derating of the F-TM ServoDrive HF (Page 147).

NOTE

Overload capability of the power unit
Operation with a peak current of 15 A is possible temporarily if the average RMS value of the output current does not exceed the rated current of the power unit up to 5 A.

7.11 Dynamic torque reduction

If dynamic torque reduction is required, this can be realized using the MOMRED signal via drive telegram 102. The torque limit currently in effect in the drive is reduced via this setpoint. MOMRED is used to specify the percentage by which the torque limit is to be reduced.

$$M_{limit.actual} = M_{reference} \bullet (1 - \frac{MOMRED}{16384})$$

NOTE

The MOMRED signal is normalized to 4000 hex (16384 dec). The value 4000 hex (16384 dec) in the MOMRED control word corresponds to a 100% reduction of the configured reference torque p2003.

The dynamic torque limit is set to the respective minimum of the configured torque limitation (p1520), the limitation via MOMRED or the limitation by the max. permissible torque-forming current value.

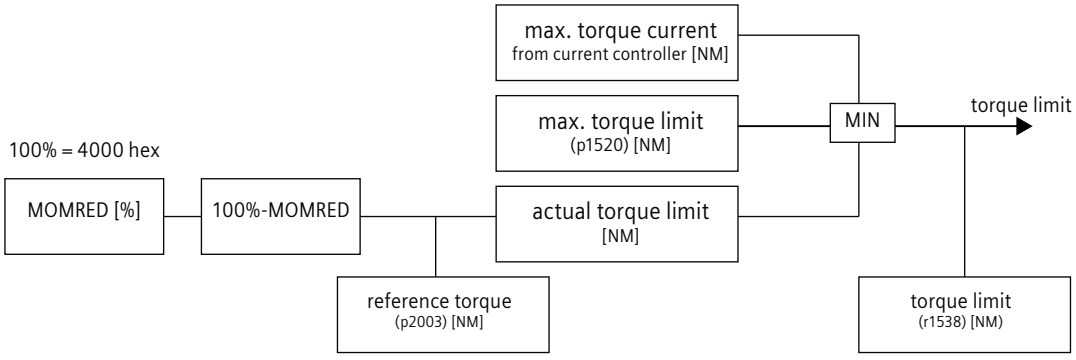

Figure 1-339 Dynamic torque limitation (MOMRED)

The torque values that are output by the drive and the torque limitation currently in effect can be viewed under "Online & Diagnostics" > "Diagnostics" > "Drive Diagnostics" > "Operating Values" if an online connection to the drive is established.

The following actual values are available:

- Torque setpoint (at the output of the speed controller) (r0079)
- Torque actual value (r0080)
- Torque limit (r1538)

Programming

8

TM Drive does not have its own control panel. A user program is required to control the motion sequences.

You have the following options for controlling the motion sequences in the user program:

- Control via the process image (Page 121)
- Control via the SINA_SPEED (Page 130) instruction
- Control with a technology object (Page 131)

8.1 Controlling TM Drive via the process image

Structure of the I/O addresses

The structure of the input addresses of the TM Drive depends on the configured communication telegram and the telegram extension.

The telegrams can be set in the "Properties" area under "General" and further via "Basic parameters". Set the Telegram extension active option to make the status available via the digital input and the status of the STO input via the process image.

NOTE

The telegram extension option is not available for telegram 102.

The structure of the output addresses of the TM Drive depends on the configured communication telegram.

Bit05_Command1Request	Bool	9.5
Bit06_Command2Request	Bool	9.6
Bit07_Mode	Bool	9.7

Basic procedure in STEP 7

1. In the project tree, create PLC data types in the CPU 2 with the appropriate structure for your configuration:
   - PLC data type for the structure of the input data (depending on PROFIdrive telegram type and telegram extension)
   - PLC data type for the structure of the output data (depending on PROFIdrive telegram type and telegram extension)
2. Create a tag from each type of the PLC data type in a tag table.
3. Assign the addresses for the tag according to the configured I/O addresses of the TM Drive.
4. Control the TM Drive by setting outputs bit-by-bit. A description of how to set the outputs to control the TM Drive can be found in the PROFIdrive standard.
   You can find the current PROFIdrive specification under (https://www.profibus.com/).

8.2 Controlling a TM Drive via the instruction SINA_SPEED

Control with the SINA_SPEED instruction

For controlling the TM Drive, you can also use the SINA-SPEED instruction from the "DriveLib" block library.

The SINA_SPEED block only works with the standard telegram 1. The telegram extension may have to be disabled. See Communication telegrams (Page 61).

The "DriveLib" block library can be downloaded from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109475044).

8.3 Controlling TM Drive with a technology object

Control with a technology object

You can also use a technology object, for example "Speed-controlled axis" or "Positioning axis", to control the TM Drive.

Note that the TM Drive does not have an integrated positioning functionality and only supports speed operation.

Procedure

1. Create, for example, a "Speed axis" technology object in the CPU in the project tree in STEP 7.
2. Open the technology object.
3. Select "TM Drive" under "Configuration" > "Hardware interface" > "Drive".
4. Reference the technology object in the user program using the Motion Control technology instructions, e.g. "MC-Power".

NOTE

We do not recommend using the "Encoder calibration at every startup" option in conjunction with positioning technology objects (positioning axis). The calibration process can lead to undesired behavior of the drive axis.

Additional information

You can find more information about the technology objects and technology instructions in the online help of STEP 7.

Maintenance

9

9.1 Firmware update

Firmware update

A firmware update is possible via PROFINET.

See SIMATIC ET200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293).

9.2 Stop responses

Overview of the stop responses

Faults with safety functions and violation of limits can trigger the following stop responses:

- "Hardware STO"

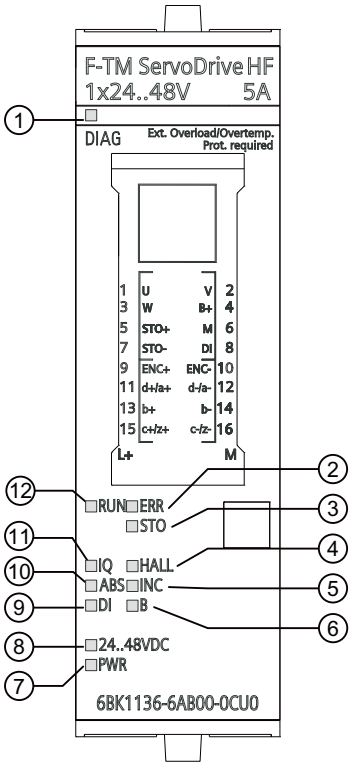
  "Safe Torque Off" (STO) corresponds to Stop Category 0 in accordance with EN 60204-1. With "Safe Torque Off" (STO), the motor is switched directly to zero torque. A motor at standstill cannot be started again accidentally. A moving motor coasts to standstill.

Table 1-674 Overview of stop responses

Stop response	Triggered ...	Action	Effect
STO	At least one signal STO+/STO- is interrupted.	Motor controllers interrupted	Drive coasts down

After the drive has been stopped, restart it with PROFIdrive.

The faults and warnings are described in the appendix Active messages (Page 138).



Interrupts, error messages and diagnostics and system alarms

10

10.1 Status and error displays

LED display

The figure below shows the LEDs on the TM Drive.

①	DIAG (red/green)	⑦	PWR (green)
②	ERR (red)	⑧	24..48V (green)
③	STO (yellow) Display not safety-related	⑨	DI (green)
④	HALL (green)	⑩	ABS (green)
⑤	INC (green)	⑪	IQ (green)
⑥	B (green)	⑫	RUN (green)

Figure 1-340 LED display on F-TM ServoDrive

Meaning of the LED displays

The following tables contain the meanings of the status and error displays.

DIAG LED

Table 1-675 DIAG status and error display

DIAG LED	Meaning	
□ Off	Backplane bus supply of the ET 200SP not OK	
☼ Flashing	Module parameters not assigned	
■ On	Module parameters assigned and no module diagnostics	
☼ Flashing	0.5 Hz (slow)	Module parameters assigned and module diagnostics There is a fault. You can find detailed information via "Online & Diagnostics" > "Diagnostics" > "Active messages" or in the section Active messages (Page 138).
	1 Hz (normal)	
	2 Hz (fast)	

RUN LED

Table 1-676 RUN status and error display

RUN LED	Meaning	
□ Off	Device is not yet ready for operation	
■ On	Device is ready for operation and error-free	
☼ Flashing	0.5 Hz (slow)	Device is performing self-test during power-up
	1 Hz (normal)	Device performs a firmware update
	2 Hz (fast)	Device has detected a parameterization error

ERR LED

Table 1-677 ERR status and error display

ERR LED	Meaning
□ Off	No fault
■ On	Device has a fault and needs to be restarted. This corresponds to a serious device error or the loaded firmware cannot be operated on these device versions.

DI LED

Table 1-678 DI status and error display

DI LED	Meaning
□ Off	Input is inactive
■ On	Input is active

B LED

Table 1-679 B status and error display

B LED	Meaning
■ On	The motor holding brake is open / information about the process image was set

STO LED

Table 1-680 STO status and error display

STO LED	Meaning
■ On	Drive ready, switch connected correctly and STO not requested
☼ flashes (0.5 Hz)	STO requested (motor is disconnected from power)

IQ LED

Table 1-681 Status and error display IQ (encoder)

IQ LED	Meaning
■ On	IQ speed encoder was assigned parameters/activated
☼ Flashes (2 Hz)	IQ speed encoder could not be initialized IQ speed encoder has a connection problem (A/B track not connected)

Hall LED

Table 1-682 Status and error display Hall (encoder)

Hall LED	Meaning
■ On	IQ speed encoder was assigned parameters/activated

INC LED

Table 1-683 Status and error display INC (encoder)

INC LED	Meaning
■ On	Incremental speed encoder was assigned parameters/activated
☼ Flashes (2 Hz)	Incremental speed encoder has a connection problem (A/B and/or Z track not connected)

LED ABS

Table 1-684 Status and error display ABS (encoder)

24..48V LED	Meaning
■ On	An absolute encoder has been configured/activated
☼ Flashes (2 Hz)	The absolute encoder has a connection problem

24..48V LED

Table 1-685 24..48V status and error display

24..48V LED	Meaning
□ Off	DC link voltage outside the configured limits
■ On	DC link voltage within the configured limits (is OK)
☼ flashes (0.5 Hz)	DC link voltage shortly before the interference threshold

PWR LEDs

Table 1-686 PWR status and error display

PWR LED	Meaning
□ Off	Logic component supply of the converter is missing
■ On	Logic component supply of the converter is OK

10.2 Diagnostics

10.2.1 Diagnostics overview of the TM Drive

Diagnostic view of the CPU and its associated I/O

If you go online to the CPU and establish an online connection via the CPU to the TM Drive, this occurs within the project context.

Procedure

To display the diagnostic information for the TM Drive, follow these steps.

1. Select the TM Drive in the project tree, for example under "Ungrouped devices".
2. Double-click "Online & diagnostics".
   The "Diagnostics - General" window appears.
3. Navigate to the required information.

The diagnostic window is divided into the following diagnostic groups:

- **General**
  The general diagnostic information is displayed for:
  - Module
  - Module information
  - Manufacturer information
- **Diagnostics status**
  "Diagnostics status" shows the current diagnostics status of the TM Drive.
- **Active messages**
  "Active messages" displays the currently pending alarms and faults in the TM Drive module.
- **Drive diagnostics**
  The current diagnostic information of the drive is displayed for:
  - Status bits
  - Operating values
  - Encoders
  - Temperatures
  - Inputs

10.2.2 Active messages

Pending faults and alarms

"Active messages" shows the currently pending faults and alarms in the TM Drive. Faults must be acknowledged after the cause has been corrected.

Procedure

To display the active messages, follow these steps:

1. Select the TM Drive in the project tree and go to "Online & diagnostics".
2. In the "Diagnostics" folder, select the "Active messages" area.

Faults and alarms

NOTE
In open-loop control operation, no diagnostics of the encoder signals is performed (see fault numbers 1045 and 1046)

The TM Drive supports the following faults.

Fault number	Description	S7 diagnostics alarm
1000	Overvoltage in the DC link	Undervoltage
1001	Undervoltage in the DC link	Overvoltage
1003	Shutdown due to overcurrent switch-off of a phase	Overload
1006	Braking resistor short-circuit	Overload
1019	External braking resistor/motor holding brake of the 4th phase interrupted	Wire break
1032	Temperature measured values implausible	Error
1035	Permitted temperature at the motor end stage exceeded	Overtemperature
1036	Permitted temperature at the motor winding exceeded	Overtemperature
1037	Permissible temperature of the braking resistor exceeded	Overtemperature
1039	Connection to IQ encoder interrupted	Wire break
1042	Fail-safe shutdown path (STO) defective	Safety-related shutdown
1043	Permissible temperature of the control electronics exceeded	Overtemperature
1044	Permissible temperature of the braking resistor exceeded The drive is switched off.	Overtemperature
1045	The connection to the A/B track of the incremental speed encoder is interrupted.	Wire break
1046	The connection to the Z track of the incremental speed encoder is interrupted.	Wire break
1047	An unsupported PROFIdrive speed encoder function was requested.	-

Fault number	Description	S7 diagnostics alarm
1049	Zero point calibration could not be performed. The rotor may be blocked. The motor holding brake may not be open.	External error
1050	A ramp/quick stop (OFF1/OFF3) could not be performed due to a timeout.	External error
1051	Zero point calibration could not be performed due to a timeout. The system may be oscillating too much.	External error
1053	Overload of the brake chopper control	Overload
1054	Permissible temperature at the motor winding when stepper motor exceeded	Overload
1055	Motor resistance detection could not be performed	Wire break
1056	Following error during controlled system detection	Overload
1057	Position error during controlled system detection	Overload
1200	CRC checksum error in absolute encoder	Error in actuator/sensor
1201	Internal encoder error in the absolute encoder	Error in actuator/sensor
1202	No communication with absolute encoder possible or communication establishment failed.	Wire break
1203	Internal error in encoder interface	Error
1300	There is an error in the parameter assignment of the motor type.	Parameterization error
1301	Electrical time constant of the q axis is too low.	Parameterization error
1302	Electrical time constant of the d axis is too low.	Parameterization error
1303	Torque constant inconsistent	Parameterization error
1340	There is an error in the parameter assignment of the encoder.	Parameterization error
1360	There is an error in the parameter assignment of the controller.	Parameterization error
1380	There is an error in the parameter assignment of the braking function.	Parameterization error
1999	General error	Error

Acknowledge faults

To acknowledge all active faults, click the "Acknowledge faults" button.

Alarms

Column	Description
Alarm number	Number of the warning
Description	Description of the warning

The TM Drive supports the following warnings.

Alarm number	Description
2000	Voltage in the DC link shortly before shutdown
2001	STO shutdown active
2002	Warning threshold when motor end stage temperature is exceeded
2003	Warning threshold when motor winding temperature is exceeded
2004	Thermal overload of the motor end stage
2005	Thermal overload of the braking resistor
2007	Switch-on delay because axis is still rotating.
2200	Encoder warning in the encoder error

10.2.3 Drive diagnostics

You can find online information on important current drive diagnostics data and drive service data in the "Drive diagnostics" area under "Online & diagnostics" in the context of the drive.

NOTE
All drive diagnostics are only available online. They are automatically updated in the user interface.

You will find diagnostic information on the following points in the "Drive diagnostics" area:

- Status bits
- Operating values
- Encoders
- Temperatures
- Inputs

Properties of drive diagnostics

Drive diagnostics

- Show the current values of various parameters
- Are cyclically updated
- Are read-only.

Drive diagnostics: Status bits

"Online & diagnostics" > "Diagnostics" > "Drive diagnostics" > "Status bits"

Table 1-687 Drive diagnostics - status bits

Number	Parameter	Display/unit
Status word		
r0899	Status bits **Note**: Signal corresponds to status word 1 PROFIdrive (r0968).	• Ready for switching on • Ready for operation • Operation • Fault active

Number	Parameter	Display/unit
		• Coasting active • Rapid stop active • Switching on inhibited active • Alarm active • Speed setpoint - actual value deviation • Control by controller • n comparison value reached • Control of the motor holding brake is active **Note:** • Status word 1 is sent cyclically by the drive to the higher-level controller.

Drive diagnostics: Operating values

"Online & diagnostics" > "Diagnostics" > "Drive diagnostics" > "Operating values"

Table 1-688 Drive diagnostics - operating values

Number	Parameter	Display/unit
r0063	Speed actual value smoothed	rpm
r1045	Speed setpoint of ramp generator	rpm
r0080	Torque actual value	Nm
r0079	Torque setpoint	Nm
r1538	Torque limit	Nm
r0026	Intermediate circuit voltage	V
r0027	Current actual value	A_{eff}
r0072	Output voltage	V

Drive diagnostics: Encoders

"Online & diagnostics" > "Diagnostics" > "Drive diagnostics" > "Encoder"

Table 1-689 Drive diagnostics - encoder

Number	Parameter	Display/unit
r7811	Position	°
r7810[0]	Steps	-
p979[2]	Increments per revolution	-
P979[5]	Number of revolutions	-
p979[3]	Fine resolution bits in actual value Gx_XIST1	Bits
P979[4]	Fine resolution bits in actual value Gx_XIST2	Bits

Drive diagnostics: Temperatures

"Online & diagnostics" > "Diagnostics" > "Drive diagnostics" > "Temperatures"

Table 1-690 Drive diagnostics -temperatures

Number	Parameter	Display/unit
-	Inputs	• Digital input • STO active

Reference

All displayed parameters have a tooltip that provides you with information and descriptions relating to the parameter as well as access to the online help.

You can find additional information on the parameters in the Product Information (https://support.industry.siemens.com/cs/ww/en/view/109773204).

Technical specifications

11

11.1 Technical specifications

Technical specifications of the IQ encoder

Article number	6BK1136-6AB00-0CU0
General information	
Product type designation	F-TM ServoDrive HF
HW functional status	V1.0
Firmware version	V1.1
• FW update possible	Yes
Product description	control of EC and stepper motors
usable BaseUnits	BU type U0
Product function	
• I&M data	Yes
• Isochronous mode	No
• Four-quadrant operation	Yes
• Speed control with encoder	Yes
• Speed control without encoder	No
• Safety Functions	Yes; Drive controller with hardwired STO
Protection function	
• Undervoltage protection	Yes
• Overvoltage protection	Yes
• Overload protection	Yes
• Ground-fault protection	No
• Short-circuit protection	Yes
Installation type/mounting	
Type of ventilation	Convection cooling
Supply voltage	
Design of the power supply	24 ... 48 V DC, SELV / PELV
permissible range, lower limit (DC)	16.8 V
permissible range, upper limit (DC)	57.6 V
Input current	
Current consumption (rated value)	6 A
Current consumption, max.	10 A
Current consumption for the electronics, max.	0.1 A
Inrush current, max.	25 A; at 24 V
output voltage / header	
Rated value, min.	24 V
Rated value, max.	48 V

Article number	**6BK1136-6AB00-0CU0**
Output current	
Current output (rated value)	5 A
Output current, max.	15 A
Output frequency	599 Hz
Encoder supply	
Number of outputs	1
5 V encoder supply	
• 5 V	Yes
• Short-circuit protection	Yes
• Output current, max.	150 mA
Power	
DC power consumption	300 W; At 50 V
Power loss	
Power loss, typ.	3.5 W
Digital inputs	
Number of digital inputs	1; input for message signal
Number of safety inputs	1; For STO, antivalent (2-pin) - 24 V DC
Encoder	
Connectable encoders	
• Incremental encoder (symmetrical)	Yes; up to 500 Hz per channel
• Absolute encoder (SSI)	Yes; BiSS-C
• BiSS-C encoder	Yes
Interrupts/diagnostics/status information	
Alarms	
• Diagnostic alarm	Yes
• Hardware interrupt	No
Diagnoses	
• Monitoring the supply voltage	Yes
• Wire-break	Yes
• Short-circuit	Yes
• Telegram error at SSI encoder	Yes; BiSS-C
• Group error	Yes
Diagnostics indication LED	
• RUN LED	Yes
• ERROR LED	Yes
Integrated Functions	
Position detection	
• Incremental acquisition	Yes
• Absolute acquisition	Yes
• Suitable for S7-1500 Motion Control	Yes
Potential separation	
Potential separation channels	
• between the channels and backplane bus	Yes

Article number	6BK1136-6AB00-0CU0
Isolation	
Isolation tested with	DC 850 V, type test (between backplane bus, DC input and functional grounding)
Overvoltage category	III
Degree of pollution	2 according to EN 61800-5-1
Degree and class of protection	
IP degree of protection	IP20
Standards, approvals, certificates	
CE mark	Yes
UKCA mark	Yes
cULus	Yes
RCM (formerly C-TICK)	Yes
KC approval	Yes
EAC (formerly Gost-R)	Yes
RoHS conformity	Yes
China RoHS compliance	Yes
Standard for EMC according to EN 61800-3	Yes
Standard for drive acc. to EN 61800-5-1	Yes
Standard for drive acc. to EN 61800-5-2	Yes
Highest safety class achievable in safety mode	
• Performance level according to ISO 13849-1	Category 3, performance level d, according to EN ISO 13849-1:2015
• SIL acc. to IEC 61508	3
• SIL according to DIN EN 61800-5-2	3
Ambient conditions	
Pollution degree during storage and transport	2
Ambient temperature during operation	
• horizontal installation, min.	-30 °C; No condensation, splash water, icing, salt spray or oil mist permitted.
• horizontal installation, max.	60 °C; No condensation, splash water, icing, salt spray or oil mist permitted. Note the derating data!
• vertical installation, min.	-30 °C; No condensation, splash water, icing, salt spray or oil mist permitted.
• vertical installation, max.	50 °C; No condensation, splash water, icing, salt spray or oil mist permitted. Note the derating data!
Ambient temperature during storage/transportation	
• Storage, min.	-30 °C
• Storage, max.	70 °C
Altitude during operation relating to sea level	
• Installation altitude above sea level, max.	3 000 m
Cables	
Cable length for motor, shielded, max.	10 m
Dimensions	
Width	20 mm
Height	73 mm
Depth	58 mm

Article number	6BK1136-6AB00-0CU0
Weights	
Weight, approx.	55 g
Other	
Brake design	holding brake control via the process image
Braking chopper	Yes

Type	IQ encoder
Output signals	2 square wave signals (A, B), 2 square wave signals inverse (nA, nB) Output differential or single ended TTL compatible, phase shifted
Number of pulses per revolution	100 (default)
Limit frequency	5 kHz
Supply voltage	+ 5 V (+/- 10 %)
Current consumption	Typ. 40 mA max. 100 mA
Permissible output current	Max. 20 mA
Permissible deviation of the pulse width from electrical 180°	+/- 90 °
Phase shift of channel A and B	Typ. 90 ° (+/- 30 °)
Output voltage (low level)	Typ. 0.25 V, max. 0.8 V (I = 20 mA at 5 V)
Output voltage (high level)	Typ. 4.25 V, max. 3.8 V (I = 20 mA at 5 V)
Permissible ambient temperature range (T_U)	-25 °C ... +105 °C
Reverse polarity protection	Occurs due to a short-circuit of the supply voltage via a protective diode, max. 200 mA continuous current permissible

Climatic and mechanical environmental conditions

You can find the climatic and mechanical ambient conditions here SIMATIC ET200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293).

If there are discrepancies between the statements in this document and the system manual, the statements in the this document take priority.

Biological environmental conditions

The standards DIN EN IEC 60721-3-1:2018, DIN EN IEC 60721-3-2:2018, IEC 60721-3-3: Edition 3.0, with the classes 1B1, 2B1 and 3B1 apply for the biological environmental conditions during operation, long-term storage and transport.

Conductive dust and sand

The TM Drive must not be exposed to conductive dust or sand during operation, long-term storage and transport.

Chemical environmental conditions

The standards DIN EN IEC 60721-3-1:2018, DIN EN IEC 60721-3-2:2018, DIN EN 60721-3-3:1995, with the classes 1C2, 2C2 and 3C2 apply for the chemical environmental conditions during operation, long-term storage and transport.

11.2 Derating of the ET 200SP TM Drive

Maximum permitted output current as a function of installation altitude and ambient temperature

You must take into account the dependency on the ambient temperature and installation altitude.

Derating of the TM Drive depends on the installation elevation
For all permissible mounting types, starting from an installation altitude of 1000 m, a derating of 10% current per additional 1000 m elevation gain applies. The motor current and the output current of the outputs must be reduced.

All other functions do not have to be reduced up to the maximum installation altitude.

The figure below shows the maximum permitted output current as a function of the ambient air temperature for the derating.

Derating of the TM Drive depends on the ambient temperature (horizontal/vertical mounting position)
When installed horizontally (DIN rail horizontal), the TM Drive can be operated up to the maximum ambient temperature (60 °C). Note the derating curve.

With vertical mounting (vertical mounting rail), the TM Drive may be operated up to a maximum of 50 °C. Note the derating curve.

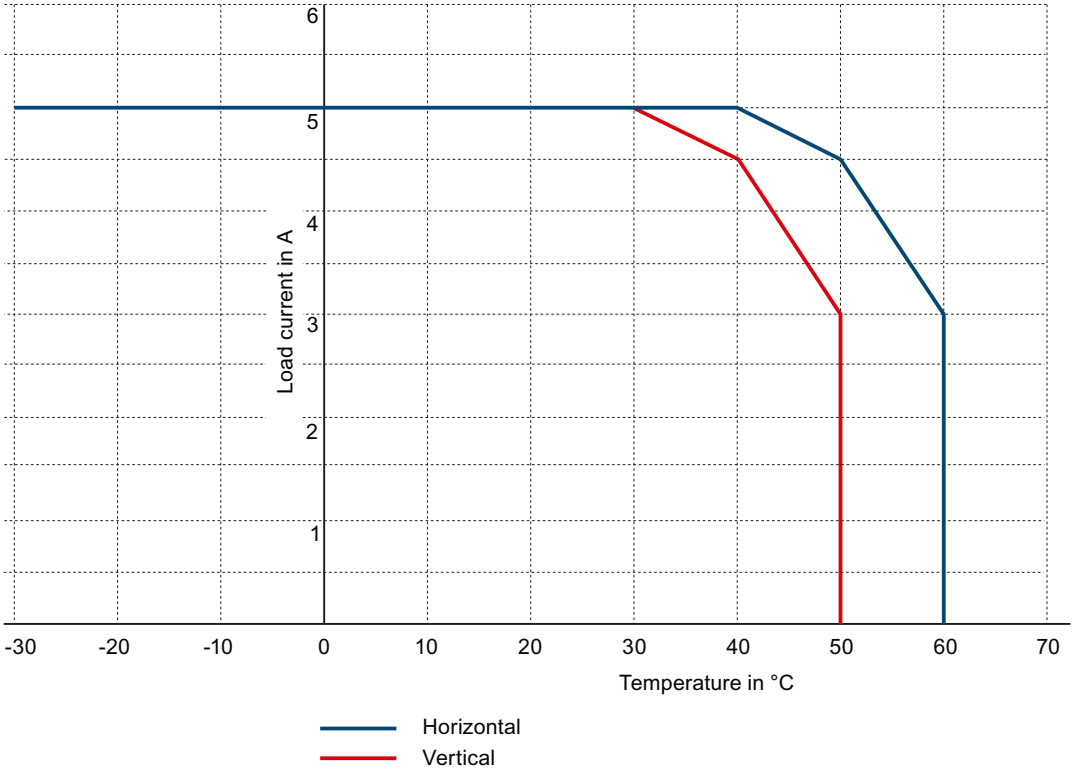

Figure 1-341 Derating of the TM Drive

Test signal suppression

The STO inputs can be dark tested. The dark test time is up to 1 ms.

Appendix

A

A.1 Response times

Introduction

Below you can find the response time of the TM Drive in STEP7. The response times of the TM Drive are included in the calculation of the response time of the F-system.

The drive system is the component that provides the safety functions.

Definition of response time

The response time is the time between the detection of an input signal and the change of a linked output signal.

Definition of process safety time of a process

The process safety time of a process is the time between the occurrence of an error within which a process can be left unattended without risk to life and limb of the operating personnel or damage to the environment and the time of the completed reaction.

Any type of F-system control is tolerated within this process safety time, i.e. the F-system can control its processes incorrectly or even not at all. The process safety time of a process depends on the type of process and must be determined on a case-by-case basis.

Check that the process safety time of the process is not exceeded. You may need to reduce the specific monitoring times of the F-system.

Fluctuation width

The actual response time falls between a minimum and maximum response time. You must always assume the maximum response time when configuring your system.

Definition of maximum response time in an error-free scenario (worst case delay time, WCDT)

In the event of errors outside the drive system (e.g. incorrect setpoint setting by a controller, limit violations due to behavior of the motor, closed-loop control, load, etc.), the "maximum response time in an error-free scenario" is guaranteed.

Definition of maximum response time when an error is present (one fault delay time, OFDT)

In the event of a single error within the drive system (e.g. defect in a shutdown path of the power unit), the "maximum reaction time in the event of error" is guaranteed.

Times required for the calculation

Function	Maximum response time
STOP_STO via terminal	20 ms

STOP_STO:
With a STOP_STO, the drive safely switches off the torque of the connected motor immediately.

A.2 Braking resistor and brake chopper power

The maximum continuous current of the brake chopper end stage is 5 A. The end stage can be overloaded, so that higher currents / powers are possible for a short time.

The average braking current of 5 A is monitored using an I2t model. Once the end stage has fully cooled down, a braking current of 10 A is possible for approx. 15 s, for example.

Related to 60 s, this results in a load cycle of 25%. For other current values, the load cycle can be estimated using the following figure.

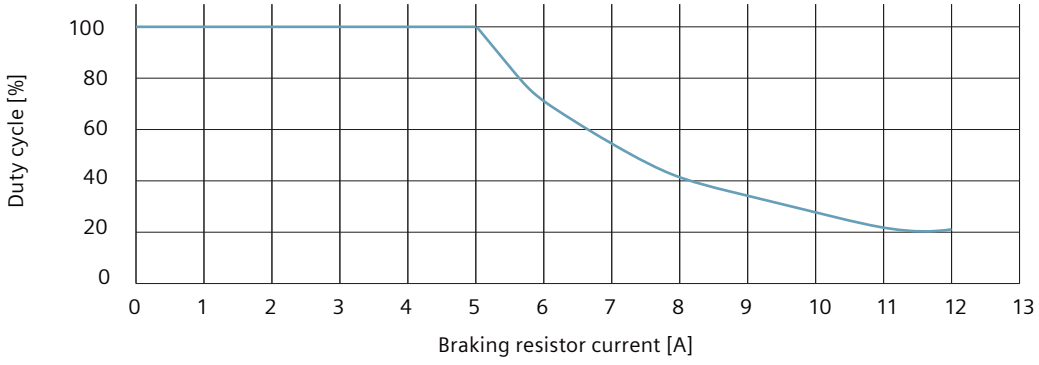

Figure 1-342 Load cycle as a function of the braking resistor current

NOTE
The resistance of the externally connectable braking resistor must be ≥ 5 ohms.

Calculation of the continuous braking power of the end stage

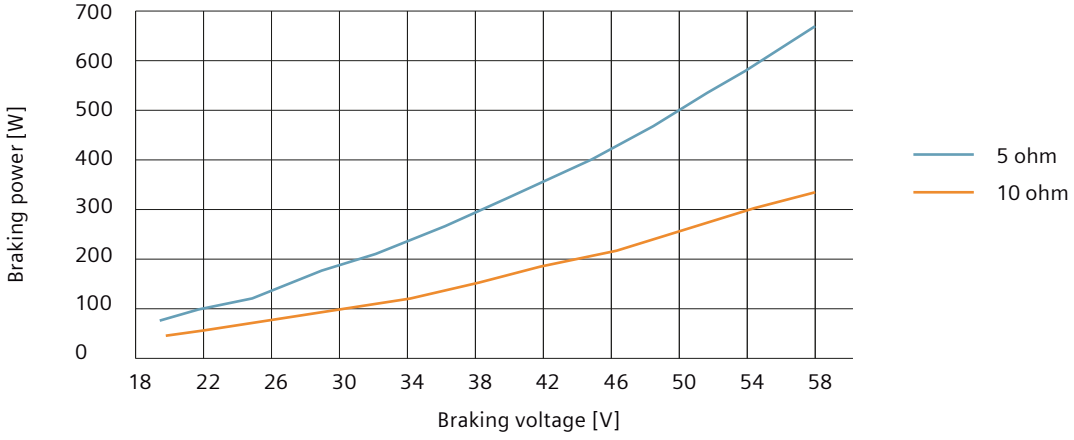
The continuous power of the end stage can be estimated using the following formula.

$$P_{chopper_{rated}} = 0.5 \bullet (U_{on} + U_{off}) \bullet 5A$$

Table 1-692 Examples of continuous power of the end stage

Medium intermediate circuit voltage	Continuous power
26 V	130 W
50 V	250 W

Calculation of the continuous braking power as a function of the braking resistor
The average braking power of the braking resistor depends on the braking resistance value and the intermediate circuit voltage or the switch-on and switch-off values of the brake chopper (U_{on} p6010 and U_{off} p6011). It can be estimated with the following formula.



$$P_{brake\ resistor} = \frac{(0.5 \bullet (U_{on} + U_{off}))^2}{R_{brake\ resistor}}$$

Table 1-693 Examples for braking resistor line

Medium intermediate circuit voltage	Braking resistor value	Braking resistor power
26 V	5 Ω	135.2 W
	10 Ω	67.6 W
50 V	5 Ω	500 W
	10 Ω	250 W

Determination of the braking resistor peak power
In order to calculate the short-time peak power of the resistor, the configured switch-on voltage U_{on} p6010 of the brake chopper must be used.

$$P_{brake\ resistor\ max\ peak} = \frac{U_{on}^{\ 2}}{R_{brake\ resistor}}$$

It must be checked whether the braking resistor can absorb the peak power and, if needed, the continuous power expected.

A.3 Data sets

You can find an overview of the data sets for the TM Drive and the structure of the data sets in the Product Information (https://support.industry.siemens.com/cs/ww/en/view/109773204).

A.4 Device disposal

Recycling and disposal

For environmentally-friendly recycling and disposal of your old device, please contact a company certified for the disposal of waste electrical and electronic equipment, and dispose of the old device as prescribed in the respective country of use.

NOTE
The device does not have its own memory. Neither personal data nor project-specific data are stored on it. It is not necessary to reset the memory for data security reasons.

Introduction

1

1.1 About SIMATIC Micro-Drive

SIMATIC MICRO-DRIVE

SIMATIC MICRO-DRIVE is the drive system for safety extra-low voltages of 24 V to 48 V. Comprising SIMATIC MICRO-DRIVE, versatile motors and connecting cables from selected product partners, it extends the SIEMENS portfolio in the safety extra-low voltage area.

Suitable controllers from the SIMATIC range round out the motion control functionalities.

SIMATIC MICRO-DRIVE TM Drives

TM Drives is a technology module for SIMATIC ET 200SP. It can be controlled by a SIMATIC S7-1500/1200, including via technology objects (TO). TM Drives can be used in combination with a Distributed Controller or the SIMATIC ET 200SP Open Controller in decentralized system concepts.

1.2 About this information for use

1.2.1 Contents

To illustrate possible application areas for our products, typical use cases are listed in this product documentation and in the online help. These are purely exemplary and do not constitute a statement on the suitability of the respective product for applications in specific individual cases. Unless explicitly contractually agreed, Siemens assumes no liability for such suitability. Suitability for a particular application in specific individual cases must be assessed by the user, taking into account all technical, legal, and other requirements on a case-by-case basis. Always observe the descriptions of the technical properties and the relevant constraints of the respective product contained in the product documentation.

Purpose of the documentation

This Equipment Manual supplements the ET 200SP System Manual (https://support.industry.siemens.com/cs/ww/en/view/58649293).

Functions that generally relate to the system are described in the System Manual.

The information provided in this Equipment Manual and in the System/Function Manuals supports you in commissioning the system.

Firmware versions

This manual is valid for firmware version FW 2.1 and current HSP versions from V18 and for the corresponding GSDML version.

NOTE

The current firmware versions can be found in Industry Online Support (https://support.industry.siemens.com/cs/ww/en/view/109807362).

Conventions

CPU: When the term "CPU" is used in the following, it applies to the central modules of the S7-1500 automation system, the S7-1200 automation system, as well as to the CPUs/interface modules of the ET 200SP distributed I/O system.

STEP 7: In this documentation, "STEP 7" is used as a synonym for all versions of the configuration and programming software "STEP 7 (TIA Portal)".

Also observe notes marked as follows:

NOTE

A note contains important information on the product described in the documentation, on the handling of the product or on the section of the documentation to which particular attention should be paid.

This documentation should be kept in a location where it can be easily accessed and made available to the personnel responsible.

Information regarding third-party products

NOTE

Recommendation relating to third-party products

This document contains recommendations relating to third-party products. Siemens accepts the fundamental suitability of these third-party products.

You can use equivalent products from other manufacturers.

Siemens does not accept any warranty for the properties of third-party products.

1.2.2 Target group

The Equipment Manual is intended for:

- Assemblers
- Commissioning engineers
- Operators
- Service personnel
- Project engineers

1.2.3 What's new?

Equipment Manual revision level	Change/new functions
03/2023	Regulated operation of stepper motors

1.2.4 Standard scope

The functions of the system as delivered can only be found in the order documents.

Further functions may be executable in the system, which are not explained in this documentation. However, there is no entitlement to these functions in the case of a new delivery or service.

This documentation does not contain all detailed information on all types of the product. Furthermore, this documentation cannot take into consideration every conceivable type of installation, operation and service/maintenance.

The machine manufacturer must document any additions or modifications they make to the product themselves.

1.2.5 Use of third-party products in this documentation

This documentation contains recommendations relating to third-party products. Siemens accepts the fundamental suitability of these third-party products. You can use equivalent products from other manufacturers.

Siemens does not accept any warranty for the use of third-party products.

1.2.6 Websites of third-party companies

This document may contain hyperlinks to third-party websites. Siemens is not responsible for and shall not be liable for these websites and their content. Siemens has no control over the information which appears on these websites and is not responsible for the content and information provided there. The user bears the risk for their use.

1.3 SIMATIC documentation

1.3.1 ET 200SP Documentation Guide

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.

This arrangement enables you to access the specific content you require.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Basic information

The System Manual describes in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP distributed I/O system.

The STEP 7 online help supports you in the configuration and programming.

Examples:

- ET 200SP System Manual
- System Manual ET 200SP HA/ET 200SP modules for devices used in a hazardous area
- Online help TIA Portal

Device information

Figure 1-343 Icon for device information

Equipment manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

Examples:

- Equipment Manuals CPUs
- Equipment Manuals Interface Modules
- Equipment Manuals Digital Modules
- Equipment Manuals Analog Modules
- Equipment Manuals Motor Starter
- BaseUnits Equipment Manuals
- Equipment Manual Server Module
- Equipment Manuals Communications Modules
- Equipment Manuals Technology Modules

General information

The function manuals contain detailed descriptions on general topics relating to the SIMATIC ET 200SP distributed I/O system.

Examples:

- Function Manual ET 200AL/ET 200SP Mixed Configuration
- Function Manual Diagnostics
- Function Manual Communication
- PROFINET Function Manual
- PROFIBUS Function Manual
- Function Manual Designing Interference-free Controllers
- MultiFieldbus Function Manual

Product Information

Changes and supplements to the manuals are documented in a Product Information. The Product Information takes precedence over the device and system manuals.

You can find the latest Product Information on the ET 200SP distributed I/O system on the Internet. (https://support.industry.siemens.com/cs/ww/en/view/73021864)

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet.
(https://support.automation.siemens.com/WW/view/en/84133942)

Manual Collection fail-safe modules

The Manual Collection contains the complete documentation on the fail-safe SIMATIC modules, gathered together in one file.

You can find the Manual Collection on the Internet.
(https://support.industry.siemens.com/cs/ww/en/view/109806400)

1.3.2 SIMATIC Technical Documentation

Additional SIMATIC documents will complete your information. You can find these documents and their use at the following links and QR codes.

The Industry Online Support gives you the option to get information on all topics. Application examples support you in solving your automation tasks.

Overview of the SIMATIC Technical Documentation

Here you will find an overview of the SIMATIC documentation available in Siemens Industry Online Support:

Industry Online Support International
(https://support.industry.siemens.com/cs/ww/en/view/109742705)

Watch this short video to find out where you can find the overview directly in Siemens Industry Online Support and how to use Siemens Industry Online Support on your mobile device:

Quick introduction to the technical documentation of automation products per video (https://support.industry.siemens.com/cs/us/en/view/109780491)

YouTube video: Siemens Automation Products - Technical Documentation at a Glance (https://youtu.be/TwLSxxRQQsA)

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You can find the application examples on the Internet.
(https://support.industry.siemens.com/cs/ww/en/ps/ae)

1.4 Service & Support

1.4.1 FAQ

You will find FAQs on TM Drive on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/26085/faq).

1.4.2 ID link and Siemens Online Support

You can find additional information about the product:

- via ID link
- using the Siemens Industry Online Support
  - Website: SIOS
  - App Industry Online Support (for Apple iOS and Android)

Product-specific information via ID link

The QR code on your product and on the product packaging contains the ID link.

ID link is a globally unique identifier according to IEC 61406-1.

You can use the ID link to access product data, manuals, Declarations of Conformity, certificates and other information about your product.

Figure 1-344 QR code with ID link included

The ID link is characterized by a frame with a black corner at the bottom right.

Content of Siemens Online Support

- Product support

1.4.3 Spare parts services

The online spare part service "Spares on Web (https://www.sow.siemens.com)" offers spare parts for the product.

1.5 Important product information

1.5.1 Intended use

This equipment is used for the open-loop and closed-loop control of EC and stepper motors for safety extra-low voltages up to 48 V DC.

⚠ WARNING

Hazardous Voltage
Can Cause Death, Serious Injury, or Property Damage.
Intended use of hardware products
This equipment is only allowed to be used for the applications described in the catalog and in the technical description, and only in conjunction with non-Siemens equipment and components recommended by Siemens.
Correct transport, storage, installation and assembly, as well as careful operation and maintenance, are required to ensure that the product operates safely and without faults.
EU note: Start-up/commissioning is absolutely prohibited until it has been ensured that the machine in which the component described here is to be installed fulfills the regulations/specifications of Directive 2006/42/EC.

1.6 Safety Evaluation Tool (SET)

You can quickly and easily evaluate the safety functions of your machine using the Safety Evaluation Tool (SET) for the IEC 62061 and ISO 13849-1 standards. You receive the results as a standard-compliant report that can be integrated in the machine documentation as proof of safety.

The free Safety Evaluation Tool is available on the Internet (https://new.siemens.com/global/en/products/automation/topic-areas/safety-integrated/factory-automation/support/safety-evaluation-tool.html).

Fundamental safety instructions

2

2.1 General safety instructions

⚠ WARNING

Electric shock and danger to life due to other energy sources

Touching live components can result in death or severe injury.

- Only work on electrical devices when you are qualified for this job.
- Always observe the country-specific safety rules.

Generally, the following steps apply when establishing safety:

1. Prepare for disconnection. Notify all those who will be affected by the procedure.
2. Isolate the drive system from the power supply and take measures to prevent it being switched back on again.
3. Wait until the discharge time specified on the warning labels has elapsed.
4. Check that there is no voltage between any of the power connections, and between any of the power connections and the protective conductor connection.
5. Check whether the existing auxiliary supply circuits are de-energized.
6. Ensure that the motors cannot move.
7. Identify all other dangerous energy sources, e.g. compressed air, hydraulic systems, or water. Switch the energy sources to a safe state.
8. Check that the correct drive system is completely locked.

After you have completed the work, restore the operational readiness in the inverse sequence.

⚠ WARNING

Risk of electric shock and fire from supply networks with an excessively high impedance

Excessively low short-circuit currents can lead to the protective devices not tripping or tripping too late, and thus causing electric shock or a fire.

- In the case of a conductor-conductor or conductor-ground short-circuit, ensure that the short-circuit current at the point where the converter is connected to the line supply at least meets the minimum requirements for the response of the protective device used.
- You must use an additional residual-current device (RCD) if a conductor-ground short circuit does not reach the short-circuit current required for the protective device to respond. The required short-circuit current can be too low, especially for TT supply systems.

⚠ WARNING

Risk of electric shock and fire from supply networks with an excessively low impedance
Excessively high short-circuit currents can lead to the protective devices not being able to interrupt these short-circuit currents and being destroyed, and thus causing electric shock or a fire.

- Ensure that the prospective short-circuit current at the line terminal of the converter does not exceed the breaking capacity (SCCR or Icc) of the protective device used.

⚠ WARNING

Electric shock if there is no ground connection
For missing or incorrectly implemented protective conductor connection for devices with protection class I, high voltages can be present at open, exposed parts, which when touched, can result in death or severe injury.

- Ground the device in compliance with the applicable regulations.

⚠ WARNING

Electric shock due to connection to an unsuitable power supply
When equipment is connected to an unsuitable power supply, exposed components may carry a hazardous voltage. Contact with hazardous voltage can result in severe injury or death.

- Only use power supplies that provide SELV (Safety Extra Low Voltage) or PELV- (Protective Extra Low Voltage) output voltages for all connections and terminals of the electronics modules.

⚠ WARNING

Electric shock due to equipment damage
Improper handling may cause damage to equipment. For damaged devices, hazardous voltages can be present at the enclosure or at exposed components; if touched, this can result in death or severe injury.

- Ensure compliance with the limit values specified in the technical data during transport, storage and operation.
- Do not use any damaged devices.

⚠ WARNING

Electric shock due to unconnected cable shield
Hazardous touch voltages can occur through capacitive cross-coupling due to unconnected cable shields.

- As a minimum, connect cable shields and the conductors of power cables that are not used (e.g. brake cores) at one end at the grounded housing potential.

⚠ WARNING

Arcing when a plug connection is opened during operation
Opening a plug connection when a system is in operation can result in arcing that may cause serious injury or death.

- Only open plug connections when the equipment is in a voltage-free state, unless it has been explicitly stated that they can be opened in operation.

NOTICE

Material damage caused by an incorrect power connection
An incorrect power connection can result in damage due to fire, device defects or malfunctions.

- Check all power connections at regular intervals, particularly after equipment has been transported.

⚠ WARNING

Electromagnetic interference due to inadequate shield support
A lack of adequate shield support for the power cables can cause malfunctions and impermissibly high levels of interference.

- Use the shield connection plates supplied or recommended.
- Use the shield connection clips recommended.

⚠ WARNING

Active implant malfunctions due to electromagnetic fields
Converters generate electromagnetic fields (EMF) in operation. Electromagnetic fields may interfere with active implants, e.g. pacemakers. People with active implants in the immediate vicinity of an converter are at risk.

- As the operator of an EMF-emitting installation, assess the individual risks of persons with active implants.
- Observe the data on EMF emission provided in the product documentation.

⚠ CAUTION

Symptomatic respiratory and skin reaction to chemicals
A newly purchased product might contain traces of substances that are identified as sensitizers.
Sensitizers are substances which can cause sensitization in the lungs and skin after exposure to them.
Once sensitized, individuals can have severe reactions to further exposure, even in small amounts. In the most extreme cases, individuals might develop asthma or dermatitis respectively.

- If the product has a strong smell, keep it in a well-ventilated area for 14 days.

⚠ WARNING

Unexpected machine movement caused by radio devices or cellphones
Using radio devices, cellphones, or mobile WLAN devices in the immediate vicinity of the components can result in equipment malfunction or faults and damage to the devices. Malfunctions may impair the functional safety of machines and can therefore put people in danger or lead to property damage.

- Avoid operating radio devices, cellphones and mobile WLAN devices in the direct vicinity of converters and operating units.
- Scan the machine readable code, e.g. a QR code, from a greater distance or switch off the converter power supply before scanning.
- Only operate built-in devices with the control cabinet doors closed.
- When control cabinet doors are open, only qualified electrical personnel are allowed to carry out service and maintenance work.

⚠ CAUTION

Radio frequency interference in residential areas
When you operate EMC category C2 devices in residential areas, the devices can cause radio frequency interference.
When you operate EMC category C3 or C4 devices in residential areas, it is to be expected that the devices will cause radio frequency interference.

- Do not operate EMC category C2 devices in residential areas.
- Do not operate EMC category C3 or C4 devices in public low-voltage networks supplying residential buildings.

NOTE

It cannot be guaranteed that EMC emission limits are complied with if the products are connected to an isolated line supply, a line supply grounded through a high ohmic connection or a line supply with a grounded line conductor.

- Draw-up an EMC plan to comply with the EMC requirements of the planned application.

⚠ WARNING

Fire due to inadequate ventilation clearances
Inadequate ventilation clearances can cause overheating of components with subsequent fire and smoke. This can cause severe injury or even death. This can also result in increased downtime and reduced service lives for devices/systems.

- Ensure compliance with the specified minimum clearance as ventilation clearance for the respective component.

NOTICE

Overheating due to inadmissible mounting position
The device may overheat and therefore be damaged if mounted in an inadmissible position.

- Only operate the device in admissible mounting positions.

NOTICE

Device damage caused by incorrect insulation resistance tests
High test voltages can damage the device.

- Measure the insulation resistance of low voltage circuits of machines or systems only with ≤ 500 V DC.
- Measure the insulation resistance of SELV circuits of machines or systems only with ≤ 250 V DC.

NOTICE

Device damage caused by incorrect voltage tests
High test voltages can damage the device. Capacitive leakage currents can distort the test results.

- Disconnect the components before carrying out a voltage test on the machine. [1)]

[1)] The components are voltage tested in accordance with the IEC 61800-5-1 product standard and must be disconnected during testing in accordance with IEC 60204-1:2021 Section 18.4.

⚠ WARNING

Unexpected movement of machines caused by inactive safety functions
Inactive or non-adapted safety functions can trigger unexpected machine movements that may result in serious injury or death.

- Observe the information in the appropriate product documentation before commissioning.
- Carry out a safety inspection for functions relevant to safety on the entire system, including all safety-related components.
- Ensure that the safety functions used in your drives and automation tasks are adjusted and activated through appropriate parameterizing.
- Perform a function test.
- Only put your plant into live operation once you have guaranteed that the functions relevant to safety are running correctly.

⚠ WARNING

Malfunctions of the machine as a result of incorrect or changed parameter settings
As a result of incorrect or changed parameterization, machines can malfunction, which in turn can lead to injuries or death.

- Protect the parameterization against unauthorized access.
- Handle possible malfunctions by taking suitable measures, e.g. emergency stop or emergency off.

2.2 Equipment damage due to electric fields or electrostatic discharge

Electrostatic sensitive devices (ESD) are individual components, integrated circuits, modules or devices that may be damaged by either electric fields or electrostatic discharge.

NOTICE

Equipment damage due to electric fields or electrostatic discharge
Electric fields or electrostatic discharge can cause malfunctions through damaged individual components, integrated circuits, modules or devices.

- Only pack, store, transport and send electronic components, modules or devices in their original packaging or in other suitable materials, e.g conductive foam rubber of aluminum foil.
- Only touch components, modules and devices when you are grounded by one of the following methods:
  - Wearing an ESD wrist strap
  - Wearing ESD shoes or ESD grounding straps in ESD areas with conductive flooring
- Only place electronic components, modules or devices on conductive surfaces (table with ESD surface, conductive ESD foam, ESD packaging, ESD transport container).

2.3 Warranty and liability for application examples

Application examples are not binding and do not claim to be complete regarding configuration, equipment, or any eventuality which may arise. Application examples do not represent customer-specific solutions, but merely serve to provide assistance with typical tasks.

As the user you yourself are responsible for ensuring that the products described are operated correctly. Application examples do not relieve you of your responsibility for safe handling when using, installing, operating and maintaining the equipment.

2.4 Cybersecurity information

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial cybersecurity measures that may be implemented, please visit
https://www.siemens.com/cybersecurity-industry.

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Cybersecurity RSS Feed under
https://new.siemens.com/cert.

Further information is provided on the Internet:
Configuration Manual Industrial Cybersecurity
(https://support.industry.siemens.com/cs/ww/en/view/109975311)

⚠ WARNING

Unsafe operating states resulting from software manipulation
Software manipulations, e.g. viruses, Trojans, or worms, can cause unsafe operating states in your system that may lead to death, serious injury, and property damage.

- Keep the software up to date.
- Incorporate the automation and drive components into a state-of-the-art, integrated industrial cybersecurity concept for the installation or machine.
- Make sure that you include all installed products in the integrated industrial cybersecurity concept.
- Protect files stored on exchangeable storage media from malicious software by with suitable protection measures, e.g. virus scanners.
- Carefully check all cybersecurity-related settings once commissioning has been completed.

2.5 Residual risks of power drive systems

When assessing the machine or system-related risk in accordance with the respective local regulations (e.g. EC Machinery Directive), the machine manufacturer or system integrator must take into account the following residual risks emanating from the control and drive components of a drive system:

1. Unintentional movements of driven machine or system components during commissioning, operation, maintenance, and repairs caused by, for example,
   - Hardware faults and/or software errors in the sensors, control system, actuators, and connections
   - Response times of the control system and of the drive
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - Parameterization, programming, cabling, and installation errors
   - Use of wireless devices/mobile phones in the immediate vicinity of electronic components
   - External influences/damage
   - X-ray, ionizing radiation and cosmic radiation
2. Unusually high temperatures inside and outside the components, including open flames, as well as emissions of light, noise, particles, gases, etc. due to fault conditions, e.g.:
   - Component failure
   - Software errors
   - Operation and/or environmental conditions outside the specification
   - External influences/damage
   - Short circuits or ground faults in the intermediate DC circuit of the converter

3. Hazardous shock voltages caused by, for example:
   - Component failure
   - Influence during electrostatic charging
   - Induction of voltages in moving motors
   - Operation and/or environmental conditions outside the specification
   - Condensation/conductive contamination
   - External influences/damage
4. Electrical, magnetic and electromagnetic fields generated in operation that can pose a risk to people with a pacemaker, implants or metal replacement joints, etc., if they are too close
5. Release of environmental pollutants or emissions as a result of improper operation of the system and/or failure to dispose of components safely and correctly
6. Influence of network-connected and wireless communications systems, e.g. ripple-control transmitters or data communication via the network or mobile radio, WLAN or Bluetooth.
7. Motors for use in potentially explosive areas:

   When moving components such as bearings become worn, this can cause enclosure components to exhibit unexpectedly high temperatures during operation, creating a hazard in areas with a potentially explosive atmosphere.

For more information about the residual risks of the drive system components, see the relevant sections in the technical user documentation.

Product overview

3

3.1 Area of application

Broad range of control applications

The SIMATIC ET 200SP distributed I/O system provides the flexibility and power required for a wide range of control applications.

The F-TM StepDrive ST is a product from the range of TM Drive modules in the ET 200SP network. In this manual, the term TM Drive is used as a synonym for F-TM StepDrive ST.

The F-TM StepDrive technology module offers you the following possible applications:

- Variable speed control
- Positioning tasks in combination with higher-level controller
- In the area of safety extra-low voltage ≤ 60 V DC with integrated hardware Safety function Safe Torque Off (STO)

Areas of application

The TM Drives have proven to be an ideal and compact drive in many applications.

Examples of applications:

- Packaging machines
- Automatic assembly machines
- Electronics and battery production
- Printing and labeling machines
- Winders/unwinders, e.g. in the textile, packing and printing and solar industries
- Driving of shuttles for storage and retrieval machines and storage rack systems
- Automated guided vehicle systems
- Battery-powered applications

②	LED for diagnostics	⑦	LED for power
③	2D matrix code	⑧	Article number
④	Wiring diagram	⑨	Color coding of module type
⑤	LEDs for motor control	⑩	Function class

Figure 1-346 View of the F-TM StepDrive ST module

Properties

The F-TM StepDrive ST has the following properties:

- Operation on ET 200SP PROFINET IMs as of V4.0
- Operation on CPU 151x as of V2.0, S7-1200, OpenController and CPU 151xSP
- Speed-controlled single-axis drive with PROFIdrive profile
- Rated voltage of the drive module: 24 to 48 V DC (safety extra-low voltage)
- Support of incremental encoders (with A, B, Z track)

- 24 V digital input
- Support of individually configurable bipolar stepper motors
- Controller parameter determination possible using HSP
- Thermal monitoring of the motor and the power end stage
- Cyclic overload capability
- Safety function STO hardwired
- Motor holding brake external via the process image
- Integrated engineering in STEP 7 (TIA Portal) via Hardware Support Package HSP0311 V16 or higher

Accessories

The following accessories, which are not included in the scope of delivery of this module, can be used with the module:

- Labeling strips
- Color-coded labels
- Reference identification labels
- Shield connection

A BaseUnit of the type U0 (6ES7193-6BP00-0DU0 oder 6ES7193-6BP00-0BU0) is needed for operation of the TM Drive. You can find an overview of the BaseUnits that you can use with the technology module in the Equipment Manual SIMATIC ET 200SP BaseUnits (https://support.industry.siemens.com/cs/ww/en/view/109751716).

For more information on accessories, refer to the system manual SIMATIC ET200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293).

NOTE

Unsuitable electronic fuses

Electronic fuses that disconnect the output voltage briefly in case of an overload and are not capable of power feedback (e.g. SITOP SEL1200) are not suitable for fuse protection.

3.3 Supported functions

System functions

The TM Drive supports the following PROFINET IO functions:

- Firmware update via PROFINET IO

The TM Drive supports the function:

- Identification data I&M 0 to 3

PROFIdrive communication types

TheTM Drive supports the following types of communication:

- Cyclic data exchange via a cyclic data channel

  Motion control systems require cyclically updated data during operation for open-loop and closed-loop control. This data must be sent as setpoints to the drive devices or read as actual values from the drive devices via the communication system. The transfer of this data is normally time-critical.
- Acyclic data exchange via an acyclic data channel

  An acyclic parameter channel for exchange of parameters between the CPU or supervisor and the drive devices is additionally available. Access to this data is not time-critical.
- Alarm channel

  Alarms are output event-triggered and indicate incoming and outgoing error states.

PROFIdrive application classes

The TM Drive supports Application Classes 1 and 4 of the PROFIdrive profile as of V4.2.

- Class 1 (AC1)

  The drive is controlled via a speed setpoint using PROFINET.

  The closed-loop speed control takes place entirely in the drive.

  Typical applications are, for example, simple frequency converters for pump and fan control.
- Class 4 (AC4)

  This PROFIdrive application class defines a speed setpoint interface with the closed-loop speed control taking place in the drive and the closed-loop position control taking place in the CPU, as is required for robot and machine tool applications with coordinated motion sequences on multiple drives.

Wiring

4

4.1 Pin assignment

Specific application

Observe the safety and accident prevention regulations applicable for specific applications, e.g. "Safety of Machinery EN ISO 13849-1".

During wiring and maintenance work, the TM Drive must be disconnected from the power supply.

EMERGENCY OFF equipment

EMERGENCY OFF devices according to IEC 60204 (corresponds to DIN VDE 0113) must remain in effect in all operating modes of the plant or system.

The drive-integrated safety function STO of the TM Drive does not replace the EMERGENCY OFF mechanism of the plant.

Excluding hazardous plant states

Hazardous operating states must not occur when

- The plant restarts up after a voltage dip or voltage failure
- Bus communication resumes after a fault

If necessary, the EMERGENCY OFF must be forced!

An uncontrolled or undefined startup must not occur after the EMERGENCY OFF is unlocked.

You can find a description on how to prevent uncontrolled startup in the section Safety Integrated functions (Page 39).

Potential group

Up to a continuous input current of up to max. 10 A for each potential group, up to 3 TM Drive can be connected together to form a drive group.

No other ET 200SP components may be located within a potential group consisting of one or more TM Drive.

A TM Drive potential group can be supplied as follows:

- With a separate power supply unit
- With a common power supply that also supplies other components. In this case, use a DC line filter (TDK Electronics 2-wire filter series B84113C) before the TM Drive potential group.

- If you are using a power supply unit with a rated current of more than 10 A or batteries/rechargeable batteries, then it is imperative to connect a circuit breaker of characteristic B with max. 10 A rated current, approved for direct current and the corresponding SELV / PELV voltage, upstream of the TM Drive potential group.
  For a potential group with only one TM Drive we recommend using an appropriate miniature circuit breaker with 6 A fuse and characteristic B.
- You must not use voltage sources with low impedances (such as supercaps) without adequate current-limiting protective measures.

Short circuits

The power outputs of the TM Drive are short-circuit proof. If the module detects a short circuit, it is still imperative to rectify the fault before switching it on again. Otherwise the module can be damaged.

Disturbance of radio communication services due to radio-frequency interferences in residential environments

The TM Drive can cause radio frequency interference which requires measures for interference suppression. This system is not designed for liberal use in the first environment (residential area) and must not be used there without appropriate radio interference suppression measures. Have the installation and commissioning performed with appropriate radio interference suppression measures by experts.

Protection from external electrical effects

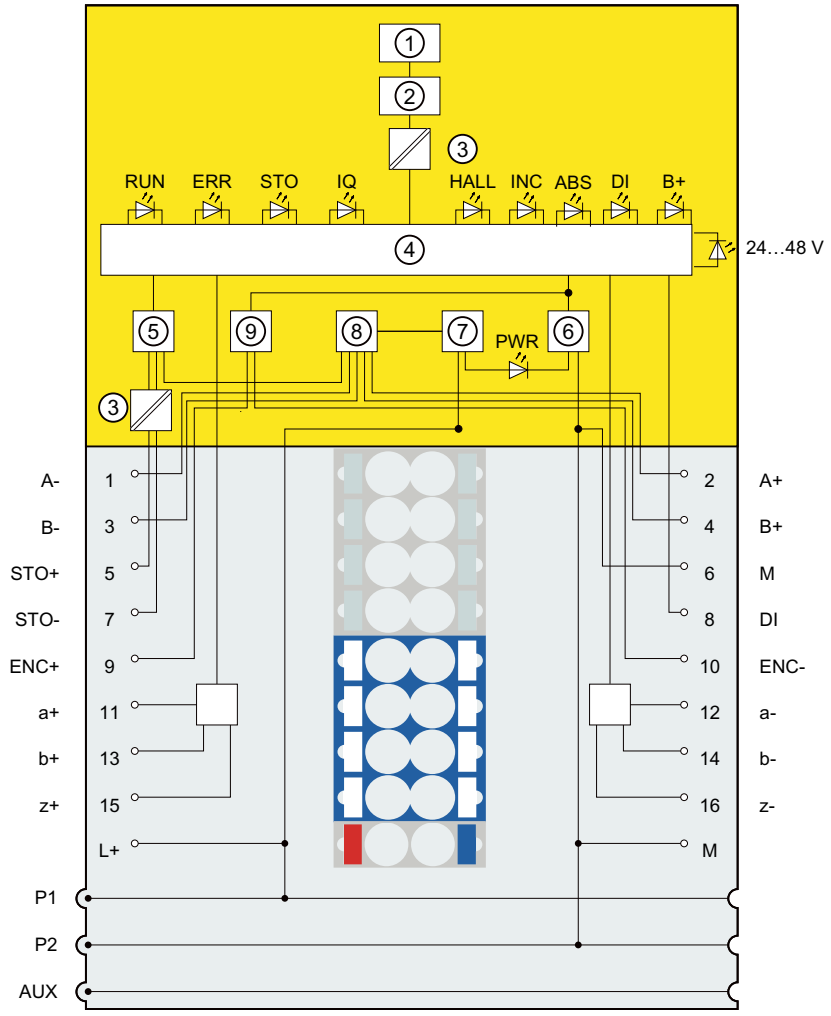
You can find information on interference-proof design in the function manual Designing interference-free controllers
(https://support.industry.siemens.com/cs/ww/en/view/59193566).

Overload

The TM Drive is overload-capable. The load of the power end stage is automatically limited by the drive.

With automatic overload limiting, the output current is automatically reduced on reaching the rated load of the power end stage to effectively prevent an overload of the power unit.

SCCR (short circuit current rating)



Suitable For Use On A Circuit Capable Of Delivering Not More Than 5kA DC Symmetrical Amperes, 48 Volts DC Maximum.

4.2 Block diagram

⚠ WARNING

Fuse for the load circuit
In general, use a suitable overcurrent protection device to protect the TM Drive.

Figure 1-347 Schematic circuit diagram

Cable lengths and cable types

If you do not use an "all-in-one" plug-in cable, the following cable lengths and cable types are permitted for the interfaces:

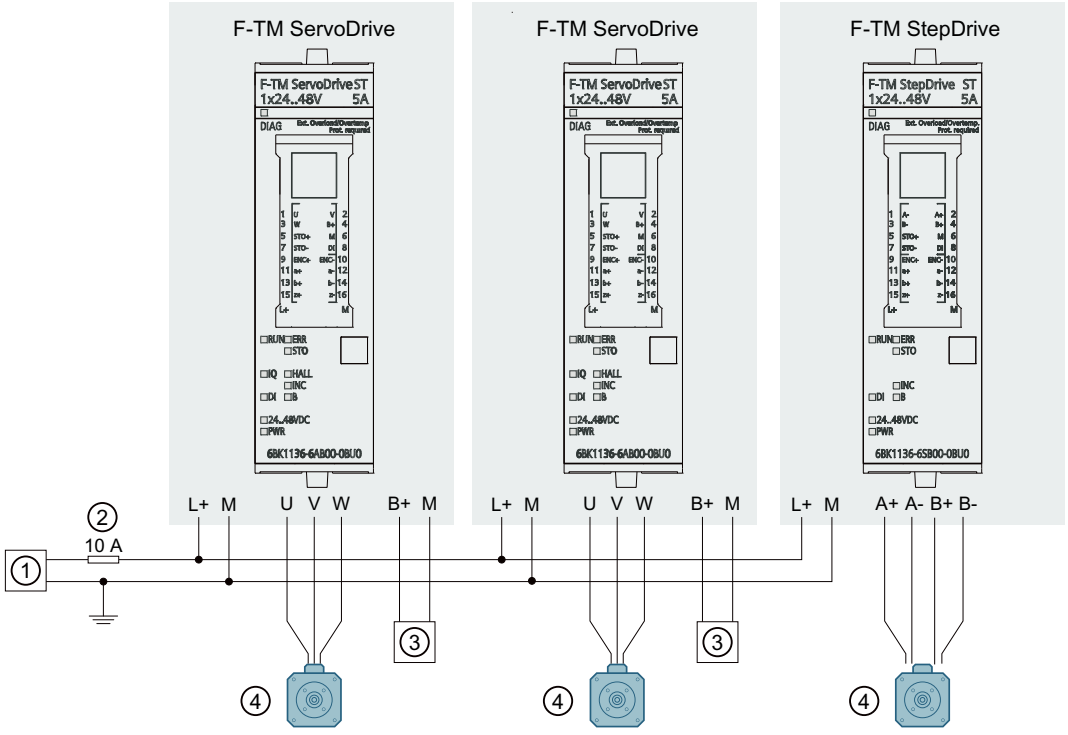
Table 1-694 Wiring rules for the interfaces

Pins	Function	Maximum cable length	Cable type
ENC+/ENC-	Incremental encoder signals and supply	10 m	Shielded For differential wiring, one twisted pair per signal pair
A+/A-/B+/B-	Motor phases	10 m	Shielded
DI, M	Input	10 m	≥ 2 m shielded
	Ground	10 m	-
L+/M	Power supply, power unit	10 m	-
a, b, z	Encoder connectors	10 m	Shielded For differential wiring, one twisted pair per signal pair
STO	Safe Torque Off	10 m	-

Permissible cable cross-sections depend on the BaseUnit used. See ET 200SP BaseUnits Equipment Manual (https://support.industry.siemens.com/cs/ww/en/view/59753521)

CABLE SPEC.	Note that connected power lines must be designed according to the expected current value at maximum ambient temperature and installation type in accordance with applicable standards.

NOTE



In addition to the shield connection on the ET 200SP the cable shield must also be grounded with a suitable fastening, for example with a metal clip on the control cabinet rear panel. The cable shield must be applied on the motor/encoder side.

4.3 Wiring of multiple TM Drive

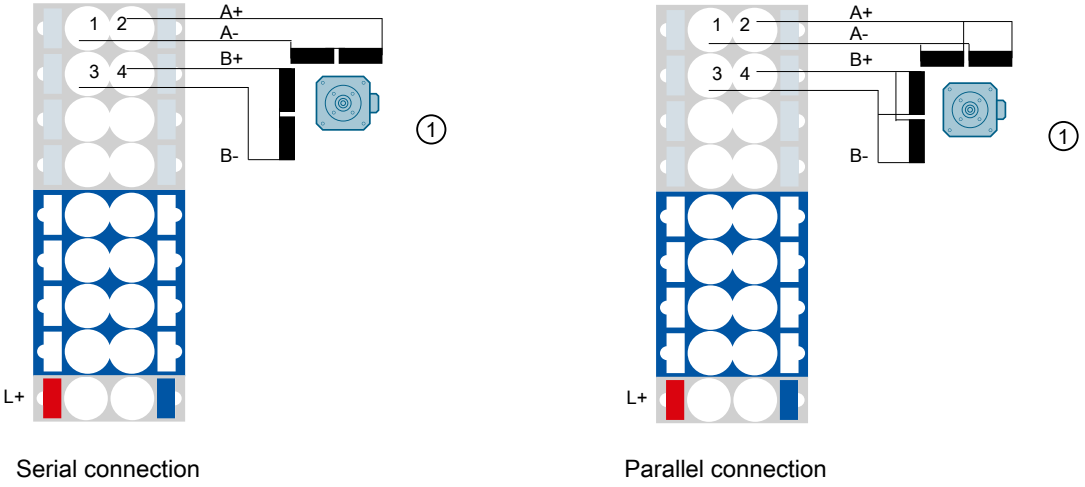
In a potential group

You can connect multiple TM Drive to form a potential group (drive line-up). The following figure shows you the TM Drive with different motors.

Wiring of multiple TM Drive to form a drive line-up

① Power supply unit
② Protective device
③ Braking resistor
④ Motor

Figure 1-348 Wiring of multiple TM Drive to form a drive line-up



4.4 Connecting the motor

Overview

The F-TM StepDrive supports bipolar interconnected stepper motors.

4.4.1 Wiring the motor phases (stepper motor)

The following figure shows the connection of the motor phases to the BaseUnit:

①	Stepper motor
A+, A-, B+, B-	Motor phases

Figure 1-349 Connecting the motor

NOTE

In addition to the shield connection on the ET 200SP the cable shield must also be grounded with a suitable fastening, for example with a metal clip on the control cabinet rear panel. The cable shield must be applied on the motor side.

Pin assignment

Pin	Designation	Function
1	A+	Motor phase A+
2	A-	Motor phase A-
3	B+	Motor phase B+
4	B-	Motor phase B-

4.5 Connecting an encoder

4.5.1 Connecting an incremental encoders

You can connect motors with a 3-channel incremental encoder to the TM Drive. The A and B tracks and a reference track Z are required for evaluation. You connect all signals as "single-ended" or "differential".

The following figure shows the connection of an incremental encoder to the BaseUnit.

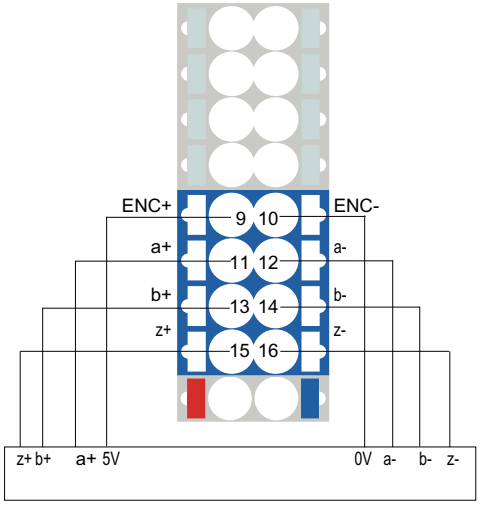


Figure 1-350 Connection of incremental encoder with differential signals

Pin assignment of incremental encoder

Pin	Designation	Function
9	ENC+	Power supply encoder 5 V
10	ENC-	Power supply encoder, negative connection
11	a+	Differential encoder signal a+
12	a-	Differential encoder signal a-
13	b+	Differential encoder signal b+
14	b-	Differential encoder signal b-
15	z+	Differential encoder signal z+
16	z-	Differential encoder signal z-

Table 1-695 Power supply and signal processing conditions of the incremental encoder

Encoder circuit	Range
TTL bipolar 5 V or differential	High 2 V .. 5.5 V
	Low -5.5 V ... -2 V
TTL unipolar 5 V	High 4 V .. 5.5 V
	Low 0 V .. 1 V

*The quadrature interface results in a maximum step resolution of 2000 kHz

Encoder circuit	Range
Encoder supply voltage	5 V ... 5.3 V
Maximum current consumption of the encoder	150 mA
Maximum signal frequency that can be processed (per signal A and B)*	500 kHz

*The quadrature interface results in a maximum step resolution of 2000 kHz

NOTE

In addition to the shield connection on the ET 200SP the cable shield must also be grounded with a suitable fastening, for example with a metal clip on the control cabinet rear panel. The cable shield must be applied on the encoder side.

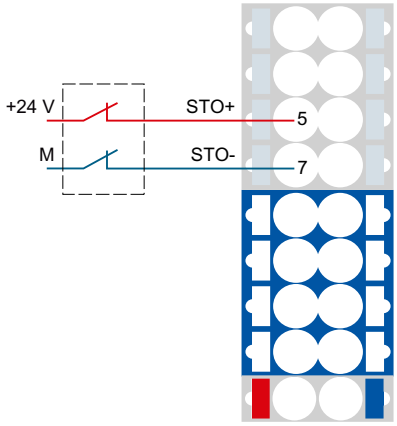
4.5.2 Connecting safe torque off (Hardware STO)

Safe Torque Off (STO)

The safety function Hardware STO is activated via an exclusive safe input (STO+ and STO-). The TM Drive safely switches off the control of the motor. As long as Hardware STO is active, the motor does not generate any torque.

The safe state "Safe Torque Off" corresponds to the de-energized state at STO+/STO- (closed-circuit current principle).

The Hardware STO function meets the specification of a digital input according to EN 61131-2 Type 1 without limitation. In addition, this input has an increased leakage current resistance of 5 mA. That is, at leakage currents below 5 mA, the safe state is always selected.



⚠ WARNING

Danger to life due to coasting down of the drive with STO

The Category 0 stop function according to EN 60204-1 (STO according to Safety Integrated) means that the drives are not braked but instead coast down for an amount of time corresponding to the kinetic energy.

- You must take this behavior into account, for example, in the logic for the protective door interlock.

Wiring the Hardware STO

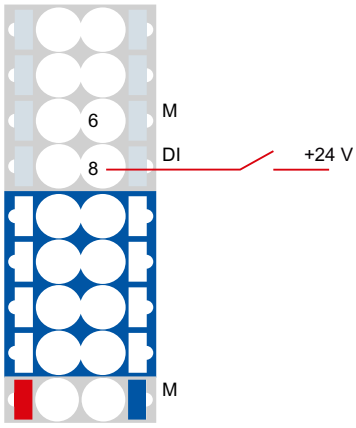
STO+ STO input 24 V
STO- STO input, negative connection

Figure 1-351 Connection of Hardware STO

NOTE
The supply voltage for the STO inputs must be different from that of the power supply.

Table 1-696 Pin assignment

Pin	Designation	Function
5	STO+	STO input 24 V
7	STO-	STO input, negative connection



The cables of the hardware STO (STO+/STO-) must be routed separately from other cables, especially power cables.

The risk of crushing and short-circuits against earth connections must be minimized by appropriate routing.

Premature aging of the cables due to continuous UV radiation must be ruled out.

4.5.3 Connecting the 24 V digital input

Connecting a 24 V digital input

DI 24 V digital input
M Ground

Figure 1-352 24 V digital input connection

Table 1-697 Pin assignment

Pin	Designation	Function
6	M	Ground, internally connected to ground of 24 - 48 V power supply
8	DI	24 V digital input

Safety functions integrated in the drive

5

5.1 Basic safety information

5.1.1 General safety information

⚠ WARNING

Danger to life if the safety instructions and residual risks are not taken into consideration

The non-observance of the safety instructions and residual risks stated in the associated F-TM StepDrive documentation can result in accidents causing severe injuries or death.

- Observe the safety instructions given in the F-TM StepDrive documentation.
- Consider the residual risks for the risk evaluation.

⚠ WARNING

Malfunctions of the machine as a result of incorrect or changed parameter settings

As a result of incorrect or changed parameter settings, machines can malfunction, which in turn can lead to injuries or death.

- Protect the parameter assignment against unauthorized access.
- Respond to possible malfunctions by implementing suitable measures (e.g. EMERGENCY STOP or EMERGENCY OFF).

⚠ WARNING

Validity of safety features

The safety features of the product are guaranteed only for intended use within the intended ambient conditions (see section Technical specifications (Page 105)).

The safety features only apply when operating with a BaseUnit of the U0 type (6ES7193-6BP00-0DU0 or 6ES7193-6BP00-0BU0).

5.1.2 Warranty and liability for application examples

Application examples are non-binding and do not claim to be complete regarding configuration and equipment as well as all eventualities. Application examples do not represent customer-specific solutions. They are only intended to provide support for typical tasks.

As user, you are responsible for ensuring that the products described are used correctly. Application examples do not relieve you of the responsibility to use safe practices in application, installation, operation and maintenance.

5.1.3 Fundamental safety instructions for Safety Integrated

Additional safety instructions and residual risks are provided outside of this section at the relevant points of this system manual.

⚠ DANGER

Risk minimization through Safety Integrated

Safety Integrated can be used to minimize the risk associated with machines and plants. However, safe operation of the machine or system with Safety Integrated is only possible if the machine manufacturer:

- Knows and complies with this technical user documentation, including the documented constraints, safety instructions and residual risks
- Carefully constructs and configures the machine/plant and verifies it through a carefully implemented and documented acceptance test by qualified personnel
- Implements and validates all the measures required in accordance with the system/machine risk analysis by means of the programmed and configured Safety Integrated functions or by other means

The use of Safety Integrated does not replace the machine/plant risk assessment carried out by the machine manufacturer as required by the CE Machinery Directive.
In addition to using Safety Integrated functions, further risk reduction measures must be implemented.

⚠ WARNING

Danger to life as a result of undesirable motor movement when automatically restarting

An emergency stop must be performed according to Stop Category 0 (STO) (EN 60204-1). The emergency stop must be ensured by external measures.
It is not permissible that the motor automatically restarts after an Emergency Stop, as this represents danger to life as a result of the associated undesirable motor motion.
If individual safety functions are deactivated, an automatic restart is permitted under certain circumstances depending on the risk analysis (except when Emergency Stop is reset). An automatic start is possible when a protective door is closed, for example.

- Ensure that no automatic restart takes place in the indicated cases.

⚠ WARNING

Danger to life as a result of undesirable motor motion when the system powers up and the drives are activated after hardware and/or software is changed or replaced

After hardware and/or software components have been modified or replaced, or after drive parameters are changed or parameter backups are loaded, it is only permissible for the system to run up and the drives to be activated with the protective devices closed. Personnel shall not be present within the danger zone during this time.

- It may be necessary to carry out a partial or complete acceptance test or a simplified functional test after making certain changes or replacements.
- Before personnel may re-enter the hazardous area, all of the drives should be tested to ensure that they exhibit stable control behavior by briefly moving them in both the plus and minus directions (+/-).

5.1.4 Safety Integrated functions

This section gives you a quick insight into the functioning of the safety functions.

The description of the safety functions starts in each case with the definition in IEC/EN 61800-5-2 and simple examples of the use of the function.

The description of the functions is simplified as far as possible so that the essential properties and setting options are made clear.

Response time

You can find additional information on the response time of the listed safety functions in section Response times (Page 110).

Examples of safety devices and 3 F-TM StepDrive

NOTE
The supply voltage for the STO inputs must be different from that of the power supply.

The following figure shows various safety devices that are connected to 3 F-TM StepDrive.

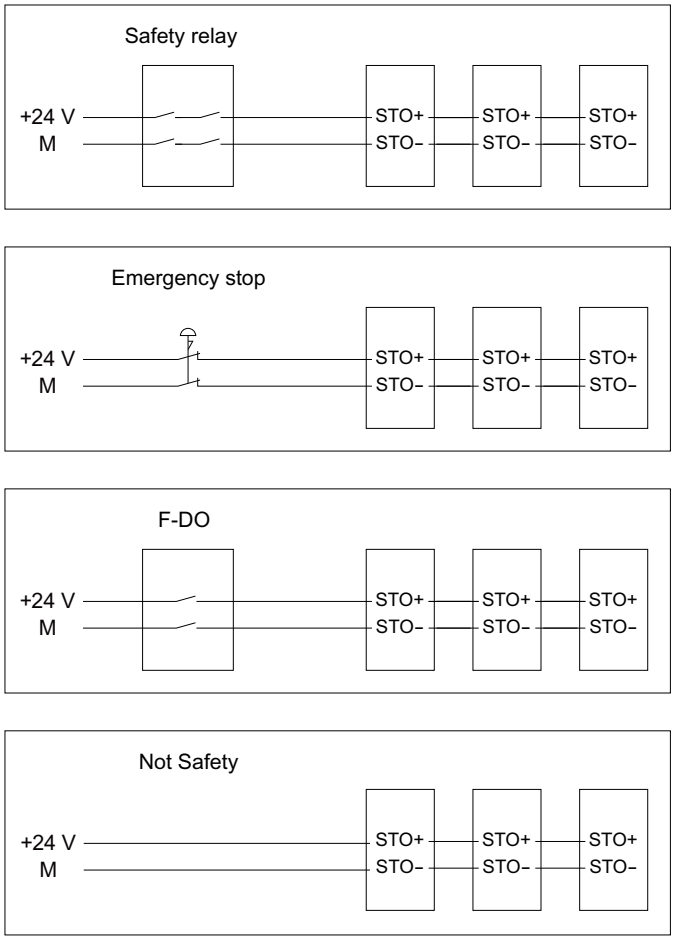


Figure 1-353 Safety devices and 3 F-TM StepDrive

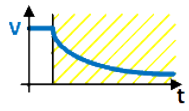
NOTE
The F-TM StepDrive does not support startup protection.
Measure:
Startup protection via additional safety relay or in higher-level controller, depending on the safety requirements.

Operating voltage range



Operate input STO+ as intended with 19.2 to 28.8 V DC for the active enable or lower 5 V DC for the disable.

Connect the input STO- for enabling or disabling the connection to ground.

Switching on again after power off

An On delay of more than 2 s must be observed between tripping and restarting the module, for example switching the power supply off and on. Otherwise the module can register an internal STO error and the module switches off in a safety-oriented manner.

5.1.4.1 Safe Torque Off (STO)

Safe Torque Off (STO) is a safety function that directly stops torque- or force-producing energy from being supplied to the motor. This function corresponds to Stop Category 0 according to EN 60204-1.

The F-TM StepDrive complies with the definition of the STO function in IEC/EN 61800-5-2: "The STO function prevents torque-producing energy from being supplied to the motor."

If the motor is still rotating when STO is selected, the motor will coast to a standstill.

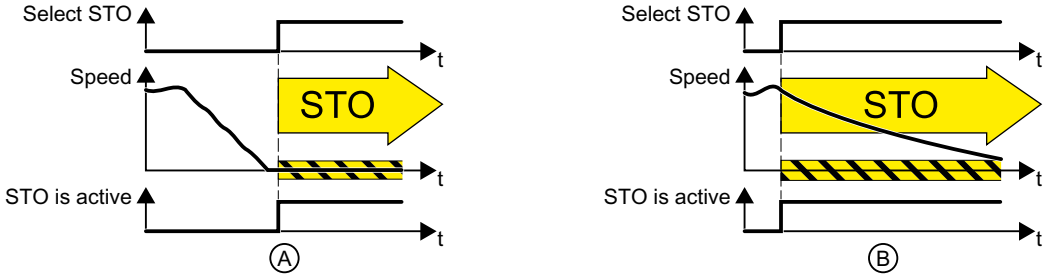


Figure 1-354 Functioning of STO (A) when motor is at stopped and (B) when motor is rotating

Functional characteristics

⚠ WARNING

Danger to life due to coasting down of the drive with STO

The Category 0 stop function according to EN 60204-1 (STO according to Safety Integrated) means that the drives are not braked but instead coast down for an amount of time corresponding to the kinetic energy.

- You must take this behavior into account, for example, in the logic for the protective door interlock.

STO is a drive-specific function and must be wired individually for each drive.

The following applies when the "Safe Torque Off" function is selected:

- An unwanted startup of the motor cannot take place.
- The torque-producing energy supply to the motor is safely interrupted.
- An electrical isolation between the power unit and motor does not occur.

The stop function category 0 (selection of STO according to Safety Integrated) is only active when selected at the STO terminals. In order to meet the requirements of an EMERGENCY STOP in accordance with EN 60204-1, you need to ensure that the STO function at the STO terminals in the system can only be deselected by means of conscious manual operation. This prevents electrically driven machine components from restarting unintentionally.

Selection

The STO safety function is always enabled and cannot be disabled via parameter assignment.

You can select the STO function via the fail-safe digital input at STO+ and STO- terminals. The selection of the STO function is enabled directly as a response to safety messages (e.g. when a defect is detected in a monitoring channel).

Range of application

You can use the STO safety function without restrictions for a bipolar connected two-phase stepper motor. A special encoder concept suitable for safety is not required.

Applications

Application areas are all machines or systems with moving axes (e.g. conveyor systems, handling systems).

STO can be used in which the motor is already at a standstill or comes to a standstill safely due to friction in a short time.

STO allows safe working while a protective door is open. A conventional Emergency Stop with electromechanical unlocking is not required. The converter remains connected to the supply system and has full diagnostics capability.

NOTE

Difference between EMERGENCY OFF and EMERGENCY STOP

EMERGENCY OFF and EMERGENCY STOP are commands that mitigate different risks in the machine or plant. The STO function is suitable for implementing an EMERGENCY STOP, but not an EMERGENCY OFF.

Hardware STO

The F-TM StepDrive internally monitors the fail-safe digital input at STO+ and STO- terminals for discrepancies.

Discrepancy monitoring

Due to the design of the Hardware STO circuit, a discrepancy cannot occur at STO+ and STO- terminals. As long as the STO terminal is de-energized, STO is selected. The Hardware STO signal is read in internally via two channels.

To comply with the requirements for timely error detection from EN 61800-5-2, the switch-off signal paths of the end stage in both monitoring channels are also cyclically tested. Errors when testing the shutdown paths trigger STO. A manual forced checking procedure (test stop) for testing the shutdown paths of the F-TM StepDrive is therefore not needed.

⚠ WARNING

Forced checking procedure

You should nevertheless examine its necessity for diagnosing the utilized sensors or for performing a test stop in the context of the overall system.

5.1.5 Overview of the Safety Integrated functions

Compared to standard drive functions, safety functions have an especially low error rate. Performance Level (PL) and Safety Integrity Level (SIL) as defined in the corresponding standards are a measure for the error rate.

For this reason, safety functions are suitable for use and for risk reduction in safety-related applications. An application is safety-related when the risk analysis of the machine or plant has identified a particular risk potential in the application.

Safety Integrated means that the safety functions are integrated in the drive and can be executed without additional external components.

Conformity of Safety Integrated functions

The Safety Integrated functions comply with:

- Safety Integrity Level (SIL) 3 according to IEC 61508 Part 1-3
- Category 3 according to ISO 13849-1
- Performance Level (PL) d according to ISO 13849-1

For functional safety of variable-speed drives, the standard IEC 61800-5-2, in which the Safety Integrated functions are defined, applies.

Function groups

The safety functions are divided into the following function groups for the F-TM StepDrive:

- Safety Integrated stop function (hardware STO)

5.1.6 Supported safety functions

The supported safety functions are included in the standard scope of the F-TM StepDrive and can be used without an additional license.

Stop functions

The stop functions do not pose any special requirements on the utilized encoder and do not need actual value acquisition. The stop functions include the following Safety Integrated functions:

- Safe Torque Off (STO)

  Safe Torque Off is a safety function for prevention of unexpected startup according to EN 60204-1. STO prevents torque-producing energy from being supplied to the motor and corresponds to Stop Category 0.

5.1.7 Examples of using the safety functions

Table 1-698 Examples of using the safety functions

Safety function	Application examples	Possible solution
Safe Torque Off (STO)	It is only permissible to open a protective door if the motor torque has been switched off.	Activate STO in the F-TM StepDrive via the STO inputs. The pulses are suppressed and the motor coasts to a standstill.
	A central Emergency Stop button ensures that multiple drives cannot start unintentionally.	Evaluate the emergency stop button in a central controller. Use a two-channel connection to the STO inputs on the F-TM StepDrive.

5.1.8 Safety concept

The safety concept of the drive controller is based on a 2-channel system structure. Each channel has the possibility of bringing about the safe state, and the two channels monitor each other through a corresponding cross-comparison and cyclic diagnostics.

Safe state

The safe state of the system exists when the motor bridge is **de-energized**.

The safe state is reached in the following cases:

- Switch-off or failure of the external power supply to L+/M
- Missing enable signal at STO+ and STO-
- Detection of an internal HW fault

Safe state of Safety Integrated functions

The safe state of the STO input terminal is reached when at least one of the two STO supply terminals is disconnected from the energy supply.

NOTE

The safe state means the absence of torque in the sense of functional safety, but not necessarily the absence of voltage in the sense of electrical safety.

5.2 Acceptance of the safety functions

Responsibilities

The machine manufacturer is responsible for the performance and documentation of the acceptance test. In this section, you will find a recommendation for how to perform and document the acceptance tests for the individual safety functions.

NOTE

The performance and documentation of the acceptance tests are plant-specific and must be adapted appropriately and performed.

5.2.1 General information on acceptance

Why is acceptance required?

The EU machinery directive and ISO 13849-1 stipulate:

- You must test safety-relevant functions and machine parts after commissioning.
  See "Acceptance test" below in this section.
  For the F-TM StepDrive Safety Integrated functions (SI functions), this means:
  The acceptance test is used to check the functionality of the safety functions used in the drive. Correct implementation of the defined safety functions is examined for this.
- You must create an "acceptance report" that describes the test results.
  See "Documentation" further on in this section.

NOTE

Purpose of the acceptance test

The measured values (e.g. speed, time) and the system behavior identified (e.g. initiation of a specific stop) serve to check the plausibility of the configured safety functions. The objective of an acceptance test is to identify potential configuration errors and/or to document the correct function of the configuration. The measured values are typical values (not worst case values). They represent the behavior of the machine at the time of measurement. These measurements cannot serve as the basis for deriving real values (e.g. maximum values for over-travel distances).

Requirements

The requirements for an acceptance test (configuration test) for safety functions of electric drives come from EN 61800-5-2, section 7.1, paragraph f). The acceptance test is called "configuration test" in this standard.

- Description of the application including an image
- Description of the safety-related components (including software versions) that are used in the application
- List of the utilized safety functions of the PDS(SR) [Power Drive System(Safety Related)]
- Results of all tests of these safety functions using the specified test procedure

Necessity of an acceptance test

An acceptance test is required (again) when the Safety Integrated functionality of a machine is commissioned or changed. The acceptance tests must be performed for each individual drive. Safety-related function extensions, transfer of commissioning to other series machines, hardware changes, software upgrades and the like may allow a partial performance test to be performed.

The conditions determining the necessity and recommendations for the test depth required in each case are summarized below.

Requirements for the acceptance test

- The machine is correctly wired.
- All safety equipment (e.g. protective door monitoring devices, light barriers, emergency limit switches) are connected and ready for operation.
- The commissioning of open-loop and closed-loop control must be complete; otherwise, the over-travel distance may be changed due to a changed dynamic response of the drive control, for example. This includes:
  - Settings of the setpoint channel
  - Position control in the higher-level CPU
  - Drive control

Acceptance test

The acceptance test comprises two parts:

- You test whether the safety functions are set correctly in the drive:
  - Does the configured safety function sufficiently reduce the residual risk at the machine/plant?
  - Do the set interfaces, timers and monitoring functions match the configuration of the machine?
- You test whether the safety-relevant functions in the machine or system function correctly.

  This part of the acceptance test goes beyond the acceptance test of the drive:
  - Is all safety equipment, such as protective door monitoring, light barriers and emergency limit switches, connected and ready for operation?
  - Do the drive settings match the configured safety-relevant function in the machine?

Documentation

The documentation consists of the following parts:

- Description of safety-relevant components and functions of the machine or system, including the program versions.
- Report of the acceptance test results.
- Report of the safety function wiring.
- The documentation must be signed off by the person who performed the acceptance test.

Authorized persons

Persons authorized by the **machine manufacturer** who, on account of their technical training and knowledge of the safety-relevant functions, can carry out the acceptance in an appropriate manner are entitled to perform the acceptance.

⚠ WARNING

Unwanted movement due to faulty wiring
Incorrect wiring for Safety Integrated functions can cause unwanted motion resulting in severe injury or death.

- For Safety Integrated functions, always carry out an acceptance test for the affected function after changing the wiring.
- Record the results of the acceptance test in an acceptance report.

⚠ WARNING

Unsafe operating states due to manipulation of the hardware configuration after the acceptance test
Changes to the wiring of the Safety Integrated functions after an acceptance test can cause unwanted motion resulting in severe injury or death.

- To prevent access to your machines and systems by unauthorized persons, implement access restrictions and take the precautions described in the security instructions in the preface.
- To prevent improper wiring of the Safety Integrated functions, take the precautions described in this manual.
- Review the safety change tracking of the drive at regular intervals. Make certain that no changes have been made to the wiring after the last successfully completed acceptance test.
- If intentional changes have been made, repeat the acceptance test for the Safety Integrated functions affected. The purpose of the acceptance test is to ensure and document safe operation of the system. Correct any unintentional changes back to the original values and repeat the acceptance test.

5.2.2 Content of an acceptance test

Documentation

Documentation of the machine including safety functions

- Machine description (with overview image)
- Information on controller (if available)
- Function table:
  - Active monitoring functions depending on operating mode and protective door
  - Additional sensors with protection functions
  - The table is an object or result of the configuration work.
- SI functions for each drive
- Information on the safety equipment

Function test of diagnostic/safety functions

Value-based function check of the SI functions used. You can use trace records of individual parameters, for example, to do this.

- Acceptance test for Safe Torque Off (STO)

Report completion

Reporting of the tested state of commissioning and countersignatures

- Control of the STO function as enable signal of the STO+ and STO- terminals
- Enable to control the motor is removed as soon as a connection (STO+ or STO-) is not connected
- Counter signature

5.2.3 Documentation of acceptance

Machine or system description

Describe your machine or plant using the following table. Insert a diagram of the plant, for example.

Table 1-699 Machine description and overview image

Designation	
Type	
Serial number	
Manufacturer	
End customer	
Overview image of the machine	

Drive data

In the following table, enter information on the drive components used and add additional components as required.

Table 1-700 Hardware components

Component	Designation	Article number	Hardware version	Type
Drive controller				
Motor				
Encoders				
Brake module				
Gearbox				

Utilized Safety Integrated functions

In the following table, describe the use of the Safety Integrated drive functions in relation to your plant or machine.

Table 1-701 Utilized SI functions of the drive

SI function	Status/Description
Safe Torque Off (STO)	

5.2.4 Acceptance test for Safe Torque Off (STO)

Procedure

Test each configured activation of the STO function.

This test consists of the following steps:

Table 1-702 Acceptance test for "Safe Torque Off" (STO) function

No.	Description	Status
1.	**Drive is ready for operation**	
	• No faults	
	• The enable signal is present (STO is deselected).	
2.	**Switch on motor**	

No.	Description		Status
2.	2.1	Set speed setpoint ≠ 0	
	2.2	Switch on motor (ON command)	
	2.3	Check that the intended motor is rotating	
3.	**Select STO**		
	3.1	Selecting STO means interrupting the wire, supplying the STO from STO+ and short-circuiting STO- (if the source is current-limited)	
	3.2	Check the following points:	
		• Motor coasts down to a standstill	
		Message is implemented, but is not safety-relevant	
4.	**Deselect STO**		
	4.1	Deselection of STO (HW STO terminal)	
	4.2	Check the following points:	
		• Enable is active, motor must allow switch-on	

5.2.5 Report completion

SI change tracking (Safety logbook)

Ensure that changes to the safety function (wiring) can be traced.

Countersignatures

Commissioning engineer
Professional execution of the above-stated tests and checks is confirmed.

Table 1-703 Report completion - Countersignature of commissioning engineer

Date	Name	Company/Department	Signature

Machine manufacturer
The correctness of the parameter assignment documented above is confirmed.

Table 1-704 Report completion - Countersignature of machine manufacturer

Date	Name	Company/Department	Signature

5.3 System features

5.3.1 Current information

Important note for maintaining the operational safety of your system:

NOTICE
Operational safety risk from unwanted motions Systems with safety-oriented variants are subject to special operational safety requirements on the part of the operator. If information becomes known in the course of product monitoring indicating insufficient product safety, this information will be disclosed in various ways. For this reason, our website provides information on product developments and features that are (or could be) relevant to operation of systems from a safety perspective.

5.3.2 Certifications

The safety functions of the F-TM StepDrive drive system meet the following requirements:

- Safety Integrity Level (SIL) 3 according to IEC 61508 Part 1-3 and IEC 61800-5-2
- Category 3 according to ISO 13849-1
- Performance Level (PL) d according to ISO 13849-1

In addition, the safety functions of the drive are generally certified by independent institutes. A list of the components that are currently already certified in each case is available on request from your Siemens branch.

5.3.3 Failure probability of the safety functions

The probability of failure of safety functions must be specified in the form of a PFH value (Probability of Failure per Hour) according to DIN EN 61800-5-2 and ISO 13849-1. The PFH value of a safety function depends on the safety concept of the drive device, its hardware configuration and the PFH values of the other components used for the safety function. For the F-TM StepDrive drive system, PFH values are provided as a function of the hardware configuration.

NOTE

PFH values

The PFH value of the integrated safety function STO is 30 FIT (10^{-9}/h) and refers to a service life of 20 years.

The underlying assumption for the calculation is an average operating temperature of 40°C, an average repair time of 8 hours and an average time to recovery of 8 hours. A proof test is not necessary.

5.3.4 Response times

The response time is the time between the detection of an input signal and the change of a linked output signal. Below you will find information on the response times of the F-TM StepDrive drive system.

NOTE

The actual response time falls between a minimum and maximum response time. You must always assume the maximum response time when configuring your system.

The drive system is the component that provides the safety functions. The description "error-free drive system" means that the component providing the safety functions itself has no defect:

- Maximum response time in error-free drive system
  When the enable is removed at the STO+ or STO- terminals, the maximum response time in an error-free drive system is guaranteed.

Stop function (via terminals)

The following table specifies the response times for the indicated stop functions from the time of activation until occurrence of the response.

Function	Maximum response time
STOP_STO	Max. 20 ms

5.4 Safety Integrated

Important notes on the Safety Integrated system are provided in this section.

Diagnostics hardware fault

If an internally diagnosed hardware fault occurs, you can only reset the module by restarting it. Nevertheless, the replacement of the F-TM StepDrive is strongly recommended. Unwanted activation of the safety function can be an indication of a hardware fault.

Wiring the F-TM StepDrive

For information on how to perform the electrical wiring for the F-TM StepDrive, refer to section Wiring (Page 27)

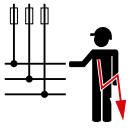
STO inputs

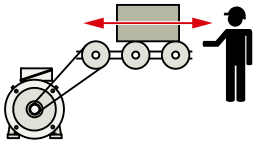
The STO inputs are described in the section Connecting safe torque off (Hardware STO) (Page 34).

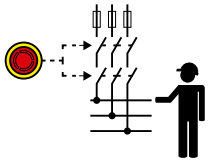
5.5 EMERGENCY OFF and EMERGENCY STOP

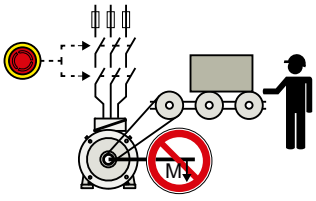
Difference between EMERGENCY OFF and EMERGENCY STOP

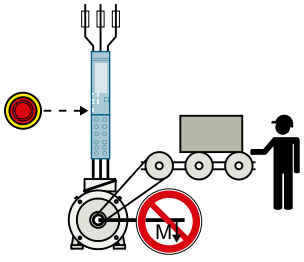
EMERGENCY OFF and EMERGENCY STOP are commands that mitigate different risks in the machine or plant.











EMERGENCY OFF Risk of electric shock	**EMERGENCY STOP** Risk of unexpected movement
	

Table 1-705 Measures and solutions

Command	**EMERGENCY OFF**	**EMERGENCY STOP**
Measure to minimize risk	**Safe switch off** Switching off the electric power supply for the installation, either completely or partially.	**Safely stop and safely prevent restarting** Stopping or preventing the dangerous movement
Classic solution	Switch off the power supply. 	Switch off the drive power supply. 
Solution with the STO safety function integrated in the drive	STO is not suitable for safely switching off a voltage.	Select STO.  You may also switch off the power supply of the drive controller. However, switching off the voltage is not required as a risk-reduction measure.

Configuring

6

Configuration and parameter assignment

STEP 7 (TIA Portal) is available for configuring a ET 200SP TM Drive.

You perform the following tasks with STEP 7 (TIA Portal), for example:

- You configure the TM Drive (insertion into the project and setting the input addresses).
- You specify the desired hardware parameters for operation of the TM Drive.

Requirements

Hardware

- Supported interface modules: See Properties (Page 24)
- You have completed installation and wiring of the hardware. Take the potential group into account, see section Pin assignment (Page 27).
- You have connected the PG/PC via the PROFINET interface of the CPU.

Software

- You have installed the HSP0311. You can find the support packages for the hardware catalog in the TIA Portal (HSP) on the Internet (https://support.industry.siemens.com/cs/ww/en/view/72341852).

As soon as the configuration and hardware parameter assignment have been successfully completed, you can create your user program and commission the drive.

⚠ WARNING

Safety Integrated

As soon as a safety program has been created, you must perform a complete function test based on your automation task.

To accept the plant, you must use the safety summary created in accordance with this manual.

Configuring a TM Drive (minimal configuration)

To configure a TM Drive , follow these steps:

1. Create a new project.
2. Add a CPU S7-1200 or S7-1500 as a new device.
3. Add a PROFINET interface module to the project under "Devices & networks" from the ET200SP system, e.g. IM 155-6PN ST.
4. Assign the inserted IO device to the configured IO controller.
5. Switch to the device view of the interface module.

6. Add the TM Drive module from the hardware catalog to the IO device.
7. Add a server module.

6.1 Communication telegrams

Selection of a communication telegram

The selection of a communication telegram determines the process data of the drive that will be transmitted between the drive and CPU.

The following table shows the supported telegram types for the drive and sensor assignment.

Table 1-706 Supported communication telegrams

Supported PROFIdrive telegrams	Brief description	User data
Standard telegram 1 PZD-2/2	Speed setpoint 16 bits, without sensor	• Control word STW1, status word ZSW1 • Speed setpoint 16 bits (NSET), actual speed value 16 bits (NACT)
Standard telegram 2 PZD-4/4	Speed setpoint 32 bits, without position encoder	• Control words STW1 and STW2, status words ZSW1 and ZSW2 • Speed setpoint 32 bits (NSET), actual speed value 32 bits (NACT)
Standard telegram 3 PZD-9/5	Speed setpoint, 32 bits with one position encoder	• Control words STW1 and STW2, status words ZSW1 and ZSW2 • Speed setpoint 32 bits (NSET), actual speed value 32 bits (NACT) • Encoder control word 1 (Gx_STW), encoder status word 1 (Gx_ZSW) • Actual encoder position value 1 (Gx_XIST1, Gx_XIST2)
Extension word	Status bits of the inputs	• Bit 0: DI • Bit 1: STO

A PZD (process data word) corresponds to a 16-bit word.

Selecting a telegram in STEP 7

To select the telegram for the TM Drive in STEP 7, follow these steps:

1. Select the TM Drive module in the device view.
2. Navigate to the properties of the module in the "General" tab under "TM Drive" > "Basic parameters".
3. Under "Telegram" in the drop-down list, select the desired telegram, e.g. "Standard telegram 3 (PZD length 9/5 words).
4. If needed, activate the extension word by selecting the "Telegram extension active" check box.

6.2 Structure of the encoder position actual value

Starting with standard telegram 3, the encoder position actual value is transmitted as a 32-bit value via the user data Gx_XIST1 and Gx_XIST2. These value provide the current **actual incremental position** of the encoder system and are read cyclically, for example by the "Positioning axis" technology object and further processed accordingly (see also section 8.3 (Page 95)). The layout of the encoder position actual value mainly depends on the following factors:

- Type of the encoder
- Resolution of the encoder

Regardless of the type of encoder, the actual position value is structured as follows:

- G1_XIST1 and Gx_XIST2 are right-aligned
- After it is switched on, a 32-bit counter is loaded with the current position value. Depending on the direction of rotation, this value is then only incremented or decremented. After reaching the max. position value, it starts again at 0.

NOTE

Dependence on the configured encoder resolution
The singleturn value ("increments / revolution") in G1_XIST1 is directly dependent on the configured encoder resolution (p408).

6.2.1 Incremental encoder

If you are using a motor with an incremental encoder and you have configured this for the type of motor encoder (p404), then the structure of the encoder position actual value is as follows:

Table 1-707 Structure of the encoder position actual value

User data	Contents	
Actual encoder position value 1 (Gx_XIST1)	Increments per revolution	Depends on the parameter assignment of the encoder resolution. You can read this back under "Drive diagnostics section 10.2.3 Encoders (Page 102)".
	Bits in Gx_XIST1 "Shift factor"	2
	Encoder type	Rotary incremental

Example of an incremental encoder with 4096 "steps per revolution", this corresponds to 1024 "steps per revolution" with a fine resolution of 2:

Table 1-708 Structure Gx_XIST1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	S	S	S	S	S	S	S	S	S	S	F	F

M: Multiturn value (number of distinguishable revolutions)
S: Singleturn value (singleturn "steps per revolution")
F: Fine resolution

Table 1-709 Structure Gx_XIST2

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																											error				

Error code: See PROFIdrive specification
(https://mall.industry.siemens.com/mall/en/WW/Catalog/Products/10293158)

6.2.2 Encoderless / calculated

If you have set encoder (0) encoderless / calculated as encoder type, the encoder position actual value is calculated. Actual encoder position value is structured as follows.

Table 1-710 Structure of the encoder position actual value

User data	Contents	
Encoder position actual value 1 (Gx_XIST1)	Increments per revolution	Depends on the parameter assignment of the encoder resolution. You can read this back under "Drive diagnostics section 10.2.3 Encoders (Page 102)".
	Bits in Gx_XIST1 "Shift factor"	2
	Encoder type	Rotary incremental

Example of a "simulated encoder" with 4096 "steps per revolution", this corresponds to 1024 "steps per revolution" with a shift factor of 2:

Table 1-711 Structure Gx_XIST1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	M	S	S	S	S	S	S	S	S	S	S	F	F

M: Multiturn value (number of distinguishable revolutions)
S: Singleturn value (singleturn "steps per revolution")
F: Fine resolution

Commissioning the 7

The engineering of the TM Drive drive controller is integrated in STEP 7 (TIA Portal). You install it with the Hardware Support Package HSP0311. The graphic user interface supports you in the configuration, parameter assignment and commissioning of the drive functions of the TM Drive.

In this section you will find information on various topics including:

- Check before powering on for the first time
- Commissioning an TM Drive drive

⚠ CAUTION

Failure to comply with the instructions for Safety Integrated poses a risk of injury
Failure to comply with the instructions may result in serious injuries. Carefully read through the safety instructions in section Safety functions integrated in the drive (Page 37) before commissioning and before operation.

⚠ WARNING

Personal injury and property damage from the falling down of a suspended axis
If the drive system is used as suspended axis, the axis will fall down if the positive and negative poles of the power supply are interchanged during connection. An unexpected falling down of a hanging axis can result in personal injury and property damage.
Before commissioning, it must be ensured that a cross brace is fitted to hold the suspended axis in place and prevent it from falling down unexpectedly. Also ensure that the power supply is connected properly.

⚠ WARNING

Personal injury and property damage from the falling down of a suspended axis
An unexpected falling down of a hanging axis can result in personal injury and property damage

.

- When using the STO function in conjunction with suspended axes, the axis may fall down unexpectedly and cause property damage and personal injury.

NOTE

Performing tests
You must ensure the safety of your plant. You therefore need to perform a complete functional test and the necessary safety checks before the final commissioning of a plant. Also allow for any possible foreseeable errors in the tests. This avoids endangering persons or equipment during operation.

7.1 Basics

7.1.1 Engineering

You perform configuration as well as diagnostics of a TM Drive with a PG/PC or notebook (commissioning device) using the TIA Portal (Hardware Support Package HSP0311 needed).

The settings can be found in STEP 7 in the device navigation under "Ungrouped devices" > "<Name of the interface module>" > "<Name of the TM Drive>".

Overview

This drive engineering is divided into the following areas:

- Device configuration
- Online & diagnostics
- Parameters

"Device configuration" area

Contents in the "Device configuration" area of the TM Drive engineering.

- Potential group
- Basic parameters
  Define telegram, activate telegram extension
- I/O addresses

"Online & diagnostics" area

Contents in the "Online & diagnostics" area of the TM Drive engineering.

Diagnostics

- General (module information):
  Order number, firmware and hardware version, I&M data
- Diagnostic status (display of status information)
- Active messages:
  Pending faults and alarms
- Drive diagnostics
  Status bits, operating values, encoders, temperatures, inputs

Functions

- Firmware update

"Parameters" area

Contents in the "Parameters" area of the TM Drive TM engineering.

- Drive:
  Drive data record, general settings, motor, gearbox, thermal model, brake module
- Setpoint channel:
  Reference values, application limits, speed-ramp sensor
- Open-loop/closed-loop control:
  Control type, controller settings, speed controller, current controller
- Messages/monitoring
  Motor (thermal motor model), intermediate circuit voltage, braking resistor (load), power end stage (load)

7.1.2 Drive parameters

Parameter tooltips

In STEP 7 engineering of the TM Drive, all displayed drive parameters are linked with tooltips. You will find detailed information on the parameter in the tooltips, e.g. parameter name, properties, factory setting, value range, descriptions, notes and dependencies.

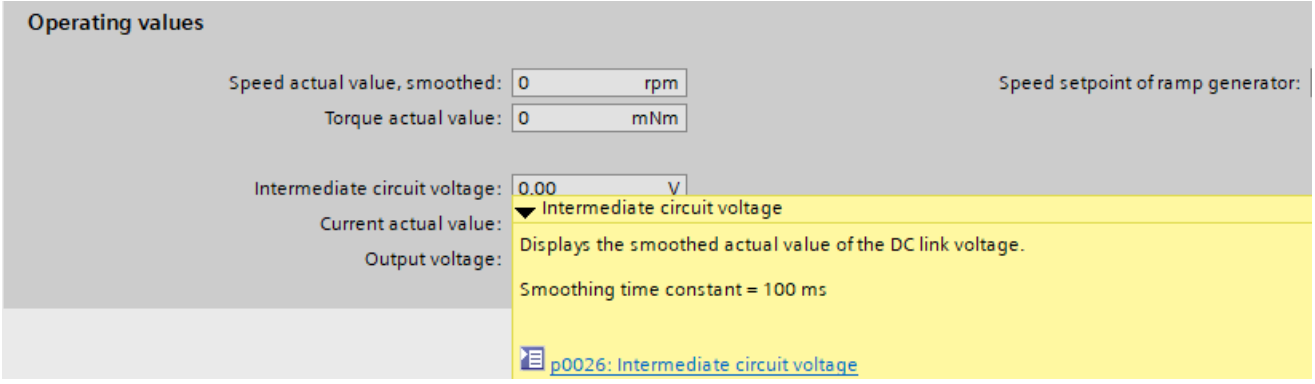

Figure 1-355 Intermediate circuit voltage tooltip

Changing a parameter

You can directly change the values of the writable adjustable parameters (p-parameters) in STEP 7.

You have the following options for this:

- You overwrite the current parameter value with the new value.
  Or
- You select a value via the drop-down list.

Invalid values are rejected.

NOTE

P-parameters cannot be changed online while the drive is in operation. In this case, the corresponding entry field is automatically disabled.

The following overview shows the display of an entry field, depending on the context and the properties of the drive parameter:

	Project (offline)	Parameter value can be changed and stored in the project.
	Project (offline)	The parameter value is write-protected.
	Project (online)	Parameter value is write-protected or disabled due to the drive status.

Parameter symbols and operator controls

The following overview explains additional symbols and operator controls in the TM Drive engineering:

	Drive value (online) could not be determined
	Bit parameter active (1-signal)
	Bit parameter inactive (0-signal)

Loading drive parameters

You can synchronize all p-parameter values of your project (offline) using the "Download to device" function.

Conditions

- When you load parameters into the device, a rotating drive automatically stops.
- After the parameters are loaded, the drive does not restart automatically. You must activate the drive once again using a new drive command.
- If you send an invalid parameter to the TM Drive, the module remains in parameter assignment mode. The drive cannot be activated until valid parameters are loaded.

"Download to device" function for drive parameters

You can use the "Download to device" function to transfer parameter values from your project (offline) to the drive (online).

Procedure

1. Select the drive in the project tree.
2. Click on "Download to device" in the menu bar.

Or

1. Select "Download to device" > "Software" in the shortcut menu.

You have transferred the current parameter values of your project to the drive.

7.1.3 Calling help information

To obtain information on parameters and alarms (messages) of the drive, open the information system via "Help" > "Show help" and search for the article number of the product.

You can also directly open the information system for a parameter or a message. To do so, click the online help link in the tooltip of a parameter or message .

7.2 Requirements for the commissioning

Requirements

- The TM Drive was installed according to the information in the following sections:
  - Wiring (Page 27)
  - Configuring (Page 54)
- The motor is installed in the drive train to be operated in accordance with the plant/device construction planning.

NOTE

Additional information concerning the requirements

You can find additional information relating to technology objects and motion control in the online help of STEP 7 under "Using technology functions" > "Motion Control".

Before powering on for the first time

Before the first power-on, check the installation and the wiring of the TM Drive.

Questions for the check

The following questions provide guidance for checking your TM Drive in the form of a checklist.

Racks

- Is the mounting rail securely mounted to the wall, in the frame or in the cabinet?
- Are the cable ducts correctly installed?
- Have the minimum clearances been observed?

Grounding and chassis concept

- Is the mounting rail connected to the protective conductor?
- Is the connection between the ground reference and ground properly established for the mounting rail?
- Has the shielding of the motor/encoder cable been applied over a large area on the device and on the motor/encoder?
- Are the required equipotential bonding cables connected with low impedance to the affected plant units?
- Are the grounding terminals correctly attached and is the motor/encoder cable correctly connected?

Module installation and wiring

- Is the TM StepDrive plugged in / installed and firmly connected or screwed according to the assembly plan and configuration with STEP 7?
- Are all connectors wired according to the circuit diagram?
- Is the PROFINET connection to the CPU and the engineering system of the STEP 7 (TIA Portal) connected?
- Is the input for Hardware STO (STO+/STO-) connected?
- Are the cables (motor connection cable, encoder cable) properly connected between the TM Drive and the motor and installed according to the guidelines?
- Is the optional digital input connected?
- Are the cables from the hardware STO (STO+/STO-) separated from the other cables, in particular from power cables?
- Have you minimized crushing hazards and short-circuits against ground connections by appropriate routing?
- Are the cables fully protected against premature aging due to continuous UV radiation?

Power supply

- Are all power supplies switched off?
- Is the power cable connector correctly wired?
- Has the connection to line voltage been made?

7.3 Procedure for commissioning the ET 200SP TM Drive

Procedure for commissioning with STEP 7

Commissioning is performed according to the steps listed below. The individual commissioning steps are optional and are to be performed as required. We recommend the following procedure for the first commissioning of a TM Drive .

Table 1-713 Commissioning procedure

Step	Procedure	Comments	See section ...
1	Configure drive data record	Use one of the following options in the "Configure drive data record" dialog under "Parameters > Drive": • Select pre-configured drive data record from list • Custom edit drive data record	Drive data sets (Page 64)
2	Define setpoint channel	Under "Setpoint channel" you configure the following: • Reference values • Application limits • Ramp generator	Setpoint channel (Page 70)
3	Set control/closed-loop control	Have the controller parameters automatically calculated using the "Speed/current controller settings" comfort function.	Controller settings (Page 75)
4	Configure intermediate circuit voltage monitoring and optionally the brake control module	• Define limits for the intermediate circuit voltage • Motor holding brake settings	Intermediate circuit voltage
5	Configure messages/monitoring	• Define warning thresholds for thermal monitoring	Messages/monitoring (Page 84)

See also

Intermediate circuit voltage (Page 80)

7.4 Drive data sets

Introduction

It is possible to connect motors from third-party motor manufacturers, provided that they meet the required conditions regarding motor, encoder system, connection technology, electrical safety, EMC etc., as described in this manual.

With the F-TM StepDrive ST, this also includes stepper motors which can be connected in a bipolar manner and which meet the boundary conditions explained in this manual.

Drive data record

The motor or drive of the TM Drive drive system is configured using a drive data set (DDS). A drive data record contains the settings and information for the following drive components:

- Motor
- Motor gear
- Thermal motor model

NOTE
The description "drive" means the combination of motor, encoder and additional built-on accessories such as a gearbox and holding brake.

Motor

You can find the settings for the motor in the "Parameters" > "Drive" > "Motor" area.

The TM Drive drive system supports stepper motors. You specify important basic data and reference data of the motor.

Observe the information and notes in the help or in the tooltips of the individual parameters.

You can also find detailed information and descriptions for the drive parameters in the Product Information (https://support.industry.siemens.com/cs/ww/en/view/109773204).

Motor encoder

The motor encoder is used for the closed-loop speed control of the drive. The encoder values are transferred to the CPU in the PROFIdrive telegram of the TM Drive, independent of the encoder type.

The following combinations are available:

Motor type: Stepper motor

- (0) No encoder / calculated
- (1) Incremental encoder (A, B, Z track)

(0) No encoder / calculated
The setting (0) encoderless / calculated is only supported in connection with a stepper motor. In this case, the rotor position is calculated and transferred to the control depending on the steps per revolution (p0408) or the steps per revolution (p0409).

(1) Incremental encoder (A, B, Z track)
When selecting the encoder type (1) incremental encoder, a 3-channel encoder with Z-track (often also referred to as I-track) can be connected.

Thermal model

The motor can be protected from thermal overload. Take section Messages/monitoring (Page 84) into consideration for this.

You define the thermal properties of the motor in the "Parameters" > "Drive" > "Thermal model" area.

7.4.1 Using the drive data set

To configure a drive, you have the following options:

- Create a user-defined drive data record and configure your motor manually.

NOTE
In the TM Drive engineering, the drive parameters can only be edited in the "Parameters" > "Drive" area if you are using a user-defined drive data set.

NOTICE

After a change of the drive data record, you must adapt or optimize the parameters for the current and speed controllers, if necessary.
See section Controller settings (Page 75).

7.4.2 Using a user-defined drive data set

Create a user-defined drive data record and configure your motor manually.

You can also use this function to edit an existing drive data record.

⚠ WARNING

Avoiding incorrect parameter assignments
Note that incorrect or modified parameter assignments can result in drive malfunctions and damage to the drive.

Procedure

To freely configure the current drive data, follow these steps:

1. Open "Parameters" > "Drive" in the context of the drive.
2. Start the configuration wizard with the "Configure drive data record..." button in the "Drive data record" area.
3. Select the "Edit drive data record by user" option.
4. Accept the configuration with "Yes".
5. Confirm that you are changing the drive data record.
6. Adjust the motor settings for your drive.

   Observe the information and notes in the help or in the tooltips of the individual parameters.

   You can also find detailed information and descriptions for the drive parameters in the Product Information (https://support.industry.siemens.com/cs/ww/en/view/109773204).

You have selected user-defined editing of the drive and adapted the settings.

Motor (Page 85)

7.4.3 Drive parameters stepper motor

Parameter number	Name	Description	Unit
Motor			
p0300	Motor type	Selection of the motor type	
p0305	Nominal current	Nominal current per coil in full step mode.	A
p0312	Hold torque	Hold torque of the stepper motor in full step mode and nominal current.	Nm
p0322	Maximum speed	Maximum speed is the mechanically permissible speed of the machine. If the speed is exceeded, the motor may be damaged.	rpm
p0372	Connection resistance	Connection resistance of a phase	Ohm
p0376	Connection inductance	Connection inductance one phase	mH
p0341	Rotor moment of inertia	The rotor moment of inertia is the mass moment of inertia of the rotor with the connecting shaft.	kgcm²
P30000	Step angle	Step angle of the stepper motor in full step mode.	-
P30001	Number of steps	The number of steps indicates the number of steps per mechanical revolution in full step mode. The value cannot be edited and is calculated from the step angle. Number of steps = 360° / step angle	-
P30014	Number of pole pairs	The number of pole pairs indicates the number of pole pairs in the motor. The value cannot be edited and is calculated from the step angle. Number of pole pairs = step angle / 4.	-
Motor gear			
P2725	Motor gear moment of inertia	Sets the motor gear moment of inertia in relation to the motor axis.	kgcm²
Thermal model			
p0611[1]	Time constant winding - environment	Setting of the thermal time constant between the winding and the environment. In nominal operation (nominal load and the ambient temperatures and installation elevation specified by the manufacturer) the limit temperature of the motor is reached after five times the time constant. Note: If the ambient conditions of the motor do not correspond to the values specified by the manufacturer, the motor must be derated. See 7.7.1 Thermal motor monitoring	s

Parameter number	Name	Description	Unit
Motor connection			
p0352	Motor cable line resistance	Input of the motor cable resistance value for outgoing and return conductor.	Ohm
p0353	Motor series inductance (=motor cable inductance)	Input of the line inductance of the outgoing and return conductor. The value can be neglected for motor connection cables < 10 m. If a series reactor is also connected between the motor and the inverter, you need to enter the inductance value as an additive to the line inductance.	mH

7.4.4 Motor encoder

Under Encoder type configuration, select the appropriate encoder type for the motor.

Encoder type configuration			
p0404	Motor encoder selection	Selection of the motor encoder	-

7.4.4.1 Encoder parameters incremental encoder and encoderless / calculated

The encoder types incremental encoder and encoderless / calculated use the same settings.

Parameter number	Name	Description	Unit
p0408	Increments per revolution	Setting of the increments per revolution or the pulses per revolution (PPR) of the motor encoder.	-
p0409	Steps per revolution	Display of the steps per revolution or counts per revolution (CPR) of the encoder. The value cannot be edited, results from the quadrature interface and is four times the value of increments per revolution (p0408).	-

Incremental encoder

With the incremental encoder, the increments per revolution must be set.

Encoderless / calculated

With the setting encoderless / calculated, the motor is moved at low speeds in the set encoder resolution steps p0408 or p0409. The encoder resolution must be at least 4 times or a multiple of the number of pole pairs of the motor. If the values are too high, the positioning accuracy can fluctuate depending on the motor quality (ripple).

Encoderless / calculated with stepper motor

With the setting encoderless / calculated with stepper motor, the motor moves at low speeds in the set encoder resolution steps p0408 or p0409. The encoder resolution (increments per revolution (p0408)) must be at least 4 times or a multiple of the number of pole pairs of the motor. If the values are too high, the positioning accuracy can fluctuate depending on the motor quality (ripple).

It is recommended to set every integer multiple of the motor full step angle (p30001); a step division into partial steps (1/2, ¼, 1/8 ...) is not necessary but can improve the positioning accuracy, especially with multi-pole stepper motors. The following table shows how the corresponding step subdivisions are determined for this.

Table 1-714 Determination of the step subdivisions

Step resolution	**Steps per revolution (p0409)**	**Increments per revolution (p0408)**	**Example: Step angle = 1.8 °; Number of steps = 200; Number of pole pairs = 50**	
			Steps per revolution (p0409)	**Increments per revolution (p0408)**
Full step	1 x number of steps (p30001)	1/4 x number of steps (p30001)	200	50
½ Half step	2 x number of steps (p30001)	2/4 x number of steps (p30001)	400	100
¼ quarter step	4 x number of steps (p30001)	4/4 x number of steps (p30001)	800	200
1/8 eighth step	8 x number of steps (p30001)	8/4 x number of steps (p30001)	1600	400
.	.	.	.	.
1/64 sixty-fourth of a step	64 x number of steps (p30001)	64/4 x number of steps (p30001)	12800	3200

7.4.4.2 Assign encoder counting direction parameters

With encoder type (1) incremental encoder, it may be necessary to invert the counting direction of the encoder by setting the Swap encoder counting direction parameter p0410. With incremental encoders, this may be necessary, for example, if the A and B tracks were swapped when the encoder was connected.

The following is defined as the positive direction of rotation of the encoder.

Incremental encoder:

The positive direction of rotation for an incremental encoder is defined as follows:

If the positive A edge comes before the positive B edge in terms of time, the motor with a view of the motor shaft rotates clockwise in the positive direction of rotation.

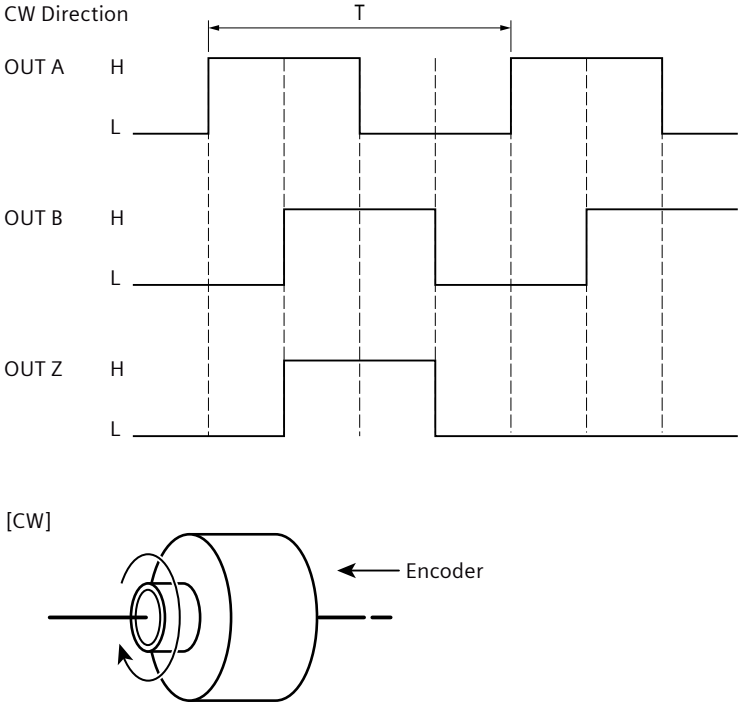

Figure 1-356 Direction of rotation for the incremental encoder

Table 1-715 **Encoder values**

Parameter number	Name	Description	Unit
p0410	Swap encoder counting direction	This setting negates the counting direction of the encoder.	-

7.5 Setpoint channel

Overview

Setpoints from the respective setpoint source are prepared for the motor control in the setpoint channel of the drive.

You specify the setpoints via the drive telegrams to PROFIdrive.

You can find the settings for the setpoint channel in the context of the drive under "Parameters" > "Setpoint channel".

Under "Setpoint channel" you configure the following:

- Reference values (Page 71)
- Application limits (Page 72)
- Ramp generator (Page 75)

The figure below shows the processing of the speed setpoint in the drive controller.

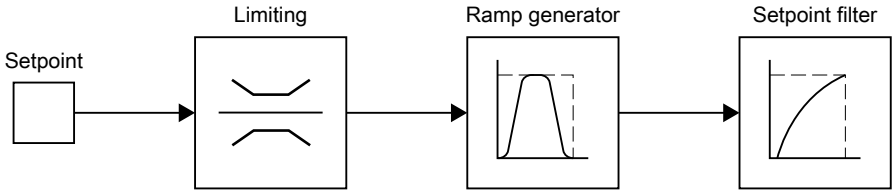

Figure 1-357 Setpoint channel

The speed setpoint from the drive telegram is limited in the setpoint channel according to the specified values, see section Reference values (Page 71).

The limited speed setpoint is fed to the ramp generator as an input signal, see section Application limits (Page 72).

The output of the ramp generator is fed to the speed controller via the speed setpoint filter, see section Ramp generator (Page 75).

7.5.1 Reference values

The physical variable speed is transmitted in the drive telegrams as a reference values.

- Speeds are normalized to the reference speed (p2000) in the drive telegram.

Here, p2000 is decisive as the reference value (telegram content = 4000 hex or 4000 0000 hex for double words if the input variable has the value p2000).

Example of the normalization of the speed:

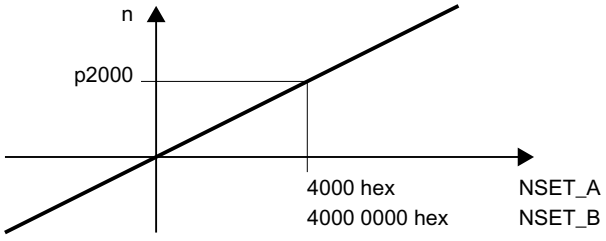

Figure 1-358 Example of normalization of the speed

NOTE

The speed and torque are specified in the drive telegram as a percentage of the reference speed in the range -200% to 200%.
Therefore, set the reference variables in such a way that the desired maximum value falls within the value range of the control from -200% to +200%.

Procedure

1. Configure the reference value in the context of the drive under:
   "Parameters" > "Setpoint channel" > "Reference values".

⚠ WARNING

Uncontrolled drive behavior
Note that the specification of reference values in the CPU and the drive must always match. Otherwise, uncontrolled drive behavior and rotating of the motor might occur. We therefore recommend that commissioning of the drive and thus specification of the references values be completed first before you commission the CPU and, for example, a technology object.

7.5.2 Application limits

In the "Parameters" > "Setpoint channel" > "Application values" area, you can configure limitations for the speed and torque of the drive if required and adapt them to the requirements of your mechanical system.

Speed limiting

If you need a direction-dependent speed limiting, you can define speed limits for each direction.

Torque limiting

You can specify the torque limiting as an absolute value. The limiting acts both when motoring as well as generating.

⚠ WARNING

Accuracy of torque limitation
The function of the torque limitation is not safe torque limiting in the sense of functional safety. The torque limitation refers to the calculated internal (air gap) torque of the motor. The internal torque is a calculated value from the internal motor constant and motor current. The torque output at the shaft is the internal torque minus friction and iron losses.
Due to the following influencing factors, the deviation of the torque calculation can be in the two-digit percentage range:

- Motor parameters
- Current measurement accuracy
- Temperature dependence
- Speed and load dependence on friction, iron and additional losses of the motor

⚠ WARNING

Danger to life due to uncontrolled movement of the drive as a result of incorrect parameter assignment
Incorrect parameterization of the torque limiting can result in uncontrolled movement of the drives if there is no counter-torque, and cause death or serious injury.
Ensure the correct parameterization.

Standstill detection

Set the speed threshold for the motor standstill detection (p1226). For braking with OFF1 or OFF3, the zero speed is detected when this threshold is fallen below.

NOTE
A zero point calibration is only started if the speed falls below the speed threshold for standstill detection (p1226).

NOTE
A switch-on process of the drive via STW1 is always delayed until the speed has fallen below the speed threshold for standstill detection (p1226).
As long as the speed is still above this speed threshold, warning 2007 is issued. This can be the case, for example, if the motor shaft is driven externally.
If the switch-on command is still set despite this warning, the drive is switched on and the specified setpoint speed is adopted as soon as the speed threshold for standstill detection has been undershot.

Speed threshold values for message

Also specify the speed threshold values for the following messages of the drive status word:

- "Speed threshold 1" (p2141)
  If the speed exceeds the threshold value, bit 10 is set as feedback in ZSW 1
- "Speed threshold 4" (p2163)
  As long as the speed deviation lies within the tolerance range, bit 8 in ZSW1 is set as feedback

- "On delay time" (p2167)
  Setting the switch-on delay time for the message "Speed setpoint/actual deviation within tolerance" (see also p2163)

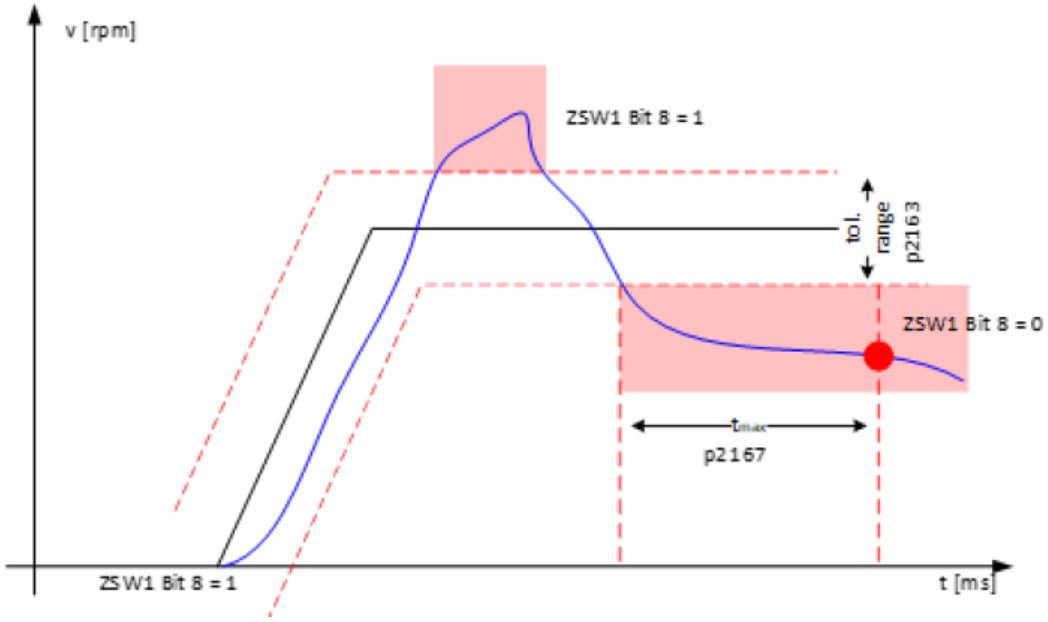

Figure 1-359 Sets the ON-delay time (p2167) and the speed threshold value 4 (p2163)

End stop detection and step loss detection with the stepper motor

If an incremental encoder and the control type [103] controlled (I = const.) are used with a stepper motor, end stop detection or step loss detection can be implemented using bit 8 in the ZSW1. The "speed threshold value 4" parameters (p2163) and the "On delay" (p2167) can be used to set the detection tolerance range.

7.5.3 Ramp generator

The TM Drive uses the speed ramp generator type "Basic ramp-function generator" p1115[0].

Speed ramp generator

The speed ramp generator is used to limit the acceleration at sudden setpoint changes and helps to prevent drive train shock loads.

An acceleration ramp and a deceleration ramp can be set independently with the ramp-up time and ramp-down time. This enables a controlled transition at setpoint changes.

The reference value for calculating the ramps from the ramp-up and ramp-down times of the speed ramp generator is the speed specified in the "Speed" dialog box.

NOTE

On principle, the ramp-up and ramp-down times of the ramp generator in the setpoint channel of the drive should be set only so fast that, in case of accelerations and decelerations, the motor speed can track the setpoint without damaging the machine. This ensures optimal functioning of the speed controller precontrol.
Especially with the control type [103] controlled (I = const.), the ramp-up and ramp-down times must not be set too steep, as otherwise the rotor cannot follow the controlled rotating field.

Procedure

You enter the settings for the speed ramp generator under "Parameters" > "Parameters" > "Ramp generator":

- Rampup time
- Ramp-down time
- Speed

NOTE

The TM Drive uses the three values entered to form the values relative to 10,000 rpm "Speed ramp generator ramp-up time" (p1120) and "Speed ramp generator ramp-down time" (p1121).
When using the GSD file, directly enter the values relative to 10,000 rpm.

7.6 Controller settings

Under "Parameters" > "Open-loop/closed-loop control", you specify the type of control, the general controller settings and the settings for speed and current controllers.

Control type

The open-loop / closed-loop control type can be selected depending on the motor type.

Motor type: Stepper motor

- [103] Controlled (I = constant)

7.6.1 Controlled (I = const.)

General controller settings

In the controlled control mode (I = const.), the speed is controlled by an angle adjuster. Depending on the respective speed, the control angle of the motor is switched faster or slower in quantified steps in the desired direction of rotation.

Speed controller
It is advisable to specify speed changes along an up and down ramp, as otherwise the drive is not able to follow the specified speed.

The internal ramp-function generator (section 7.5.3) can be used as speed ramp.

Current controller
With the control mode controlled (I = const.), the current controller applies a constant current value to the motor. The motor current is specified using two current values for travel mode (p1738 run current) and standstill mode (p1739 stop current). The current values are effective values.

- Run current p1738
- Stop current p1739

The stop current is impressed on the motor while it is at a standstill and ensures a corresponding holding torque. If a speed not equal to 0 1/min is specified, the current setpoint is switched from stop current to run current. If the motor comes to a standstill from a movement, the setpoint current is switched from run current to stop current after 1 s.

In many applications, the stop current can be reduced during standstill. As a result, energy can be saved during the stop phases and the motor is subjected to less thermal stress.

For reasons of protection, the run and stop current may not be greater than 1.5 times the rated motor current (p0305).

NOTE
With the closed-loop control mode (I = const.), no distinction is made between the magnetic longitudinal inductance (for Id) and transverse inductance (for Iq) of the motor. There are therefore only current controller values for the total current.

Enter the general controller settings under "Parameters" > "Control/closed-loop control" > "Controller settings".

- Moment of inertia load p1398
- Speed setpoint filter p1416

Additional important settings
The speed and current controllers can be determined in the best possible way if, in addition to the properties of the electric motor, you also specify the properties of the gearbox and the connecting cable.

- Motor cable line resistance p0352
- Motor cable/series inductance p0353
- Motor gear moment of inertia p2725

Current controller

You can either set the current controller manually or have the controller settings calculated by STEP 7.

Having controller settings calculated
To have the controller settings of STEP 7 calculated, proceed as follows:

1. Click on the "Calculate current controller settings" button in the Controller settings area. The "Controller calculation" window opens. The window displays the appropriate controller parameters.
2. Apply the controller settings by clicking the "Apply" button.

You can then continue to change the calculated controller settings manually.

Setting the controller settings manually

Enter the settings for the current controller under "Parameters" > "Control/closed-loop control" > "Current controller".

- Proportional gain
- Integral action time

NOTE
If you manually set the controller parameters to inappropriate values, the drive system can be damaged.
Make changes to the controller settings in small steps. Keep checking the behavior of the drive system until you have found a satisfactory setting.

7.6.2 OFF responses

OFF1 (Switch off)

By resetting bit 0 in STW1 (On), you activate OFF1 and the drive is braked to 0 in a speed-controlled manner according to the ramp generator ramp-down (p1120, p1121). If the actual speed falls below the value of the "Standstill detection" parameter (p1226) or if a timeout is detected, the pulses are blocked after the motor brake closing time p1217 has expired. "Switching on inhibited" is activated.

Timeout
With OFF1, the time is calculated in which the drive should normally stop from twice the reference speed. If the drive does not stop within 2 times of this time, the drive is de-energized and it coasts down.

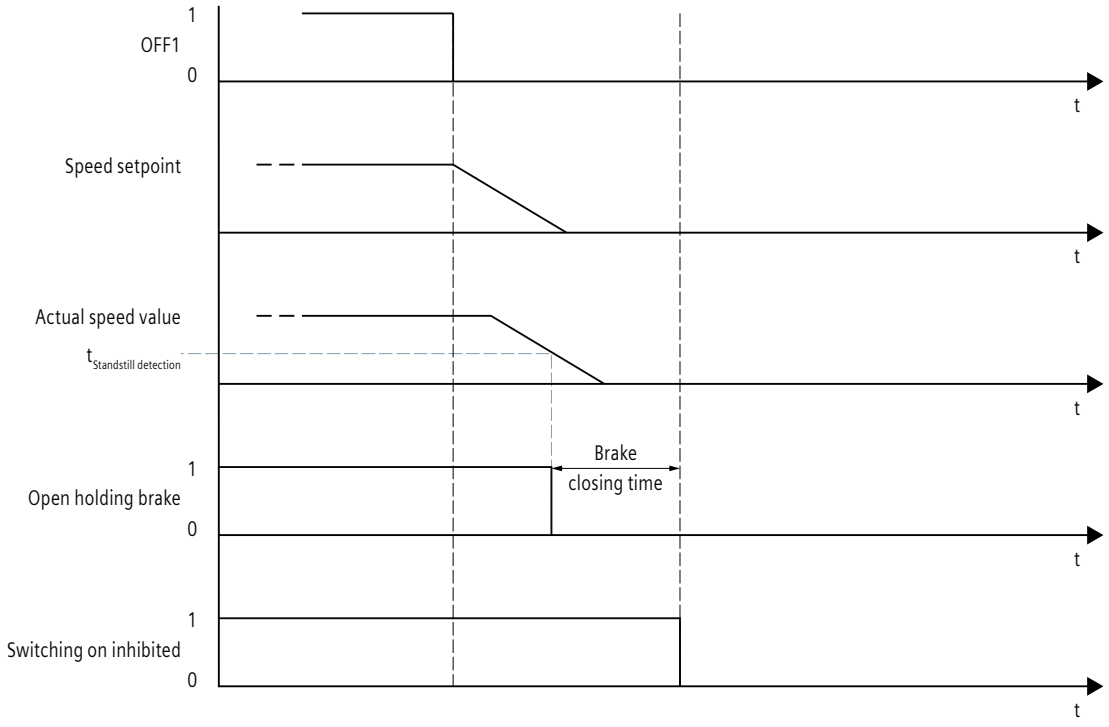

Figure 1-360 OFF1 sequence diagram

OFF2 (Coast down)

You activate OFF2 by resetting bit 1 in STW1 (NoCoastStop). The pulses are immediately canceled, any parameterized motor holding brake is applied and the drive coasts down. "Switching on inhibited" is activated.

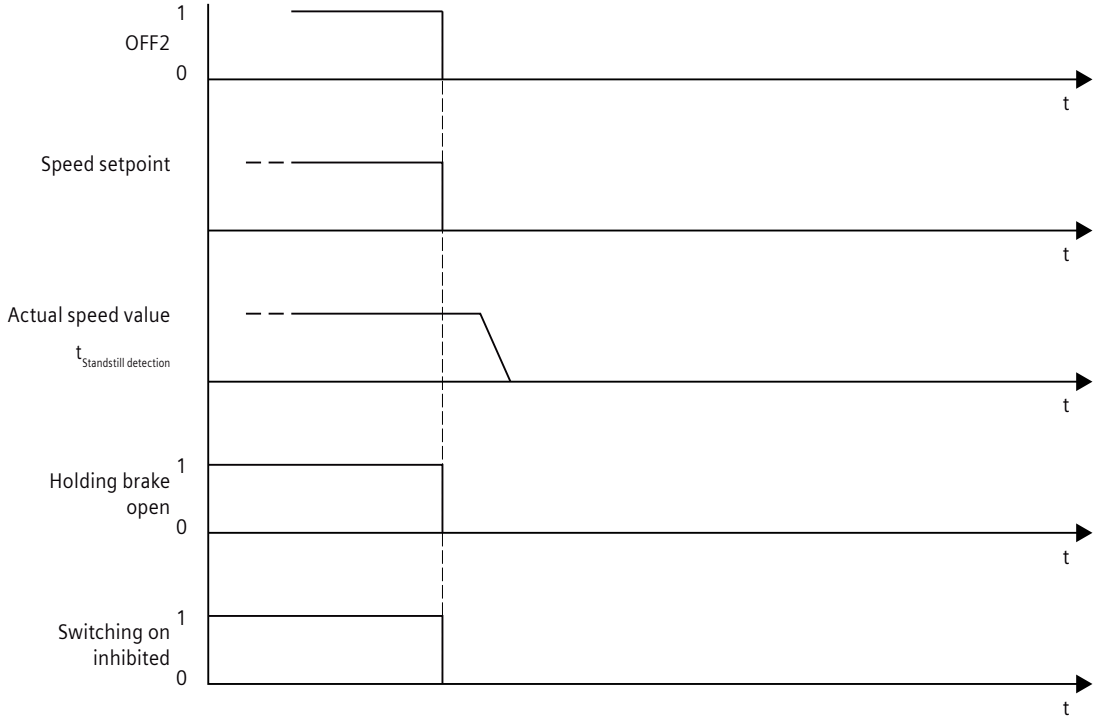

Figure 1-361 OFF2 sequence diagram

OFF3 (QuickStop)

You trigger a quick stop (OFF3) by resetting bit 2 in STW1 (NoQuickStop). The rapid stop takes into account the ramp-down time configured in the HSP ("Parameter" > "Setpoint channel" > "Speed – Ramp generator"). After the standstill is detected or the monitoring time has elapsed, any configured motor holding brake is closed and the pulses are deleted after the motor holding brake closing time p1217 has expired. "Switching on inhibited" is activated.

NOTE

NOTE on rapid stop (OFF3)

You trigger a quick stop (OFF3) by resetting bit 2 in STW1 (NoQuickStop). The rapid stop takes into account the ramp-down time configured in the HSP ("Parameter" > "Setpoint channel" > "Speed – Ramp generator"). The rapid stop is monitored for time and causes the motor to be energized after 6 seconds at the latest.

Timeout
The rapid stop is monitored for time and causes the motor to be energized after 6 seconds at the latest.

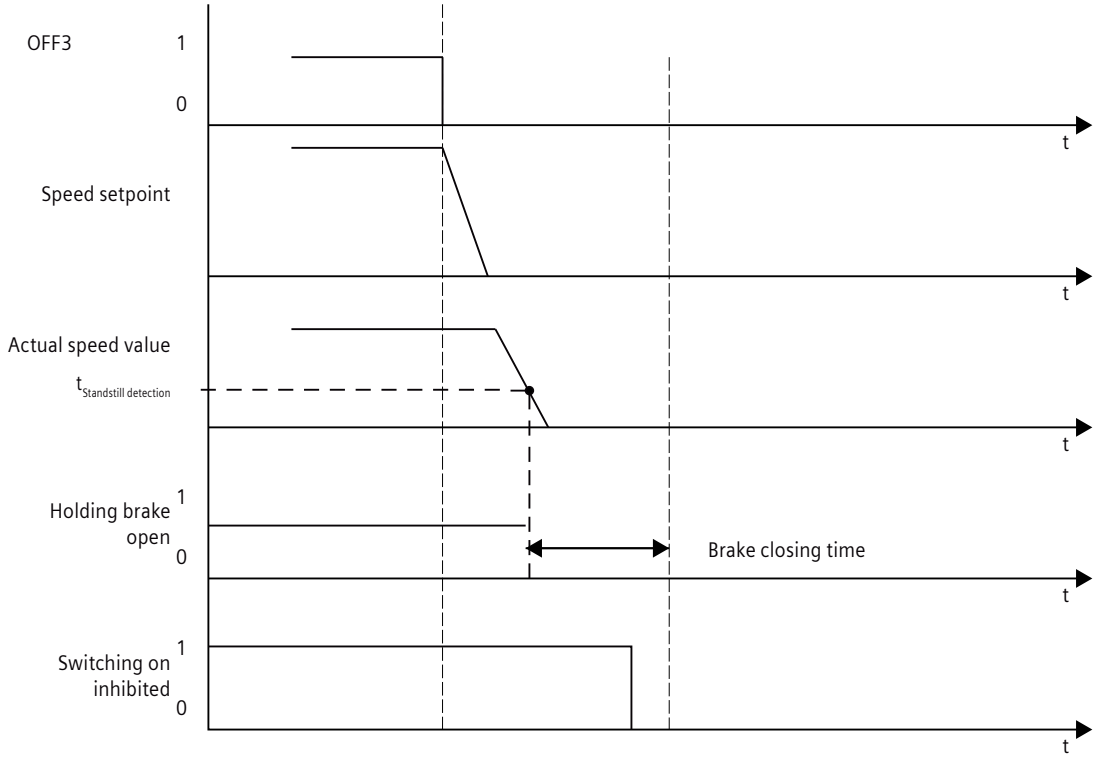

Figure 1-362 OFF3 sequence diagram

Prioritization

The OFF responses are prioritized as follows:

- OFF2 (coast down) > OFF1 (switch off)
- OFF3 (QuickStop) > OFF1 (Switch off)

7.7 Intermediate circuit voltage

The TM Drive system cyclically monitors the intermediate circuit voltage. The limit values can be set under "Alarms/Monitoring".

The following options can be selected under "Intermediate circuit voltage":

- Minimum value of the intermediate circuit voltage (p0390)
- Maximum value of the intermediate circuit voltage (p0391)

If the limit values are exceeded or not reached, the motor control is switched off. If a intermediate circuit voltage close to the limit values is detected, a corresponding warning is issued.

7.8 Brake module

The drive system TM Drive can externally control a motor holding brake via the process image using a DQ or relay module.

The following options for the stepper motor type can be selected under "Brake module":

- [0] No function
- [4] Motor holding brake externally via the process image

If stepper motors are selected, the brake chopper function cannot be used. Should a brake chopper nevertheless be required, you can install another TM Drive module with brake chopper functionality in the same potential group and connect the brake resistor there and parameterize the brake chopper.

7.8.1 External motor holding brake

The motor holding brake can be used when the drive system is disabled (e.g. when the power supply to the drive system is switched off) to prevent unwanted movements of the suspended load (e.g. falling due to gravity). The motor can move by its own weight or an external force even if the motor power supply is interrupted.

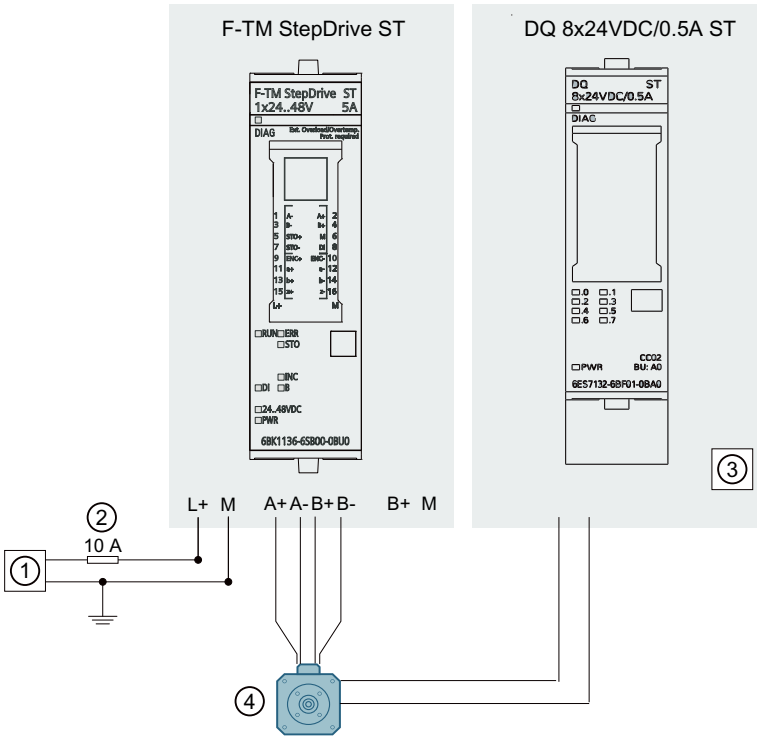
NOTE

- Use this brake only for "holding", which means to maintain the standstill. Do not use it for "braking", which means to stop the moving load. Use the holding brake only to hold a motor at a standstill.
- The holding brake is enabled when the motor is switched off.

If the motor holding brake function is enabled, you must configure the following settings in the area "Parameters" > "Drive" > "Brake module".

Adjust the opening and closing times of the motor holding brake:

- Motor holding brake opening time (p1216)
- Motor holding brake closing time (p1217)



For the closing and opening times, delay times of relays may have to be taken into account and added to the times of the motor holding brake.

p1216 = motor brake opening time + relay opening time

p1217 = motor brake closing time + relay closing time

If the motor holding brake is parameterized, the drive takes the delay times into account and accordingly sets bit 12 in the process image ZSW1. This bit can be used to control a motor holding brake, for example with a DQ module or relay module.

RC circuit of a TM Drive with DQ module and motor holding brake

① Power supply unit
② Protective device
③ DQ module
④ Motor with holding brake

Figure 1-363 RC circuit of a TM Drive with DQ module and motor holding brake

Braking sequence

The sequence diagram shows an example of the behavior of the drive with OFF1.

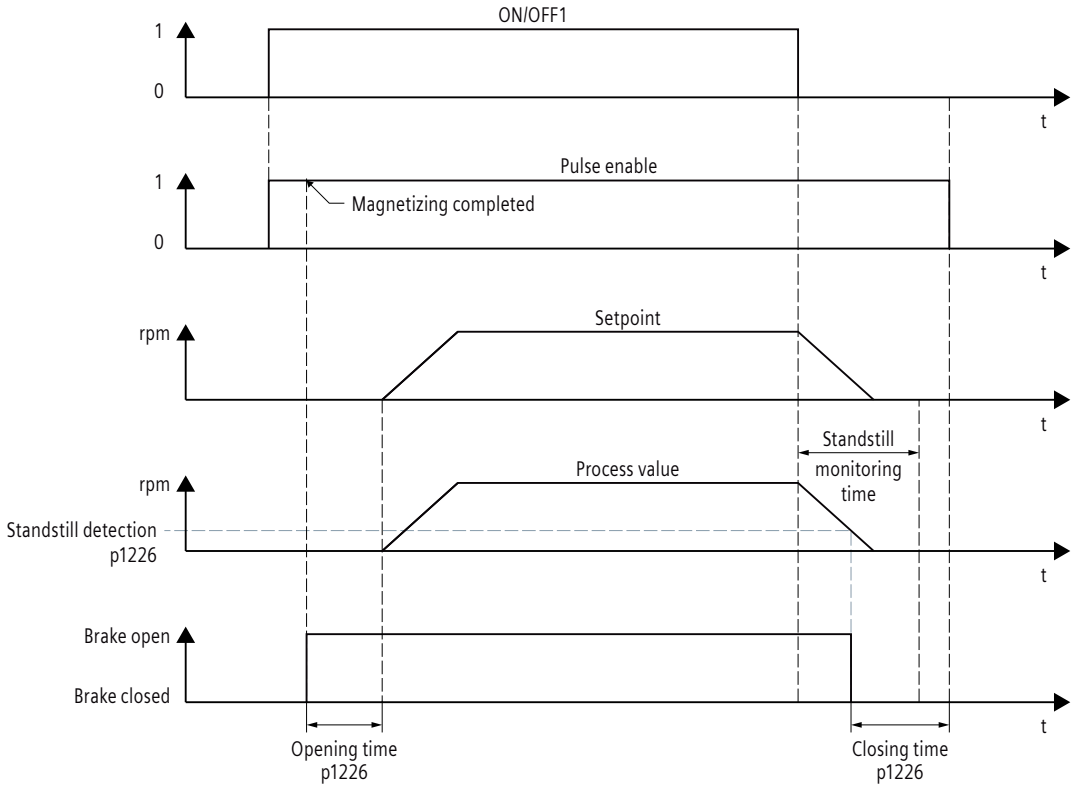


Figure 1-364 Braking sequence

The magnetizing time is calculated automatically depending on the motor parameters.

The influence of the motor holding brake on the OFF reactions is described in section 7.6.4 (Page 77) OFF reaction.

NOTICE
Improper use Improper use of the motor brake will shorten its service life. The motor brake is only intended for holding purposes. Frequent emergency stops with the motor brake shorten its service life. Unless absolutely necessary, do not use the motor brake as emergency stop.

7.9 Messages/monitoring

Thermal monitoring

The purpose of thermal monitoring is to detect critical states. Parameterizable warning thresholds are available that allow further operation of the drive (e.g. with reduced power) and prevent an immediate shutdown. However, the parameter assignment options are only interventions below the shutdown thresholds.

The following thermal monitoring options are available:

- Motor
  - Motor I^2t model
- Power end stage
  - Overload protection
  - Temperature sensor

When an overload is detected by one of these monitoring functions, a warning is output first. The respective warning thresholds (p0291) are parameterizable. The current status of the monitoring functions is displayed. If an alarm or fault limit is exceeded, the "Temperature monitoring" message is sent.

NOTE

All alarm and fault limits are provided with a corresponding hysteresis. The corresponding alarm or fault messages therefore remain until the threshold including hysteresis has been fallen below.

NOTE

Motor monitoring

The thermal motor resistance utilization is a calculated value. The values are not saved. After a power reset, the values only match again after a sufficiently long cooling time.

Operating temperature

Note that the specified ambient temperature range for the drive must always be adhered to, see section Technical specifications (Page 105).

7.9.1 Motor

Thermal motor monitoring

The thermal motor monitoring is performed using a configurable I^2t temperature model.

⚠ WARNING

Thermal motor utilization cannot be immediately determined after initialization
The thermal model is reinitialized after changing the drive data record and when switching on the device.
After initialization, the thermal motor utilization cannot be immediately determined as the model must first settle. As a consequence, an initial utilization of 50 % is used as basis. The settling phase duration depends on the given thermal time constants; the accuracy depends on to what extent the specific installation situation deviates from the model.
During the settling time it is possible that the set alarm and/or fault threshold is reached with some delay. For the installation situation simulated in the model, a comparatively unfavorable installation was selected so that generally deviations occur on the safe side.

You can define the warning threshold under Parameters > Messages/monitoring > Motor relative to the respective shutdown threshold.

Procedure

1. Open the "Motor" area in the context of the drive under "Parameters" > "Messages/monitoring".
2. Configure the warning threshold p0291[1].

Motor I^2t model

The I^2t monitoring operates with the relative motor power loss, and in addition to the nominal motor current (p0305) as reference value, only requires the thermal time constant winding - environment (p0611[0]) to calculate the limiting integral. The 100 % shutdown threshold corresponds to the maximum continuous power loss of the motor, i.e. to the square of the nominal motor current (p0305).

⚠ WARNING

Compliance with the ambient conditions specified by the motor manufacturer
The motor may only be operated in ambient conditions such as ambient temperature, installation elevation, etc. as specified by the manufacturer.
If the ambient conditions of the motor do not correspond to the values specified by the manufacturer, the motor must be derated. The derating behavior and the resulting lower motor performance data must be obtained from the motor manufacturer and adjusted accordingly in the motor parameters of the TM Drive.
If the motor is used outside its specification, the thermal model does not provide sufficient protection.

7.9.2 Power end stage

Thermal monitoring of power end stage

The power end stage is monitored with a temperature sensor. You can specify the warning threshold (p0291[1]) relative to the shutdown threshold "System maximum temperature power end stage".

Procedure

1. Open the "Power end stage" area in the context of the drive under "Parameters" > "Messages/monitoring".
2. Configure the warning threshold p0291[1].

Besides the temperature monitoring, the current load is also monitored. The current load of the power unit is decisive for the temperature rise. The relative load of the power end stage is calculated based on the square of the output current according to the I^2t method.

Automatic overload limiting

The TM Drive is overload-capable. The load of the power end stage is automatically limited by the drive.

The maximum overload time $t_{overload}$ is calculated depending on the temperature of the power end stage T_{PU}. When operating with cyclic overload, the rated power is not exceeded the by the time-averaged power (rms).

Stepper motor

With a stepper motor, a double overload of the rated current I_n cyclic for a duration of $t_{overload}$ = 3 s with a subsequent recovery time of 17 s at T_{PU} = 20 °C is possible. At T_{PU} = 80 °C, the overload time $t_{overload} \approx 0.75$ s.

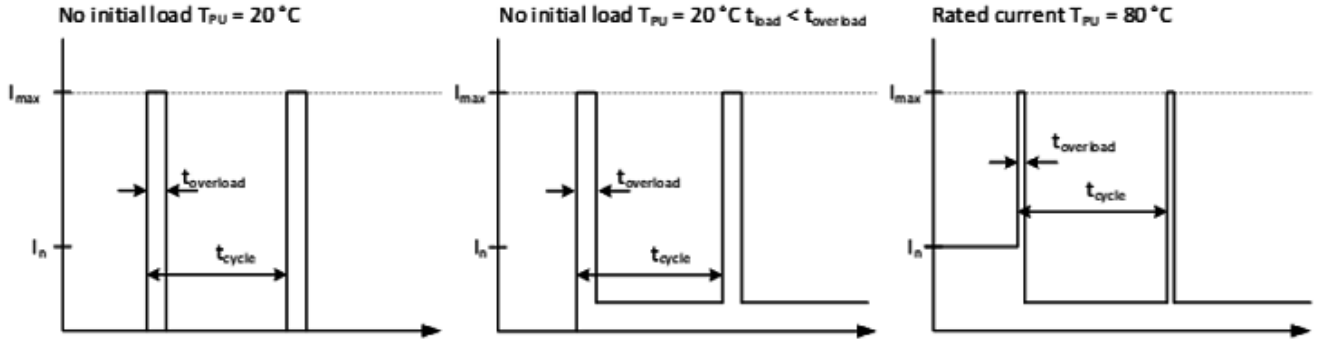

Figure 1-365 Overload behavior of TM Drive

Note the information on derating as a function of environmental conditions (e.g. temperature, mounting position) in section Derating of the ET 200SP TM Drive (Page 108).

NOTE

Overload capability of the power unit

Operation with a peak current of 10 A is possible temporarily if the average RMS value of the output current does not exceed the rated current of the power unit up to 5 A.

7.9.3 Intermediate circuit voltage

Monitoring of the intermediate circuit voltage

The energy recovery in the power supply cannot be suppressed. Energy is fed back when the drive brakes and the braking chopper is not connected and configured. The energy recovery results in an increase of the intermediate circuit voltage.

You can set the limits for the intermediate circuit voltage within the permissible values.

If the limits are exceeded, the module switches off. Before the module is switched off, a warning (limit - 5%) indicates that the limit has almost been exceeded. The user is responsible for ensuring compliance with the permissible voltage limits.

Procedure

1. Open the "Intermediate circuit voltage" area in the context of the drive under "Parameters" > "Messages/monitoring".
2. Configure the minimum value (p0390) and the maximum value (p0391).

⚠ WARNING

Operation above the voltage setting range
Under the given application conditions, ensure that the motor is not operated above the voltage setting range by selecting the appropriate motor and gear unit. Otherwise, the intermediate voltage may increase when the control is inactive via 60 V DC.

Programming

8

TM Drive does not have its own control panel. A user program is required to control the motion sequences.

You have the following options for controlling the motion sequences in the user program:

- Control via the process image (Page 88)
- Control via the SINA_SPEED (Page 94) instruction
- Control with a technology object (Page 95)

8.1 Controlling TM Drive via the process image

Structure of the I/O addresses

The structure of the input addresses of the TM Drive depends on the configured communication telegram and the telegram extension.

The structure of the output addresses of the TM Drive depends on the configured communication telegram.

Standard telegram 1 Structure I/O addresses

Inputs

Bool	Data type	Offset
Status word 1	**Structure**	**0.0**

Basic procedure in STEP 7

1. In the project tree, create PLC data types in the CPU 2 with the appropriate structure for your configuration:
   - PLC data type for the structure of the input data (depending on PROFIdrive telegram type and telegram extension)
   - PLC data type for the structure of the output data (depending on PROFIdrive telegram type and telegram extension)
2. Create a tag from each type of the PLC data type in a tag table.
3. Assign the addresses for the tag according to the configured I/O addresses of the TM Drive.
4. Control the TM Drive by setting outputs bit-by-bit. A description of how to set the outputs to control the TM Drive can be found in the PROFIdrive standard.
   You can find the current PROFIdrive specification under (https://www.profibus.com/).

8.2 Controlling a TM Drive via the instruction SINA_SPEED

Control with the SINA_SPEED instruction

For controlling the TM Drive, you can also use the SINA-SPEED instruction from the "DriveLib" block library.

The SINA_SPEED block only works with the standard telegram 1. The telegram extension may have to be disabled. See Communication telegrams.

The "DriveLib" block library can be downloaded from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109475044).

See also

Communication telegrams (Page 55)

8.3 Controlling TM Drive with a technology object

Control with a technology object

You can also use a technology object, for example "Speed-controlled axis" or "Positioning axis", to control the TM Drive.

Note that the TM Drive does not have an integrated positioning functionality and only supports speed operation.

Procedure

1. Create, for example, a "Speed axis" technology object in the CPU in the project tree in STEP 7.
2. Open the technology object.
3. Select "TM Drive" under "Configuration" > "Hardware interface" > "Drive".
4. Reference the technology object in the user program using the Motion Control technology instructions, e.g. "MC-Power".

NOTE

We do not recommend using the "Encoder calibration at every startup" option in conjunction with positioning technology objects (positioning axis). The calibration process can lead to undesired behavior of the drive axis.

Additional information

You can find more information about the technology objects and technology instructions in the online help of STEP 7.

Maintenance

9

9.1 Firmware update

Firmware update

A firmware update is possible via PROFINET.

See SIMATIC ET200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293).

9.2 Stop responses

Overview of the stop responses

Faults with safety functions and violation of limits can trigger the following stop responses:

- "Hardware STO"

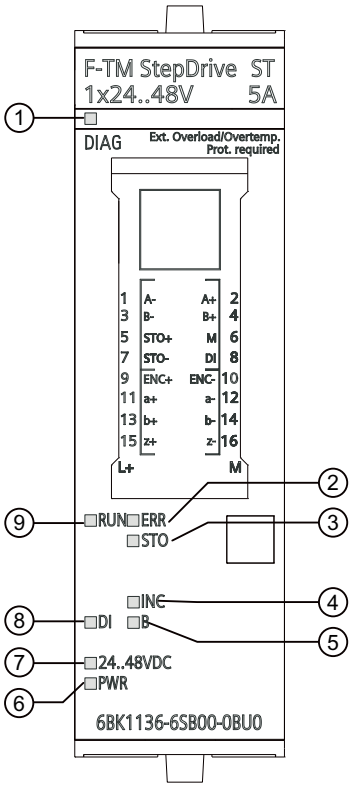
  "Safe Torque Off" (STO) corresponds to Stop Category 0 in accordance with EN 60204-1. With "Safe Torque Off" (STO), the motor is switched directly to zero torque. A motor at standstill cannot be started again accidentally. A moving motor coasts to standstill.

Table 1-716 Overview of stop responses

Stop response	Triggered ...	Action	Effect
STO	At least one signal STO+/STO- is interrupted.	Motor controllers interrupted	Drive coasts down

After the drive has been stopped, restart it with PROFIdrive.

The faults and warnings are described in the appendix Active messages (Page 101).



Interrupts, error messages and diagnostics and system alarms

10

10.1 Status and error displays

LED display

The figure below shows the LEDs on the TM Drive.

① DIAG (red/green)
② ERR (red)
③ STO (yellow)
Display not safety-related
④ INC (green)
⑤ B (green)
⑥ PWR (green)
⑦ 24..48V (green)
⑧ DI (green)
⑨ RUN (green)

Figure 1-366 LED display on F-TM StepDrive

Meaning of the LED displays

The following tables contain the meanings of the status and error displays.

DIAG LED

Table 1-717 DIAG status and error display

DIAG LED	Meaning	
Off	Backplane bus supply of the ET 200SP not OK	
Flashing	Module parameters not assigned	
On	Module parameters assigned and no module diagnostics	
Flashing	0.5 Hz (slow)	Module parameters assigned and module diagnostics There is a fault. You can find detailed information via "Online & Diagnostics" > "Diagnostics" > "Active messages" or in the section Active messages (Page 101).
	1 Hz (normal)	
	2 Hz (fast)	

RUN LED

Table 1-718 RUN status and error display

RUN LED	Meaning	
Off	Device is not yet ready for operation	
On	Device is ready for operation and error-free	
Flashing	0.5 Hz (slow)	Device is performing self-test during power-up
	1 Hz (normal)	Device performs a firmware update
	2 Hz (fast)	Device has detected a parameterization error

ERR LED

Table 1-719 ERR status and error display

ERR LED	Meaning
Off	No fault
On	Device has a fault and needs to be restarted. This corresponds to a serious device error or the loaded firmware cannot be operated on this device version.

DI LED

Table 1-720 DI status and error display

DI LED	Meaning
Off	Input is inactive
On	Input is active

B LED

Table 1-721 B status and error display

B LED	Meaning
■ On	The motor holding brake is open / information about the process image was set

STO LED

Table 1-722 STO status and error display

STO LED	Meaning
■ On	Drive ready, switch connected correctly and STO not requested
☼ flashes (0.5 Hz)	STO requested (motor is disconnected from power)

INC LED

Table 1-723 Status and error display INC (encoder)

INC LED	Meaning
■ On	Incremental speed encoder was assigned parameters/activated
☼ Flashes (2 Hz)	Incremental speed encoder has a connection problem (A/B and/or Z track not connected)

24..48V LED

Table 1-724 24..48V status and error display

24..48V LED	Meaning
□ Off	DC link voltage outside the configured limits
■ On	DC link voltage within the configured limits (is OK)
☼ flashes (0.5 Hz)	DC link voltage shortly before the interference threshold

PWR LEDs

Table 1-725 PWR status and error display

PWR LED	Meaning
□ Off	Logic component supply of the converter is missing
■ On	Logic component supply of the converter is OK

10.2 Diagnostics

10.2.1 Diagnostics overview of the TM Drive

Diagnostic view of the CPU and its associated I/O

If you go online to the CPU and establish an online connection via the CPU to the TM Drive, this occurs within the project context.

Procedure

To display the diagnostic information for the TM Drive, follow these steps.

1. Select the TM Drive in the project tree, for example under "Ungrouped devices".
2. Double-click "Online & diagnostics".
   The "Diagnostics - General" window appears.
3. Navigate to the required information.

The diagnostic window is divided into the following diagnostic groups:

- **General**
  The general diagnostic information is displayed for:
  - Module
  - Module information
  - Manufacturer information
- **Diagnostics status**
  "Diagnostics status" shows the current diagnostics status of the TM Drive.
- **Active messages**
  "Active messages" displays the currently pending alarms and faults in the TM Drive module.
- **Drive diagnostics**
  The current diagnostic information of the drive is displayed for:
  - Status bits
  - Operating values
  - Encoders
  - Temperatures
  - Inputs

10.2.2 Active messages

Pending faults and alarms

"Active messages" shows the currently pending faults and alarms in the TM Drive. Faults must be acknowledged after the cause has been corrected.

Procedure

To display the active messages, follow these steps:

1. Select the TM Drive in the project tree and go to "Online & diagnostics".
2. In the "Diagnostics" folder, select the "Active messages" area.

Faults and alarms

NOTE
In open-loop control operation, no diagnostics of the encoder signals is performed (see fault numbers 1045 and 1046)

The TM Drive supports the following faults.

Fault number	Description	S7 diagnostics alarm
1000	Overvoltage in the DC link	Undervoltage
1001	Undervoltage in the DC link	Overvoltage
1003	Shutdown due to overcurrent switch-off of a phase	Overload
1032	Temperature measured values implausible	Error
1035	Permitted temperature at the motor end stage exceeded	Overtemperature
1036	Permitted temperature at the motor winding exceeded	Overtemperature
1042	Fail-safe shutdown path (STO) defective	Safety-related shutdown
1043	Permissible temperature of the motor electronics exceeded	Overtemperature
1045	The connection to the A/B track of the incremental speed encoder is interrupted.	Wire break
1046	The connection to the Z track of the incremental speed encoder is interrupted.	Wire break
1047	An unsupported PROFIdrive speed encoder function was requested.	-
1050	A ramp/quick stop (OFF1/OFF3) could not be performed due to a timeout.	External error
1054	Permissible temperature at the motor winding when stepper motor exceeded	Overload
1300	There is an error in the parameter assignment of the motor type.	Parameterization error

Fault number	Description	S7 diagnostics alarm
1340	There is an error in the parameter assignment of the encoder.	Parameterization error
1360	There is an error in the parameter assignment of the controller.	Parameterization error
1380	There is an error in the parameter assignment of the braking function.	Parameterization error

Acknowledge faults

To acknowledge all active faults, click the "Acknowledge faults" button.

Alarms

Column	Description
Alarm number	Number of the warning
Description	Description of the warning

The TM Drive supports the following warnings.

Alarm number	Description
2000	Voltage in the DC link shortly before shutdown
2001	STO shutdown active
2002	Warning threshold when motor end stage temperature is exceeded
2003	Warning threshold when motor winding temperature is exceeded
2004	Thermal overload of the motor end stage
2200	Encoder warning in the encoder error

10.2.3 Drive diagnostics

You can find online information on important current drive diagnostics data and drive service data in the "Drive diagnostics" area under "Online & diagnostics" in the context of the drive.

NOTE
All drive diagnostics are only available online. They are automatically updated in the user interface.

You will find diagnostic information on the following points in the "Drive diagnostics" area:

- Status bits
- Operating values
- Encoders
- Temperatures
- Inputs

Properties of drive diagnostics

Drive diagnostics

- Show the current values of various parameters
- Are cyclically updated
- Are read-only.

Drive diagnostics: Status bits

"Online & diagnostics" > "Diagnostics" > "Drive diagnostics" > "Status bits"

Table 1-726 Drive diagnostics - status bits

Number	Parameter	Display/unit
Status word		
r0899	Status bits **Note**: Signal corresponds to status word 1 PROFIdrive (r0968).	• Ready for switching on • Ready for operation • Operation • Fault active • Coasting active • Rapid stop active • Switching on inhibited active • Alarm active • Speed setpoint - actual value deviation • Control by controller • n comparison value reached • Control of the motor holding brake is active **Note:** • Status word 1 is sent cyclically by the drive to the higher-level controller.

Drive diagnostics: Operating values

"Online & diagnostics" > "Diagnostics" > "Drive diagnostics" > "Operating values"

Table 1-727 Drive diagnostics - operating values

Number	Parameter	Display/unit
r0063	Speed actual value smoothed	rpm
r0080	Torque actual value	Nm
r1045	Speed setpoint in front of the ramp generator	rpm
r0026	DC link voltage	V
r0027	Current actual value	A_{eff}
r0072	Output voltage	V

NOTE

With a stepper motor and the "controlled (I = const.)" control type, the actual torque value corresponds to the current hold torque.

Drive diagnostics: Encoders

"Online & diagnostics" > "Diagnostics" > "Drive diagnostics" > "Encoder"

Table 1-728 Drive diagnostics - encoder

Number	Parameter	Display/unit
r7811	Position	°
r7810[0]	Single-turn steps	-
p979[2]	Increments per revolution	-
p979[3]	Fine resolution bits in actual value Gx_XIST1	Bits

Drive diagnostics: Temperatures

"Online & diagnostics" > "Diagnostics" > "Drive diagnostics" > "Temperatures"

Table 1-729 Drive diagnostics -temperatures

Number	Parameter	Display/unit
r0037[0]	Current microcontroller	°C
r0037[1]	Microcontroller max.	
r0037[4]	Power end stage	
r0037[5]	Power end stage max.	

Drive diagnostics: Inputs

"Online & diagnostics" > "Diagnostics" > "Drive diagnostics" > "Inputs"

Table 1-730 Drive diagnostics - inputs

Number	Parameter	Display/unit
-	Inputs	• Digital input • STO active

Reference

All displayed parameters have a tooltip that provides you with information and descriptions relating to the parameter as well as access to the online help.

You can find additional information on the parameters in the Product Information (https://support.industry.siemens.com/cs/ww/en/view/109773204).

Technical specifications

11.1 Technical specifications

Technical specifications of TM Drive

Article number	6BK1136-6SB00-0BU0
General information	
Product type designation	F-TM StepDrive ST
HW functional status	V1.0
Firmware version	V1.0
• FW update possible	Yes
Product description	control of stepper motors
usable BaseUnits	BU type U0
Product function	
• I&M data	Yes
• Isochronous mode	No
• Four-quadrant operation	Yes
• Speed control with encoder	No
• Speed control without encoder	No
• Safety Functions	Yes; Drive controller with hardwired STO
Protection function	
• Undervoltage protection	Yes
• Overvoltage protection	Yes
• Overload protection	Yes
• Ground-fault protection	No
• Short-circuit protection	Yes
Installation type/mounting	
Type of ventilation	Convection cooling
Supply voltage	
Design of the power supply	24 ... 48 V DC, SELV / PELV
permissible range, lower limit (DC)	16.8 V
permissible range, upper limit (DC)	57.6 V
Input current	
Current consumption (rated value)	6 A
Current consumption, max.	10 A
Current consumption for the electronics, max.	0.1 A; at 24 V
Inrush current, max.	25 A; at 24 V
output voltage / header	
Rated value, min.	24 V
Rated value, max.	48 V

Article number	**6BK1136-6SB00-0BU0**
Output current	
Current output (rated value)	5 A
Output current, max.	10 A
Output frequency	1 000 Hz
Encoder supply	
Number of outputs	1
5 V encoder supply	
• 5 V	Yes
• Short-circuit protection	Yes
• Output current, max.	150 mA
Power	
DC power consumption	300 W; At 50 V
Power loss	
Power loss, typ.	3.5 W
Digital inputs	
Number of digital inputs	1; input for message signal
Number of safety inputs	1; For STO, antivalent (2-pin) - 24 V DC
Encoder	
Connectable encoders	
• Incremental encoder (symmetrical)	Yes; up to 500 Hz per channel
Interrupts/diagnostics/status information	
Alarms	
• Diagnostic alarm	Yes
• Hardware interrupt	No
Diagnoses	
• Monitoring the supply voltage	Yes
• Wire-break	Yes
• Short-circuit	Yes
• Group error	Yes
Diagnostics indication LED	
• RUN LED	Yes
• ERROR LED	Yes
Integrated Functions	
Position detection	
• Incremental acquisition	Yes
• Absolute acquisition	No
• Suitable for S7-1500 Motion Control	Yes
Potential separation	
Potential separation channels	
• between the channels and backplane bus	Yes
Isolation	
Isolation tested with	DC 850 V, type test (between backplane bus, DC input and functional grounding)
Overvoltage category	III
Degree of pollution	2 according to EN 61800-5-1

Article number	6BK1136-6SB00-0BU0
Degree and class of protection	
IP degree of protection	IP20
Standards, approvals, certificates	
CE mark	Yes
UKCA mark	Yes
cULus	Yes
RCM (formerly C-TICK)	Yes
KC approval	Yes
EAC (formerly Gost-R)	Yes
RoHS conformity	Yes
China RoHS compliance	Yes
Standard for EMC according to EN 61800-3	Yes
Standard for drive acc. to EN 61800-5-1	Yes
Standard for drive acc. to EN 61800-5-2	Yes
Highest safety class achievable in safety mode	
• Performance level according to ISO 13849-1	Category 3, performance level d, according to EN ISO 13849-1:2015
• SIL acc. to IEC 61508	3
• SIL according to DIN EN 61800-5-2	3
Ambient conditions	
Pollution degree during storage and transport	2
Ambient temperature during operation	
• horizontal installation, min.	-30 °C; No condensation, splash water, icing, salt spray or oil mist permitted.
• horizontal installation, max.	60 °C; No condensation, splash water, icing, salt spray or oil mist permitted. Note the derating data!
• vertical installation, min.	-30 °C; No condensation, splash water, icing, salt spray or oil mist permitted.
• vertical installation, max.	50 °C; No condensation, splash water, icing, salt spray or oil mist permitted. Note the derating data!
Ambient temperature during storage/transportation	
• Storage, min.	-30 °C
• Storage, max.	70 °C
Altitude during operation relating to sea level	
• Installation altitude above sea level, max.	3 000 m
Cables	
Cable length for motor, shielded, max.	10 m
Dimensions	
Width	20 mm
Height	73 mm
Depth	58 mm

Weight, approx.	55 g
Other	
Brake design	holding brake control via the process image
Braking chopper	No

Climatic and mechanical environmental conditions

You can find the climatic and mechanical ambient conditions here SIMATIC ET200SP distributed I/O system (https://support.industry.siemens.com/cs/ww/en/view/58649293).

If there are discrepancies between the statements in this document and the system manual, the statements in the this document take priority.

Biological environmental conditions

The standards DIN EN IEC 60721-3-1:2018, DIN EN IEC 60721-3-2:2018, IEC 60721-3-3: Edition 3.0, with the classes 1B1, 2B1 and 3B1 apply for the biological environmental conditions during operation, long-term storage and transport.

Conductive dust and sand

The TM Drive must not be exposed to conductive dust or sand during operation, long-term storage and transport.

Chemical environmental conditions

The standards DIN EN IEC 60721-3-1:2018, DIN EN IEC 60721-3-2:2018, DIN EN 60721-3-3:1995, with the classes 1C2, 2C2 and 3C2 apply for the chemical environmental conditions during operation, long-term storage and transport.

11.2 Derating of the ET 200SP TM Drive

Maximum permitted output current as a function of installation altitude and ambient temperature

You must take into account the dependency on the ambient temperature and installation altitude.

Derating of the TM Drive depends on the installation elevation
For all permissible mounting types, starting from an installation altitude of 1000 m, a derating of 10% current per additional 1000 m elevation gain applies. In this case, the motor current and the output current of the digital outputs must be reduced.

All other functions do not have to be reduced up to the maximum installation altitude.

The figure below shows the maximum permitted output current as a function of the ambient air temperature for the derating.

Derating of the TM Drive depends on the ambient temperature (horizontal/vertical mounting position)
When installed horizontally (DIN rail horizontal), the TM Drive can be operated up to the maximum ambient temperature (60 °C). Note the derating curve.

With vertical mounting (vertical mounting rail), the TM Drive may be operated up to a maximum of 50 °C. Note the derating curve.

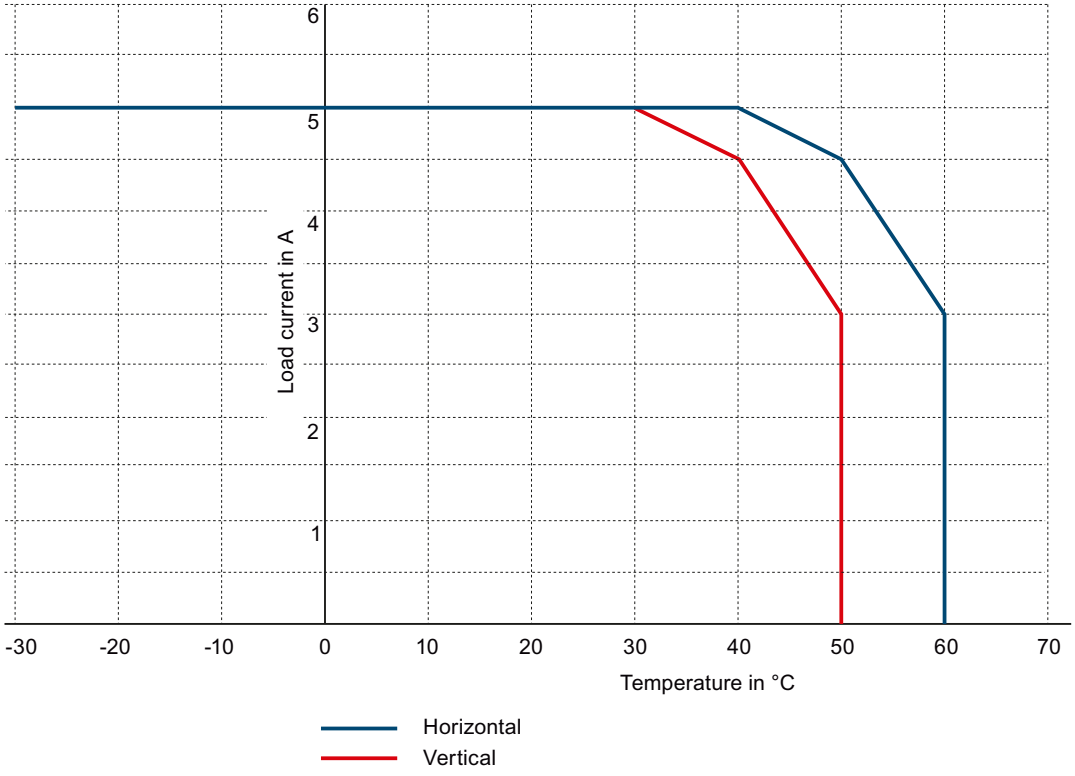

Figure 1-367 Derating the TM Drive with a stepper motor

Test signal suppression

The STO inputs can be dark tested. The dark test time is up to 1 ms.

Appendix

A

A.1 Response times

Introduction

Below you can find the response time of the TM Drive in STEP7. The response times of the TM Drive are included in the calculation of the response time of the F-system.

The drive system is the component that provides the safety functions.

Definition of response time

The response time is the time between the detection of an input signal and the change of a linked output signal.

Definition of process safety time of a process

The process safety time of a process is the time between the occurrence of an error within which a process can be left unattended without risk to life and limb of the operating personnel or damage to the environment and the time of the completed reaction.

Any type of F-system control is tolerated within this process safety time, i.e. the F-system can control its processes incorrectly or even not at all. The process safety time of a process depends on the type of process and must be determined on a case-by-case basis.

Check that the process safety time of the process is not exceeded. You may need to reduce the specific monitoring times of the F-system.

Fluctuation width

The actual response time falls between a minimum and maximum response time. You must always assume the maximum response time when configuring your system.

Definition of maximum response time in an error-free scenario (worst case delay time, WCDT)

In the event of errors outside the drive system (e.g. incorrect setpoint setting by a controller, limit violations due to behavior of the motor, closed-loop control, load, etc.), the "maximum response time in an error-free scenario" is guaranteed.

Definition of maximum response time when an error is present (one fault delay time, OFDT)

In the event of a single error within the drive system (e.g. defect in a shutdown path of the power unit), the "maximum reaction time in the event of error" is guaranteed.

Times required for the calculation

Function	Maximum response time
STOP_STO via terminal	20 ms

STOP_STO:
With a STOP_STO, the drive safely switches off the torque of the connected motor immediately.

You can find an overview of the data sets for the TM Drive and the structure of the data sets in the Product Information (https://support.industry.siemens.com/cs/ww/en/view/109773204).

A.2 Device disposal

Recycling and disposal

For environmentally-friendly recycling and disposal of your old device, please contact a company certified for the disposal of waste electrical and electronic equipment, and dispose of the old device as prescribed in the respective country of use.

NOTE

The device does not have its own memory. Neither personal data nor project-specific data are stored on it. It is not necessary to reset the memory for data security reasons.

Preface

Purpose of the documentation

This device manual complements the system manual ET 200SP distributed I/O system. General functions of the ET 200SP are described in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293).

The information provided in this device manual and the system manual enables you to commission the ET 200SP distributed I/O system.

Conventions

Note the following identified notes:

NOTE

A note includes important information on the product described in the documentation, on handling the product or on the part of the documentation to which you should pay special attention.

Security information

Siemens provides automation and drive products with industrial security functions that support the secure operation of plants or machines. They are an important component in a holistic industrial security concept. With this in mind, our products undergo continuous development. We therefore recommend that you keep yourself informed with respect to our product updates. Please find further information and newsletters on this subject at: (http://support.automation.siemens.com)

To ensure the secure operation of a plant or machine it is also necessary to take suitable preventive action (e.g. cell protection concept) and to integrate the automation and drive components into a state-of-the-art holistic industrial security concept for the entire plant or machine. Any third-party products that may be in use must also be taken into account. Please find further information at: (http://www.siemens.com/industrialsecurity)

Documentation guide

1

1.1 Documentation Guide for Power Module F-PM-E 24VDC/8A PPM ST

Introduction

The documentation of the SIMATIC products has a modular design and includes topics concerning your automation system.

The complete documentation of the ET 200SP system consists of different modules divided into system manuals, function manuals and manuals.

The STEP 7 (online help) information system supports you in configuring and programming your automation system.

Overview of documentation for the F-PM-E 24VDC/8A PPM ST fail-safe power module

The table below lists additional documents that complement this description of the F-PM-E 24VDC/8A PPM ST fail-safe power module and are available on the Internet.

Table 1-731 Documentation for the F-PM-E 24VDC/8A PPM ST fail-safe power module

Topic	Documentation	Most important contents
Description of the system	System manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)	• Application planning • Installation • Connecting • Commissioning • Approvals • TÜV certificate
BaseUnits	Manual ET 200SP BaseUnits (http://support.automation.siemens.com/WW/view/en/58532597/133300)	Technical specifications
Description of the SIMATIC Safety F-system	Programming and operating manual SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126)	• Configuring • Programming • Approvals

SIMATIC manuals

The latest manuals for SIMATIC products are available on the Internet (http://www.siemens.com/automation/service&support) for free download.

Functional Safety Services

Siemens Functional Safety Services support you with a comprehensive package of services from risk assessment to verification all the way to plant commissioning and modernization. We also offer consultation on the use of fail-safe and fault-tolerant SIMATIC S7 automation systems.

You will find more detailed information on the Internet (http://www.siemens.com/safety-services).

Please send your questions to us by e-mail (mailto:safety-services.industry@siemens.com).

Product overview

2

2.1 Properties of the F-PM-E 24VDC/8A PPM ST

Order number

6ES7136-6PA00-0BC0

View of the module

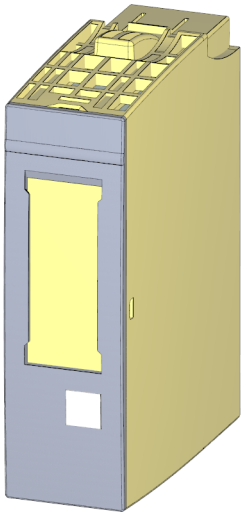

Figure 1-368 View of the F-PM-E 24VDC/8A PPM ST module

Properties

- Technical properties
  - Fail-safe digital module
  - 2 inputs (SIL3/Cat.4/PLe)
  - 1 output PM-switching or PP-switching, output current 8 A (SIL3/Cat.4/PLe)
  - 2 outputs for sensor supply
  - Sink input (P-reading)
  - Source output (PM/PP-switching)
  - Supply voltage L+
  - Suitable for connection of 2-wire sensors to IEC 61131, type 1
  - Channel-specific assignable input delay 0.4 ms to 20 ms
  - Diagnostic display (DIAG red/green LED)
  - Status display for each input or output (green LED)

  - Fault display for each input or output (red LED)
  - Diagnostics, e.g., short circuit/wire break, channel-specific
  - Diagnostics, e.g., load voltage missing, module-specific
  - Channel-specific or passivation throughout the module
- Supported functions
  - Firmware update
  - I&M identification data
  - PROFIsafe

WARNING

The fail-safe performance characteristics in the technical specifications apply to a proof-test interval of 20 years and a mean time to repair of 100 hours. If a repair within 100 hours is not possible, remove the respective module from the BaseUnit or switch off its supply voltage before 100 hours expires. The module switches off independently after the 100 hours have expired.
Follow the repair procedure described in section Diagnostic messages (Page 57).

Accessories

The following accessories, which are not included in the product package of the F-module, can be used with the F-module:

- Labeling strips
- Color identification labels
- Reference identification labels
- Shield connection

Additional information on accessories can be found in the ET 200SP Distributed I/O System System Manual (http://support.automation.siemens.com/WW/view/en/58649293).

Safety-related shutdown of standard DQ modules by the F-PM-E 24VDC/8A PPM ST

This cost-effective solution allows for full and simultaneous shutdown of all affected outputs of the standard DQ modules when a fault is detected in the process or on the F-PM-E 24VDC/8A PPM ST power module.

You achieve SIL2/Cat.3/PLd with safety-related shutdown of standard DQ modules.

You can use the F-PM-E 24VDC/8A PPM ST power module with all standard DQ modules within a potential group. Additional information is available in Applications for safety-related shutdown of standard modules (Page 49).

Passivation of fail-safe outputs over a long period of time

⚠ WARNING

Unintentional activation of F-I/O with fail-safe outputs
If an F-I/O with fail-safe outputs is passivated for a period longer than that specified in the safety parameters (> 100 hours) and the fault remains uncorrected, you need to exclude the possibility that the F-I/O can be activated unintentionally by a second fault, and thus place the F-system in a dangerous state.
Even though it is highly unlikely that such hardware faults occur, you must prevent the unintentional activation of F-I/O with fail-safe outputs by using circuit measures or organizational measures.
One possibility is the shutdown of the power supply of the passivated F-I/O within a time period of 100 hours, for example.
The required measures are standardized for plants with product standards.
For all other plants, the plant operator must create a concept for the required measures and have it approved by the inspector.

Connecting

5	DQ-P_0	**6**	DQ-M_0			
7	AUX	**8**	AUX			
L+	DC24V	**N**	M			
L+	DC24V	**N**	M			

[1] Usable BaseUnit types can be identified by the last two digits of their order number. See also *ET 200SP Distributed I/O System* system manual

NOTE

Make sure that you only use the power module with BaseUnit type C0 during commissioning.

Digital output

The digital output switches the voltage L+ and M using two electronic switches (see Block diagram (Page 13)). The switched voltage and chassis are conducted to the internal voltage buses P1 and P2. The switched voltage and chassis is also available at the BaseUnit at DQ-P_0 and DQ-M_0.

This results in two connection options that can be used at the same time, if desired:

- One load can be wired directly to the BaseUnit (see Applications for the output DQ/P1 and P2 (Page 34)).
- The standard modules can be supplied and switched off safety-related by means of the internal voltage buses P1 and P2. You can, in turn, connect loads to the standard modules (see Applications for safety-related shutdown of standard modules (Page 49)).

WARNING

It is no longer possible to shut down an actuator if a cross circuit has developed between L+ and DQ. To prevent cross circuits between L+ and DQ, you must route the cables used to connect the actuators in a cross-circuit proof manner (for example, as separate, sheathed cables or in separate cable ducts).

Redundant ground conductor required

WARNING

The ground conductor to the BaseUnit for F-PM-E 24VDC/8A PPM ST must be installed twice for safety reasons. Any interruption of a single ground conductor would prevent the safety-related shutdown of voltage bus P2.

Property of the individual shutdown of F-modules with fail-safe outputs

A channel-specific shutdown occurs when a fault is detected. It is also possible to react to critical process states staggered over time or to perform safety-related shutdown of individual outputs.

Switching of loads with ground if the F-module is configured PM-switching

If the following two conditions are met, F-PM-E 24VDC/8A PPM ST detects a short circuit:

- If loads that have a connection between chassis and ground are switched by the F-PM-E 24VDC/8A PPM ST , for example, to improve the EMC properties.
- If chassis and ground are connected at the power supply unit.

From the perspective of the F-module, the M-switch is bridged by the chassis-ground connection (refer to the diagram below as an example for an F-PM-E 24VDC/8A PPM ST).

Remedy:

- Use the F-PM-E 24VDC/8A PPM ST configured as a PP-switching module.
- Increase the value of the resistance between chassis and ground at the load end to more than 100 kΩ.
- Reduce the capacitance value between chassis and ground at the load end to less than 2 µF.

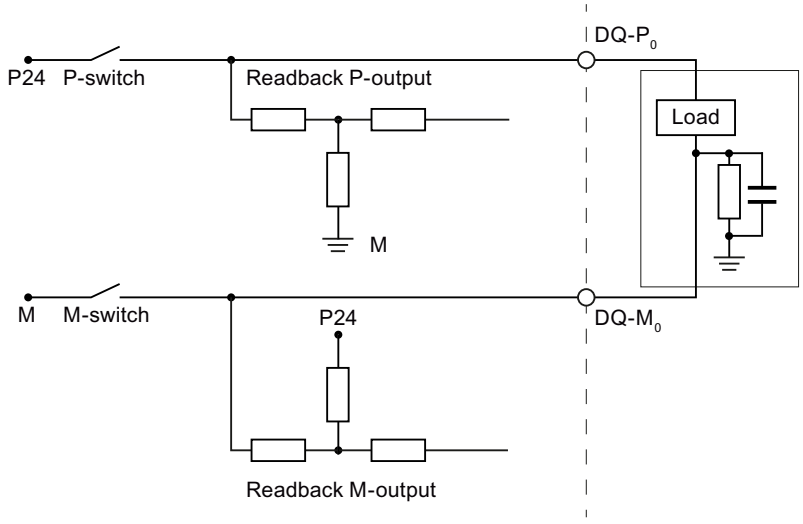

Figure 1-369 Switching of grounded loads (resistance between chassis and ground)

WARNING

During startup, the F-PM-E 24VDC/8A PPM ST carries out a switch-on test of approximately 3 ms. The capacitance between chassis and ground at the load end is charged by way of the load resistance. This low charging current may briefly trigger sensitive load circuits.

4.1 Parameters

Parameters

WARNING

Diagnostic functions should be activated or deactivated in accordance with the application.

Table 1-733 Parameters for power module

Parameter	Value range	Parameter reassignment in RUN	Scope
F-parameters:			
Manual assignment of the F-monitoring time	• disable • enable	no	Module
F-monitoring time	1 to 65535 ms	no	Module
F-source address	1 to 65534	no	Module
F-destination address	1 to 65534	no	Module
F-parameter signature (without address)	0 to 65535	no	Module
Behavior after channel faults	• Passivate entire module • Passivate channel	no	Module
F-I/O DB manual number assignment	• disable • enable	no	Module
F-I/O DB number	—	no	Module
F-I/O DB name	—	no	Module
PM-parameters:			
Maximum test period	• 100 s • 1000 s	no	Module
Sensor supply:			
Short circuit test	• disable • enable	no	Channel
Time for short circuit test	0.5 ms to 2 s	no	Channel
Startup time of the sensors after short circuit test	0.5 ms to 2 s	no	Channel
Inputs:			
Sensor evaluation	• 1oo1 evaluation • 1oo2 evaluation, equivalent • 1oo2 evaluation, non-equivalent	no	Channel pair
Discrepancy behavior	• Supply last valid value • Supply 0 value	no	Channel pair

Parameter	Value range	Parameter reassignment in RUN	Scope
Discrepancy time	5 ms to 30 s	no	Channel pair
Reintegration after discrepancy error	• Test 0-signal necessary • Test 0-signal not necessary	no	Channel pair
Activated	• disable • enable	no	Channel
Sensor supply	• Sensor supply 0 • Sensor supply 1 • External sensor supply	no	Channel
Input delay	• 0.4 ms • 0.8 ms • 1.6 ms • 3.2 ms • 6.4 ms • 10.0 ms • 12.8 ms • 20 ms The provided value range depends on the parameter assignment of the employed sensor supply.	no	Channel
Pulse extension	• — • 0.5 s • 1 s • 2 s	no	Channel
Chatter monitoring activated	• disable • enable	no	Channel
Number of signal changes	2 to 31	no	Channel
Monitoring window	0 to 100 s (If 0 s is configured, the monitoring window is 0.5 s long.)	no	Channel
Output:			
Activated	• disable • enable	no	Channel
Control of the output	• F-CPU • F-CPU and onboard F-DI	no	Module
Output type	• PM switching • PP switching	no	Channel
Max. readback time dark test	0.8 to 400.0 ms	no	Channel
Disable dark test for 48 hours	• disable • enable	no	Channel
Max. readback time switch on test	0.8 to 5.0 ms	no	Channel
Activated light test	• disable • enable	no	Channel
Diagnosis: Wire break	• disable • enable	no	Channel

4.2 Explanation of parameters

4.2.1 F-parameters

F-parameters

Information on F-parameters is available in the SIMATIC Safety - Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

4.2.2 PM-parameters

4.2.2.1 Maximum test period

Here you specify the time within which the light and dark tests (in all combinations) should be performed throughout the module. When this time expires, the tests are repeated.

The "Maximum test period" parameter is a module parameter, which means the test cycle for the entire fail-safe output module is performed within the configured maximum test time. If the bit pattern test is not performed within the configured time (or the shortened test time of 60 seconds in case of an error), the module goes into the error state.

4.2.3 Parameters of the sensor supply

4.2.3.1 Short circuit test

Here you enable the short-circuit detection for the channels of the F-module for which "Internal sensor supply" is set.

The short-circuit test is only useful if you are using simple switches that do not have their own power supply. For switches with power supply, for example, 3/4-wire proximity switches, a short-circuit test is not possible.

The short-circuit detection switches off the sensor supply briefly. The length of the deactivation period is equivalent to the configured "Time for sensor test".

If a short-circuit is detected, the F-module triggers a diagnostic interrupt and the input is passivated.

The following short-circuits are detected:

- Short-circuit of input to L+
- Short-circuit of the input of another channel when it has a 1 signal
- Short-circuit between the input and sensor supply of another channel
- Short-circuit between the sensor supply and the sensor supply of another channel

If the short-circuit test is disabled, you must make your wiring short-circuit and cross-circuit proof or select a connection type (discrepancy, non-equivalent) which also detect the cross-circuits using discrepancy.

During the execution time (Time for sensor test + Startup time of sensor after sensor test) of the short circuit test, the last valid value of the input before the start of the short circuit test is passed to the F-CPU. The activation of the short-circuit test thus affects the response time of the respective channel or channel pair.

4.2.3.2 Time for short circuit test

Function

When the short-circuit test is enabled, the corresponding sensor supply is switched off for the configured time. If the module does not detect a "0" signal at the input within the assigned time, a diagnostic message is generated.

When assigning parameters, note that

- If the channel is passivated, this may be due to too high capacitance between sensor supply and input. This consists of the capacitance per unit length of the cable and the capacitance of the employed sensor. If the connected capacitance does not discharge within the assigned time, you need to adjust the "Time for sensor test" parameter.
- The values available for the input delay depend on the "Ramp-up time of the sensor after short-circuit test" and the "Time for short-circuit test" of the configured sensor supply.

4.2.3.3 Startup time of sensors after short circuit test

Function

In addition to the off time ("Time for sensor test"), a startup time must be specified for performing the short circuit test. You use this parameter to notify the module how long the utilized sensor needs to start up after connecting the sensor supply. This prevents an undefined input state due to transient reactions in the sensor.

When assigning parameters, note that

- This parameter must be greater than the transient recovery time of the employed sensor.
- Because the assigned time affects the response time of the module, we recommend that you set the time as short as possible but long enough so that your sensor can settle safely.
- The values available for the input delay depend on the "Ramp-up time of the sensor after short-circuit test" and the "Time for short-circuit test" of the configured sensor supply.

Requirement

The short circuit test is enabled.

4.2.4 Parameters of the inputs

4.2.4.1 Sensor evaluation

Overview

Select the type of sensor evaluation with the "Sensor evaluation" parameter:

- 1oo2 evaluation, equivalent
- 1oo2 evaluation, non-equivalent

1oo2 evaluation equivalent/non-equivalent

With a 1oo2 evaluation equivalent/non-equivalent, two input channels are occupied by:

- One single-channel sensor
- One non-equivalent sensor
- One two-channel sensor
- Two single-channel sensors

The input signals are compared internally for equivalence or non equivalence.

Note that in 1oo2 evaluation, two channels are combined into a channel pair. The number of available process signals of the F-module is reduced accordingly.

Discrepancy analysis

When using a two-channel sensor or two single-channel sensors which measure the same process variable, the sensors interact with a slight time delay due to the limited precision of their arrangement.

The discrepancy analysis for equivalence/non-equivalence is used for fail-safe applications to prevent errors from time differences between two signals for the same function. The discrepancy analysis is initiated when different levels are detected in two associated input signals (when testing for non-equivalence: the same levels). A check is made to determine whether the difference in levels (when testing for non equivalence: the same levels) has disappeared after an assignable time period, the so-called discrepancy time. If not, this means that a discrepancy error exists.

Achievable safety class

The following safety class can be achieved depending on the selected sensor evaluation:

- SIL3/Cat.4/PLe with "1oo2 evaluation equivalent/non-equivalent"

4.2.4.2 Discrepancy behavior

Function

For the "Discrepancy behavior", you assign the value that is supplied to the safety program in the F-CPU during a discrepancy between two relevant input channels, which means while discrepancy time is running. You assign the discrepancy behavior as follows:

- "Supply last valid value"
- "Supply value 0"

Requirements

You have assigned the following:

- "Evaluation of the sensors": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non-equivalent"

"Supply last valid value"

The most recent valid value (old value) before the discrepancy occurred is made available to the safety program in the F-CPU as soon as a discrepancy is detected between the signals of the two affected input channels. This value is supplied until the discrepancy disappears or the discrepancy time expires and a discrepancy error is detected. The sensor-actuator response time is correspondingly increased by this time.

This means the discrepancy time of connected sensors with 1oo2 evaluation must be adjusted to fast response times. It makes no sense, for example, if connected sensors with a discrepancy time of 500 ms trigger a time-critical shutdown.. In the worst-case scenario, the sensor-actuator response time is extended by an amount approximately equal to the discrepancy time:

- For this reason, position the sensors in the process in such a way as to **minimize discrepancy**.
- Then select the **shortest possible** discrepancy time which is also sufficient to compensate for faulty triggering of discrepancy errors.

"Supply value 0"

As soon as a discrepancy between the signals of the two relevant input channels is detected, the value "0" is made available to the safety program in the F-CPU.

If you have set "Supply value 0", the sensor-actuator response time is not affected by the discrepancy time.

4.2.4.3 Discrepancy time

Function

You can set the discrepancy time for each channel pair.

Requirements

You have assigned the following:

- "Evaluation of the sensors": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non-equivalent"

In most cases, a discrepancy time is started, but does not fully expire because the signal differences are cleared within a short time.

Set the discrepancy time high enough that in the error-free case the difference between the two signals (when testing for non equivalence: the same levels) has always disappeared before the discrepancy time has expired.

Behavior while discrepancy time is running

While the programmed discrepancy time is running internally on the module, either the **last valid value** or **"0"** is returned to the safety program on the F-CPU by the input channels involved, depending on the parameter settings for the behavior at discrepancy.

Behavior after expiration of the discrepancy time

If no agreement (when checking for non equivalence: inequality) of the input signals exists once the assigned discrepancy time expires, for example, due to a break in a sensor wire, a discrepancy error is detected and the "Discrepancy error" diagnostic message containing information on which channels are faulty is generated.

4.2.4.4 Reintegration after discrepancy error

Function

This parameter specifies the criteria for when a discrepancy error is regarded as corrected, thus enabling reintegration of the relevant input channels. The following parameter assignment options are available:

- "Test 0-signal necessary"
- "Test 0-signal not necessary"

Requirements

You have assigned the following:

- "Sensor evaluation": "1oo2 evaluation, equivalent" or "1oo2 evaluation, non equivalent"

"Test 0-signal necessary"

If you have assigned "Test 0-signal necessary", a discrepancy error is not regarded as corrected until a 0-signal is present at both of the relevant input channels.

If you are using non equivalent sensors, which means you have set "Sensor evaluation" to "1oo2 evaluation, non equivalent", a 0-signal must be present again at the low order channel of the channel pair.

"Test 0-signal not necessary"

If you have assigned "Test 0-Signal not necessary", a discrepancy error is regarded as corrected when a discrepancy no longer exists at both of the relevant input channels.

4.2.4.5 Activated

You hereby enable the corresponding channel for signal processing in the safety program.

4.2.4.6 Sensor supply

Here you select one of the internal sensor supplies VS_0 to VS_n or an external sensor supply.
The selection of an internal sensor supply is required for using the short circuit test.

See also

Time for short circuit test (Page 17)

4.2.4.7 Input delay

Function

To suppress stray interference, you can set an input delay for the entire channel or channel pair.
Interference pulses whose pulse time is less than the set input delay (in ms) are suppressed. Suppressed interference pulses are invisible in the PII.
A high input delay suppresses longer interference pulses, but results in a longer response time.
The values available for the input delay depend on the "Startup time of sensors after short circuit test" and the "Time for short circuit test" of the configured sensor supply.

NOTE
Due to the physical properties, there is a possibility of crosstalk between signals in the case of long, unshielded signal lines (see section "Electromagnetic compatibility" in the system manual ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293)).
Adapt the input delay or use shielded signal lines in order to prevent possible passivation of the fail-safe digital inputs and switch-off of the sensor supply.

See also

Technical specifications (Page 63)

4.2.4.8 Pulse extension

Function

Pulse extension is a function to change a digital input signal. A pulse on a digital input is extended to at least the assigned length. If the input pulse is already longer than the assigned length, the pulse is not changed.
The fail-safe electronic module only lengthens pulses with the value "0" because the basis of the safety concept is that there is a safe state for all process variables. For digital F-I/O, this is the value "0", which applies to sensors as well as to actuators.

With 1oo2 evaluation, the result of the evaluation of both sensors is used for the pulse extension.

4.2.4.9 Chatter monitoring

Function

Chatter monitoring is a process control function for digital input signals. It detects and reports unusual signal sequences in the process with 1oo1 evaluation, for example, an input signal fluctuating between "0" and "1" too frequently. The occurrence of such signal characteristics is an indication of faulty sensors or process control instability.

Recognizing unusual signal patterns

An assigned monitoring window is available for each input channel. The monitoring window starts with the first signal change of the input signal. If the input signal changes within the monitoring window at least as often as the assigned "Number of signal changes", a chatter error is detected. If no chatter error is detected within the monitoring window, the next signal change restarts the monitoring window.

If a chatter error is detected, a diagnostic is signaled. If the chatter error does not occur for the monitoring window for three times the configured period, the diagnostic is reset.

Principle

The figure below shows the principle of chatter monitoring as a graphic.

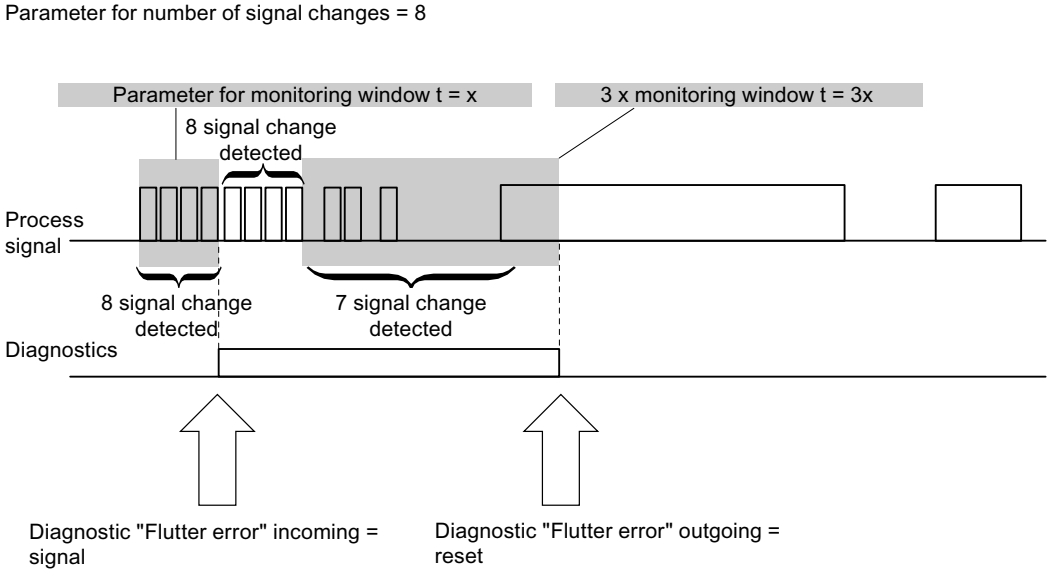

Figure 1-371 Figure chatter monitoring

Number of signal changes

Sets the number of signal changes after which a chatter error should be reported.

4.2.4.10 Monitoring window

Sets the time for the monitoring window of flutter monitoring.
You can set times of 1 s to 100 s in whole seconds for the monitoring window.
You can configure a monitoring window of 0.5 s when you set 0 s.

4.2.5 Parameters of the output

4.2.5.1 Activated

If you select this check box, the corresponding channel is enabled for signal processing in the safety program.

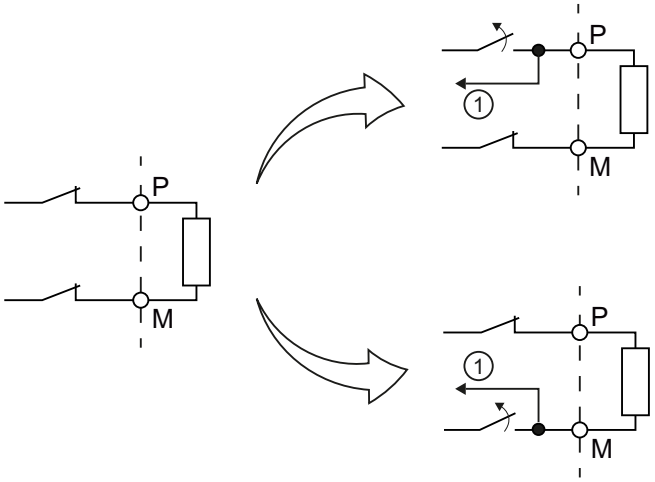
You can deactivate an unused channel with this parameter.

4.2.5.2 Controlling the output

Activates the internal evaluation.

Additional information on internal evaluation is available in the chapter "Application for internal evaluation" (Page 47).

4.2.5.3 Output type



The parameter specifies if the output switches PM or PP.

4.2.5.4 Max. readback time dark test

Function

Dark tests are shutdown tests with bit pattern test.

For a dark test, a test signal is switched to the output channel while the output channel is active (output signal "1"). This output channel is then briefly disabled (= "dark period") and read back. A sufficiently slow actuator does not respond to this and remains switched on.

① Readback

Figure 1-372 Functional principle of the dark test (PM switching)

This parameter allows you to set the time for the readback.

If the expected signals (P-readback and M-readback) could not be read back correctly after expiration of the readback time dark test, the output channel is passivated.

No new process values are switched to the output channels while a bit pattern is still active (switch test is carried out). This means that a higher maximum readback time for the dark test increases the response time of the F-module.

⚠ WARNING

Through the configured readback time dark test, short circuits (cross-circuits) to a signal with a frequency greater than 1/(2 x configured readback time dark test) Hz cannot be recognized (50:50 sampling ratio).
Short circuits (cross-circuits) to an output of the same module are recognized.

The parameter also has an effect on the short circuit detection (cross-circuit) with "1" signal when the output signal is changed from "1" to "0" with the safety program.

Setting readback time dark test

Because the fault reaction time is extended by the length of the readback time dark test, we recommend that you set the readback time dark test by trial and error as low as possible, but high enough that the output channel is not passivated.

You determine the readback time required for your actuator with the diagram in the chapter Switching capacitive loads (Page 69).

If the capacity of the actuator is not known, it may be necessary for you to determine the value for the readback time light test by trial and error. This may also be necessary due to the part variances in the actuator or external influences.

Proceed as follows:

- Set the readback time dark test so that the output channel can be read back correctly but your actuator does not respond yet.
- If the output channel is passivated sporadically, set a higher value for the maximum readback time dark test.
- If the output channel is passivated, the readback time dark test is too small for a connected capacitive load. The discharge cannot take place during the configured readback time dark test. Increase the readback time dark test.

If you have set the readback time dark test to the maximum value of 400 ms and there is still a passivation of the output channel, there is either an external fault or the connected capacity is outside the permitted range.

Test pulses of the dark test

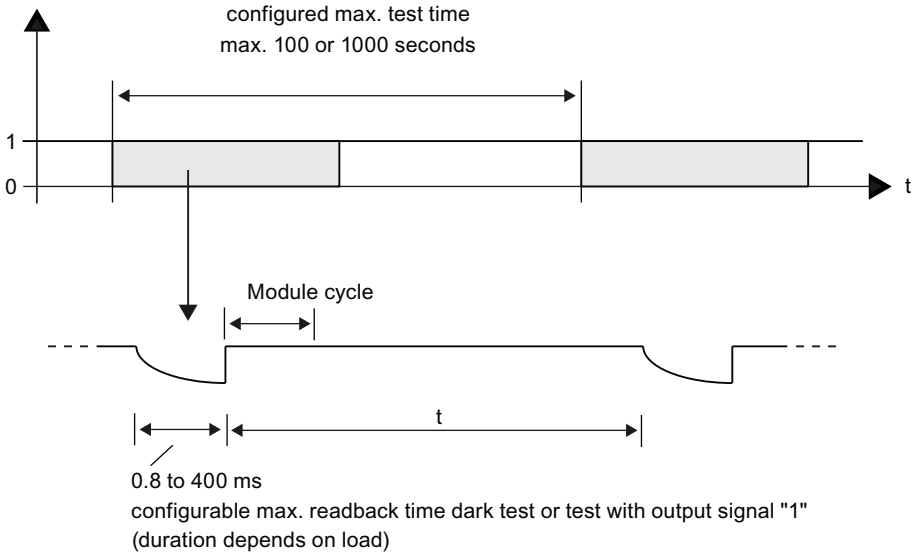


Figure 1-373 Test pulses of the dark test

The distance between two test pulses (t) depends on the parameter assignment. Additional information is available in Minimum distance of test pulses (Page 68).

4.2.5.5 Disable dark test for 48 hours

This option allows you to suppress the dark test.

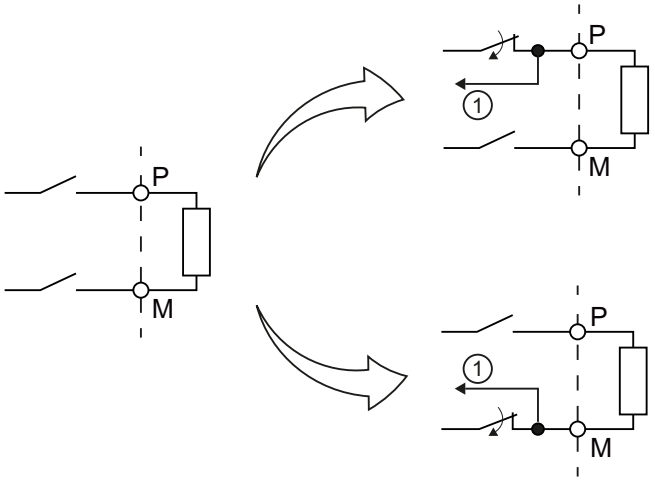
If the channel is permanently active (1) for 48 hours, 2 dark test pulses (PP switching) or 3 dark test pulses (PM switching) are directed to this channel once the time has expired.

You must provide the signal change from 1 to 0 at the channel yourself within 48 hours to prevent the dark test pulse. The dark test is suspended for another 48 hours after the signal change from 0 to 1.

The dark test is permanently suppressed if the following condition is met:

- A signal change from 1 to 0 takes place before the 48 hours have expired.

⚠ WARNING



The output is passivated if an error caused by a short-circuit is recognized when the safety-function is executed (output turned off). This is necessary because a complete bit pattern test is not performed within 48 hours, which means an undetected error burst may not be ruled out.
If the channel can retain signal 0 for 48 hours and longer, the function "Disable dark test for 48 hours" must not be used.
Consult the respective requirements of your product standards regarding error detection time.

4.2.5.6 Max. readback time switch on test

Function

The switch on test is part of the bit pattern test.

During the switch on test, the P-switch and M-switch of the output channel are alternately closed and read back when the output channel is inactive (output signal "0"). Contrary to the light test, no power flows through the connected load during the switch on test.

① Readback

Figure 1-374 Functional principle of the switch on test (PM switching)

This parameter allows you to set the time for the readback. If the signal was not read back correctly once the time has expired, the output channel is passivated.

The switch on test detects the following faults:

- Short circuit to L+ with output signal "0"
- Short circuit to ground with output signal "0"

⚠ WARNING

Through the configured readback time, short circuits (cross-circuits) to an interfering signal with a frequency > 1 / (2 x configured readback time) Hz can be suppressed (50:50 sampling ratio).
Short circuits (cross-circuits) to an output of the same module are recognized.

Setting readback time

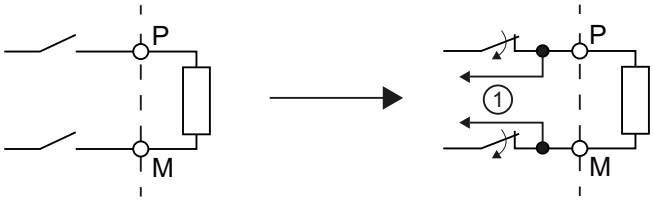
Because the fault reaction time is extended by the length of the set readback time, we recommend that you set the readback time by trial and error as low as possible but high enough that the output channel is not passivated.

To determine the readback time required for your actuator, refer to the diagram in the chapter Switching capacitive loads (Page 69).

If the capacity of the actuator is not known, it may be necessary for you to determine the required value for the readback time by trial and error. This may also be necessary due to the part variances in the actuator or external influences.

Proceed as follows:

- Set the readback time switch on test in such a way that the output channel can be read back correctly but your actuator does not respond yet.
- If the output channel is passivated sporadically, set a higher value for the maximum readback time switch on test.
- If the output channel is passivated, the readback time switch on test is too small for a connected capacitive load. The charge of the capacitive load cannot take place within the configured readback time switch on test. Increase the readback time.



If you have set the readback time to the maximum value of 5 ms and there is still a passivation of the output channel, there is either an external fault or the connected capacity is outside the permitted range.

4.2.5.7 Activated light test

Function

Overload and wire break are detected with a 0 signal at the output.

For a light test, several test signals are switched to the output channel while the output channel is inactive (output signal "0"). The output channel is switched on briefly during the light test (= "light period") and read back. A sufficiently slow actuator does not respond to this and remains switched off.

① Readback

Figure 1-375 Functional principle of the light test (PM switching)

In contrast to the switch on test, the P-switch and the M-switch switch at the same time during the light test and power flows through the connected load.

If the readback signals are incorrect, the signal is present for the configured readback time at the output channel before the fault causes passivation of the output channel.

If the signal was not read back correctly once the maximum readback time switch on test has expired, the output channel is passivated.

No new process values are switched to the output channels while a bit pattern is still active (switch test is carried out). This means that a higher maximum readback time switch on test for the light test increases the response time of the F-module.

Test pulses of the light test

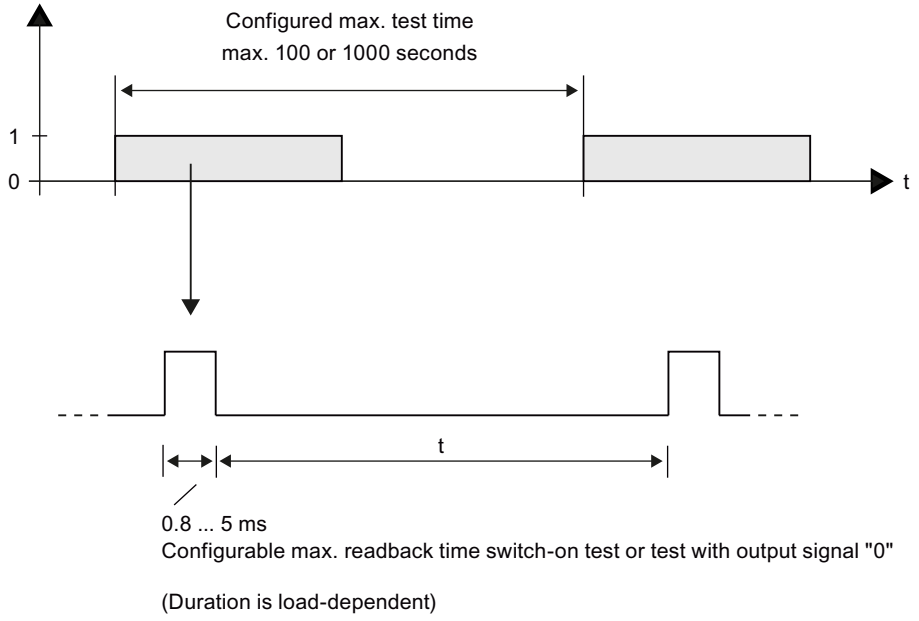


Figure 1-376 Test pulses of the light test

The distance between two test pulses (t) depends on the parameter assignment. Additional information is available in Minimum distance of test pulses (Page 68).

If a light pulse returns a fault, the same light pulse (which means the same bit pattern) is repeated once after t. If the fault is still present, the maximum test time is automatically reduced to 60 seconds and a diagnostic message is generated. If the fault is no longer present, the output channel is reintegrated after the next fault-free test cycle.

4.2.5.8 Diagnosis: Wire break

You can use a wire break test to monitor the connection from the output channel to the actuator.

Selecting this check box enables the wire break monitoring for the relevant channel.

Wire break is signaled when the following conditions are met:

- Wiring to the actuator is interrupted.
- A module that is disabled in fail-safe mode by the F-PM module has been removed.

You also have to activate the light test to detect a wire break with an output signal "0".

4.3 Address space

Address assignment of power module F-PM-E 24VDC/8A PPM ST

The F-PM-E 24VDC/8A PPM ST power module occupies the following address areas in the F-CPU:

Table 1-734 Address assignment in the F-CPU

Occupied bytes in the F-CPU:	
In input range	**In output range**
x + 0 to x + 6	x + 0 to x + 4

x = Module start address

Address assignment of the user data and value status of power module F-PM-E 24VDC/8A PPM ST

Of the assigned addresses of power module F-PM E 24VDC/8A PPM ST, the user data occupy the following addresses in the F-CPU:

Table 1-735 Address assignment of user data **in the input range**

Byte in the F-CPU	**Assigned bits in F-CPU per F-module:**							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
x + 0	—	—	—	—	—	—	DI_1	DI_0
x + 1	—	—	—	—	—	—	Value status for DI_1	Value status for DI_0
x + 2	—	—	—	—	—	—	—	Value status DQ_0

x = Module start address

Table 1-736 Address assignment of user data **in the output range**

Byte in the F-CPU	**Assigned bits in F-CPU per F-module:**							
	7	**6**	**5**	**4**	**3**	**2**	**1**	**0**
x + 0	—	—	—	—	—	—	—	DQ_0

x = Module start address

NOTE

You may only access the addresses occupied by user data and value status.

The other address areas occupied by the F-modules are assigned for functions including safety-related communication between the F-modules and F-CPU in accordance with PROFIsafe.

1oo2 evaluation of the sensors combines the two channels. With 1oo2 evaluation of the sensors you may only access the low order channel in the safety program.

Additional information

For detailed information about F-I/O access, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

5

5.1 Applications for the output DQ/P1 and P2

Conditions for achieving SIL/Cat./PL

The table below lists the conditions which have to be met for achieving the various safety categories.

Table 1-737 Conditions for achieving SIL/Cat./PL

F-PM-E 24VDC/8A PPM ST		Achievable safety class
Digital output DQ	Without standard DQ modules	SIL3/Cat.4/PLe
	With standard DQ modules	SIL2/Cat.3/PLd

5.1.1 Applications: Safety mode up to SIL3/Cat.4/PLe

Wiring

The wiring is carried out on the matching BaseUnit (Page 10).

5.1.1.1 Application: Wiring a load to the digital output, PM switching

The fail-safe digital output consists of two P-switches for DQ-P_0 and one M-switch for DQ-M_0. They connect the load between the P-switches DQ-P_0 and the M-switch DQ-M_0. The two P-switches and the M-switch are always activated so that voltage is applied to the load. This circuit achieves SIL3/Cat.4/PLe.

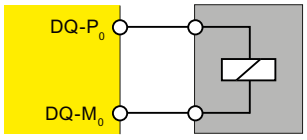

Figure 1-377 Wiring diagram of power module F-PM-E 24VDC/8A PPM ST

WARNING

In order to achieve SIL3/Cat.4/PLe with this wiring, you must install a qualified actuator, for example, in accordance with IEC 60947.

Parameter assignment

Assign the following parameter for the corresponding channel:

Table 1-738 Parameters

Parameter	
Output type	PM switching

5.1.1.2 Application: Wiring a load to the digital output, PP switching

The fail-safe digital output consists of two P-switches for DQ-P_0 and one M-switch for DQ-M_0. You connect the load between the P-switch DQ-P_0 and chassis in this case. The two P-switches are always activated so that voltage is applied to the load. This circuit achieves SIL3/Cat.4/PLe.

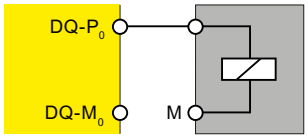

Figure 1-378 Wiring diagram of power module F-PM-E 24VDC/8A PPM ST

⚠ WARNING

In order to achieve SIL3/Cat.4/PLe with this wiring, you must install a qualified actuator, for example, in accordance with IEC 60947.

Parameter assignment

Assign the following parameter for the corresponding channel:

Table 1-739 Parameters

Parameter	
Output type	PP switching

5.1.1.3 Application: Wiring two loads in parallel to the digital output, PM switching

You achieve SIL3/Cat.4/PLe with the following wiring variant.

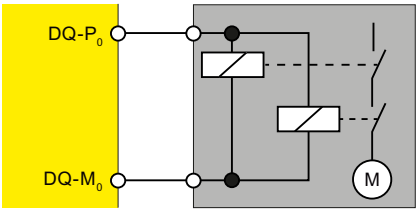

Figure 1-379 Wiring diagram for connecting two relays each in parallel to F-DQ of power module F-PM-E 24VDC/8A PPM ST

NOTE

When two relays are connected in parallel to one digital output (as shown above), a wire break is only detected if the wire break disconnects both relays from P or M. The diagnostics generated in the process is not safety-related.

Parameter assignment

Assign the following parameter for the corresponding channel:

Table 1-740 Parameters

Parameter	
Output type	PM switching

5.1.1.4 Application: Wiring two loads in parallel to the digital output, PP switching

You achieve SIL3/Cat.4/PLe with the following wiring variant.

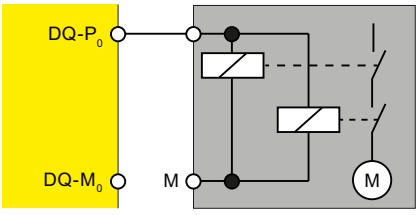

Figure 1-380 Wiring diagram for connecting two relays each in parallel to F-DQ of power module F-PM-E 24VDC/8A PPM ST

NOTE

When two relays are connected in parallel to one digital output (as shown above), a wire break is only detected if the wire break disconnects both relays from P or M. The diagnostics generated in the process is not safety-related.

Parameter assignment

Assign the following parameter for the corresponding channel:

Table 1-741 Parameters

Parameter	
Output type	PP switching

5.2 Applications for inputs

5.2.1 Applications of the electronic module

Selecting the application

The diagram below supports you in selecting the application that suits your fail-safe requirements. In the following sections, you will learn how to wire the F-module, the specific parameters you must assign in STEP 7 Safety and the errors that are detected.

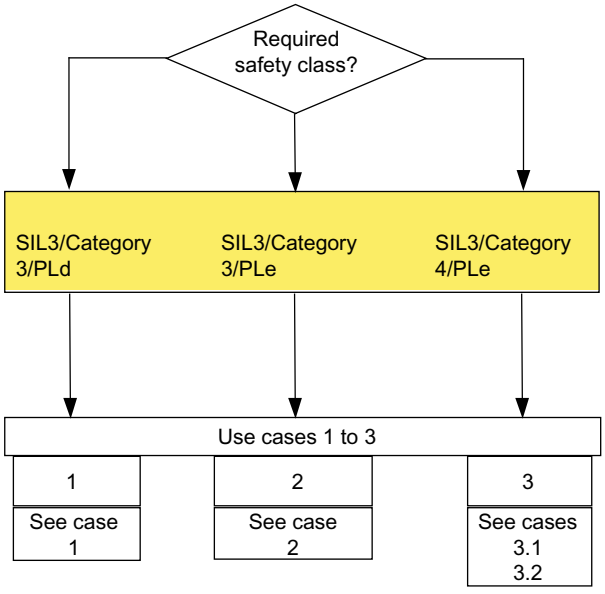

Figure 1-381 Selecting the application – digital inputs of the F-PM-E 24VDC/8A PPM ST

WARNING

The achievable safety class depends on the quality of the sensor and the duration of the proof-test interval in accordance with IEC 61508:2010. If the quality of the sensor is lower than the quality required by the safety class, redundant sensors connected via two channels must be used and evaluated.

Conditions for achieving SIL/Cat./PL

The table below lists the conditions which have to be met for achieving at least the corresponding safety requirements.

Table 1-742 Conditions for achieving SIL/Cat./PL

Application	Sensor evaluation	Sensor supply	Achievable SIL/Cat./PL
1	1oo1	Any	3 / 3 / d
2	1oo2 equivalent	Internal, without short circuit test	3 / 3 / e
		External	
3.1	1oo2 equivalent	Internal, with short circuit test	3 / 4 / e
3.2	1oo2 non-equivalent	External/internal, with short circuit test	

Sensor requirements

Information on safety-related use of sensors is available in the section Requirements for sensors and actuators for fail-safe modules in the ET 200SP distributed I/O system (http://support.automation.siemens.com/WW/view/en/58649293) system manual.

5.2.2 Application 1: Safety mode SIL3/Cat.3/PLd

Wiring

The wiring is carried out on the matching BaseUnit (Page 10).

Sensor supply

The sensor supply can be powered internally or externally.

Wiring diagram – connecting one sensor via one channel

One sensor is connected via one channel (1oo1 evaluation) for each process signal. Any sensor supply of the module can be assigned to each input.

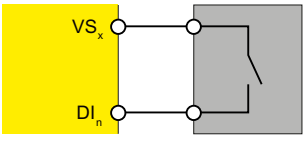

Figure 1-382 One sensor connected via one channel, internal sensor supply

You can also supply the sensor by means of an external sensor supply.

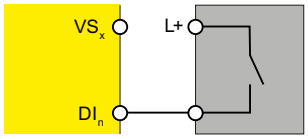

Figure 1-383 One sensor connected via one channel, external sensor supply

⚠ WARNING

To achieve SIL3/Cat.3/PLd using this wiring, you must use a qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 1-743 Parameter assignment

Parameters	Channel with internal sensor supply	Channel with external sensor supply
Sensor evaluation	1oo1 evaluation	
Short circuit test	• disable • enable	disable
Sensor supply	• Sensor supply n	External sensor supply*

*) Otherwise a diagnostic message will be generated when short circuit test is activated.

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 1-744 Fault detection

Fault	Fault detection		
	Internal sensor supply and short circuit test activated	Internal sensor supply and short circuit test deactivated	External sensor supply
Short circuit with other channels or other sensor supplies (short circuit with other channels is detected only if they use a different sensor supply)	yes*	no	no
Short circuit with L+ to DI$_n$	yes	no	no
Short circuit with M to DI$_n$	yes*	yes*	no

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal. If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

Fault	Fault detection		
	Internal sensor supply and short circuit test activated	**Internal sensor supply and short circuit test deactivated**	**External sensor supply**
Discrepancy error	—	—	—
Short circuit with L+ to VS_n	yes	no	—
Short circuit with M to VS_n or defective	yes	yes	—

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal. If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

WARNING

If the short circuit test is not activated or the sensor supply to digital inputs is set to "External sensor supply", the wiring between the sensor and the input channel must be short circuit proof.

5.2.3 Application 2: Safety mode SIL3/Cat.3/PLe

Assigning inputs to each other

The F-PM-E 24VDC/8A PPM ST power module has two fail-safe inputs, DI_0 and DI_1 (SIL3). You can combine the two inputs into one input.

The process signal is supplied by channel DI_0.

Wiring

The wiring is carried out on the matching BaseUnit (Page 10).

Sensor supply

The sensor supply can be powered internally or externally.

Wiring diagram – connecting a two-channel sensor via two channels

A two-channel sensor is connected equivalent to two inputs of the F-module for each process signal (1oo2 evaluation).

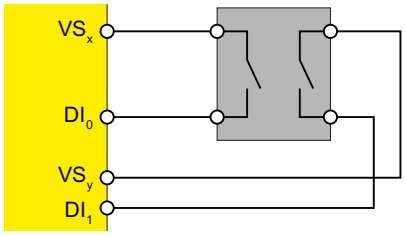

Figure 1-384 One two-channel sensor connected via two channels, internal sensor supply

You can also supply the sensor by means of an external sensor supply.

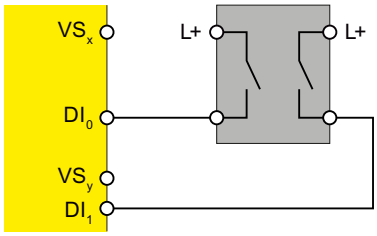

Figure 1-385 One two-channel sensor connected via two channels, external sensor supply

Wiring diagram – connecting two single-channel sensors via two channels

Two single-channel sensors that capture the same process value are connected to two inputs of the F-module for each process signal (1oo2 evaluation).

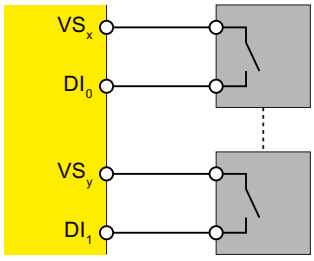

Figure 1-386 Two single-channel sensors connected via two channels, internal sensor supply

You can also supply the sensor by means of an external sensor supply.

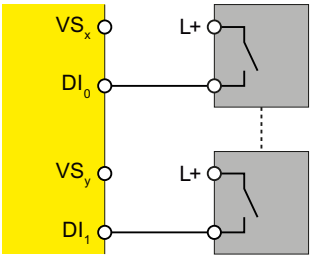

Figure 1-387 Two single-channel sensors connected via two channels, external sensor supply

⚠ WARNING

To achieve SIL3/Cat.3/PLe using this wiring, you must use a qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 1-745 Parameter assignment

Parameter	Channel with internal sensor supply	Channel with external sensor supply
Sensor evaluation	1oo2 evaluation, equivalent	
Short circuit test	• disable • enable	disable

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 1-746 Fault detection

Fault	Fault detection	
	Internal sensor supply and short circuit test deactivated	External sensor supply
Short circuit within the channel pair, with other channels or other sensor supplies	no	no
Short circuit with L+ to DI$_n$	yes*	yes*
Short circuit with M to DI$_n$	yes*	yes*
Discrepancy error	yes	yes
Short circuit with L+ to VS$_n$	no	no
Short circuit with M to VS$_n$ or defective	yes	—

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

5.2.4 Application 3: Safety mode SIL3/Cat.4/PLe

Assigning inputs to each other

The F-PM-E 24VDC/8A PPM ST power module has two fail-safe inputs, DI_0 and DI_1 (SIL3). You can combine the two inputs into one input.

The process signal is supplied by channel DI_0.

Wiring

The wiring is carried out on the matching BaseUnit (Page 10).

Sensor supply

The sensor must be supplied **internally** for application 3.1 (Page 44).

The sensor can be supplied internally or externally for application 3.2 (Page 45).

Requirements for applications in machine protection with Cat.4

Both conditions must be met for applications in machine protection with Cat.4:

- The wiring between sensors and automation system and between automation system and actuators must be designed to state-of-the-art engineering and standards to prevent short circuits.
- All short circuits listed in Fault detection and Fault detection must be detected. You only need to detect **one** short circuit because two faults are required to generate it. This means both signal cables in short circuit have an isolation fault. A multiple short circuit analysis is not required.

Procedures for locating all short circuits are also permitted if single short circuits are not located. One of the two conditions must be met for this purpose:

- Short circuits may not corrupt the read signals compared to the sensor signals.
- Short circuits cause a corruption of the read signals compared to sensor signals in the direction that ensures safety.

5.2.4.1 Application 3.1 (SIL3/Cat.4/PLe)

Wiring diagram – connecting a two-channel sensor via two channels

A two-channel sensor is connected to both inputs of the power module for each process signal (1oo2 evaluation).

Supply the sensors from two different sensor supplies.

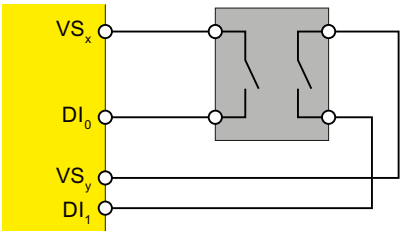

Figure 1-388 One two-channel sensor connected via two channels, internal sensor supply

You can also connect two single-channel sensors via two channels. In this case, the same process variable is acquired with two mechanically separate sensors.

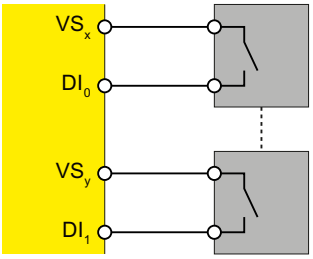

Figure 1-389 Two single-channel sensors connected via two channels, internal sensor supply

WARNING

To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 1-747 Parameter assignment

Parameter	Channel with internal sensor supply
Sensor evaluation	1oo2 evaluation, equivalent
Short circuit test	enable
Sensor supply	• Sensor supply n • External sensor supply

Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 1-748 Fault detection

Fault	Fault detection
Short circuit within the channel pair, with other channels or other sensor supplies	yes*
Short circuit with L+ to DI_n	yes* / yes (for channel whose short circuit test is activated)
Short circuit with M to DI_n	yes*
Discrepancy error	yes
Short circuit with L+ to VS_n	yes
Short circuit with M to VS_n or defective	yes

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.

5.2.4.2 Application 3.2 (SIL3/Cat.4/PLe)

Wiring diagram – connecting a nonequivalent sensor nonequivalent via two channels

A nonequivalent sensor is connected nonequivalent via 2 channels to both inputs of the power module for each process signal (1oo2 evaluation, nonequivalent).

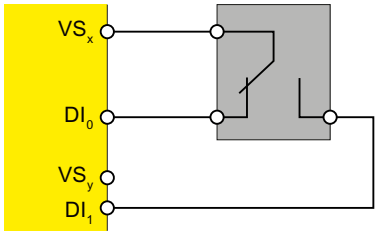

Figure 1-390 Nonequivalent sensor connected, internal sensor supply

You can also supply the sensor by means of an external sensor supply.

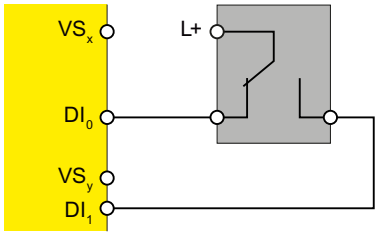

Figure 1-391 Nonequivalent sensor connected, external sensor supply

⚠ WARNING

To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Wiring diagram – connecting two single-channel sensors nonequivalent via two channels

Two single-channel sensors are connected nonequivalent to both inputs of the power module for each process signal (1oo2 evaluation).

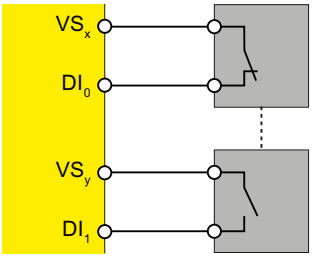

Figure 1-392 Two single-channel sensors connected nonequivalent, internal sensor supply

You can also supply the sensors by means of an external sensor supply.

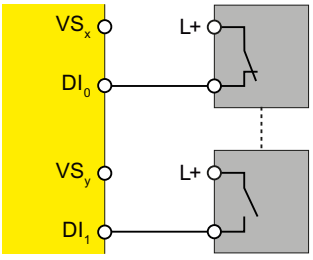

Figure 1-393 Two single-channel sensors connected nonequivalent, external sensor supply

⚠ WARNING

To achieve SIL3/Cat.4/PLe using this wiring, you must use a suitably qualified sensor.

Parameter assignment

Assign the following parameters for the corresponding channel:

Table 1-749 Parameter assignment

Parameters	
Sensor evaluation	1oo2 evaluation, non equivalent
Short circuit test	• disable • enable
Sensor supply	• Sensor supply n • External sensor supply

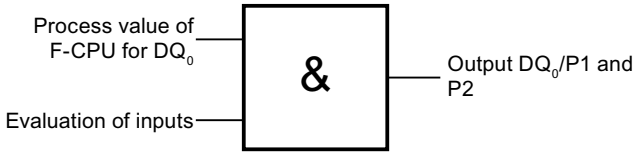
Fault detection

The following table presents fault detection according to the sensor supply and the parameter assignment for the short circuit test:

Table 1-750 Fault detection

Fault	Fault detection
Short circuit within the channel pair, with other channels or other sensor supplies	yes
Short circuit with L+ to DI_n	yes* / yes (for channel whose short circuit test is activated)
Short circuit with M to DI_n	yes*
Discrepancy error	yes
Short circuit with L+ to VS_n	yes, if used
Short circuit with M to VS_n or defective	yes, if sensor supply is activated

*) Fault detection only if signals are corrupted. That is, the read signal differs from the sensor signal (discrepancy error). If there is no signal corruption with respect to the sensor signal, fault detection is not possible and is not required from a safety standpoint.



5.3 Application for internal evaluation

Function

The evaluation of the safety function takes place internally in the F-module.

You can choose between 1oo1 evaluation or nonequivalent/equivalent 1oo2 evaluation of the sensors.

- With 1oo1 evaluation, the activated inputs are logically ANDed with the process image of output DQ_0.
- With 1oo2 evaluation, the result of the inputs is logically ANDed with the process image of output DQ_0.

The acknowledgment in case of an error takes place by the safety program in the F-CPU.

Use the wiring diagrams Applications for the output DQ/P1 and P2 (Page 34) and Applications for inputs (Page 37).

You achieve SIL3/Cat.4/PLe.

WARNING

In order to achieve SIL3/Cat.4/PLe with this wiring, you must install a qualified actuator and sensor, for example, in accordance with IEC 60947.

NOTE
If an error occurs at the inputs in this application, the F-module also outputs the error message "Safety-related shutdown" or "Safety event" for the output. Following elimination of the error at the inputs, a reintegration of the output is only possible after the bit pattern test (within the test time shortened to 60 s) has been performed.

Interconnection example

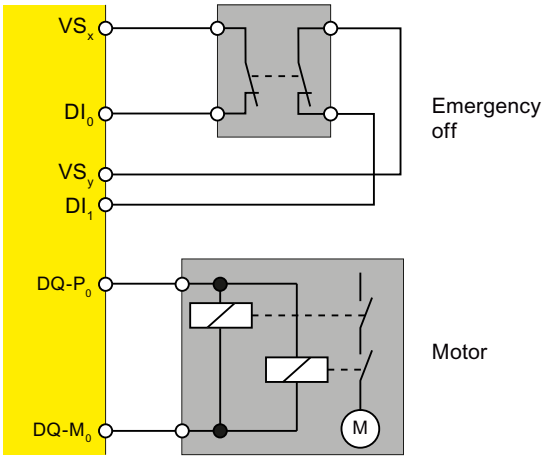


Figure 1-394 Emergency Off shutdown of a motor with equivalent 1oo2 evaluation

Parameter assignment

Assign the following parameters for the F-module:

Parameter	
Control of the output	F-CPU and onboard F-DI
Type of sensor interconnection	• 1-channel • 2-channel equivalent • 2-channel, non equivalent
Sensor supply	Sensor supply 0, Sensor supply 1, or External sensor supply

5.4 Applications for safety-related shutdown of standard modules

5.4.1 Safety-related shutdown of standard output modules, PM-switching

The F-PM-E 24VDC/8A PPM ST power module opens, together with the matching BaseUnit, a new potential group . Standard DQ modules that you use in the potential group can undergo a safety-related shutdown by the F-PM-E 24VDC/8A PPM ST power module. For this, the F-PM-E 24VDC/8A PPM ST power module performs a safety-related shutdown of voltage buses P1 and P2.

Configure the power module parameters as described in section Terminal assignment (Page 10).

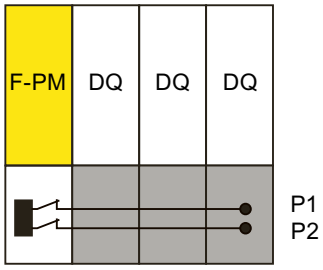

Figure 1-395 Safety-related shutdown of standard output modules

You achieve SIL2/Cat.3/PLd with safety-related shutdown of standard DQ modules.

⚠ WARNING

Safety-related activation of standard DQ module outputs is not possible; only safety-related **shutdown** is possible. You must therefore take the following possible effects into consideration:
In the worst case scenario, you must consider all possible faults of the standard DQ modules and the program controlling them for which there is no direct fault detection. For example, the F-PM-E 24VDC/8A PPM ST and F-DQ 4×24VDC/2A PM HF do not detect external short circuits to L+ at the standard DQ module outputs. All faults of the standard DQ modules act on the process via final controlling elements. The process must be made known to the F-CPU by way of sensors and a corresponding safety program.
Because safety-critical faults in the standard DQ modules cannot be detected by self-tests within the module, the "diagnostics" must be performed indirectly via the controlled process. As long as the incorrectly controlled process does not pose a hazard, the safety-related control does not intervene It only performs a shutdown if the process exhibits unwanted or potentially dangerous behavior.
It therefore follows that the reaction times for faults within standard DQ modules are not based on the specified short fault detection times of S7 but rather depend on the controlled process and the evaluation of feedback from the process.
Safety-related process values must be

- safely
- read in by way of fail-safe inputs or fail-safe input modules (e.g., F-DI)
- the safety function must be evaluated locally in the power module F-PM-E 24VDC/8A PPM ST or processed by the fail-safe CPU to form output commands and
- output by the fail-safe output module for shutdown of the corresponding safety relay or
- output by the F-PM-E 24VDC/8A PPM ST fail-safe power module.

If the expectations at the process end are not met (due to a process malfunction or faulty standard DO modules), the standard DQ modules must be brought to a safe state by way of the higher-level safety circuit.
The process safety time is of particular importance here. During this process safety time, no hazard is posed by an incorrectly controlled process.
The safety program must react in a safety-related and logical manner to unwanted or potentially dangerous states in the process via the F-PM-E 24VDC/8A PPM ST, F-DQ 4×24VDC/2A PM HF and fail-safe output modules.

If you want to avoid the problems described above completely, we recommend that you use the PM-switching F-DQ 4×24VDC/2A PM HF module instead of standard DQ modules.

⚠ WARNING

Always connect the 24 V DC supply for the standard ET 200SP modules to the F-PM-E 24VDC/8A PPM ST. Otherwise, the outputs of DQ modules may exhibit safety-critical behavior.

⚠ WARNING

When supplying standard DQ modules, always use the BaseUnits of these modules to supply the actuators (actuator feedback on the DQ module).
See also Terminal assignment (Page 10).

⚠ WARNING

Note the following for the "Safety-related shutdown of standard modules" application:
If standard modules behind a F-PM-E 24VDC/8A PPM ST power module are exposed to surge conditions, immunity according to failure criterion B is achieved (according to EN 298 and IEC 61326-3-2), i.e., the standard modules may fail in the event of surge conditions.

5.4.2 Safety-related shutdown of standard output modules, PP-switching

The F-PM-E 24VDC/8A PPM ST power module opens, together with the matching BaseUnit, a new potential group . Standard DQ modules that you use in the potential group can undergo a safety-related shutdown by the F-PM-E 24VDC/8A PPM ST power module. For this, the F-PM-E 24VDC/8A PPM ST power module performs a safety-related shutdown of voltage bus P1.

Configure the power module parameters as described in section Terminal assignment (Page 10).

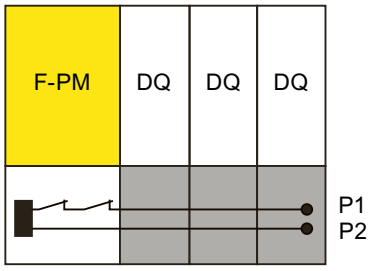

Figure 1-396 Safety-related shutdown of standard output modules

You achieve SIL2/Cat.3/PLd with safety-related shutdown of standard DQ modules.

⚠ WARNING

Safety-related activation of standard DQ module outputs is not possible; only safety-related **shutdown** is possible. You must therefore take the following possible effects into consideration:
In the worst case scenario, you must consider all possible faults of the standard DQ modules and the program controlling them for which there is no direct fault detection. For example, the F-PM-E 24VDC/8A PPM ST and F-DQ 4×24VDC/2A PM HF do not detect external short circuits to L+ at the standard DQ module outputs. All faults of the standard DQ modules act on the process via final controlling elements. The process must be made known to the F-CPU by way of sensors and a corresponding safety program.
Because safety-critical faults in the standard DQ modules cannot be detected by self-tests within the module, the "diagnostics" must be performed indirectly via the controlled process. As long as the incorrectly controlled process does not pose a hazard, the safety-related control does not intervene It only performs a shutdown if the process exhibits unwanted or potentially dangerous behavior.
It therefore follows that the reaction times for faults within standard DQ modules are not based on the specified short fault detection times of S7 but rather depend on the controlled process and the evaluation of feedback from the process.
Safety-related process values must be

- safely
- read in by way of fail-safe inputs or fail-safe input modules (e.g., F-DI)
- the safety function must be evaluated locally in the power module F-PM-E 24VDC/8A PPM ST or processed by the fail-safe CPU to form output commands and
- output by the fail-safe output module for shutdown of the corresponding safety relay or
- output by the F-PM-E 24VDC/8A PPM ST fail-safe power module.

If the expectations at the process end are not met (due to a process malfunction or faulty standard DO modules), the standard DQ modules must be brought to a safe state by way of the higher-level safety circuit.
The process safety time is of particular importance here. During this process safety time, no hazard is posed by an incorrectly controlled process.
The safety program must react in a safety-related and logical manner to unwanted or potentially dangerous states in the process via the F-PM-E 24VDC/8A PPM ST, F-DQ 4×24VDC/2A PM HF and fail-safe output modules.

If you want to avoid the problems described above completely, we recommend that you use the PM-switching F-DQ 4×24VDC/2A PM HF module instead of standard DQ modules.

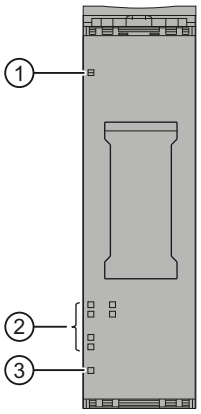
⚠ WARNING

Always connect the 24 V DC supply for the standard ET 200SP modules to the F-PM-E 24VDC/8A PPM ST. Otherwise, the outputs of DQ modules may exhibit safety-critical behavior.

⚠ WARNING

When supplying standard DQ modules, always use the BaseUnits of these modules to supply the actuators (actuator feedback on the DQ module).
See also Terminal assignment (Page 10).

⚠ WARNING



Note the following for the "Safety-related shutdown of standard modules" application:
If standard modules behind a F-PM-E 24VDC/8A PPM ST power module are exposed to surge conditions, immunity according to failure criterion B is achieved (according to EN 298 and IEC 61326-3-2), i.e., the standard modules may fail in the event of surge conditions.

Interrupts/diagnostic messages

6.1 Status and error display

LED display

① DIAG (green/red)
② Channel status (green), channel fault (red)
③ PWR (green)

Figure 1-397 LED display

Meaning of the LED displays

The following tables explain the meaning of the status and error displays. Remedies for diagnostic messages can be found in section Diagnostic messages (Page 57).

WARNING

The DIAG LED and the channel status and channel fault LEDs of the inputs and outputs are not designed as safety-related LEDs and therefore may not be evaluated for safety-related activities.

PWR LED

Table 1-751 Meaning of the PWR LED

PWR	Meaning
□ Off	Supply voltage L+ missing
■ On	Supply voltage L+ available

DIAG LED

Table 1-752 Meaning of the DIAG LED

DIAG	Meaning
□ Off	Backplane bus supply of the ET 200SP not okay
☼ Flashing	Module parameters not configured
■ On	Module parameters configured and no module diagnostics
☼ Flashing	Module parameters configured and module diagnostics

Channel status/channel fault LED

Table 1-753 Meaning of the channel status/channel fault LED

Channel status	Channel fault	Meaning
□ Off	□ Off	Process signal = 0 and no channel diagnostics
■ On	□ Off	Process signal = 1 and no channel diagnostics
□ Off	■ On	Process signal = 0 and channel diagnostics
/ Alternately flashing		Channel waiting for user acknowledgment

Channel status/DIAG/channel fault LED

Table 1-754 Meaning of the channel status/DIAG/channel fault LED

Channel status	DIAG	Channel fault	Meaning
□ Off	☼ Flashing	■ All On	The PROFIsafe address does not match the configured PROFIsafe address
☼ Flashing	☼ Flashing	□ Off	Identification of the F-module when assigning the PROFIsafe address

6.2 Interrupts

Introduction

The F-PM-E 24VDC/8A PPM ST fail-safe power module supports diagnostic interrupts.

Diagnostic interrupt

The F-module generates a diagnostic interrupt for each diagnostic message described in section Diagnostic messages (Page 57).

The table below provides an overview of the diagnostic interrupts of the F-module . The diagnostic interrupts are assigned either to one channel or the entire F-module.

⚠ WARNING

Before acknowledging the short circuit diagnostic message, remedy the respective fault and validate your safety function. Follow the fault remedying procedure described in section Diagnostic messages (Page 57).

Table 1-755 Diagnostic interrupts of the F-PM-E 24VDC/8A PPM ST

Diagnostic interrupt	Fault code	Signaled in application	Scope of diagnostic interrupt	Configurable
Overtemperature	5_D	—	F-module	No
Parameter assignment error	16_D			
Load voltage missing	17_D			
Access to retentive storage of F-address not possible	30_D			
Different destination address (F_Dest_Add)	64_D			
Invalid destination address (F_Dest_Add)	65_D			
Invalid source address (F_Source_Add)	66_D			
Watchdog time is 0 ms (F_WD_Time or F_WD_Time2)	67_D			
"F_SIL" parameter exceeds the application-specific SIL	68_D			
"F_CRC_Length" parameter does not match the generated CRC	69_D			
Incorrect F-parameter version or F_Block_ID	70_D			
CRC1 error	71_D			
Inconsistent iParameters (iParCRC error)	75_D			
F_Block_ID not supported	76_D			
Internal error	256_D			
Time monitoring activated	259_D			
Internal supply voltage of the module failed	260_D			
Output short-circuited to L+	261_D		Channel	Yes
Output short-circuited to ground	262_D			
Wire break	265_D			
Incorrect/inconsistent firmware present. Firmware update required	283_D			No
Discrepancy error, channel status 0/0	768_D	2, 3		
Discrepancy error, channel status 0/1	769_D			

Diagnostic interrupt	Fault code	Signaled in application	Scope of diagnostic interrupt	Configurable
Discrepancy error, channel status 1/0	770_D	2, 3	Channel	No
Discrepancy error, channel status 1/1	771_D			
Input signal could not be clearly detected	773_D	1, 2, 3		
Short circuit of internal sensor supply to L+	774_D			Yes
Overload or short circuit of internal sensor supply to ground	775_D			
No pulse detected	778_D	1		
Sensor signal chatters	784_D			
Switching frequency too high	785_D	1,2,3		No
Undertemperature	786_D		F-module	
Fault in input circuit	787_D			
PROFIsafe communication error (timeout)	792_D			
PROFIsafe communication error (CRC)	793_D			
PROFIsafe address assignment error	794_D			
Input short-circuited to L+	796_D		Channel	Yes
Output defective	797_D	—		No
Readback error	798_D			
Overload	800_D			
Supply voltage too high	802_D	1, 2, 3	F-module	
Supply voltage too low	803_D			

6.3 Diagnostic messages

Digital module error types

Module faults are indicated as diagnostics (module status).

Once the fault is eliminated, the F-module must be reintegrated in the safety program. For additional information on passivation and reintegration of F-I/O, refer to the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Table 1-756 Diagnostic messages of the F-PM-E 24VDC/8A PPM ST

Diagnostic message	Fault code	Meaning	Remedy
Overtemperature	5_D	An excessively high temperature was measured in the F-module.	Operate the F-module within the specified temperature range. (see Technical specifications (Page 63)) Once the fault has been eliminated, the F-module must be removed and inserted or the power switched OFF and ON
Wire break	6_D	Possible causes: • There is an interrupted cable between the module and actuator. • The channel is not connected (open). • There is a short circuit between channels with different signals.	• Establish a cable connection. • Disable the wire break detection for the channel in the parameter assignment. • Eliminate the short circuit.

Diagnostic message	Fault code	Meaning	Remedy
Parameter assignment error	16_D	Parameter assignment errors include: • The F-module cannot use the parameters (unknown, invalid combination, etc.). • The F-module parameters have not been configured.	Correct the parameter assignment.
Load voltage missing	17_D	Missing or insufficient supply voltage L+	• Check supply voltage L+ at BaseUnit • Check BaseUnit type
Access to retentive storage of F-address not possible	30_D	The F-destination address stored in the coding element cannot be accessed.	Verify that the coding element is present or replace the coding element.
Different destination address (F_Dest_Add)	64_D	The PROFIsafe driver has detected a different F-destination address.	Check the parameter assignment of the PROFIsafe driver and the address setting of the F-module.
Invalid destination address (F_Dest_Add)	65_D	The PROFIsafe driver has detected an invalid F-destination address.	Check the parameter assignment of the PROFIsafe driver.
Invalid source address (F_Source_Add)	66_D	The PROFIsafe driver has detected an invalid F-source address.	
Watchdog time is 0 ms (F_WD_Time or F_WD_Time2)	67_D	The PROFIsafe driver has detected an invalid watchdog time.	
"F_SIL" parameter exceeds the application-specific SIL	68_D	The PROFIsafe driver has detected a discrepancy between the SIL setting of the communication and the application.	
"F_CRC_Length" parameter does not match the generated CRC	69_D	The PROFIsafe driver has detected a discrepancy in the CRC length.	
Incorrect F-parameter version or F_Block_ID	70_D	The PROFIsafe driver has detected an incorrect version of the F-parameters or an invalid F_Block_ID.	
CRC1 error	71_D	The PROFIsafe driver has detected inconsistent F-parameters.	
Inconsistent iParameters (iParCRC error)	75_D	The PROFIsafe driver has detected inconsistent iParameters.	Check the parameter assignment.
F_Block_ID not supported	76_D	The PROFIsafe driver has detected an incorrect Block ID.	Check the parameter assignment of the PROFIsafe driver.
Internal error	256_D	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate the interference. The module must then be pulled and plugged, or the power switched OFF and ON • Replace the F-module.
Internal supply voltage of the module failed	260_D	Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate the electromagnetic interference. The module must then be pulled and plugged, or the power switched OFF and ON • Replace the F-module.
Output short-circuited to L+	261_D	Short circuit to L+ can mean: • The sensor cable is short-circuited to L+. • The output cable is short-circuited to L+.	Correct the process wiring.

Diagnostic message	Fault code	Meaning	Remedy
Output short-circuited to ground	262_D	Short circuit to ground can mean: • The sensor cable is short-circuited to ground. • The output cable is short-circuited to ground. • The output signal is short-circuited to ground.	Correct the process wiring.
Incorrect/inconsistent firmware present. Firmware update required	283_D	The firmware is incomplete and/or firmware added to the F-module is incompatible. This leads to errors or functional limitations when operating the F-module.	• Perform a firmware update for all parts of the F-module and note any error messages. • Use only firmware versions released for this F-module.
Discrepancy error, channel status 0/0	768_D	Possible causes: • The process signal is faulty. • The sensor is defective. • The configured discrepancy time is too low. • There is a short circuit between an unconnected sensor cable and the sensor supply cable. • Wire break in connected sensor cable or the sensor supply cable • An error occurred during the discrepancy check.	• Check the process signal. • Replace the sensor. • Check the parameter assignment of the discrepancy time. • Check the process wiring.
Discrepancy error, channel status 0/1	769_D		
Discrepancy error, channel status 1/0	770_D		
Discrepancy error, channel status 1/1	771_D		
Input signal could not be clearly detected	773_D	An error occurred in the plausibility check of the input signal between the processors. You must eliminate the error within 100 hours. If you do not eliminate the error within 100 hours, the F-module will become inoperative. Possible causes: • The input signal is faulty, e.g., as a result of impermissibly high electromagnetic interference. • A high-frequency input signal is present, e.g., due to mutual interference of sensors or the signal being above the sampling frequency of the input signal. • A momentary interruption/short circuit of the sensor cable (loose contact) is present. • The sensor/switch is bouncing.	• Use shielded cables to reduce the EMC effects. • Reduce the input frequency. • Check the wiring of the sensor.
Short circuit of internal sensor supply to L+	774_D	Possible causes: • There is a short circuit of the internal sensor supply with L+. • There is a short circuit of two sensor supplies. • The capacitance of the connected sensor for the configured test time is too high. • The sensor is defective.	• Eliminate the short circuit in the process wiring. • Check the configured test time and the process wiring. • Replace the sensor.

Diagnostic message	Fault code	Meaning	Remedy
Overload or short circuit of internal sensor supply to ground	775_D	Possible causes: • The internal sensor supply is short-circuited to ground. • Impermissibly high electromagnetic interference is present.	• Eliminate the overload. • Eliminate the short circuit in the process wiring. • Check the "Sensor supply" parameter. • Eliminate/reduce the electromagnetic interference.
No pulse detected	778_D	A pulse with a length greater than or equal to "Minimum pulse time" has not occurred within the time configured with the "Pulse monitoring window" parameter. Possible causes: • The "Pulse monitoring window" parameter setting is too low. • The "Minimum pulse time" parameter setting is too high. • There is a wire break in the process wiring.	• Check the "Pulse monitoring window" parameter. • Check the "Minimum pulse time" parameter. • Check the process wiring.
Sensor signal chatters	784_D	Too many signal changes have occurred within the time configured with the "Monitoring window" parameter. • The "Monitoring window" parameter setting is too high. • The "Number of signal changes" parameter setting is too low. • A momentary interruption/short circuit of the sensor cable (loose contact) is present. • Impermissibly high electromagnetic interference is present. • The sensor is bouncing. • The sensor is defective.	• Check the "Monitoring window" parameter. • Check the "Number of signal changes" parameter. • Check the process wiring. • Eliminate/reduce the electromagnetic interference. • Replace the sensor.
Switching frequency too high	785_D	The maximum switching frequency of the F-module has been exceeded.	Reduce the switching frequency. (see Technical specifications (Page 63))
Undertemperature	786_D	The minimum permissible temperature limit has been violated.	Operate the F-module within the specified temperature range. (see Technical specifications (Page 63))
Fault in input circuit	787_D	The F-module has detected an internal error. Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	• Eliminate/reduce the electromagnetic interference. • Replace the F-module.
PROFIsafe communication error (timeout)	792_D	The PROFIsafe driver has detected a timeout. Possible causes: • The F-monitoring time is set incorrectly. • Bus faults are present.	• Check the parameter assignment. • Ensure that communication is functioning correctly.

Diagnostic message	Fault code	Meaning	Remedy
PROFIsafe communication error (CRC)	793_D	The PROFIsafe driver has detected a CRC error. Possible causes: • The communication between the F-CPU and F-module is disturbed. • Impermissibly high electromagnetic interference is present. • An error occurred in the sign-of-life monitoring.	• Check the communication connection between the F-module and F-CPU. • Eliminate the electromagnetic interference.
PROFIsafe address assignment error	794_D	An error occurred during the automatic PROFIsafe address assignment.	Check the configuration.
Input short-circuited to L+	796_D	The input signal is short-circuited to L+.	Eliminate the short circuit.
Output defective	797_D	The F-module has detected an internal error. Possible causes: • Short circuit to L+ or M • The F-module is defective.	• Check the wiring. • Replace the F-module.
Readback error	798_D	The F-module has detected an internal error. Possible causes: • Impermissibly high electromagnetic interference is present. • The F-module is defective.	If the error persists, replace the F-module.
Overload	800_D	The maximum permissible output current has been exceeded. The output stage has been switched off. Possible causes: • A short circuit exists.	Check the process wiring.
Supply voltage too high	802_D	The supply voltage is too high.	Check the supply voltage.
Supply voltage too low	803_D	The supply voltage is too low.	Check the supply voltage.

Supply voltage outside the nominal range

In the case of a voltage dip in the supply voltage L+, the DIAG LED flashes and the module is passivated.

When the voltage has recovered (level must remain above the specified value for at least 1 minute (see Technical specifications (Page 63): Voltages, Currents, Potentials)), the DIAG LED stops flashing. The module remains passivated.

Behavior in case of cross circuit/short circuit to the sensor supply

When internal sensor supply is specified and short circuit test is disabled, short circuits to ground at the sensor supplies are detected. Channels for which the relevant sensor supply is configured will be passivated.

When internal sensor supply is specified and short circuit test is enabled, short circuits to ground and potential at the sensor supply are detected. Channels for which the relevant sensor supply is configured will be passivated.

Special features for fault detection

The detection of certain faults (short-circuits or discrepancy errors, for example) depends on the application, the wiring, and the parameter assignment of the short circuit test and the sensor power supply. The corresponding tables for fault detection for the applications are available under Applications of the F-I/O module (Page 34).

Generally applicable information on diagnostics

Information on diagnostics that pertains to all fail-safe modules (for example, readout of diagnostics functions or passivation of channels) is available in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

6.4 Value status

Properties

In addition to the diagnostic messages and the status and error display, the F-module makes available information about the validity of each input and output signal – the value status. The value status is entered in the process image along with the input signal.

Value status for digital input and output modules

The value status is additional binary information of a digital input or output signal. It is entered in the process image of the inputs (PII) at the same time as the process signal. It provides information about the validity of the input or output signal.

The value status is influenced by the wire break check, short-circuit, chatter monitoring, pulse extension, and plausibility check.

- 1_B: A valid process value is output for the channel.
- 0_B: A fail-safe value is output for the channel, or the channel is deactivated.

Assignment of the inputs and value status in the PII

Each channel of the F-module is assigned a value status in the process image of the inputs. You can find the assignment in section Address space (Page 32).

Reference

A detailed description of the evaluation and processing of the respective input signals can be found in the SIMATIC Safety – Configuring and Programming (http://support.automation.siemens.com/WW/view/en/54110126) manual.

Technical specifications

Technical specifications of F-PM-E 24VDC/8A PPM ST

	6ES7136-6PA00-0BC0
Product type designation	F-PM-E PPM 24VDC
General information	
Hardware product version	01
Firmware version	V1.0.0
Product function	
I&M data	Yes; IM0 to IM3
Engineering with	
STEP 7 TIA Portal configurable/integrated as of version	V12.0
STEP 7 configurable/integrated as of version	as of V5.5 SP3 / -
PROFIBUS as of GSD version/GSD revision	V2.3
PROFINET as of GSD version/GSD revision	V2.31
Operating mode	
Multi-output	No
Installation type/mounting	
Rack mounting possible	No
Front installation possible	No
Rail mounting possible	Yes; standard DIN rail
Wall mounting/direct mounting possible	No
Supply voltage	
Type of supply voltage	24 V DC
Rated value (DC)	24 V
Low limit of permissible range (DC)	20.4 V
High limit of permissible range (DC)	28.8 V
Reverse polarity protection	Yes
Input current	
Current consumption (rated value)	75 mA; without load
Current consumption, max.	21 mA; from backplane bus
Output voltage	
Rated value (DC)	24 V
Sensor supply	
Number of outputs	2
Output current	
Up to 60 °C, max.	0.3 A
Short circuit protection	Yes; electronic (response threshold 0.7 A to 2.1 A)
24 V sensor supply	
24 V	Yes; min. L+ (-1.5 V)
Short circuit protection	Yes
Output current, max.	600 mA; total current of all sensors

	6ES7136-6PA00-0BC0
Power	
Power consumption from the backplane bus	70 mW
Power loss	
Power loss, typ.	5 W
Address space	
Address space per module	
Input	7 bytes
Output	5 bytes
Digital inputs	
Number of inputs	2
m/p-reading	Yes; p-reading
Input characteristic curve according to IEC 61131, Type 1	Yes
Input voltage	
Type of input voltage	DC
Rated value, DC	24 V
For "0" signal	-30 to +5 V
For "1" signal	+15 to +30 V
Input current	
For "1" signal, typ.	3.7 mA
Input delay (for rated value of input voltage)	
For standard inputs	
Assignable	Yes
For "0" to "1", min.	0.4 ms
For "0" to "1", max.	20 ms
For "1" to "0", min.	0.4 ms
For "1" to "0", max.	20 ms
For counter/technological functions	
Assignable	No
Length of cable	
Cable length, shielded, max.	1000 m
Cable length unshielded, max.	500 m
Digital outputs	
Number of outputs	1
Digital outputs, configurable	Yes
Short circuit protection	Yes
Response threshold, typ.	> 14.8 A
Wire break detection	Yes
Response threshold, typ.	8 mA
Overload protection	Yes
Response threshold, typ.	8.8 A
Voltage induced on current interruption limited to	max 1.5 V
Switching capacity of outputs	
With resistive load, max.	8 A
With lamp load, max.	100 W
Load resistance range	
Low limit	3 Ω

	6ES7136-6PA00-0BC0
High limit	2000 Ω
Output voltage	
Type of output voltage	DC
For "1" signal, min.	24 V; L+ (-0.5 V)
Output current	
For "1" signal, rated value	8 A
For "0" signal, residual current, max.	1.5 mA; PP-switching: Max. 1.5 mA; PM-switching: Max. 1 mA
Switching frequency	
With resistive load, max.	10 Hz; symmetrical
With inductive load, max.	0.1 Hz; acc. to IEC 947-5-1, DC13, symmetrical
With lamp load, max.	4 Hz; symmetrical
Total current of outputs	
Max. current per channel	8 A; (note derating data in the manual)
Max. current per module	8 A; (note derating data in the manual)
Length of cable	
Cable length, shielded, max.	1000 m
Cable length unshielded, max.	500 m
Interrupts/diagnostics/status information	
Fail-safe values can be switched to	No
Interrupts	
Diagnostic interrupt	Yes
Hardware interrupt	No
Diagnostic messages	
Diagnostics	Yes, see section "Interrupts/diagnostic messages" in the manual
Diagnostics display LED	
RUN LED	Yes; green LED
ERROR LED	Yes; red LED
Monitoring of supply voltage	Yes; green PWR LED
Channel status display	Yes; green LED
For channel diagnostics	Yes; red LED
For module diagnostics	Yes; green/red DIAG LED
Electrical isolation	
Electrical isolation channels	
Between channels	No
Between the channels and the backplane bus	Yes
Between the channels and the supply voltage of the electronics	No
Permitted potential difference	
Between different circuits	60 V DC / 75 V AC
Isolation	
Isolation test voltage	707 V DC (type test)
Standards, approvals, certificates	
SIL acc. to IEC 61508	SIL 3
Suitable for safety functions	Yes
Maximum achievable safety class in safety mode	

	6ES7136-6PA00-0BC0
Performance level according to EN ISO 13849-1	PLe
Low demand (PFD) acc. to SIL3	< 2.00E-05 1/h
High demand (PFH) acc. to SIL3	< 1.00E-09 1/h
Environmental conditions	
Operating temperature	
Min.	0 °C
Max.	60 °C
Horizontal installation, min.	0 °C
Horizontal installation, max.	60 °C
Vertical installation, min.	0 °C
Vertical installation, max.	50 °C
Storage/transport temperature	
Min.	-40 °C
Max.	70 °C
Dimensions	
Width	20 mm
Height	72 mm
Depth	55 mm
Weights	
Weight, approx.	70 g

Temperature characteristic values (derating)

Mounting position	Maximum temperature	Maximum output current
Horizontal	40 °C	8 A
	50 °C	6 A
	60 °C	4 A
Vertical	50 °C	4 A

Response times

A

A.1 Response times

Introduction

The next section shows the response times of power module F-PM-E 24VDC/8A PPM ST. The response times of the fail-safe modules are included in the calculation of the F-system response time.

Times required for the calculation

Maximum internal processing time: $T_{max.}$ = 29 ms

Maximum cycle time: T_{cycle} = 14 ms

Short circuit test time for the sensor supply configured for the channel = "Time for short circuit test" + "Startup time after short circuit test"

The input delay, short circuit test times, dark test time, switch-on time, discrepancy time, and test time are configured in STEP 7.

Definition of response time for fail-safe digital inputs

The response time represents the interval between a signal change at the digital input and reliable availability of the safety frame on the backplane bus.

Definition of response time for internal evaluation: Cycle time + Input delay + Short circuit test time + Maximum(readback time, switch-on time, light test time)

Maximum response time in the error-free case with 1oo1 evaluation

Maximum response time = T_{max} + Input delay + Short circuit test time for the sensor supply configured for the channel

Maximum response time in the error-free case with 1oo2 evaluation

Maximum response time = T_{max} + Input delay + Maximum (short circuit test time for the sensor supply configured for channel 0, short circuit test time for the sensor supply configured for channel n1)

Maximum response time with external short circuits

Maximum response time = Input delay + (n × T_{cycle}) + Sum(all short circuit test times + all startup times of sensors with activated short circuit test)

n = Number of sensor supplies with activated short circuit test

Maximum response time with discrepancy error and 1oo2 evaluation

Maximum response time = T_{max} + Input delay + Discrepancy time + 2 × Maximum (short circuit test time for the sensor supply configured for channel 0, short circuit test time for the sensor supply configured for channel 1)

Maximum response time with error and change of user data

Maximum response time = 3 × T_{cycle} + Maximum(dark test time, switch-on time)

Maximum response time with detection by bit pattern test

Maximum response time = T_{cycle} + Maximum(dark test time, switch-on time) + configured test time

Definition of response time for fail-safe digital outputs

The response time represents the interval between an incoming safety message frame from the backplane bus and the signal change at the digital output.

Maximum response time for fail-safe digital outputs

The maximum response time for fail-safe digital outputs in the error-free case is equal to:

Maximum response time = 2 × T_{cycle} + Maximum(dark test time, switch-on time)

The maximum response time for fail-safe digital outputs in the presence of an error is equal to:

Maximum response time = T_{cycle} + 2 × Maximum(dark test time, switch-on time) + interval between test pulses

A.2 Minimum distance of test pulses

The minimum interval between two test pulses depends on the activation of the light test, the configured maximum test time, and whether the output has been specified as a PM-switching or PP-switching output.

You can find the dependencies in the table below:

Assigned maximum test time	PM switching, light test not active	PM switching, light test active	PP switching, light test not active	PP switching, light test active
1000 s	62.080 s	45.147 s	82.913 s	38.137 s
100 s	5.830 s	4.238 s	7.913 s	3.521 s

Switching of loads

B

B.1 Connecting capacitive loads

If the output of power module F-PM-E 24VDC/8A PPM ST is interconnected with loads that require little current and have capacitance, this can lead to detection of a short circuit or overload. Reason: The capacitance cannot be sufficiently discharged or charged during the configured readback time of the bit pattern test.

The figure below shows typical curves for the assignable readback times representing the correlation between load resistance and switchable load capacitance at a supply voltage of 24 V DC.

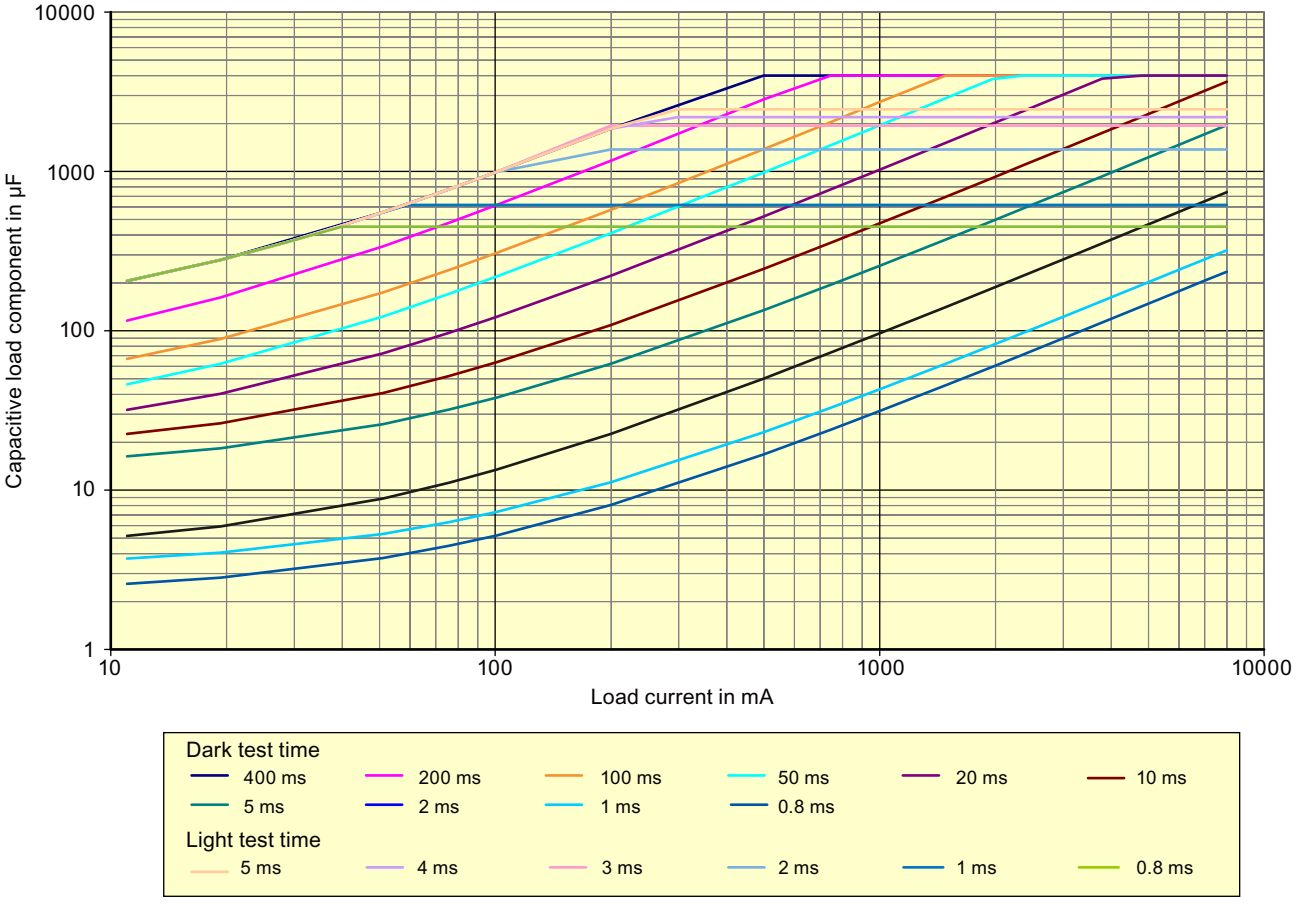

Figure 1-398 Switching of capacitive loads for the F-PM-E 24VDC/8A PPM ST power module depending on the configured dark and light test times

The curves shown were plotted using a SIMATIC PS 307 10A power supply unit with a cable length of 25 m (cable cross-section of 1.5 mm^2) between the output of the F-PM-E 24VDC/8A PPM ST power module and the load.

Remedy for detecting a short circuit

1. Determine the load current and capacitance of the load.
2. Locate the operating point in the diagram above.
3. If the operating point is above the curve, you must increase the load current until the new operating point is below the curve by connecting a resistor in parallel.

B.2 Switching of inductive loads

Switching of inductive loads

The diagram below shows the maximum permitted inductive loads as a function of the load current and switching frequency.

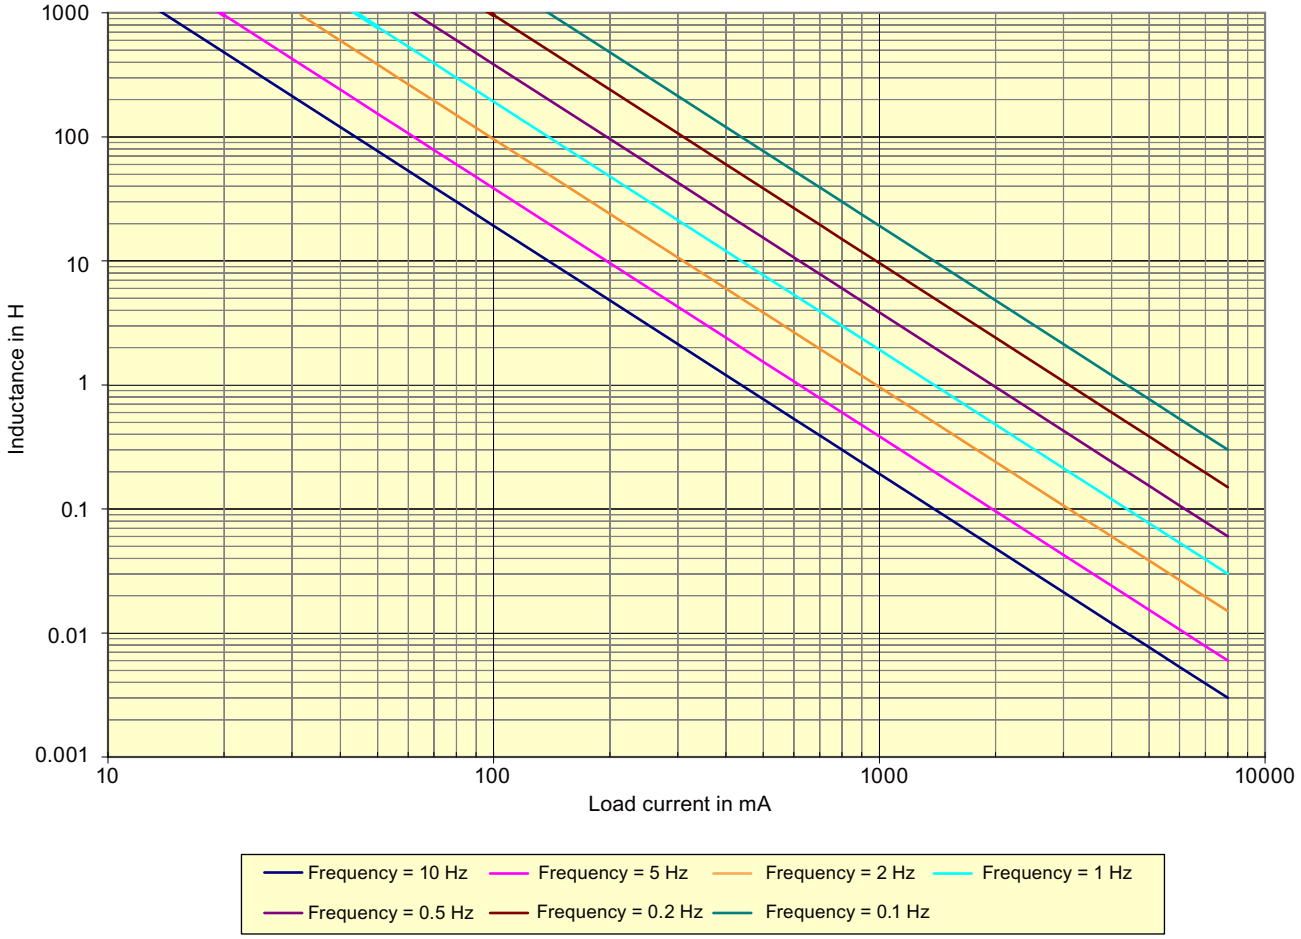

Figure 1-399 Switching of inductive loads for the F-PM-E 24VDC/8A PPM ST power module depending on the load current and switching frequency

SIEMENS

Product Information for ET 200SP F-TM Count 1x1Vpp sin/cos HF (6ES7136-6CB00-0CA0)

Product Information

Introduction

Scope of the product information

This product information includes amendments and corrections to the documentation of the *ET 200SP Distributed I/O System, System Manual*. This product information also includes the addition of the ET 200SP F-TM Count 1x1Vpp sin/cos HF module (F-TM Count). The statements provided herein should be considered to be more up-to-date than other documentation if uncertainties arise.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.
In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.
Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.
For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.
To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (https://www.siemens.com/cert).

Incorrect counter value

Description

1. An issue has been identified which may cause the count value to be reported incorrectly or the module to enter a fatal error state. Either situation may occur when all three of the following selections are enabled:

- The encoder Signal type is set to "Sin/Cos encoder (A, B, N)".
- The "Invert direction" option is selected.
- The Reaction to signal N parameter is set to "Synchronization at signal N".

While a solution is under development, the following steps constitute a suitable workaround:

1. Swap the wiring of the SIN and COS signals on the terminal block.
2. Unselect the "Invert direction" configuration in TIA Portal.

2. An additional issue has been identified which may cause the count value to be incorrect if the N signal synchronization occurs at frequencies greater than 4 KHz. The error in the count value is proportional to the counting frequency when the N signal is processed by the counter module. The error in the count value will be most visible when the movement stops. The count error does not accumulate over multiple revolutions, but is reset each time the counter module processes an N signal.

© Siemens 2022. All rights reserved

The issue occurs when the following selections are enabled:

- The encoder Signal type is set to "Sin/Cos encoder (A, B, N)".
- The Reaction to signal N parameter is set to "Synchronization at signal N".

While a solution is under development, a workaround is to decelerate prior to stopping. This will minimize the error in the count value.

General amendments to the documentation

Content
This Product Information contains additional information and corrections relating to the documentation on power module F-PM-E 24VDC/8A PPM ST (6ES7136-6PA00-0BC0) firmware version V2.0.0 and higher.
The Product Information is part of the product supplied. The statements provided in it should be considered more up-to-date than other documentation if uncertainties arise.
You can use the power module F-PM-E 24VDC/8A PPM ST with the standard modules listed under entry ID: 83203124 (https://support.industry.siemens.com/cs/ww/es/view/83203124) within a potential group.

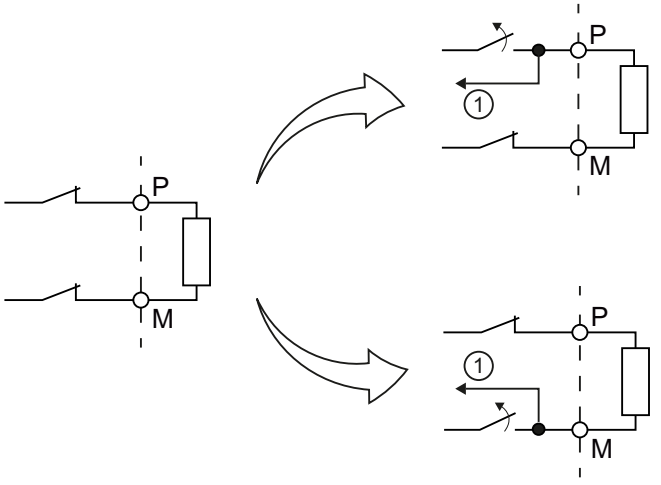
Parameters

Table 1 **Parameters for power module**

Parameters	Value range	Parameter reassign-ment in RUN	Scope
Output:			
Activated	• disable • enable	no	Channel
Control of the output	• F-CPU • F-CPU and onboard F-DI	no	Module

* Firmware V2.0.0 and higher

© Siemens 2018. All rights reserved



Parameters	Value range	Parameter reassignment in RUN	Scope
Output type	• PM switching • PP switching	no	Channel
Max. readback time, dark test and shutdown test	0.8 to 400.0 ms	no	Channel
Max. readback time switch on test	0.8 to 5.0 ms	no	Channel
Activated light test	• disable • enable	no	Channel
Diagnosis: Wire break	• disable • enable	no	Channel
Deactivation dark test (max. SIL2, Cat. 3, PLd) *	• disable • enable	no	Channel

* Firmware V2.0.0 and higher

Addendum to section "Max. readback time, dark test and shutdown test" of the "Power Module F-PM-E 24VDC/8A PPM ST (6ES7136-6PA00-0BC0)" manual

Function

Dark tests are switch-off tests with bit pattern test.
For "Deactivation dark test" mode, the parameter "Max. readback time, dark test and switch-off test" is only relevant for the process value change.
For a dark test, a test signal is switched to the output channel while the output channel is active (output signal "1"). This output channel is then briefly disabled (= "dark period") and read back. A sufficiently slow actuator does not respond to this and remains switched on.

① Readback

Figure 1 Functional principle of the dark test (PM switching)

This parameter allows you to set the time for the readback.
If the expected signals (P-readback and M-readback) could not be read back correctly after expiration of the readback time dark test, the output channel is passivated.

No new process values are switched to the output channels while a bit pattern is still active (switch test is carried out). This means that a higher maximum readback time for the dark test increases the response time of the F-module.

⚠ WARNING

Through the configured "Max. readback time, dark test and switch-off test", short circuits (cross-circuits) to a signal with a frequency greater than 1/(2 x configured readback time dark test) Hz cannot be recognized (50:50 sampling ratio).
Short circuits (cross-circuits) to an output of the same module are recognized.

The parameter also has an effect on the short circuit detection (cross-circuit) with "1" signal when the output signal is changed from "1" to "0" with the safety program.

Setting the parameter "Max. readback time, dark test and switch-off test"
Because the fault reaction time is extended by the length of the readback time dark test, we recommend that you set the readback time dark test by trial and error as low as possible, but high enough that the output channel is not passivated.
You determine the readback time required for your actuator with the diagram in the chapter Switching capacitive loads.
If the capacity of the actuator is not known, it may be necessary for you to determine the value for the readback time light test by trial and error. This may also be necessary due to the part variances in the actuator or external influences.
Proceed as follows:

- Set the "Max. readback time, dark test and switch-off test" so that the output channel can be read back correctly but your actuator does not respond yet.
- For verification use the process value "0" with a minimum duration that corresponds to the "maximum test time" parameter. Execute a process value change from "1" to "0".
- If the output channel is passivated sporadically, set a higher value for the maximum readback time dark test.
- If the output channel is passivated, the readback time dark test is too small for a connected capacitive load. The discharge cannot take place during the configured readback time dark test. Increase the readback time dark test.

If you have set the readback time dark test to the maximum value of 400 ms and there is still a passivation of the output channel, there is either an external fault or the connected capacity is outside the permitted range.

Test pulses of the dark test

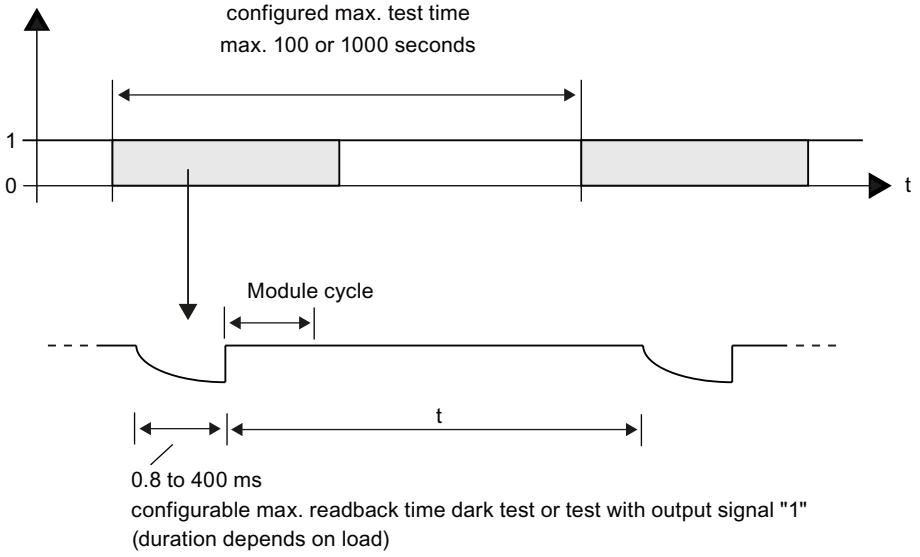


Figure 2 Test pulses of the dark test

The distance between two test pulses (t) depends on the parameter assignment. Additional information is available in Minimum distance between test pulses.

Deactivation dark test (max. SIL2, Cat. 3, PLd)

To prevent an unwanted reaction of the actuator to a dark test, you can deactivate the dark test at the F-module output. This undesirable reaction can be, for example, a brief failure of a magnetic drive or a process value change of a digital input with very short input delay.
A capacitive load that does not meet the load curve (see section Switching capacitive loads) can result in a passivation of the output in case of a process value change, switch on test or light test, even if the dark test is deactivated.
You can reach SIL2/Cat.3/PLd with deactivated dark test.
For deactivated dark test:

⚠ WARNING

SIL2/category 3/PLd requires that there is a signal change from 1 to 0 at output DQ/P1 and P2 at least once a year. It is not enough to simply turn off the supply voltage of the F-module and turn it on again.

You achieve the following technical specifications with deactivated dark test:

XE TDB_S	6ES7136-6PA00-0BC0
Maximum achievable safety class in safety mode XE U1:1	
Performance Level to EN ISO 13849-1:2015 XE T:2	PLd
SIL according to IEC 61508 XE T:2	SIL 2
Low demand mode: PFDavg according to SIL2 XE N:2	< 2.00E-04
High demand/continuous mode: PFH according to SIL2 XE N:2	1/h; < 1.00E-08

Addendum to section 5.1 "*Applications for the output DQ/P1 and P2*"
You can reach SIL2/Cat.3/PLd with deactivated dark test.

Addendum to section 5.3 "*Application for internal evaluation*"

NOTE
If an error occurs at the inputs in this application, the F-module also outputs the error message "Safety-related shutdown" or "Safety event" for the output. Following elimination of the error at the inputs, a reintegration of the output is only possible after the bit pattern test (within the test time shortened to max. 120 seconds) has been performed.

Minimum distance of test pulses

The minimum interval between two test pulses depends on the activation of the light test, the configured maximum test time, and whether the output has been specified as a PM-switching or PP-switching output.
The minimum interval between two test pulses at a maximum test time of 100 s is at least 2 seconds, and with a maximum test time of 1000 s at least 20 seconds.

SIEMENS

SIMATIC
ET 200SP
Product Information on documentation for the digital output module F-DQ 4x24VDC/2A PM HF (6ES7136-6DB00-0CA0) as of firmware version V2.0.0

Product Information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.
In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.
Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.
For additional information on industrial security measures that can be implemented, please visit (https://www.siemens.com/industrialsecurity).
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.
To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (https://www.siemens.com/industrialsecurity).

General amendments to the documentation

Content
Product Information contains supplements and corrections on the documentation for the digital output module F-DQ 4x24VDC/2A PM HF (6ES7136-6DB00-0CA0) as of firmware version V2.0.0
The Product Information is part of the product supplied. The statements provided in it should be considered more up-to-date than other documentation if uncertainties arise.

Parameters

Table 1 Parameters for F-DQ 4×24VDC/2A PM HF

Parameters	Value range	Parameter reassignment in RUN	Scope
DQ parameters:			
Maximum test period	• 100 s • 1000 s	no	Module
Disable Dark Test (max. SIL2, CAT3, PLd) *	• disable • enable	no	Module
Channel parameters:			
Channel n			
Activated	• disable • enable	no	Channel

* Firmware V2.0.0 and higher

© Siemens 2018. All rights reserved

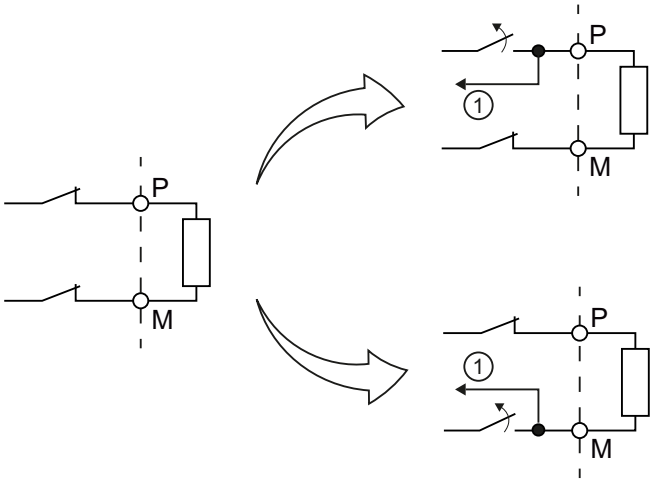
Parameters	Value range	Parameter reassignment in RUN	Scope
Max. readback time, dark test and switch-off test *	0.6 ms to 400.0 ms	no	Channel
Max. readback time switch-on test	0.6 ms to 5.0 ms	no	Channel
Activated light test	• disable • enable	no	Channel
Diagnostics: Wire break	• disable • enable	no	Channel

* Firmware V2.0.0 and higher

Disable Dark Test (max. SIL2, CAT3, PLd)

To prevent an unwanted reaction of the actuator to a dark test, you can deactivate the dark test at the F-module output. An unwanted reaction can be for example, the brief de-energizing of a magnetic drive or a process value change of a digital input with very short input delay.
A capacitive load that does not meet the load curve (see section Switching capacitive loads) can result in a passivation of the output in case of a process value change, switch-on test or light test, even if the dark test is deactivated.
You can reach up to SIL2/Cat.3/PLd with disabled dark test.
For disabled dark test:

⚠ WARNING



SIL2/Cat.3/PLd requires that there is a signal change from "1" to "0" at the corresponding output at least once a year. The "0" signal must have a duration of at least 2 seconds. It is not enough to simply turn off the supply voltage of the F-module and turn it on again.

⚠ WARNING

When you use the function "Disable dark test", cross-circuits between channels with "1" signal are not detected. If an error caused by short-circuits (cross-circuits) is detected when you request the safety function (shutdown of the output), not only is this output passivated, but all outputs are shut down and the F-module is passivated. Also take into consideration the respective requirements of your product standards regarding error detection time.

Max. readback time, dark test and switch-off test

Function
Dark tests are switch-off tests with bit pattern test.
For "Disable dark test" mode, the parameter "Max. readback time, dark test and switch-off test" is only relevant for the process value change.
For a dark test, a test signal is switched to the output channel while the output channel is active (output signal "1"). This output channel is then briefly disabled (= "dark period") and read back. A sufficiently slow actuator does not respond to this and remains switched on.

① Readback

Figure 1 Functional principle of the dark test (PM switching)

This parameter allows you to set the time for the readback.
If the expected signals (P-readback and M-readback) could not be read back correctly after expiration of the max. readback time, dark test and switch-off test, the output channel is passivated.
No new process values are switched to the output channels while a bit pattern is still active (switch test is carried out). This means that a higher max. readback time, dark test and switch-off test increases the response time of the F-module.

⚠ WARNING

Through the configured "Max. readback time, dark test and switch-off test", short circuits (cross-circuits) to a signal with a frequency greater than 1/(2 x configured max. readback time, dark test and switch-off test) Hz cannot be detected (50:50 sampling ratio).
Short circuits (cross-circuits) to an output of the same module are recognized.

The parameter also has an effect on the short circuit detection (cross-circuit) with "1" signal when the output signal is changed from "1" to "0" with the safety program.

Setting the parameter "Max. readback time, dark test and switch-off test"
Because the fault response time is extended by the max. readback time, dark test and switch-off test, we recommend that you set the max. readback time, dark test and switch-off test by trial and error as low as possible, but high enough that the output channel is not passivated.
You determine the readback time required for your actuator with the diagram in the chapter Switching capacitive loads.
If the capacity of the actuator is not known, it may be necessary for you to determine the value for the max. readback time, dark test and switch-off test by trial and error. This may also be necessary due to the part variances in the actuator or external influences.

Proceed as follows:

- Set the "Max. readback time, dark test and switch-off test" so that the output channel can be read back correctly but your actuator does not respond yet.
- For verification use the process value "0" with a minimum duration that corresponds to the "maximum test time" parameter. Execute a process value change from "1" to "0".
- If the output channel is passivated sporadically, set a higher value for the max. readback time, dark test and switch-off test.
- If the output channel is passivated, the max. readback time, dark test and switch-off test is too small for a connected capacitive load. The discharge cannot take place within the configured max. readback time, dark test and switch-off test. Increase the max. readback time, dark test and switch-off test.

If you have set the max. readback time, dark test and switch-off test to the maximum value of 400 ms and there is still a passivation of the output channel, there is either an external fault or the connected capacity is outside the permitted range.

Test pulses of the dark test

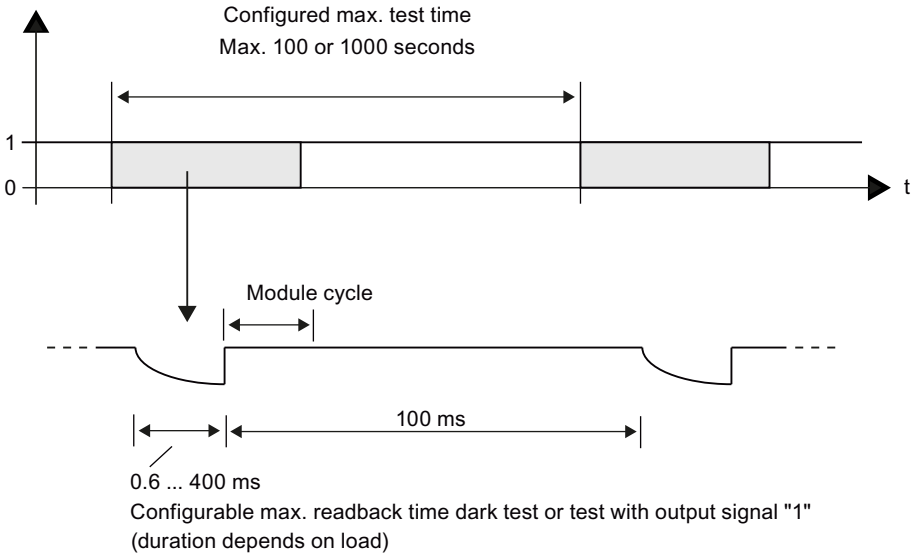


Figure 2 Test pulses of the dark test

The interval between two test pulses amounts to at least 100 ms.

Applications of the F-I/O module

Supplement to section 5 "Applications of the F-I/O module"
You can reach up to SIL2/Cat.3/PLd with disabled dark test.

Technical specifications

Technical specifications of the F-DQ 4×24VDC/2A PM HF
You achieve the following technical specifications with disabled dark test:

XE TDB_S	6ES7136-6DB00-0CA0
Maximum achievable safety class in safety mode XE U1:1	
Performance level according to EN ISO 13849-1:2015 XE T:2	PLd
Category according to EN ISO 13849-1:2015 XE T:2	Cat.3

XE TDB_S	6ES7136-6DB00-0CA0
SIL according to IEC 61508 XE T:2	SIL 2
Low demand mode: PFDavg according to SIL2 XE N:2	< 2.00E-04
High demand/continuous mode: PFH according to SIL2 XE N:2	< 1.00E-08 1/h

Response times

Introduction
The next section shows the response times of the digital output module F-DQ 4×24VDC HF. The response times of the F-DQ 4×24VDC HF digital output module are included in the calculation of the F-system response time.

Definition of response time for fail-safe digital outputs
The response time represents the interval between an incoming safety message frame from the backplane bus and the signal change at the digital output.

Times required for the calculation
Maximum cycle time: T_{cycle} = 15.5 ms
You assign the dark test time and switch-on time in STEP 7.

The following applies to the enabling of the dark test:

Maximum response time with no faults
The maximum response time for fail-safe digital outputs in the error-free case is equal to:
Max. response time = 2 × T_{cycle} + Maximum(dark test time, switch-on time)

Maximum response time with error and change of user data
Max. response time = 3 × T_{cycle} + Maximum(dark test time, switch-on time)

Maximum response time with detection by bit pattern test
Maximum response time = T_{cycle} + Maximum(dark test time, switch-on time) + configured test time

The following applies to the disabling of the dark test:

Maximum response time with no faults
The maximum response time for fail-safe digital outputs in the error-free case is equal to:
Max. response time = 2 × T_{cycle} + Maximum(dark test time, switch-on time)

Maximum response time with error and change of user data
Max. response time = 3 × T_{cycle} + Maximum(dark test time, switch-on time)
A channel fault might not be detected until a process value change "1" to "0" takes place on the corresponding output.

SIEMENS

SIMATIC
ET 200SP
Product information for the ET 200SP fail-safe modules: Use at altitudes > 2000 m above sea level
Product Information

Introduction
This document contains important product information on the F-modules specified in the section "Validity". The product information is part of the product supplied. This product information should be considered more up-to-date than other documentation if uncertainties arise.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.
In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.
Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.
For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.
To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed visit (https://www.siemens.com/industrialsecurity).

Validity
The statements in this product information apply to the F-modules listed below for operating altitudes > 2000 m above sea level:

Table 1 Validity

Designation	Article number	Version	Max. operating altitude
ET 200SP F-DI 8x24VDC HF	6ES7136-6BA00-0CA0	FS04 or higher	4000 m above sea level
ET 200SP F-DQ 4x24VDC/2A PM HF	6ES7136-6DB00-0CA0	FS04 or higher

Effects on the availability of modules
The higher cosmic radiation present during operation at altitudes over 2000 m above sea level will also start to have an effect on the failure rate of electronic components (the so-called soft error rate). In rare cases this can result in a transition of the module into the safe state, especially for safety modules. However, the functional safety of the module is fully retained.

Currently valid markings and approvals

NOTE

Information on the components of the ET 200SP automation system:
The markings and approvals printed on the components of the ET 200SP automation system are currently based on an operating altitude of up to 2000 m above sea level. The fail-safe modules are certified for use in safety mode up to the maximum operating altitude listed in Table 1 (according to IEC 61508:2010, EN ISO 13849-1:2015 and IEC 62061:2005/A2:2015).

F-DI 8x24VDC HF (6ES7136-6BA00-0CA0)

Shipping and storage conditions
The following information applies to the fail-safe module F-DI 8x24VDC HF.

Table 2 Shipping and storage conditions for modules

Type of condition	Permissible range
Barometric pressure	From 1140 hPa to 616 hPa (corresponds to an altitude of -1000 m to 4000 m above sea level)

Climatic environmental conditions
The following information applies to the fail-safe module F-DI 8x24VDC HF.

Table 3 Climatic environmental conditions

Ambient conditions	Permissible range	Comments
Barometric pressure	From 1140 hPa to 616 hPa	Corresponds to an altitude of -1000 m to 4000 m above sea level

Table 4 Permissible ambient temperature depending on installation location

Mounting position	Installation location above sea level		
	- 1000 m to 2000 m	from 2000 m to 3000 m	from 3000 m to 4000 m
	Maximum ambient temperature		
Horizontal	60 °C	54 °C	48 °C
Vertical	50 °C	45 °C	40 °C

The normative basis for the derating is IEC 61131-2:2017.

Comments
Linear interpolation between altitudes is permissible.
The derating factors compensate for the decreasing cooling effect of air at higher altitudes due to lower density.

NOTE

Ensure that the power supply units used are also suitable for altitudes > 2000 m above sea level.

Safety characteristics values
The safety characteristic values (PFD_{avg}, PFH values) given in the manual already include the influence of stronger cosmic radiation (soft error rate) for an application up to 4000 m above sea level.

F-DQ 4x24VDC/2A PM HF (6ES7136-6DB00-0CA0)

General amendments to the documentation

This Product Information contains amendments and corrections to the documentation of the ET 200SP fail-safe modules. The Product Information is part of the product supplied. The statements provided in it should be considered more up-to-date than other documentation if uncertainties arise.

Validity of the Product Information
The following information supplements the equipment manual of the ET 200SP fail-safe module:

- ET 200SP Digital Output Module F-DQ 8x24VDC/0.5A PP HF (https://support.industry.siemens.com/cs/ww/en/view/109747998)

Section 5.5 "Application: Connection of the ET 200SP digital output module F-RQ 1x24VDC/24..230VAC/5A (6ES7136-6RA00-0BF0)"
For the operation of the digital output module F-RQ 1x24VDC/24..230VAC/5A from FS 04 on, the use of the following readback times is required: Channel parameter "Max. readback time light test / dark test" with the default value "0.8 / 1.0 ms".

Validity of the Product Information
The following information supplements the equipment manuals of the ET 200SP fail-safe modules:

- ET 200SP Digital input module F-DI 8x24VDC HF (https://support.industry.siemens.com/cs/us/en/view/78589499)
- ET 200SP Digital output module F-DQ 4x24VDC/2A PM HF (https://support.industry.siemens.com/cs/us/en/view/78645789)
- ET 200SP Power module F-PM-E 24VDC/8A PPM ST (https://support.industry.siemens.com/cs/us/en/view/78645796)

© Siemens 2015 - 2022. All rights reserved

Section 6.3 "Interrupts/diagnostic alarms" – Table 6-6

Diagnostic alarm	Error code	Meaning	Remedy
Supply voltage too high	801_D	The supply voltage is too high.	Check the supply voltage and then test the safety application.
Supply voltage too low	802_D	The supply voltage is too low.	Check the supply voltage and then test the safety application.

Supply voltage outside the nominal range
If the supply voltage L+ is outside the specified value range, the DIAG LED flashes and the F-module is passivated.
When the voltage has recovered (level must remain within the specified value range for at least 1 minute (see section 7 "Technical specifications", subsection "Voltages, currents, potentials)), the DIAG LED stops flashing. The F-module remains passivated.

NOTICE

When an undervoltage or overvoltage event is detected (supply voltage too high/low – outside nominal range), it must be assumed that components may not execute their correct function properly after the supply voltage has returned to the nominal operating range. You can identify these components using a function check.
Therefore, we recommend that you always perform a full function check of the machine/plant or in any case a check of the safety functions directly after an undervoltage or overvoltage event before re-commissioning.

Introduction

Observe the following notes and explanations for PROFINET IO during parameterization of fail-safe modules with GSD file in the PROFIsafe profile 2.4 (BP mode).

NOTE

When using fail-safe modules with the GSD file on an F-host, note that the warnings, information and references to other manuals contained in the F-module equipment manuals are still valid.
Please also observe the F-host specifications.

Implementation of the Device_Fault bit in BP (Basic Protocol) mode of the fail-safe modules

PROFIsafe 2.4 with automatic reintegration:
In this mode, the F-host is responsible for module-wide passivation in the event of a channel fault. This means that if an individual channel reports a fault, the F-host performs passivation of all channels within an F-module. Notification of the F-CPU about faults and the consequent reaction of the F-CPU takes place via PROFIsafe status and control bits.
Reintegration of an F-module with faults in this mode takes place automatically after all channel faults have been completely eliminated.
After all pending faults have been corrected, the F-module returns to the normal state and process values are updated cyclically again.

© Siemens 2022. All rights reserved

PROFIsafe 2.4 with operator acknowledgment for reintegration:
This is the same mode as before, but the reintegration can only be completed after a pending operator acknowledgment signal is released by the F-host (i.e. operator acknowledgment is handled by the F-host).
From the operator's perspective, waiting for the operator acknowledgment signal is indicated by specific LED flashing (red-green). This means that, after pending faults of an affected channel have been eliminated, the value status is set to "good" and the LED flashing will show optically that the channel is ready to finish reintegration.
After all channel faults have been eliminated, the F-module checks whether operator acknowledgment from the F-host is pending by evaluating the PROFIsafe control bit **OA_Req**. As long as this control bit is set to "true", the channel shows "Waiting for reintegration" through flashing LEDs. In this state, note that the value status bits for the channels have already been set to "good" and the F-module is ready to function normally. For this reason, the received operator acknowledgment only affects the LED flashing.

Summary of failure and reintegration from the perspective of the F-module

1. Fault occurs and is detected.
2. Device_Fault is sent to the F-host.

NOTE

This can be viewed as an implicit request for an operator acknowledgment.

3. Channel fault is corrected, Device_Fault=0 is sent to the F-host and the F-module is reintegrated
4. Operator acknowledgment via the PROFIsafe control bit OA_Req is received by the F-host and the alternating flashing of the LEDs is switched off.

Restart
After all channel faults have been corrected (all I/O self-tests are completed successfully), the process values are automatically output or supplied again.

⚠ WARNING

Manual reintegration must be realized on the F-host side
You can find a description of suitable measures in the technical specification PROFISafe Version 2.6, Annex C, subsection *"C.1.4.2 Prevent unintentional restart by application measures"*.

Security information

Siemens provides products and solutions with industrial security functions that support the secure operation of plants, systems, machines and networks.
In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial security concept. Siemens' products and solutions constitute one element of such a concept.
Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.
For additional information on industrial security measures that may be implemented, please visit (https://www.siemens.com/industrialsecurity).
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.
To stay informed about product updates, subscribe to the Siemens Industrial Security RSS Feed under (https://www.siemens.com/industrialsecurity).

Important note for maintaining the operational safety of your system - Upgrade to firmware version >= V1.0.5

This product information contains important details on maintaining the operational safety of your system. The product information is part of the product supplied. The statements provided in it should be considered more up-to-date than other documentation if uncertainties arise.

Measures for maintaining operational safety in the event of undervoltage/overvoltage events
To maintain the operational safety, you must install a firmware version >= V1.0.5.

Reason:
Within the scope of internal quality assurance measures and continuous market observations, output characteristics of 24 V DC switched-mode power supplies on the market have been detected which significantly differ in their quality from the voltage curves for the supply of programmable controllers specified by IEC/EN 61131-2.
Switched-mode power supplies can maintain the output voltage at less than 50% of the nominal output voltage when an overload or short-circuit occurs and then return to the rated value.

© Siemens 2018. All rights reserved

The fail-safe modules ET 200SP F-DI 8x24VDC HF (6ES7136-6BA00-0CA0) and ET 200SP F-PM-E 24VDC/8A PPM ST (6ES7136-6PA00-0BC0) passivate themselves in the event of undervoltage and thereby guarantee safety in the machine/system. Once the fault is eliminated and the supply voltage returns to the nominal voltage range for at least 1 minute, the modules can be acknowledged, depassivated and reintegrated into the system.
In rare cases, due to the above-mentioned characteristics of switched-mode power supplies, the modules may erroneously indicate correct operation. Correct operation can be restored with an OFF/ON of the 24 V DC supply voltage or pulling/plugging the modules.
In order to ensure that the modules are acknowledged or depassivated and normal operation is resumed, install a firmware version >= V1.0.5 for the affected output versions of the two modules.
In general, we recommend that you always observe the following warning and implement the described measures:

⚠ WARNING

When an undervoltage or overvoltage event is detected (supply voltage too high/low – outside nominal range), it must be assumed that components may not execute their correct function properly after the supply voltage has returned to the nominal operating range. You can identify these components using a function check.
Therefore, we recommend that you always perform a full function check of the machine/plant or in any case a check of the safety functions directly after an undervoltage or overvoltage event and before re-commissioning.

General amendments to the documentation

This Product Information contains amendments and corrections to the documentation of the following ET 200SP fail-safe modules.

- Digital input module F-DI 8x24VDC HF (6ES7136-6BA00-0CA0)
- Digital input module F-DI 8x24VDC HF (6ES7136-6BA01-0CA0)
- Digital output module F-DQ 4x24VDC/2A PM HF (6ES7136-6DB00-0CA0)
- Digital output module F-DQ 8x24VDC/0.5A PP HF (6ES7136-6DC00-0CA0)
- Power module F-PM-E 24VDC/8A PPM ST (6ES7136-6PA00-0BC0)
- Digital output module F-RQ 1x24VDC/24..230VAC/5A (6ES7136-6RA00-0BF0)
- Analog input module F-AI 4xU 0..10V HF (6ES7136-6AB00-0CA1)
- Analog input module F-AI 4xI 0(4)..20mA 2-/4-wire HF (6ES7136-6AA00-0CA1)
- Counter module F-TM Count 1x1Vpp sin/cos HF (6ES7136-6CB00-0CA0)

The Product Information is part of the product supplied. The statements provided in it should be considered more up-to-date than other documentation if uncertainties arise.
You can use the Power Module F-PM-E 24VDC/8A PPM ST with the standard modules listed under entry ID: 83203124 (https://support.industry.siemens.com/cs/ww/en/view/83203124) **within a potential group.**

Supplement to the section "Response times" of the Equipment Manual "Digital input module F-DI 8x24VDC HF (6ES7136-6BA01-0CA0)"
The discrepancy time is included in the calculation of the maximum response time (T_{WCDT}) and can therefore be set to 0 in the SIMATIC STEP 7 response-time table.

© Siemens 2013 - 2024. All rights reserved

Amendment to chapter 5.1.1.2 "*Application: Wiring a load to the digital output, PP switching*", 5.1.1.4 "*Application: Wiring of two parallel loads to the digital output, PP switching*" and 5.4.2 "*Safety-related shutdown of standard output modules, PP switching*" of the manual "Power module F-PM-E 24VDC/8A PPM ST (6ES7136-6PA00-0BC0)"

⚠ WARNING

The light test must be activated if the output channel can permanently carry the "0" signal for 100 hours or more. Consult the respective requirements of your product standards regarding error detection time.

Addendum to section 5.1 "*Applications for the output DQ/P1 and P2*" and 5.4 "*Applications for the safety-related shutdown of standard modules*" of the manual "Power module F-PM-E 24VDC/8A PPM ST (6ES7136-6PA00-0BC0)"

⚠ WARNING

A defective F-module can result in cyclic "1" signals with the duration of the "Max. readback time switch on test" at the output DQ/P1 and P2.

Correction of section 3.1 "*Terminal assignment*" of the manual "Power Module F-PM-E 24VDC/8A PPM ST (6ES7136-6PA00-0BC0)"

The warning in the section "Redundant ground conductor required" is being omitted, and being replaced by the new warning in section 5.1.1.2 "*Application: Wiring a load to the digital output, PP switching*", section 5.1.1.4 "*Application: Wiring two loads in parallel to the digital output, PP switching*" and section 5.4.2 "*Safety-related shutdown of standard output modules, PP switching*".

Amendment to chapter 5.1.1.2 "*Application: Wiring a load to the digital output, PP switching*", section 5.1.1.4 "*Application: Wiring two loads in parallel to the digital output, PP switching*" and section 5.4.2 "*Safety-related shutdown of standard output modules, PP switching*" of the manual "Power module F-PM-E 24VDC/8A PPM ST (6ES7136-6PA00-0BC0)"

⚠ WARNING

In this application, you have to connect two ground cables to the BaseUnit for safety reasons. Otherwise, the maximum residual current at signal "0" (specified in the technical specifications) cannot be maintained if a single ground cable is interrupted.

Amendment to chapter 5.2 "*Application 1: Safety mode SIL3/Cat.3/PLd*" of the Equipment Manual "Digital input module F-DI 8x24VDC HF (6ES7136-6BA00-0CA0)" and section 5.2.2 "Application 1: Safety mode SIL3/Cat.3/PLd" of the manual "Power module F-PM-E 24VDC/8A PPM ST (6ES7136-6PA00-0BC0)"

NOTE

SIL3/Cat.3/PLd can be achieved through cross-circuit proof wiring and for the sensor, through application of the principle of positive opening operation.

Unsupported parameters

The "Pulse stretching" and "Disable dark test for 48 hours" parameters are not supported.

Dependencies between the "Discrepancy time" and "Input delay" parameters

The configured discrepancy time must be greater than the configured input delay.

Dependencies between the "Startup time of the sensors after short circuit test" and "Time for short circuit test" parameters
The startup time of the sensor after a short-circuit test must amount to at least 1% of the time for the short-circuit test.

Switching on the supply voltage L+ for the ET 200SP F-modules and IM
Make sure that the F-module as well as the IM were de-energized at the same time before you switch on the supply voltage L+ for an F-module. You do not have to observe a switch-on sequence.

Cyclic reading of I&M data
Cyclic reading of I&M data can affect the timing of the F-modules. You should therefore avoid short read cycles of less than 500 ms.

Wire break detection for F-DQ 4x24VDC/2A PM HF fail-safe module up to and including hardware revision level 02
The response threshold of the wire break detection is < 15 mA.

T_{DAT} acknowledgment time

F-Module	T_{DAT} acknowledgment time
Digital input module F-DI 8x24VDC HF	23 ms
Digital output module F-DQ 4x24VDC/2A PM HF	31 ms
Power module F-PM-E 24VDC/8A PPM ST	30 ms

Technical specifications
The information on "Permitted potential difference between different circuits" is no longer part of the technical specifications.

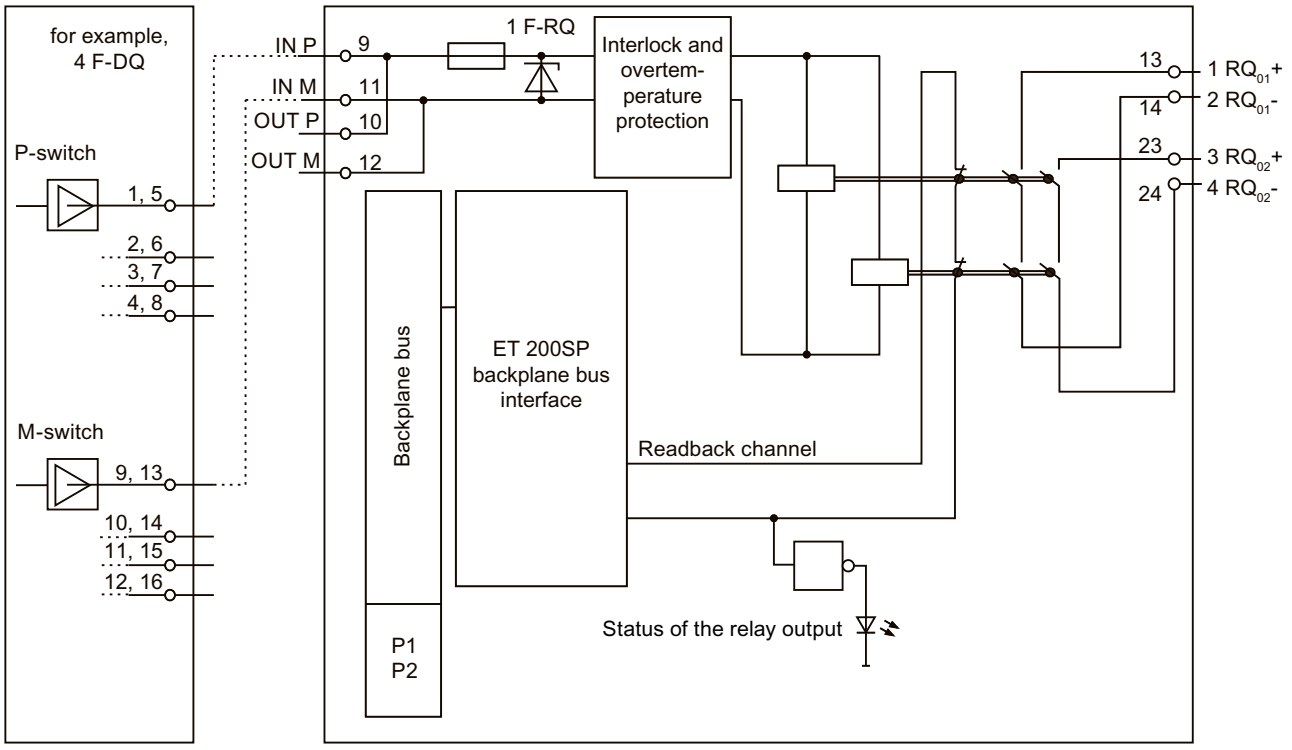

Figure 1 Block diagram F-RQ 1x24VDC/24..230VAC/5A

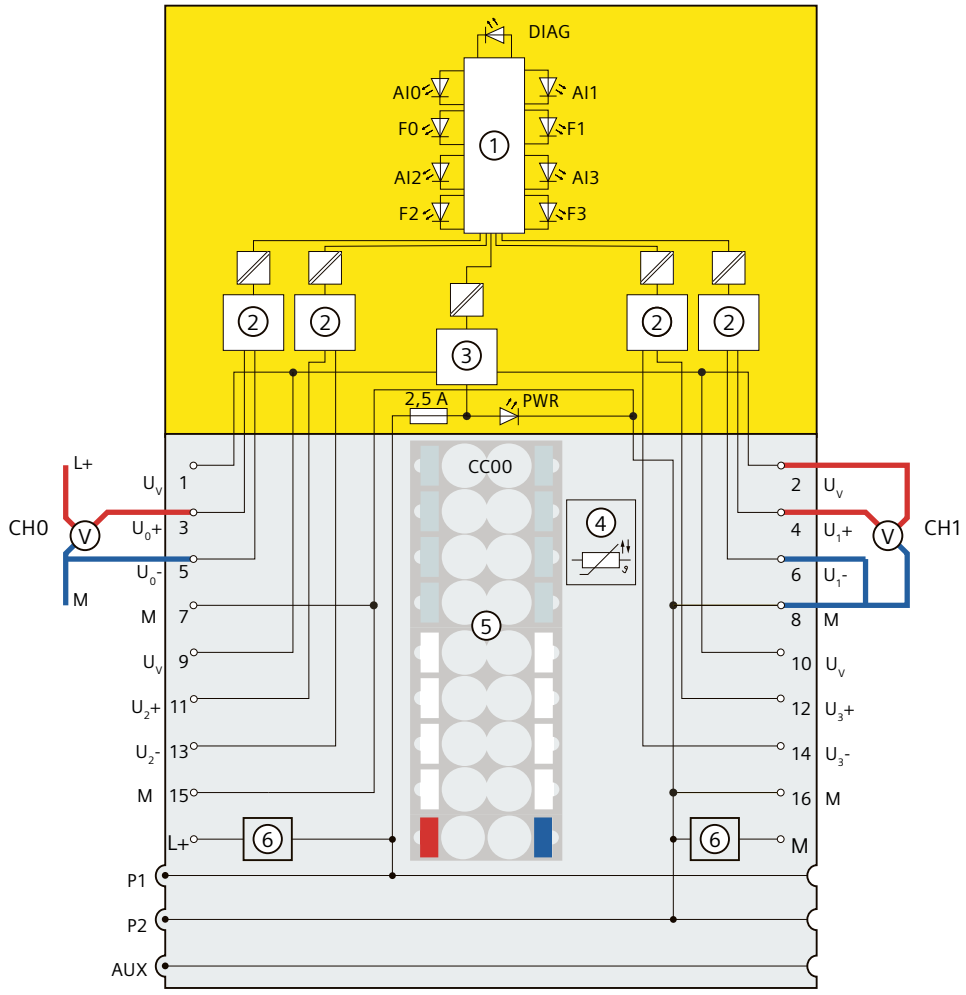
Amendment to section 5.1 "Application 1: Safety mode SIL2/Cat.3/PLd with two-wire connection, 1oo1 evaluation" of the Equipment Manual "Analog input module F-AI 4xU 0..10V HF (6ES7136-6AB00-0CA1)"

⚠ WARNING

In the case of 1oo1 evaluation, faults with the sensor or wiring of the F-AI module are not detected.

Amendment to section 5.3 "Application 3: Safety mode SIL2/Cat.3/PLd with four-wire connection, 1oo1 evaluation" of the Equipment Manual "Analog input module F-AI 4xU 0..10V HF (6ES7136-6AB00-0CA1)"



⚠ WARNING

In the case of 1oo1 evaluation, faults with the sensor or wiring of the F-AI module are not detected.

New section 5.5 "Application 5: Safety mode SIL2/Cat.3/PLd with 3-wire connection, 1oo1 evaluation" in the Equipment Manual "Analog input module F-AI 4xU 0..10V HF (6ES7136-6AB00-0CA1)"

Voltage measurement 0 V to 10 V

Four process signals can be connected to the F-module in this interconnection variant. Sensor supply U_V is provided by the F-module for 4 channels. You can also supply the sensors by means of an external sensor supply.

①	Backplane bus interface	U_V	Sensor supply
②	Analog-to-digital converter (ADC)	M	Chassis ground
③	Sensor supply/reverse polarity protection	L+	24 V DC (infeed only with light-colored BaseUnit)
④	Temperature measurement for BU type A1 only (the function cannot be used for this module.)	P1, P2, AUX	Internal self-establishing voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)
⑤	Color-coded label with color code CC00 (optional)	DIAG	Diagnostics LED (green, red)
⑥	Filter circuit supply voltage (available in light-colored BaseUnit only)	AI0, AI1, AI2, AI3	Channel status LED (green)

U_n-	Voltage input negative, channel n	PWR	Power LED (green)

Figure 2 1oo1 evaluation

⚠ WARNING

To achieve SIL2/Cat.3/PLd when using this wiring, you must use a suitably qualified sensor.

⚠ WARNING

All cables need to be laid in such a way that they are resistant to interference voltage. Use shielded cables.

⚠ WARNING

For voltage inputs, changes in resistance along the transmission path (from sensor to module) can result in the measured value being falsified.
For correct measured value acquisition during the entire service life, you must take these changes in resistance into account when designing the safety functions and take appropriate measures.

⚠ WARNING

In the case of 1oo1 evaluation, faults with the sensor or wiring of the F-AI module are not detected.

Assignable parameters for Application 5

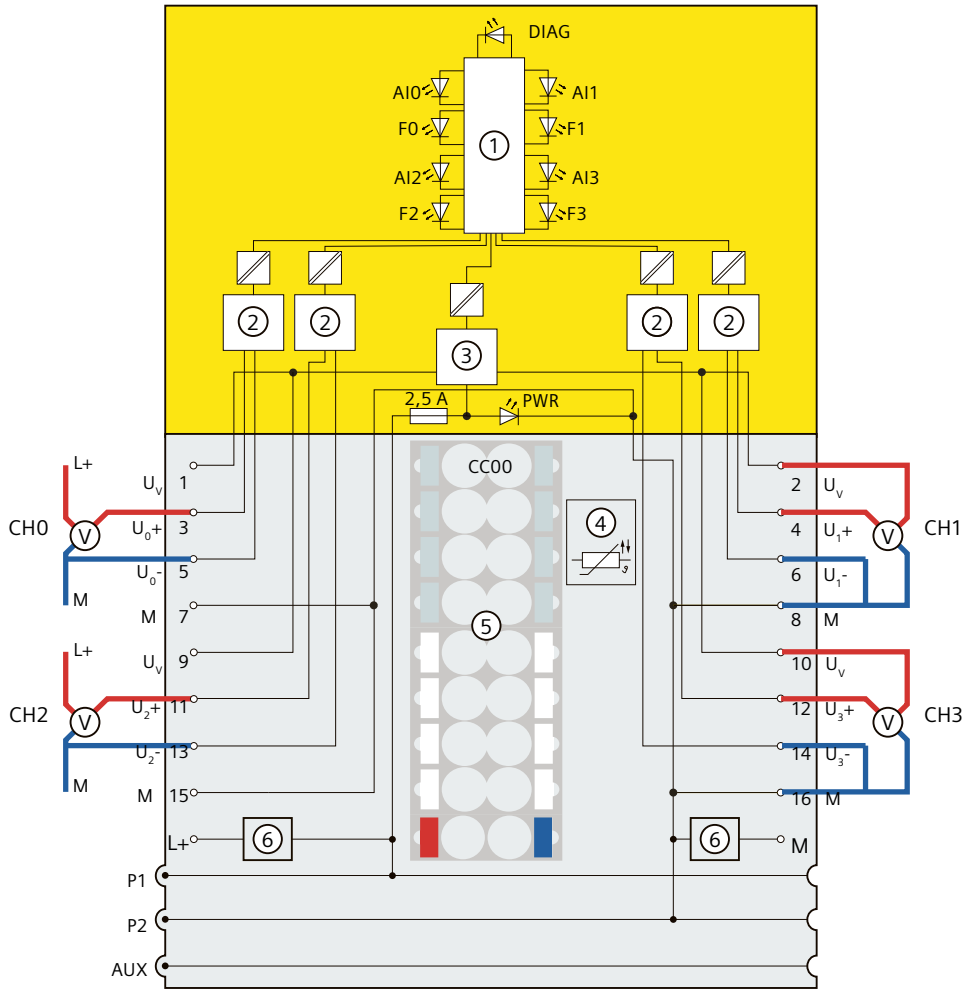

Table 1 Parameters for Application 5 of the F-AI 4xU 0..10V HF

Parameter	Value range in safety mode
Behavior after channel faults	• Passivation of the entire F-module • Passivation of the channel
Interference frequency suppression	• 50 Hz • 60 Hz
Evaluation of the sensors	1oo1 evaluation (max. SIL2/Cat.3/PLd)
Measuring range	0 to 10 V
Diagnostics: Wire break	• Disable • Enable
Smoothing	1 / 2 / 4 / 8 / 16 / 32 / 64 conversion cycles

New section "5.6 Application 6: Safety mode SIL3/Cat.4/PLe with 3-wire connection, 1oo2 evaluation" in the Equipment Manual "Analog input module F-AI 4xU 0..10V HF (6ES7136-6AB00-0CA1)"

Voltage measurement 0 V to 10 V

Two process signals can be connected to the F-module in this interconnection variant. Sensor supply U_V is provided by the F-module for 4 channels. You can also supply the sensors by means of an external sensor supply.

WARNING

To achieve SIL3/Cat.4/PLe with this wiring, you must use suitably qualified sensors.

WARNING

All cables need to be laid in such a way that they are resistant to interference voltage. Use shielded cables.

Assignable parameters for Application 6

Table 2 Parameters for Application 6 of the F-AI 4xU 0..10V HF

Parameter	Value range in safety mode
Standard value	• MIN • MAX
Discrepancy time	100 to 30000 ms
Tolerance window %, absolute	2.0 to 20.0%
Tolerance window %, relative	2.0 to 20.0%
Behavior after channel faults	• Passivation of the entire F-module • Passivation of the channel
Interference frequency suppression	• 50 Hz • 60 Hz
Evaluation of the sensors	1oo2 evaluation (max. SIL3/Cat.4/PLe)
Measuring range	0 to 10 V
Diagnostics: Wire break	• Disable • Enable
Smoothing	1 / 2 / 4 / 8 / 16 / 32 / 64 conversion cycles

Amendment to section 5.1 "Application 1: Safety mode SIL3/Cat.3/PLd with 2-wire transducer" of the Equipment Manual "Analog input module F-AI 4xI 0(4)..20mA 2-/4-wire HF (6ES7136-6AA00-0CA1)"

WARNING

In the case of 1oo1 evaluation, faults with the sensor or wiring of the F-AI module are not detected.

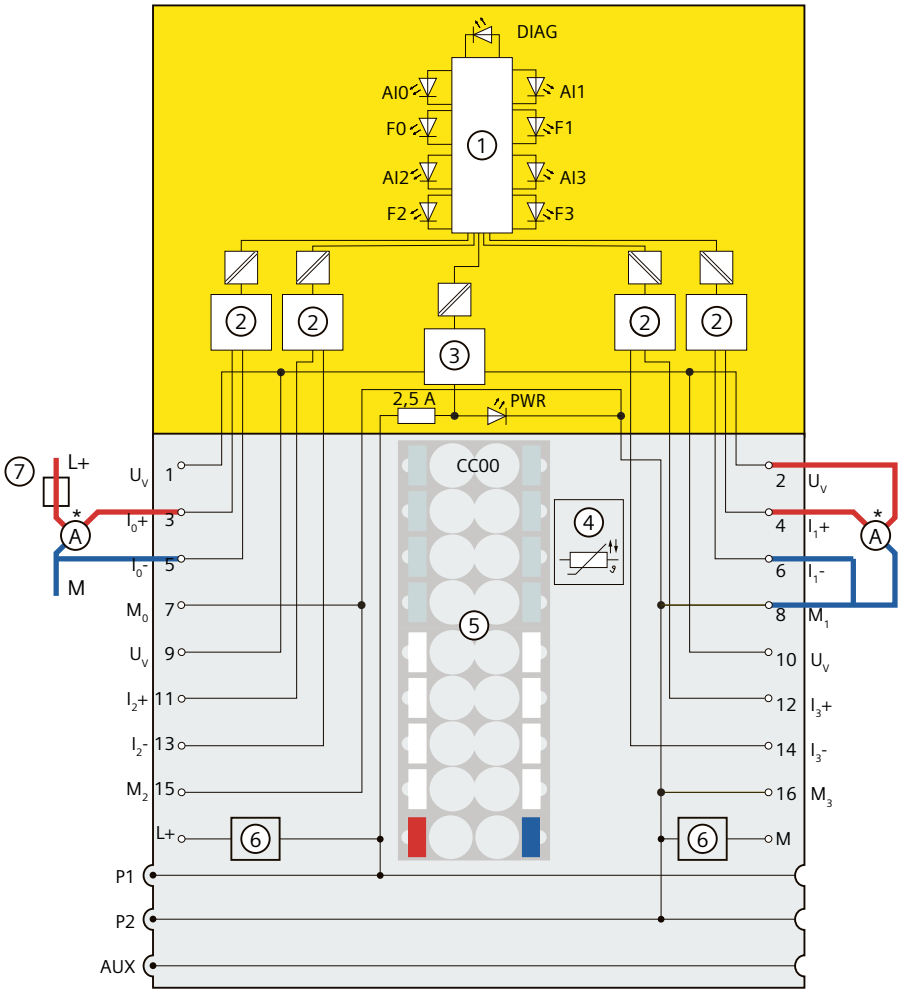
Amendment to section 5.3 "Application 3: Safety mode SIL3/Cat.3/PLd with 4-wire transducer" of the Equipment Manual "Analog input module F-AI 4xI 0(4)..20mA 2-/4-wire HF (6ES7136-6AA00-0CA1)"

WARNING

In the case of 1oo1 evaluation, faults with the sensor or wiring of the F-AI module are not detected.

New section 5.5 "Application 5: Safety mode SIL3/Cat.3/PLd with 3-wire measuring transducer" in the Equipment Manual "Analog input module F-AI 4xI 0(4)..20mA 2-/4-wire HF (6ES7136-6AA00-0CA1)"

Introduction



The following section describes the wiring scheme and the parameter assignment of the F-AI 4xI 0(4)..20mA 2-/4-wire HF for

- Application 5: Safety mode SIL3/Cat.3/PLd, 1oo1 evaluation with 3-wire measuring transducer.

Possible diagnostic messages, the error causes and possible corrective measures are specified in the section "Diagnostic messages".

Current measurement 0/4 to 20 mA, 3-wire measuring transducer

Four process signals can be connected to the F-module in this interconnection variant. Sensor supply U_V is provided by the F-module for 4 channels. You can also supply the sensors by means of an external sensor supply.

①	Backplane bus interface	U_V	Sensor supply
②	Analog-to-digital converter (ADC)	M	Supply voltage ground
③	Sensor supply/reverse polarity protection	M_n	Ground reference to U_V, channel n
④	Temperature measurement for BU type A1 only (the function cannot be used for this module.)	L+	24 V DC (infeed only with light-colored BaseUnit)
⑤	Color-coded label with color code CC00 (optional)	P1, P2, AUX	Internal self-establishing voltage buses Connection to left (dark-colored BaseUnit) Connection to left interrupted (light-colored BaseUnit)

Use of radio devices and cell phones

⚠ WARNING

Unexpected malfunctions of machines caused by radio devices/cell phones
Malfunctions are possible when radio devices or cell phones are used in the direct proximity of F-I/O. This can result in death, serious injury or property damage.
If you scan the 2D matrix code/ID Link or use the "SIEMENS Industry Support App" with a powered-on F-I/O, then deactivate all radio connections of the radio device/cell phone beforehand. Alternatively, power off the F-I/O before scanning.
Power off radio devices in the immediate proximity of the F-I/O.

Supplement to the Attachment "Reaction times" of the Manuals "Power Module F-PM-E 24VDC/8A PPM ST (6ES7136-6PA00-0BC0)" and "Digital Input Module F-DI 8x24VDC HF (6ES7136-6BA00-0CA0)"

Digital output of the Power Module F-PM-E 24VDC/8A PPM ST

Definition of response time for fail-safe digital outputs
The response time represents the interval between an incoming safety message frame from the backplane bus and the signal change at the digital output.

Following applies to activation of the dark test:
Maximum response time with no faults
The maximum response time for fail-safe digital outputs in the error-free case is equal to:
Max. response time = 2 × T_{cycle} + Maximum(dark test time, switch-on time)
Maximum response time in case of error with detection by readback (change of user data)
Max. response time = 3 × T_{cycle} + Maximum(dark test time, switch-on time)
Maximum response time in case of error with detection by bit pattern test
Max. response time = Configured test period

The following applies to deactivation of the dark test:
Maximum response time with no faults
The maximum response time for fail-safe digital outputs in the error-free case is equal to:
Max. response time = 2 × T_{cycle} + Maximum(dark test time, switch-on time)
Maximum response time in case of error with detection by readback (change of user data)
Max. response time = 3 × T_{cycle} + Maximum(dark test time, switch-on time)
A channel fault may not be detected until process value change 1 to 0 takes place at the output DQ/P1 and P2.

Digital inputs of Power Module F-PM-E 24VDC/8A PPM ST and fail-safe module F-DI 8x24VDC HF

Definition of the response time for fail-safe digital inputs
The response time represents the interval between a signal change at the digital input and reliable availability of the safety frame on the backplane bus.

Maximum response time with external short-circuits
F-PM-E 24VDC/8A PPM ST:
Max. response time = T1 + T_{cycle} + (n * T_{cycle}) + Sum[x=0...1](Tsx) + MAX(T_{cycle}, T2)

F-DI 8x24VDC HF:
Max. response time = T1 + T_{cycle} + (n * T_{cycle}) + Sum[x=0...7](Tsx) + MAX(T_{cycle}, T2)

Tsx sum term:
(T2x + T3x) < T_{cycle} → Tsx = T_{cycle}
(T2x + T3x) >= T_{cycle} → Tsx = MAX(T2x, T_{cycle}) + T3x
For deactivated sensor supplies or sensor supplies with deactivated short-circuit test, enter the value of 0 in the formula for Tsx.

T1 = Input delay for the considered channel
T2 = Short-circuit test time for the considered channel

x = activated sensor supply
T2x = Time for the short-circuit test
T3x = Startup time of sensors after the short-circuit test
n = Number of sensor supplies with activated short-circuit test

Examples

The following section contains an example for the calculation of the maximum response time with external short-circuits at an F-DI 8x24VDC HF with a maximum cycle time T_{cycle} of 11.5 ms with the default parameter assignment.

Channel	T1 [ms]	Short-circuit test	T2 [ms]	T3 [ms]	T_{cycle} [ms]	T2 + T3 < T_{cycle}	Ts [ms]	MAX(T_{cycle}, T2) [ms]	Max. response time with external short-circuits [ms]
0	3.2	Enable	4.2	4.2	11.5	YES	11.5	11.5	210.2
1	3.2	Enable	4.2	4.2	11.5	YES	11.5	11.5	210.2
2	3.2	Enable	4.2	4.2	11.5	YES	11.5	11.5	210.2
3	3.2	Enable	4.2	4.2	11.5	YES	11.5	11.5	210.2
4	3.2	Enable	4.2	4.2	11.5	YES	11.5	11.5	210.2
5	3.2	Enable	4.2	4.2	11.5	YES	11.5	11.5	210.2
6	3.2	Enable	4.2	4.2	11.5	YES	11.5	11.5	210.2
7	3.2	Enable	4.2	4.2	11.5	YES	11.5	11.5	210.2

Sample calculation: Sum term Ts = (4.2 ms + 4.2 ms) < 11.5 ms → Tsx = T_{cycle}

The following section shows an example for the calculation of the maximum response time with external short-circuits at an F-DI 8x24VDC HF with a maximum cycle time T_{cycle} of 11.5 ms depending on the parameter assignment.

Channel	T1 [ms]	Short-circuit test	T2 [ms]	T3 [ms]	T_{cycle} [ms]	T2 + T3 < T_{cycle}	Ts [ms]	MAX(T_{cycle}, T2) [ms]	Max. response time with external short-circuits [ms]
0	0.4	Enable	0.5	0.5	11.5	YES	11.5	11.5	5465.3
1	0.8	Enable	4.2	10	11.5	NO	21.5	11.5	5465.7
2	1.6	Enable	20	4.2	11.5	NO	24.2	20	5475.0
3	3.2	Enable	100	100	11.5	NO	200	100	5556.6
4	0.4	Disable	-	-	11.5	-	0	11.5	- *)
5	0.8	Enable	100	4.2	11.5	NO	104.2	100	5554.2
6	1.6	Enable	500	500	11.5	NO	1000	500	5955.0
7	3.2	Enable	2000	2000	11.5	NO	4000	2000	7456.6

*) With short-circuit test deactivated, external short-circuits are not detected.

Sample calculation: Sum term Ts = (4.2 ms +10 ms) >= 11.5 ms → Tsx = MAX(4.2 ms, 11.5 ms) + 10 ms

Diagnostic messages

Table 5 Diagnostic messages of the F-PM-E 24VDC/8A PPM ST

Diagnostic message	Fault code	Meaning	Remedy
Overtemperature	5_D	• An excessively high temperature was measured in the F-module. • The PWM function of a load causes interference signals in the supply voltage of the F-module.	• Operate the F-module within the specified temperature range (see Technical specifications) Once the fault has been eliminated, the F-module must then be pulled and plugged, or the power switched OFF and ON. • Decouple the supply voltages of the load using the PWM function and the F-module.

Product Information for ET200SP F-TM Count Firmware Update V1.0.2

Product Information

Cybersecurity information

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines, and networks.
In order to protect plants, systems, machines, and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.
Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.
For more information on protective industrial cybersecurity measures for implementation, please visit (https://www.siemens.com/global/en/products/automation/topic-areas/industrial-cybersecurity.html).
Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customers' exposure to cyber threats.
To stay informed about product updates at all times, subscribe to the Siemens Industrial Cybersecurity RSS Feed under (https://new.siemens.com/global/en/products/services/cert.html).

Description

Description
The firmware update V1.0.2 for the ET 200SP F-TM-C module is now available that fixes these issues.

- The maximum firmware cycle time of this fail-safe module has been increased from 5ms to 6ms. Each firmware cycle is not permitted to reach or exceed 6ms.
- An issue has been identified which can cause an internal counter diagnostic to bring the module to a safe state. This can be caused by the following conditions:
  - Using the module in the consistent presence of external electrical noise
  - Placing encoder signal wires in the same tray with AC power wiring or high-energy, rapidly-switched DC wiring
  - Using unshielded encoder cables or improper shielded encoder cables

Refer to the ET 200SP System Manual (https://support.industry.siemens.com/cs/ww/en/view/109793497) for more information about the ET 200SP product family. Refer to the description on the Internet (https://support.industry.siemens.com/cs/ww/en/view/58649293) of how to perform a firmware update for the SIMATIC ET 200SP F-TM Count.

© Siemens 2024. All rights reserved

Options for the firmware update
The following options are available for updating firmware:

- Online in STEP 7 through Online & Diagnostics
- Online in STEP 7 through accessible devices (PROFINET)
- Online with the MultiFieldbus Configuration Tool (MFCT)
- Using a SIMATIC memory card (possible for CPU and central I/O modules)
- Through the integrated Web server (possible for CPU, as well as centralized and distributed I/O modules)
- Online through the SIMATIC Automation Tool

NOTE

Firmware update of I/O modules
The L+ supply voltage must be present on the module at the start of and during the firmware update.

⚠ WARNING

Check the firmware version for fail-safe approval
When using a new firmware version, always check that the version is approved for use in the module in question. The attachments of the certificate for SIMATIC Safety (https://support.automation.siemens.com/WW/view/en/49368678/134200) specify the approved firmware version.

The table below provides an overview of the media that can be used to update the firmware of a specific module.

Table 1 Overview of firmware update options

Introduction

1

Purpose of the documentation

This Equipment Manual describes the non-fail-safe and the fail-safe ET 200SP motor starters with firmware version V1.0.0 or higher.

This Equipment Manual supplements the ET 200SP System Manual (http://support.automation.siemens.com/WW/view/en/58649293). Functions affecting the system in general are described in the System Manual. There, you will also find information on installation, connection and the installation conditions of the ET 200SP motor starter.

The information provided in this Equipment Manual, the System Manual and the function manuals enables you to commission the ET 200SP distributed I/O system.

Basic knowledge required

A general knowledge of the following areas is needed in order to understand this manual:

- Industrial controls
- Digital circuit logic
- Automation technology
- Safety functions
- PROFINET and PROFIBUS bus topology
- TIA Portal

Definition

In the manual, "ET 200SP motor starter" is used as a synonym for all non-fail-safe and fail-safe variants of the ET 200SP motor starter.

1.1 Responsibility for system configuration and functionality

The products described here have been developed to carry out safety-related functions as part of a complete plant or machine. In general, a complete safety system consists of sensors, evaluation units, signaling devices and methods for safe tripping. It is the responsibility of the manufacturer to ensure that the system or machine is functioning properly as a whole.

Siemens AG, its subsidiaries, and associated companies (hereinafter referred to as "Siemens") are not in a position to guarantee every characteristic of a complete plant or machine not designed by Siemens.

Nor can Siemens assume liability for recommendations that appear or are implied in the following description. No new guarantee, warranty, or liability claims beyond the scope of the SIEMENS general terms of supply are to be derived or inferred from the following description.

1.2 Change documentation

Release number	Changes
03/2025	Incorporation of new firmware functions V1.2.2 such as chatter monitoring and "5-life"

1.3 Siemens Industry Online Support

Information and service

At Siemens Industry Online Support you can obtain up-to-date information from our global support database:

- Product support
- Application examples
- Forum
- mySupport

Link: Siemens Industry Online Support (https://support.industry.siemens.com/cs/de/en)

Product support

You can find information and comprehensive know-how covering all aspects of your product here:

- **FAQs**
  Answers to frequently asked questions
- **Manuals/operating instructions**
  Read online or download, available as PDF or individually configurable.
- **Certificates**
  Clearly sorted according to approving authority, type and country.
- **Characteristics**
  For support in planning and configuring your system.
- **Product announcements**
  The latest information and news concerning our products.
- **Downloads**
  Here you will find updates, service packs, HSPs and much more for your product.
- **Application examples**
  Function blocks, background and system descriptions, performance statements, demonstration systems, and application examples, clearly explained and represented.
- **Technical data**
  Technical product data for support in planning and implementing your project

Link: Product support (https://support.industry.siemens.com/cs/ww/en/ps)

mySupport

The following functions are available in your personal work area "mySupport":

- **Support Request**
  Search for request number, product or subject
- **My filters**
  With filters, you limit the content of the online support to different focal points.
- **My favorites**
  With favorites you bookmark articles and products that you need frequently.
- **My notifications**
  Your personal mailbox for exchanging information and managing your contacts. You can compile your own individual newsletter in the "Notifications" section.
- **My products**
  With product lists you can virtually map your control cabinet, your system or your entire automation project.
- **My documentation**
  Configure your individual documentation from different manuals.
- **CAx data**
  Easy access to CAx data, e.g. 3D models, 2D dimension drawings, EPLAN macros, device circuit diagrams
- **My IBase registrations**
  Register your Siemens products, systems and software.

1.4 Siemens Industry Online Support app

Siemens Industry Online Support app

The Siemens Industry Online Support app provides you access to all the device-specific information available on the Siemens Industry Online Support portal for a particular article number, such as operating instructions, manuals, data sheets, FAQs etc.

The Siemens Industry Online Support app is available for Android and iOS:

Android

iOS

1.5 Support Request

After you have registered, you can use the Support Request form in the online support to send your question directly to Technical Support:

Support Request:	Internet (https://support.industry.siemens.com/My/ww/en/requests)

1.6 Recycling and disposal

These devices can be recycled thanks to their low pollutant content.

NOTE

For environmentally friendly recycling and disposal of your old device, contact a company certified for the disposal of electronic waste and dispose of the device in accordance with the regulations in your country.

Cybersecurity information

2

Siemens provides products and solutions with industrial cybersecurity functions that support the secure operation of plants, systems, machines and networks.

In order to protect plants, systems, machines and networks against cyber threats, it is necessary to implement – and continuously maintain – a holistic, state-of-the-art industrial cybersecurity concept. Siemens' products and solutions constitute one element of such a concept.

Customers are responsible for preventing unauthorized access to their plants, systems, machines and networks. Such systems, machines and components should only be connected to an enterprise network or the internet if and to the extent such a connection is necessary and only when appropriate security measures (e.g. firewalls and/or network segmentation) are in place.

For additional information on industrial cybersecurity measures that may be implemented, please visit
https://www.siemens.com/cybersecurity-industry.

Siemens' products and solutions undergo continuous development to make them more secure. Siemens strongly recommends that product updates are applied as soon as they are available and that the latest product versions are used. Use of product versions that are no longer supported, and failure to apply the latest updates may increase customer's exposure to cyber threats.

To stay informed about product updates, subscribe to the Siemens Industrial Cybersecurity RSS Feed under
https://new.siemens.com/cert.

Information about third-party software

3

Note to resellers: Please pass on this document to your customers to avoid license infringements.

Third-party software information

This product, solution or service ("Product") contains third-party software components listed in this document. These components are Open Source Software licensed under a license approved by the Open Source Initiative or similar licenses as determined by SIEMENS ("OSS") and/or commercial or freeware software components. With respect to the OSS components, the applicable OSS license conditions prevail over any other terms and conditions covering the Product. The OSS portions of this Product are provided royalty-free and can be used at no charge.

If SIEMENS has combined or linked certain components of the Product with/to OSS components licensed under the GNU LGPL version 2 or later as per the definition of the applicable license, and if use of the corresponding object file is not unrestricted ("LGPL Licensed Module, whereas the LGPL Licensed Module and the components that the LGPL Licensed Module is combined with or linked to is the "Combined Product"), the following additional rights apply, if the relevant LGPL license criteria are met: (i) you are entitled to modify the Combined Product for your own use, including but not limited to the right to modify the Combined Product to relink modified versions of the LGPL Licensed Module, and (ii) you may reverse-engineer the Combined Product, but only to debug your modification. The modification right does not include the right to distribute such modifications and you shall maintain in confidence any information resulting from such reverse-engineering of a Combined Product.

Certain OSS licenses require SIEMENS to make source code available, for example, the GNU General Public License, the GNU Lesser General Public License and the Mozilla Public License. If such licenses are applicable and this Product is not shipped with the required source code, a copy of this source code can be obtained by anyone in receipt of this information during the period required by the applicable OSS licenses by contacting the following address.

SIEMENS may charge a handling fee of up to 5 Euro to fulfil the request.

Warranty regarding further use of the Open Source Software

SIEMENS' warranty obligations are set forth in your agreement with SIEMENS. SIEMENS does not provide any warranty or technical support for this Product or any OSS components contained in it if they are modified or used in any manner not specified by SIEMENS. The license conditions listed below may contain disclaimers that apply between you and the respective licensor. For the avoidance of doubt, SIEMENS does not make any warranty commitment on behalf of or binding upon any third-party licensor.

Open Source Software and/or other third-party software contained in this Product

If you like to receive a copy of the source code, please contact SIEMENS at the following address:

Siemens AG

Product-specific safety instructions

4

4.1 General safety notes

⚠ DANGER

Hazardous voltage.
Will cause death or serious injury.
Turn off and lock out all power supplying this device before working on this device.

NOTICE

Damage caused by electrostatic charge
The motor starter can become damaged by an electrostatic charge if the unoccupied pins of the motor starter are contacted.
When handling and installing the ET 200SP motor starter, ensure protection against electrostatic charging of the components. Changes to the system configuration and wiring are only permissible after disconnection from the power supply.
It is only permitted to connect ET 200SP motor starters after disconnection of the electronic power supply (PELV and SELV) and of the line power supply (500 V AC).

⚠ WARNING

Use of radio devices or cell phones
Malfunctions are possible when using radio devices or cell phones in the immediate vicinity of fail-safe I/O. This can cause death, serious physical injury or material damage.
If you scan the 2D matrix code/ID link or use the "SIEMENS Industry Support App" when the fail-safe I/O is switched on, deactivate all wireless connections of the radio/cell phone beforehand. Alternatively, switch off the fail-safe I/O before scanning.
Switch off radio devices in the immediate vicinity of fail-safe I/O.

4.2 Safety information for hazardous areas

⚠ WARNING

Explosion hazard in Class I and Class II Hazardous Locations.
Can cause death or serious injury.
The fail-safe motor starter is permitted for the operation of device group II, Cat (2), area G D.
The fail-safe motor starter itself must not be located in the hazardous area.

4.3 Safety instructions for safety-related applications

⚠ WARNING

Hazardous voltage.
Will cause death or serious injury.
To avoid an electric shock, observe the following safety measures when working on the plant and the device:

- Turn off and lock out all power supplying this device before working on this device.
- Make sure that the device cannot be switched back on.
- Verify that the equipment is not live.
- Ground the plant.
- Cover adjacent live parts or erect barriers around them.

⚠ WARNING

Hazardous Voltage
Work on live parts of the ET 200SP motor starter system can result in death or serious injury. The device is only allowed to be commissioned and operated by qualified personnel. For the purpose of the safety information in this documentation, a "qualified person" is someone who is authorized to energize, ground, and tag equipment, systems, and circuits in accordance with established safety procedures.

NOTICE

Loss of the safety function
For the fail-safe ET 200SP motor starter, the key safety values apply in the case of a function test interval (state change of the outputs) ≤ 1 month.
To check functioning of the switching elements, switch the motor on or off at least once every month. For additional information on checking the switching elements, see chapter"Operating motor starters (Page 33)".

⚠ WARNING

Loss of the safety function with incorrect wiring
If wiring is incorrect, the motor starter cannot shut down in the event of a fault and the motor will continue to run. There is a risk of severe injury or death. Material damage is also possible.
To ensure the safety function, in the case of a single-phase load route the phase and the neutral conductor through the motor starter. You will find additional information next to the connection examples in chapter "Single-phase motor (Page 149)". In the case of a three-phase load, do not connect the neutral conductor to the star point of the load.

NOTICE
Electromagnetic interference To ensure interference immunity of the motor starter, ground PELV/SELV power supply units in accordance with regulations. (Please also note the documentation for the respective power supply unit in this regard.)

4.4 Intended use

⚠ WARNING
Improper use of hardware products. **Serious damage to property, can cause death or serious injury.** This equipment is only allowed to be used for the applications described in the catalog and in the technical description, and only in conjunction with non-Siemens equipment and components recommended by Siemens. Correct transport, storage, installation and assembly, as well as careful operation and maintenance, are required to ensure that the product operates safely and without faults. EU note: Commissioning is absolutely prohibited until it has been ensured that the machine in which the component described here is to be installed complies with the stipulations of the Directive 2006/42/EC.

4.5 Current information about operational safety

Important note for maintaining operational safety of your system

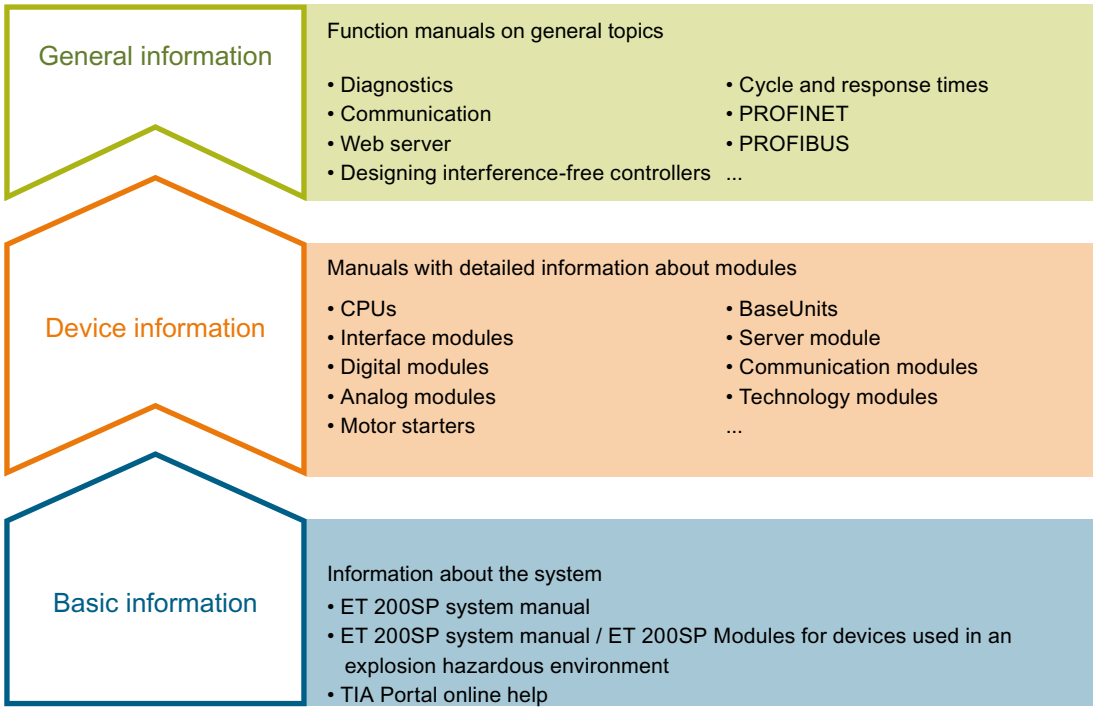
⚠ DANGER
Hazardous voltage **Can cause death, serious injury or property damage** **Please take note of our latest information!** Systems with safety-related characteristics are subject to special operational safety requirements on the part of the operator. The supplier is also obliged to comply with special product monitoring measures. We therefore also provide information in the newsletters Industrial controls (https://new.siemens.com/global/en/products/automation/industrial-controls/forms/newsletter.html) and Safety Integrated (https://new.siemens.com/global/en/products/automation/topic-areas/safety-integrated/factory-automation/newsletter.html) about new products, further technical developments as well as standards and guidelines.

4.6 Declaration of conformity

The manufacturer declares that the safety components of the fail-safe ET 200SP motor starter series in the designs marketed by us comply with the applicable basic health and safety requirements of the EC Directives stated (including amendments), and that the stated standards were applied in their design and construction.

You can download the entire EC Declaration of Conformity: Declaration of Conformity (http://www.siemens.com/sirius/approvals).

Standards



The table below shows the standards that each of the ET 200SP motor starters comply with:

Standard	Direct-on-line starter	Reversing starter	Fail-safe direct-on-line starter	Fail-safe reversing starter
IEC 60947-4-2:2011-05	x	x	x	x
IEC 60947-4-3:2011-07	x	-	-	-
EN 62061: 2005	-	-	x	x
EN ISO 13849-1:2015	-	-	x	x
IEC 61508-1:2010	-	-	x	x
IEC 61508-2:2010	-	-	x	x
IEC 61508-3:2010	-	-	x	x

ET 200SP Documentation Guide

5

The documentation for the SIMATIC ET 200SP distributed I/O system is arranged into three areas.
This arrangement enables you to access the specific content you require.

Basic information
The System Manual and Getting Started describe in detail the configuration, installation, wiring and commissioning of the SIMATIC ET 200SP distributed I/O system. The STEP 7 online help supports you in the configuration and programming.

Device information
Product manuals contain a compact description of the module-specific information, such as properties, wiring diagrams, characteristics and technical specifications.

General information
The function manuals contain detailed descriptions on general topics regarding the SIMATIC ET 200SP distributed I/O system, e.g. diagnostics, communication, Web server, motion control and OPC UA.

You can download the documentation free of charge from the Internet (https://support.industry.siemens.com/cs/ww/en/view/109742709).

Changes and supplements to the manuals are documented in a Product Information.

You can download the product information free of charge from the Internet (https://support.industry.siemens.com/cs/us/en/view/73021864).

Manual Collection ET 200SP

The Manual Collection contains the complete documentation on the SIMATIC ET 200SP distributed I/O system gathered together in one file.

You can find the Manual Collection on the Internet (https://support.automation.siemens.com/WW/view/en/84133942).

"mySupport"

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (https://support.industry.siemens.com/My/ww/en).

"mySupport" - Documentation

With "mySupport", your personal workspace, you make the best out of your Industry Online Support.

In "mySupport", you can save filters, favorites and tags, request CAx data and compile your personal library in the Documentation area. In addition, your data is already filled out in support requests and you can get an overview of your current requests at any time.

You must register once to use the full functionality of "mySupport".

You can find "mySupport" on the Internet (https://support.industry.siemens.com/My/ww/en/documentation).

"mySupport" - CAx data

In the CAx data area of "mySupport", you can access the latest product data for your CAx or CAe system.

You configure your own download package with a few clicks.

In doing so you can select:

- Product images, 2D dimension drawings, 3D models, internal circuit diagrams, EPLAN macro files
- Manuals, characteristics, operating manuals, certificates
- Product master data

You can find "mySupport" - CAx data on the Internet (https://support.industry.siemens.com/my/ww/en/CAxOnline).

Application examples

The application examples support you with various tools and examples for solving your automation tasks. Solutions are shown in interplay with multiple components in the system - separated from the focus on individual products.

You will find the application examples on the Internet (https://support.industry.siemens.com/cs/ww/en/ps/ae).

TIA Selection Tool

With the TIA Selection Tool, you can select, configure and order devices for Totally Integrated Automation (TIA).
This tool is the successor of the SIMATIC Selection Tool and combines the known configurators for automation technology into one tool.
With the TIA Selection Tool, you can generate a complete order list from your product selection or product configuration.

You can find the TIA Selection Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/109767888).

SIMATIC Automation Tool

You can use the SIMATIC Automation Tool to perform commissioning and maintenance activities simultaneously on various SIMATIC S7 stations as a bulk operation independent of TIA Portal.

The SIMATIC Automation Tool provides a multitude of functions:

- Scanning of a PROFINET/Ethernet system network and identification of all connected CPUs
- Address assignment (IP, subnet, gateway) and station name (PROFINET device) to a CPU
- Transfer of the date and the programming device/PC time converted to UTC time to the module
- Program download to CPU
- RUN/STOP mode switchover
- CPU localization by means of LED flashing
- Reading out of CPU error information
- Reading of the CPU diagnostics buffer
- Reset to factory settings
- Firmware update of the CPU and connected modules

You can find the SIMATIC Automation Tool on the Internet (https://support.industry.siemens.com/cs/ww/en/view/98161300).

PRONETA

SIEMENS PRONETA (PROFINET network analysis) allows you to analyze the plant network during commissioning. PRONETA features two core functions:

- The topology overview automatically scans the PROFINET and all connected components.
- The IO check is a fast test of the wiring and the module configuration of a plant, incl. fail-safe inputs and outputs.

You can find SIEMENS PRONETA on the Internet (https://support.industry.siemens.com/cs/ww/en/view/67460624).

SINETPLAN

SINETPLAN, the Siemens Network Planner, supports you in planning automation systems and networks based on PROFINET. The tool facilitates professional and predictive dimensioning of your PROFINET installation as early as in the planning stage. In addition, SINETPLAN supports you during network optimization and helps you to exploit network resources optimally and to plan reserves. This helps to prevent problems in commissioning or failures during productive operation even in advance of a planned operation. This increases the availability of the production plant and helps improve operational safety.

The advantages at a glance

- Network optimization thanks to port-specific calculation of the network load
- Increased production availability thanks to online scan and verification of existing systems
- Transparency before commissioning through importing and simulation of existing STEP 7 projects
- Efficiency through securing existing investments in the long term and the optimal use of resources

You can find SINETPLAN on the Internet (https://www.siemens.com/sinetplan).

Views of the ET 200SP motor starter

The ET 200SP motor starter is a 30-mm-wide compact device with hybrid technology. The ET 200SP motor starter has electronic overload protection for switching of three-phase asynchronous motors and single-phase AC motors up to 5.5 kW (at 500 V) during normal operating conditions. Fail-safe variants of the motor starter are also available.

The figure below shows an ET 200SP HF motor starter:

Figure 1-409 View of the ET 200SP motor starter with mounted 3DI/LC module (optionally available)

The figure below shows a fail-safe ET 200SP motor starter:

Figure 1-410 View of the fail-safe ET 200SP motor starter with mounted 3DI/LC module (optionally available)

Properties of the ET 200SP motor starter

The ET 200SP motor starter has the following technical properties:

- Switching and protection device for three-phase asynchronous motors and single-phase AC motors
- Integrated short-circuit and overload protection
- Direct-on-line or reversing start function

Fail-safe motor starters additionally support safety-related disconnection (Safe Torque Off). The fail-safe variants of the motor starter are therefore suitable for the following uses:

- Safety-related applications up to SIL 3 to EN 61508, PL e/Cat. 4 to EN ISO 13849-1
- Overload protection of motors in hazardous areas

You can find all the functions supported by the ET 200SP motor starter in Chapter Functions (Page 45)

The following system functions of the ET 200SP family remain supported:

- I&M data
- Firmware update
- Maintenance
- PROFIenergy

You will find the descriptions of these functions and also rules and regulations for commissioning in the ET 200SP System Manual (https://support.industry.siemens.com/cs/ww/de/view/58649293/en?dl=en).

Accessories of the ET 200SP motor starter

You can order the following accessories separately:

- BaseUnit with width of 30 mm (3RK1908-0AP00-0xx0)
- Labeling strips in various versions:
  - 500 units light-gray on a roll (6ES7193-6LR10-0AA0)
  - 500 units yellow on a roll (6ES7193-6LR10-0AA0)
  - 1000 units light-gray on DIN A4 sheets (6ES7193-6LA10-0AG0)
  - 1000 units yellow on DIN A4 sheets (6ES7193-6LA10-0AG0)
- 160 reference identification labels (6ES7193-6LF30-0AW0)
- 3DI/LC module (3RK1908-1AA00-0BP0)
- Fan (3RW4928-8VB00); is already included with all 4-12 A motor starters

NOTICE
Blowing direction of the fan Observe the blowing direction of the fan when mounting. The air flow must be directed into the inside of the motor starter. The correct blowing direction is indicated by arrows on the bottom of the fan. See ET 200SP System Manual (https://support.industry.siemens.com/cs/ww/de/view/58649293/en?dl=en), "Installing fans" section.

- Mechanical bracket for BaseUnit (3RK1908-1EA00-1BP0)
- Cover for an empty BaseUnit (3RK1908-1CA00-0BP0)
- Touch protection for infeed bus (3RK1908-1DA00-2BP0); is already provided with all BaseUnits with 500 V AC infeed

You can find further information on accessories in the ET 200SP System Manual (https://support.industry.siemens.com/cs/ww/de/view/58649293/en?dl=en) in the Appendix "Accessories/spare parts".

Introduction (Page 6)

6.2 Electromagnetic compatibility

Definition of EMC

Electromagnetic compatibility (EMC) is the ability of an electrical installation to function satisfactorily in its electromagnetic environment without interfering with that environment.

Designing interference-free motor starters

For interference-free operation of the ET 200SP station in accordance with standard IEC 60947-4-2, use a dummy module before the first motor starter. No dummy module is necessary to the right of the motor starter.

Note the following mounting rules:

Use the following dummy module on the standard mounting rail between the previous module and the ET 200SP motor starter:

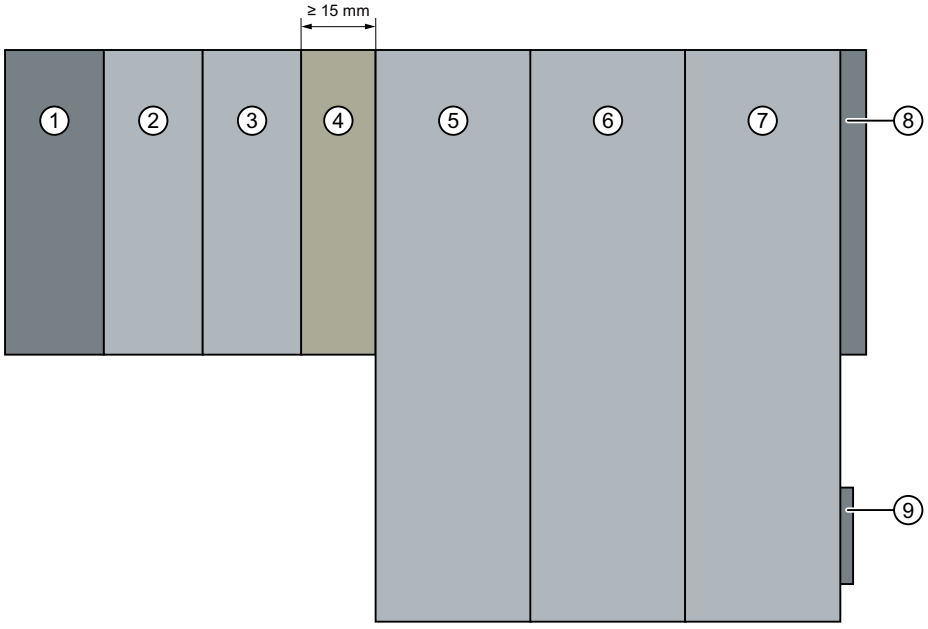
BU cover 15 mm: 6ES7133-6CV15-1AM0 with BaseUnit 6ES7193-6BP00-0BA0

For operation of the ET 200SP station with an unused BaseUnit, a cover must be provided for the open BaseUnit plug contacts (power connector, power bus connector, and backplane bus connector).

The cover protects the plug contacts against dirt. The BU cover can be ordered as an accessory.

NOTE

Use of interference suppressors with hybrid switchgear



No EMC protective wiring (e.g. RC element or varistor interference suppression module) is ever necessary with the ET 200SP motor starter. Observe the following section in this context Designing motor starters in conjunction with electromechanical switching devices (Page 28).

Under normal operating conditions, the motor is always switched off in current zero due to the specific properties of the hybrid switching technology. As result, no critical states in terms of EMC ever arise in the surrounding environment.

If EMC interferences nevertheless arise, an RC element can be connected to the motor (see section Designing motor starters in conjunction with electromechanical switching devices (Page 28), figure "Use of RC elements for reducing voltage peaks").

Mounting the dummy module

The figure below provides a schematic representation of how to implement measures for improving interference immunity.

① Interface module
② Digital input module
③ Digital output module
④ Dummy module
⑤ Motor starter
⑥ Motor starter
⑦ Motor starter
⑧ Server module
⑨ Infeed bus cover

NOTICE

Ensuring interference immunity
You must not plug any other module into the BaseUnit of the dummy module, otherwise interference immunity is no longer ensured.

NOTE

Using a dummy module
The dummy module cannot be configured in all versions of TIA Portal.
In this case, leave this slot unoccupied in TIA Portal.

6.3 Designing motor starters in conjunction with electromechanical switching devices

NOTICE
Use of motor starters in series with mechanical switching devices, e.g. line contactors When using motor starters in series with mechanical switching devices, e.g. line contactors, ensure that voltage peaks are prevented by means of the mechanical shutdown of small motors (high inductance). You can achieve this with a corresponding shutdown sequence or through the use of RC elements.

One advantage of the hybrid motor starters is, among other things, the shutdown in the current zero point, which has the advantage that no voltage peaks or arcing occur in the power circuit. Thus, electromagnetic interferences no longer exists due to the shutdown.

Switching an inductive load, in particular of motors with an output of < 1 kW with correspondingly high inductance, e.g. with a contactor, can cause an inductive voltage of several 1000 V with steep voltage edges, depending on the switching time. This can also occur multiple times due to the bouncing of the contactor contacts and the resultant arcs. For a contactor, this leads to increased contact erosion (wear) and to high electromagnetic load on other components due to coupling into other electric lines.

If a line contactor is also connected upstream or downstream of a motor starter, the shutdown of the line contactor when the motor is running generates a counter-acting self-induction voltage, which can reach a voltage of several 1000 V with a very steep voltage rise.

The motor starter is protected against overvoltage by internal varistors. If, however, the voltage peaks are significantly higher and/or they occur more frequently or in rapid succession (due to contactor bouncing), the varistors become overloaded and can no longer limit the voltage peaks. The voltage peaks are then present directly on the electronic switching element of the motor starter and can ultimately lead to damage and a defective device.

Remedial measures

- Delayed shutdown of the line contactor by the motor starter shutting down before the contact (in current zero point). These voltage peaks do not occur at all and the contactor can be shut down (de-energized) approx. 100 ms later. This also results in an increased service life of the contactor, because it always switches without load.
- Use of RC elements on the 3 motor phases. As a consequence, the voltage peaks and also the steep voltage rise are reduced.

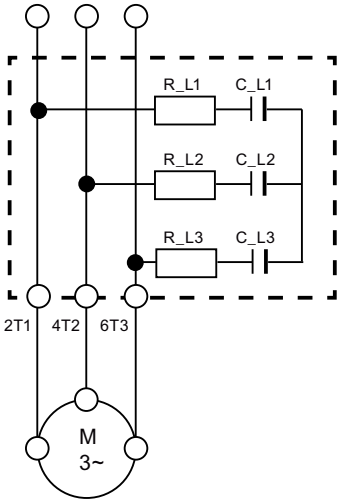


Figure 1-411 Use of RC elements for reducing voltage peaks

The following RC elements are suitable:

- 3RK1911-6EA00 for the direct mounting on standard mounting rail
- 3RK1911-6EB00 for direct attachment to the motor terminal board
- RC elements for direct attachment on the S00 contactor (3RT2916-1P*). RC elements for load contactors larger than size S00 must be obtained through third-party manufacturers.

NOTICE
Connected motors Observe the dimensioning of the connected motors.

If other regenerative components (FU, motors, transformers, etc.) are connected to the motor starter, the FAQ "EMC interference with fail-safe ET 200SP motor starter with a device fault (https://support.industry.siemens.com/cs/us/en/view/109818881)" must be observed.

6.4 Applications

You can use the ET 200SP motor starters wherever you want to switch and protect drives up to 5.5 kW with an ET 200SP system.

The ET 200SP motor starters are used for the following, for example:

- Conveyor technology
- Logistics systems
- Production machines
- Machine tools
- Gas discharge lamps

Fail-safe motor starters are designed exclusively for the switching and protection of motor loads.

6.5 Permissible ambient temperatures up to 1000 m above sea level.

General supplementary conditions

You can install the motor starter in two mounting positions:

- Horizontal mounting position
- Vertical mounting position

The mounting position depends on the position of the standard mounting rail. The following maximum permissible ambient temperatures apply depending on the mounting position:

- Horizontal mounting position: 60 °C
- Vertical mounting position: 50 °C

Observe the following general conditions when using the motor starters:

- Parameterized rated operational current I_e
- Current of the infeed system (500 V AC)
- Current of the power bus (24 V DC)
- Fan operation; the fan switches itself on and off automatically depending on the temperature in the motor starter.

Stand-alone installation

You can operate motor starters equipped with fans with the max. parameterizable I_e within the specified temperature limits.

Use of fans in group configuration (side by side)

1) Operation with infeed system (500 V AC) up to 27 A
See the table below for the cases in which you must use a fan depending on the ambient temperature during operation with a infeed system (500 V AC) up to 27 A:

Set operational current I_e	Direct-on-line starter		Reversing starter	
	Horizontal mounting position	Vertical mounting position	Horizontal mounting position	Vertical mounting position
	Ambient temperature			
1 A	45°... 60 °C [1]	40°... 50 °C [1]	45°... 60 °C [1]	40°... 50 °C [1]
3 A	45 ... 60 °C [1]	40°... 50 °C [1]	45°... 60 °C [1]	40°... 50 °C [1]
5 A	40°... 60 °C [1]	35 ... 50 °C [1]	37°... 60 °C [1]	32°... 50 °C [1]
7 A	35 ... 60 °C [1]	30°... 50 °C [1]	32 ... 60 °C [1]	27°... 50 °C [1]
9 A	30°... 60 °C [1]	25 ... 50 °C [1]	25°... 55 °C [1]	20°... 50 °C [1]
> 9 A	Up to max. 50 °C [1] [2]	Up to max. 50 °C [1] [2]	Up to max. 50 °C [1] [2]	Up to max. 50 °C [1] [2]
> 10 A	Up to max. 45 °C [1] [2]	Up to max. 45 °C [1] [2]	Up to max. 45 °C [1] [2]	Up to max. 45 °C [1] [2]

1) In operation with an infeed system up to 32 A, the maximum usage temperature is reduced by 10 K.

2) Fans are included in the scope of supply

NOTICE
Loadability of the power bus The power bus (24V DC) can only be loaded with up to 7 A when used with the motor starters.

2) Current of the infeed system (500 V AC) in accordance with UL/CSA requirements

NOTICE
A fan is absolutely necessary In this type of operation you always have to use a fan.

See the table below for the maximum ambient temperature at which you can run the motor starter when operating it with a infeed system (500 V AC) in accordance with UL/CSA requirements:

Set operational current I_e	**Direct-on-line starter, reversing starter**	
	Horizontal mounting position	**Vertical mounting position**
	Ambient temperature	
1 A	Up to max. 60 °C	Up to max. 50 °C
3 A	Up to max. 60 °C	Up to max. 50 °C
5 A	Up to max. 60 °C	Up to max. 50 °C
> 5 A	Up to max. 50 °C	Up to max. 50 °C
> 9 A	Up to max. 45 °C [1)]	Up to max. 45 °C [1)]

1) Fans are included in the scope of supply

NOTICE
Loadability of the power bus The power bus (24V DC) can only be loaded with up to 7 A when used with the motor starters.

6.6 Permissible ambient temperatures at more than 1000 m above sea level.

Current derating as a function of the installation altitude is applicable for devices with and without fans.

Possible restrictions through current derating at installation altitudes above 1000 m above sea level can be compensated for by using a fan.

The following table shows the current derating as a function of the altitude of the installation location:

Installation altitude h in m	I_e in %	Max. ambient temperature (vertical/horizontal installation)
1000 m	100 % (see above)	
2000 m	92 %	+ 60 °C ... + 50 °C
3000 m	85 %	+ 54 °C ... + 45 °C
4000 m	78 %	+ 48 °C ... + 40 °C

The I_e values can be interpolated on the basis of the available altitude specifications.

NOTICE

Derating of the nominal/rated data for the insulation coordination beyond specific altitudes above sea level

- Up to an elevation of 2000 m above sea level, operation is possible without derating of the nominal/rated data for the insulation coordination.
- With an installation altitude higher than 2000 m and below 4000 m above sea level, observe the following:
  - Line connection / E-bus: the permitted overvoltage category is reduced from III to II
  - Power bus (24 V power supply): only SELV / PELV supply permitted

NOTICE

Extension of the application range for fail-safe SIMATIC ET 200SP motor starters at installation altitudes of up to 4000 m above sea level

For information on this, please refer to the current product release Extension of the application range for fail-safe SIMATIC ET 200SP motor starters up to an installation altitude of 4000 m (https://support.industry.siemens.com/cs/ww/en/view/109778836).

6.7 Device versions

Current ranges

The table below shows the switchable motor powers depending on the primary voltage, according to DIN EN 60947-4-1: Table G.1. The stated current ranges are valid for the ET 200SP motor starters.

	0.1 ... 0.4 A		0.3 ... 1 A		0.9 ... 3 A		2.8 ... 9 A		4 ... 12 A	
	0.1 A	0.4 A	0.3 A	1 A	0.9 A	3 A	2.8 A	9 A	4 A	12 A
230 V AC	< 0.06 kW	0.09 kW	< 0.06 kW	0.18 kW	0.18 kW	0.55 kW	0.55 kW	2.20 kW	0.75 kW	3.0 kW
400 V AC	< 0.06 kW	0.12 kW	< 0.09 kW	0.25 kW	0.37 kW	1.10 kW	1.50 kW	4.00 kW	1.5 kW	5.5 kW
500 V AC	< 0.06 kW	0.18 kW	< 0.12 kW	0.37 kW	0.55 kW	1.50 kW	1.50 kW	4.00 kW	2.2 kW	5.5 kW

The assignments of the motor currents to the motor powers are recommended values. Due to the introduction of energy-efficient motors (IE3, IE4) to the market, rated currents are falling for any given power. At the same time, the start-up currents rise.

NOTICE

Dimensioning instructions

Take the current characteristics of the connected motor and motor starter into account when dimensioning. The following characteristic values are relevant:

- Ratio of rated current to motor starting current
- The maximum starting current of the motor may deviate from the values specified by the manufacturer by 20% in accordance with EN 60034-1.
- Maximum permissible current range of the motor starter: The permissible current range can be found in the graphic in Chapter "Device protection model (Page 70)".

You will find more information on dimensioning switching devices for IE3/IE4 motors in the Switching devices application manual (http://support.automation.siemens.com/WW/view/en/94770820).

6.8 Operating motor starters

Hardware and software requirements

Fail-safe ET 200SP motor starters are supported by IM155-6PN BA interface modules with firmware V3.2 or higher, IM155-6PN ST with firmware V3.1 or higher, IM155-6PN HF with firmware V3.1 or higher and IM155-6DP HF with firmware V3.0 or higher.

You require SIMATIC STEP 7 V14 or higher for configuring and programming fail-safe ET 200SP motor starters. No additional safety software (e.g. F-Configuration Pack) is required for configuring and programming the fail-safe ET 200SP motor starter.

NOTE

Requirements for manual bus mode

The device firmware V1.2.0 or higher is required for manual bus mode of the ET 200SP motor starter.

NOTE
Configuration of the ET 200SP motor starters with the TIA Portal software SIMATIC STEP 7 V13 or higher is possible with a GSD file (GSDML).

Checking switching elements

The switching elements (semiconductors, relays) are checked automatically when the motor is switched off and on via the motor starter.

The switching elements cannot be checked in the following operating states:

- During operation (Motor ON)
- In the switched-off state (Motor OFF)

Therefore ensure that the switching elements are regularly checked by the following actions:

- Monthly self-test of the motor starter if the motor starter has been switched off for more than a month:
  - Self-test by switching the motor on and off

  or alternatively
  - Commissioning of the entire system
- If the motor is operated continuously, disconnect it from the power supply at least once monthly by way of the motor starter.
- In the case of reversing starters, check the switching elements for both directions of rotation: To do this, start the motor once in the clockwise direction and once in the counter-clockwise direction.

The switching on and off routines must be run through without errors. This means:

- Current must flow.
- The motor starter must not display any errors.
- The supply voltage must be stable.

The switching on or off routine is canceled as soon as an error is detected. The motor starter assumes the safe OFF state. Observe to the diagnostic messages in DS72 logbook - Read device error (Page 128). Depending on the error message, you can reset the error by switching off the 24 V supply voltage and then switching it on again.

If you switch on when the line voltage is interrupted or a load is missing, the following messages are generated:

- Residual current detected
- Residual current disconnection

This message can be acknowledged by the Trip Reset / Reset pushbutton.

If the supply voltage is interrupted during switching on or off, this may lead to a device fault (entry 308 in data set 92 (Page 133)). In addition, the following entries in DS72 logbook - Read device error (Page 128) are possible:

- 20017 "Residual current detection during switching on/off routine or bypass element does not close"
- 20018 "Error in switching element diagnostics in the switching off process"

You can reset these faults and subsequently continue operating the motor starter following a fault-free test cycle as described above. If the faults recur, this indicates that the motor starter is defective in spite of the fact that the supply voltage conditions are stable. Replace the motor starter in this case.

Replacing the fail-safe motor starter

When replacing a fail-safe motor starter, pay attention to the commissioning specifications for fail-safe systems.

Fail-safe input F-DI on the BaseUnit

The fail-safe input on the BaseUnit is designated as follows in the manual with "F-DI".

In the case of safety-related applications, control the F-DI on the BaseUnit from a safe output.

NOTICE

Connection of the F-DI input of the BU-30-MS5 to BU-30-MS10 BaseUnits to surge filters
If your equipment makes it necessary to protect the contact against overvoltage, you have to connect the F-DI input of the BU-30-MS5 to BU-30-MS10 BaseUnits to surge filters!
Refer to Chapter "Electromagnetic compatibility" in ET 200SP System Manual (https://support.industry.siemens.com/cs/ww/de/view/58649293/en?dl=en).

⚠ WARNING

Safety-related shutdown via the F-DI
Depending on peripherals used, the shutdown takes place via one or two output channels (terminals):

- PM switching: The shutdown takes place via two output channels.
- PP switching: The shutdown takes place via one output channel.

Shutdown via one output channel (PP switching) achieves SILCL 3 according to EN 62061, PL e/Cat. 4 according to EN ISO 13849-1 if steps are taken to ensure that the cables are installed in such a way that they are protected against a cross-circuit/line-to-line fault.
For the BU-30-MS7 to BU-30-MS10 F-DI forwarding BaseUnits, only PP switching is possible.
For the single F-DI BaseUnits BU-30-MS5 and BU-30-MS6, PM and PP switching are possible.

Bright and dark tests

With bright and dark tests, safety relays such as ET 200SP F-PM-E (6ES7136-6PA00-0BC0) or SIRIUS 3SK check whether their safe outputs can still be activated and deactivated. The bright and dark tests are run cyclically. The ET 200SP motor starter is intended for operation with an F-PM-E or 3SK connected upstream and is adapted to the bright and dark test times of these devices.

You can find more information on the operating principle and parameter assignment of bright and dark tests in the respective device manual.

To avoid an unintentional response of the fail-safe motor starter during the bright and dark test, these tests must not exceed a certain time. Due to component aging, the permissible read-back time can also decrease throughout the motor starter's service life. The voltage of the power supply unit also has an influence on the permissible read-back time. Increase the power supply unit's output voltage to minimize the risk of incorrect deactivation during dark tests.

By trial and error, set the read-back time as low as possible, but so high that the output channel is not deactivated.

⚠ WARNING
Inadvertent starting of the motor if the bright test lasts too long The motor can start if the bright test lasts more than 10 ms. There is a risk of severe injury or death. Material damage is also possible. Make sure that the bright test lasts less than 10 ms on devices that are connected upstream of the motor starter.

Power supply

In the case of a 24 V DC power supply, observe the following safety measures:

- Ensure safe electrical separation and separate routing of cables.
- Ensure increased insulation of the extra-low voltage (SELV/PELV) from circuits with hazardous potentials in accordance with IEC 60364-4-41.
- To deactivate safely via the 24 V power bus, use a suitable power supply in compliance with the requirements of the safety classification used.
- In corner-grounded delta networks, ensure increased insulation of the extra-low voltage (SELV/PELV) from circuits with hazardous potentials in accordance with NFPA 79.

Current consumption of the ET 200SP motor starters in the electric torque

NOTICE
Brief current peak possible In the electric torque of the 24 V DC power supply, a brief current peak can occur depending on the number of motor starters. Ensure an appropriate layout of your voltage source, taking this current peak into consideration.

Selection of a SITOP power supply including selective load circuit monitoring for an ET 200SP station with fail-safe I/O modules and motor starters:
See FAQ ET 200SP motor starter + fail-safe I/O + SITOP including selectivity (https://support.industry.siemens.com/cs/ww/en/view/109781189) in Industry Online Support.

Peak current in the start-stop torque

Number of motor starters	Current in A	Time in ms (until 8 A rated current is reached)
1	25	0.145
2	47	0.24
3	64	0.32
4	78	0.36
5	91	0.42

Number of motor starters	Current in A	Time in ms (until 8 A rated current is reached)

Connecting and operating motor brakes

ET 200SP motor starters can be operated for the following braking applications:

- Variant 1: High Feature DOL starter or reversing starter and F DOL starter or F reversing starter with 400 V brake
- Variant 2: High Feature DOL starter or reversing starter with 230 V brake
- Variant 3: High Feature DOL starter or reversing starter and F DOL starter or F reversing starter with 230 V brake without connection to the neutral conductor

Variant 1. High Feature DOL starter or reversing starter and F DOL starter or F reversing starter with 400 V brake

The current for the braking device is drawn from two phases.

NOTICE
Current drain for the braking device Note that the current for the braking device may only be taken from terminals T1 and T3. Otherwise, the motor starter may be damaged.

The connection of the motor brake leads to phase asymmetry at the motor connection. This is detected by the motor starter, which responds based on its parameter settings and the magnitude of the asymmetry.

Asymmetry limit:

The asymmetry limit is a percentage value by which the motor current is allowed to deviate in each phase. Asymmetry is detected as soon as one of the three phases deviates by more than 40 % from the mean value of all phases.

Response to asymmetry:

You use this device parameter to determine the behavior of the motor starter in the event of asymmetry:

- Warning (not permissible for fail-safe motor starters in ATEX operation)
- Shutdown

NOTE

Using brake motors

When using brake motors, you have to increase the set rated motor current by the braking current (see example on motor and brake starting current later in this chapter).

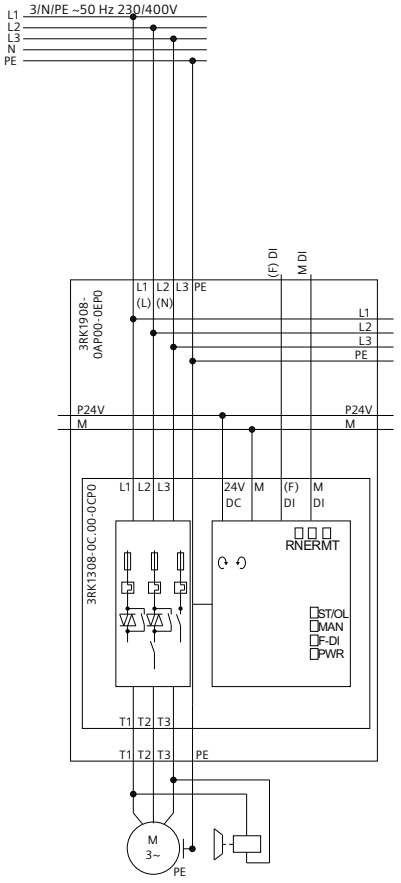

Figure 1-413 Connection of a 400 V brake to an ET 200SP motor starter

Variant 2. High Feature DOL starter or reversing starter with 230 V brake

The current for the braking device is drawn from only one switched phase. Connection is via T1.

The single-phase connection of the motor brake leads to phase asymmetry at the motor connection. This is detected by the motor starter, which responds based on its parameter settings and the magnitude of the asymmetry.

Asymmetry limit:

The asymmetry limit is a percentage value by which the motor current is allowed to deviate in each phase. Asymmetry is detected as soon as one of the three phases deviates by more than 40 % from the mean value of all phases.

Response to asymmetry:

You use this device parameter to determine the behavior of the motor starter in the event of asymmetry:

- Warning (not permissible for fail-safe motor starters in ATEX operation)
- Shutdown

NOTE

Using brake motors

When using brake motors, you have to increase the set rated motor current by the braking current (see example on motor and brake starting current later in this chapter).

NOTICE

Using this mode

This operating mode is **not** suitable for 3RK1308-0C and fail-safe 3RK1308-0D motor starters as there is a connection to the neutral conductor.

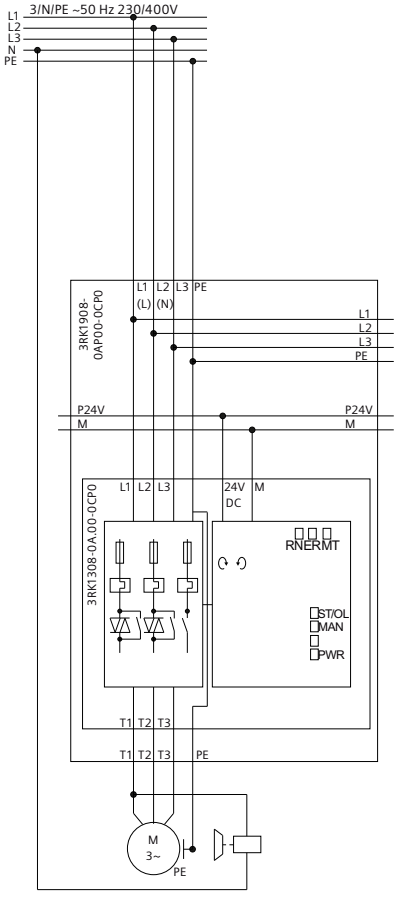

Figure 1-414 Connection of a 230 V brake with connection to the neutral conductor to an ET 200SP motor starter

Variant 3. High Feature DOL starter or reversing starter and F DOL starter or F reversing starter with 230 V brake without connection to the neutral conductor

The current for the braking device is drawn from only one switched phase. Connection is via T1. The second connection of the braking device is made at the neutral point of the motor windings and there is **no** connection to the neutral conductor.

The single-phase connection of the motor brake leads to phase asymmetry at the motor connection. This is detected by the motor starter, which responds based on its parameter settings and the magnitude of the asymmetry.

Asymmetry limit:

The asymmetry limit is a percentage value by which the motor current is allowed to deviate in each phase. Asymmetry is detected as soon as one of the three phases deviates by more than 40 % from the mean value of all phases.

Response to asymmetry:

You use this device parameter to determine the behavior of the motor starter in the event of asymmetry:

- Warning (not permissible for fail-safe motor starters in ATEX operation)
- Shutdown

NOTE

Using brake motors

When using brake motors, you have to increase the set rated motor current by the braking current (see example on motor and brake starting current later in this chapter).

NOTICE
Using this mode This operating mode is **also** suitable for fail-safe 3RK1308-0C and 3RK1308-0D motor starters as there is no connection to the neutral conductor.

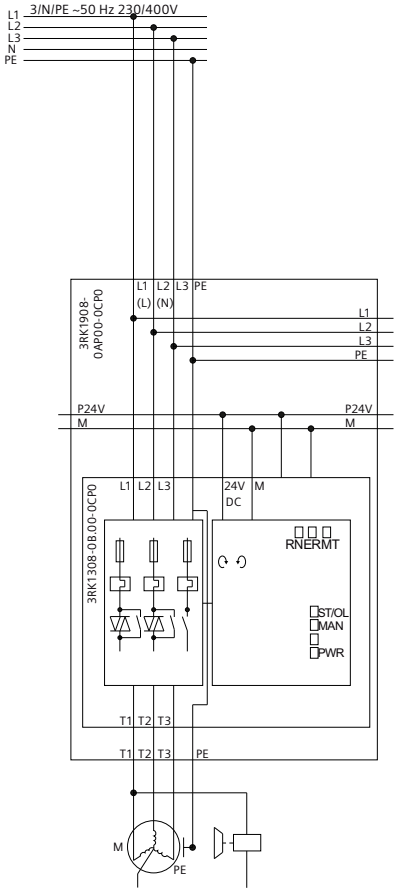

Figure 1-415 Connection of a 230 V brake in star connection and connection to the neutral point on an ET 200SP motor starter

Overview

The table below shows which motor starters can be operated with which of the three variants (✓ = permissible; - = not permissible):

Version	**1** **400 V brake**	**2** **230 V brake with connection to the neutral conductor**	**3** **230 V brake with connection to the neutral point**
Motor connection	Star or delta connection	Star or delta connection	Star connection only
Brake closing time 1)	Long	Very short	Medium
High Feature DOL starter	✓	✓	✓
High Feature reversing starter	✓	✓	✓
High Feature F DOL starter	✓	-	✓
High Feature F reversing starter	✓	-	✓

NOTICE
Brake properties The brake properties vary depending on the type of connection. Please observe the information provided by the motor manufacturer.

NOTE

1)

The brake closing time is influenced accordingly by the type of connection and the selected braking device.

For detailed information, see the documentation provided by the motor manufacturer. The brake configurations described can result in a time response that deviates from the specifications of the motor manufacturer.

Checking the settings

Always check the safety-related parameters during acceptance of the system. Also always check the parameters if a parameter has been changed or if you are commissioning the system for the first time.

Example of the correct engineering of a motor starter

NOTICE
Maximum current-carrying capacity Note that the sum of the starting current of the motor and the inrush current of the brake must not exceed the maximum current-carrying capacity of the selected motor starter.

- Rated motor current I_{rated}: 2.45 A
- Braking current I_B: 0.50 A
- Setting value on motor starter: $I_e = I_{rated} + I_B = 2.95$ A
- Motor starting current factor: I_{St}/I_{rated} 8-fold
- Brake inrush current factor: 8-fold
- Motor starting current: $I_{St} = I_{rated} * I_{St}/I_{rated} = 2.45$ A * 8 = 19.6 A
- Maximum brake inrush current: $I_B * 8 = 0.5$ A * 8 = 4 A
- Motor starting current + brake inrush current: 19.6 A + 4 A = 23.6 A

- Maximum current-carrying capacity of 3 A motor starter (3RK1308 - 0AC00-0CP0): 30 A; see also data sheet (https://support.industry.siemens.com/cs/ww/en/ps/21800/faq (https://support.industry.siemens.com/cs/ww/en/ps/21800/faq))
- **Result:** The maximum current-carrying capacity is 23.6 A. It is below 30 A for this application. This means that you can use the ET 200SP motor starter (3RK1308 - 0AC00-0CP0) for this application.

Operation by experienced users only

⚠ WARNING

Qualified personnel required
All work involved in connecting, commissioning, operation and maintenance must be carried out by **qualified, responsible** personnel.
Failure to follow proper procedures may result in **personal injury and damage to property**.

ATEX-certified motor overload protection

Fail-safe ET 200SP motor starters are approved under device group II, Category 2) in the "GD" area. This means that the fail-safe motor starters can protect motors that are located in hazardous gas, vapor, mist and air mixtures and also combustible dust.

⚠ WARNING

The motor starter is not suitable for installation in hazardous areas.
Due to the increased danger in hazardous areas, observe the following standards:

- EN 60079-14 / VDE 0165-1 Explosive atmospheres - Part 14: Electrical installations
- EN 60079-17 Explosive atmospheres - Part 17: Electrical installations inspection and maintenance
- EN 50495 Safety devices required for the safe functioning of equipment with respect to explosion risks

Functions

7

7.1 Overview of functions

The table below shows the functions of the various versions of ET 200SP motor starters:

	Direct-on-line starter	Reversing starter	Fail-safe direct-on-line starter	Fail-safe reversing starter
Basic function/basic parameter (Page 48)				
• Rated operational current (Page 48)	x	x	x	x
• Load type (Page 49)	x	--- (Only 3-phase possible)	x ("1-phase" not possible for ATEX applications)	---
Motor control (Page 50)				
• Electronic switching technology (hybrid switching technology) (Page 50)	x	x	x	x
• Control function (Page 53)	---	x	---	x
• Operating modes (Page 54)	x	x	x	x
Overload protection (Page 55)	x	x	x (Restrictions in ATEX operation)	x (Restrictions in ATEX operation)
Substation monitoring (Page 65)				
• Response to residual current detection (Page 65)	x	x	--- (Only "Deactivate" possible)	--- (Only "Deactivate" possible)
• Upper/lower current warning limit (Page 69)	x	x	x	x
• Upper/lower current limit (Page 69)	x	x	x	x
• Substation monitoring (Page 65)	x	x	x	x
• Blocking time and blocking current (Page 70)	x	x	x	x
• Blocking time and blocking current (Page 70)	x	x	x	x
• Asymmetry monitoring (Page 73)	x	x	x (Restrictions in ATEX operation)	x (Restrictions in ATEX operation)
• Short-circuit protection (fuses) (Page 74)	x	x	x	x
Response to CPU/master STOP (Page 76)	x	x	x	x
Group fault diagnostics/group warning diagnostics (Page 76)	x	x	x	x
TEST/RESET button (Page 119)	x	x	x	x

	Direct-on-line starter	Reversing starter	Fail-safe direct-on-line starter	Fail-safe reversing starter
Emergency start (Page 84)	x	x	x (Not with an ATEX application)	x (Not with an ATEX application)
Trip RESET (Page 88)	x	x	x	x
Cold start (Page 88)	x	x	x [1)]	x [1)]
PROFIenergy (Page 91)	x	x	x	x
Logbook (Page 90)	x	x	x	x
Maintenance (Page 122)	x	x	x	x
Parameter start interlock [1)]	x	x	x	x
Manual bus [1)]	x	x	x	x
Diagnosis "Supply voltage too low"	x	x	x	x

1) From FW Version 1.2.0

The following functions are available when using the 3DI/LC module via the inputs:

	Direct-on-line starter	Reversing starter	Fail-safe direct-on-line starter	Fail-safe reversing starter
Inputs (Page 76)	x	x	x	x
Manual local (local control) (Page 81)	x	x	x	x
Trip without restart (Page 81)	x	x	x	x
Trip with restart (Page 82)	x	x	x	x
Trip emergency end position CW (Page 82)	x	x	x	x
Trip emergency end position CCW (Page 84)	x	x	x	x
Group warning (Page 84)	x	x	x	x
Emergency start (Page 84)	x	x	x (Not with an ATEX application)	x (Not with an ATEX application)
Motor CW (Page 85)	x	x	x	x
Motor CCW (Page 85)	---	x	---	x
Quick Stop direction-independent (Page 86)	x	x	x	x
Quick Stop clockwise (Page 87)	x	x	x	x
Quick Stop counter-clockwise (Page 88)	---	x	---	x
Trip RESET (Page 88)	x	x	x	x
Cold start (Page 88)	x	x	x [1)]	x [1)]
Operational trip end position CW (Page 89)	x	x	x	x
Operational trip end position CCW (Page 90)	x	x	x	x

1) From FW Version 1.2.0

The following functions are safety-related:

	Fail-safe direct-on-line starter	Fail-safe reversing starter
Response to safety-related tripping (Page 74) (STO = Safe Torque Off)	x	x
Ex motor application (Page 75)	x	x
Rated operational current (Page 48)	x (ATEX application only)	x (ATEX application only)
Overload protection (Page 55)	x (ATEX application only)	x (ATEX application only)

NOTE

Restrictions in relation to monitoring and input functions
When you activate safety-related functions, parameterization of the monitoring or input functions may be restricted.

7.2 Intrinsic protection

The ET 200SP motor starter protects itself against overload. Intrinsic device protection cannot be parameterized or switched off. You can find more information on the permissible ambient temperatures in chapter Permissible ambient temperatures up to 1000 m above sea level. (Page 30).

If the intrinsic protection becomes active, the follow responses occur:

- The motor trips.
- Emergency starting is not possible in the case of tripping due to intrinsic device protection.
- The diagnostic message "Switching element overload" is output in DS92 Read device diagnostics (Page 133).
- The entry "Number of switching element overload trips" in DS95 Read statistics (Page 137) is incremented by 1.

As of device firmware V1.2.0, the value of the device protection model can be read out via the DS94 Read measured values (Page 137).

If the intrinsic device protection was active, the device's diagnostics function indicates a device fault.

NOTICE

Damage due to operation of capacitive loads possible
When capacitive loads are used, the switching components in the ET 200SP motor starter can be destroyed by high inrush currents.

NOTICE
Material damage due to operation with frequency converters possible Operation in series with a frequency converter is not allowed. The switching components in the motor starter can be destroyed when operating an ET 200SP motor starter in series with a frequency converter.

7.3 Basic function/basic parameter

7.3.1 Basic functions/parameters during first commissioning

The default settings listed in the following two chapters apply to first commissioning and as defaults for the programming devices (exception: rated operational current). When a motor starter is set to the commissioning mode again, it uses the values that were valid when the technology supply voltage was last lost.

7.3.2 Rated operational current

This parameter is used to set the rated operational current that the feeder can carry without interruption. Usually, the rated operational current of the motor is specified on the rating plate of the motor. The adjustment range depends on the performance class of the ET 200SP motor starter.

NOTE

Rated operational current

The rated operational current is one of the key parameters.

You cannot disable motor protection completely. However, you can prevent the shutdown of the motor by selecting the parameter Overload protection (Page 55).

In this case, motor protection must be ensured by other measures (e.g. a thermistor in the motor).

NOTE

Functional switching

Observe the minimum loads for the ET 200SP motor starters.

The minimum loads are specified in the technical specifications of the relevant device. You can find more information on the minimum loads in chapter "Minimum load current (Page 52)".

Current motor current

The latest current in the motor starter is returned via the process image for analysis. In addition, you can read out the latest current with phase precision in data set 94.

The current is measured in two phases. The current for the third phase is calculated. The highest of the three values is determined. The returned 6-bit value specifies the motor current ratio I_{curr} / I_{rated} (I_{rated} = parameterized rated operational current).

The value is represented by one digit before the decimal point (DI 1.5) and five digits after the point (DI 1.0 to DI 1.4). This results in a maximum ratio for I_{curr} / I_{rated} of 1.96875 (approx.

197 %).
The resolution is 1/32 per bit (3.125 %).

DI 1.5	DI 1.4	DI 1.3	DI 1.2	DI 1.1	DI 1.0	
2^0	2^{-1}	2^{-2}	2^{-3}	2^{-4}	2^{-5}	
1	0.5	0.25	0.125	0.0625	0.03125	Sum = 1.96875
0	0	0	0	0	0	$I_{curr} = 0$
1	0	0	0	0	0	$I_{curr} = I_{rated}$ x 1
1	0	1	1	0	0	$I_{curr} = I_{rated}$ x 1.375
1	1	1	1	1	1	$I_{curr} = I_{rated}$ x 1.96875

I_{curr} = rated operational current I_{rated} x value (DI 1.0 to DI 1.5)
I_{rated} = rated current of the motor

Default setting

- In the ET 200SP motor starter, the rated operational current is preset at the factory to the maximum value. In the event of renewed parameterization, the parameters last set apply.
- Due to the engineering systems, the rated operational current is preset to the minimum value for safety reasons. You must therefore parameterize this value when you configure the system. The ET 200SP motor starter may otherwise trip due to overload on first starting.

Settings

Table 1-781 Settings for actual motor current

Device parameters	Default settings	Setting range
Rated operational current	• In the motor starter: maximum value or last parameterization • In engineering systems: minimum value	• 0.1 A ... 0.4 A • 0.3 A ... 1 A • 0.9 A ... 3 A • 2.8 A ... 9 A • 4 A ... 12 A Increment: 0.01 A

The setting range depends on the device type.

7.3.3 Load type

This is where you select whether the motor starter should protect a single-phase or a three-phase load.

NOTE

Reversing starter
1-phase loads are not permissible on the reversing starter. 1-phase operation is also not permissible after activation of the "EX motor" parameter in the case of fail-safe direct motor starters.

Settings

Table 1-782 Settings for load type

Device parameters	Default setting	Setting range
Load type	3-phase	• 3-phase • 1-phase

3-phase operation
In 3-phase operation, you can operate a 3-phase asynchronous motor at the connections of the motor starter.

To ensure motor protection, do not connect more than one motor to one motor starter.

Do not operate several single-phase motors on one motor starter in three-phase operation.

1-phase operation
In 1-phase operation, you can operate a 1-phase asynchronous motor at the connections of the motor starter. 1-phase operation is only possible when using a direct-on-line starter. The relevant three-pole tripping characteristics apply to single-phase operation.

Feed in the line voltage on terminals L1 and L2(N) only and connect the single-phase motor to the terminals T1 and T2 only.

An ATEX application in 1-phase operation is not possible with the motor starter.

7.4 Motor control

7.4.1 Electronic switching technology (hybrid switching technology)

The ET 200SP motor starter combines the advantages of semiconductor technology and relay technology.

The ET 200SP motor starter switches the load in phases L1 and L2 via semiconductors and bypass relays. Phase L3 is always switched via a relay.

⚠ DANGER

Hazardous Voltage
Can Cause Death or Serious Injury
If the line voltage is applied at the infeed bus of the motor starter, a hazardous voltage may be active at the output of the motor starter even without a motor ON command. When working on the feeder, you must ensure disconnection from the power, e.g. by the position "Parking position/OFF".
You will find further information on the "Parking position/OFF" in the System Manual.

This combination is known as hybrid switching technology. Hybrid switching technology in the ET 200SP motor starter is characterized by the following properties:

Switching on

The inrush current in the case of motorized loads is conducted briefly via the semiconductors.

Advantage: The relay contacts are protected. Longer service life is achieved thanks to reduced wear and tear.

Current routing

The continuous current is routed via relay contacts.

Advantage: Relay contacts cause lower thermal losses than semiconductors.

Switching off

Switching off is implemented via the semiconductors.

Advantage: The contacts are not stressed with arcs when switching via the semiconductors. This results in increased service life.

Schematic circuit diagram

The following figures show schematic circuit diagrams of the High Feature version and of the fail-safe version of the ET 200SP motor starter (direct-on-line starter version):

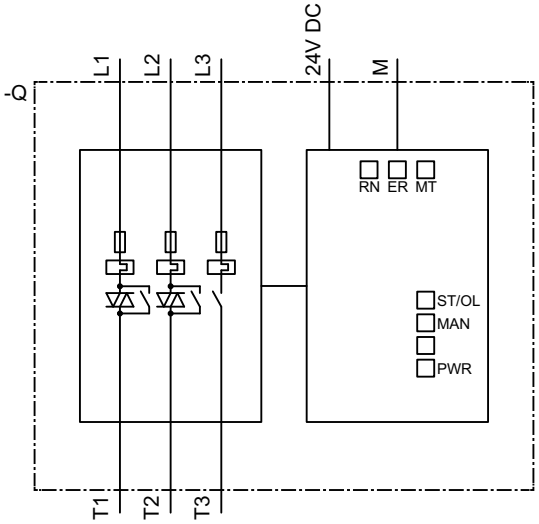

Figure 1-416 Schematic circuit diagram of HF direct-on-line starter

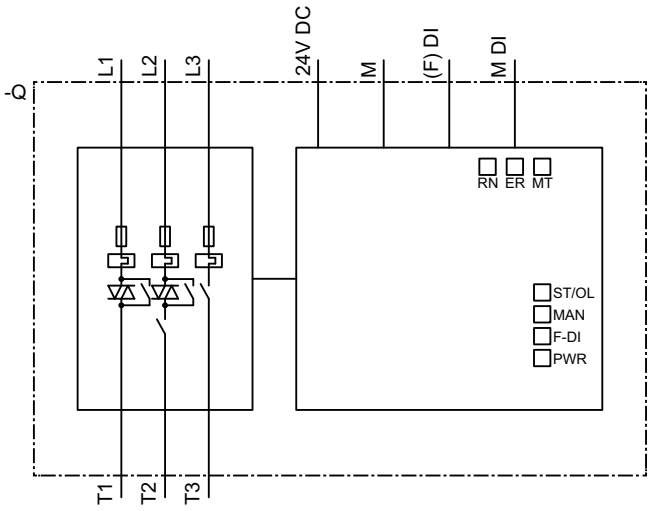

Figure 1-417 Schematic circuit diagram of fail-safe direct-on-line starter

The ET 200SP motor starters do not possess any galvanic isolation of the switching elements in the main circuits. The isolating function in compliance with EN 60947-1 is only warranted in the parking position.

See also

ET 200SP System Manual (http://support.automation.siemens.com/WW/view/en/58649293)

7.4.2 Minimum load current

The minimum load current is 20% of the set motor current, but at least the absolute minimum current specified in the tables below.

The minimum load current differs between the ET 200SP motor starters and the fail-safe ET 200SP motor starters:

Load current	0.1 ... 0.4 A	0.3 ... 1 A	0.9 ... 3 A	2.8 ... 9 A	4 ... 12 A
Motor/ohmic load of motor starter	0.05	0.15	0.18	0.56	0.8
Motor load of fail-safe motor starter	0.05	0.15	0.45	1.4	2

As soon as the minimum current limit is undershot during operation, the fault detection (residual current detection) picks up.

Disconnection or a warning is triggered depending on the setting of the "Response to residual current detection" parameter.

Residual current detection cannot be parameterized to "Warn" in the case of fail-safe motor starters.

DS72 logbook - Read device error (Page 128)
DS92 Read device diagnostics (Page 133)

7.4.3 Control function

The motor starter controls the direction of rotation of motors with the control function. Internal logic prevents you from activating both directions of rotation simultaneously.

The graphic below shows the reaction times of the motor starter to control commands. The reaction times when restarting and changing direction of rotation are identical.

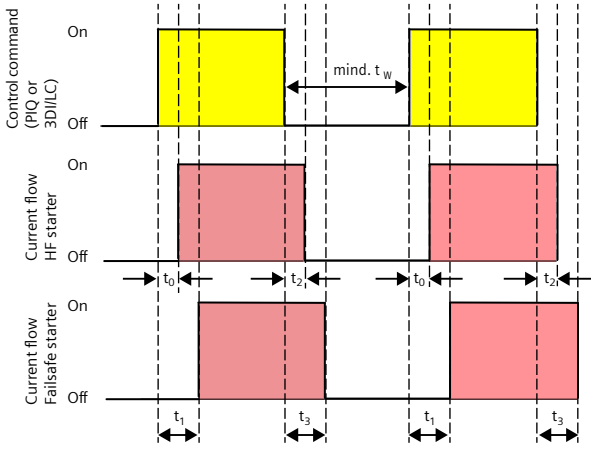

Figure 1-418 Control command reaction times

Timing:

Times t_0 to t_3 for the PIQ include a time dependency on the clock of the fieldbus and the station topology of +5 ms jitter.

For the 3DI/LC modules, a debounce time of 10 ms is included.

Timing (worst case) PIQ

- t_0: Time until current flow after the switch-on command for the HF starter: 30 ms (up to V1.2.0 25ms)
- t_1: Time until current flow after the switch-on command Safety starter: 40 ms (up to V1.2.0 30ms)
- t_2: OFF delay after switch-off command HF starter: 35 ms
- t_3: OFF delay after switch-off command Failsafe starter: 50 ms
- t_W: Recovery time: Time that must elapse due to an internal interlocking time until a repeat switch-off command is accepted after a switch-off command:
  - HF starter 195 ms
  - Failsafe starter: 215 ms

Timing (worst case) 3DI/LC

- t_0: Time until current flow after the switch-on command for the HF starter: 35 ms (up to V1.2.0 30 ms)
- t_1: Time until current flow after the switch-on command Safety starter: 45 ms (up to V1.2.0 35 ms)
- t_2: OFF delay after switch-off command HF starter: 40 ms

- t_3: OFF delay after switch-off command Failsafe starter: 55 ms
- t_W: Recovery time: Time that must elapse due to an internal interlocking time until a repeat switch-off command is accepted after a switch-off command:
  - HF starter 200 ms
  - Failsafe starter: 220 ms

7.4.4 Operating modes

The following modes are available (in ascending order of priority):

- Operating mode: Automatic (lowest priority)

  The motor starter can only be controlled with the PLC via the fieldbus.

  Automatic mode is activated automatically when communication with the interface module or the higher-level CPU is established.
- Operating mode: Manual bus: Controlling the motor starter by means of software, e.g. TIA Portal V16, via fieldbus is possible [1)]
- Operating mode: Manual local via the 3DI/LC module (highest priority)

  The motor starter can be controlled as follows:
  - Set the "Local Control" (LC on the 3DI/LC module) input to activate manual local mode.
  - Also set a digital input on the 3DI/LC module (1, 2 or 3, depending on the parameterization) to "Motor CW" or "Motor CCW", for example.

Using the LED "MAN", the message bits in the Address space (Page 113) and the DS92 Read device diagnostics (Page 133), you detect which control source currently has control priority:

- Operating mode: Automatic ("MAN" LED off)
- Operating mode: Manual local ("MAN" LED on)

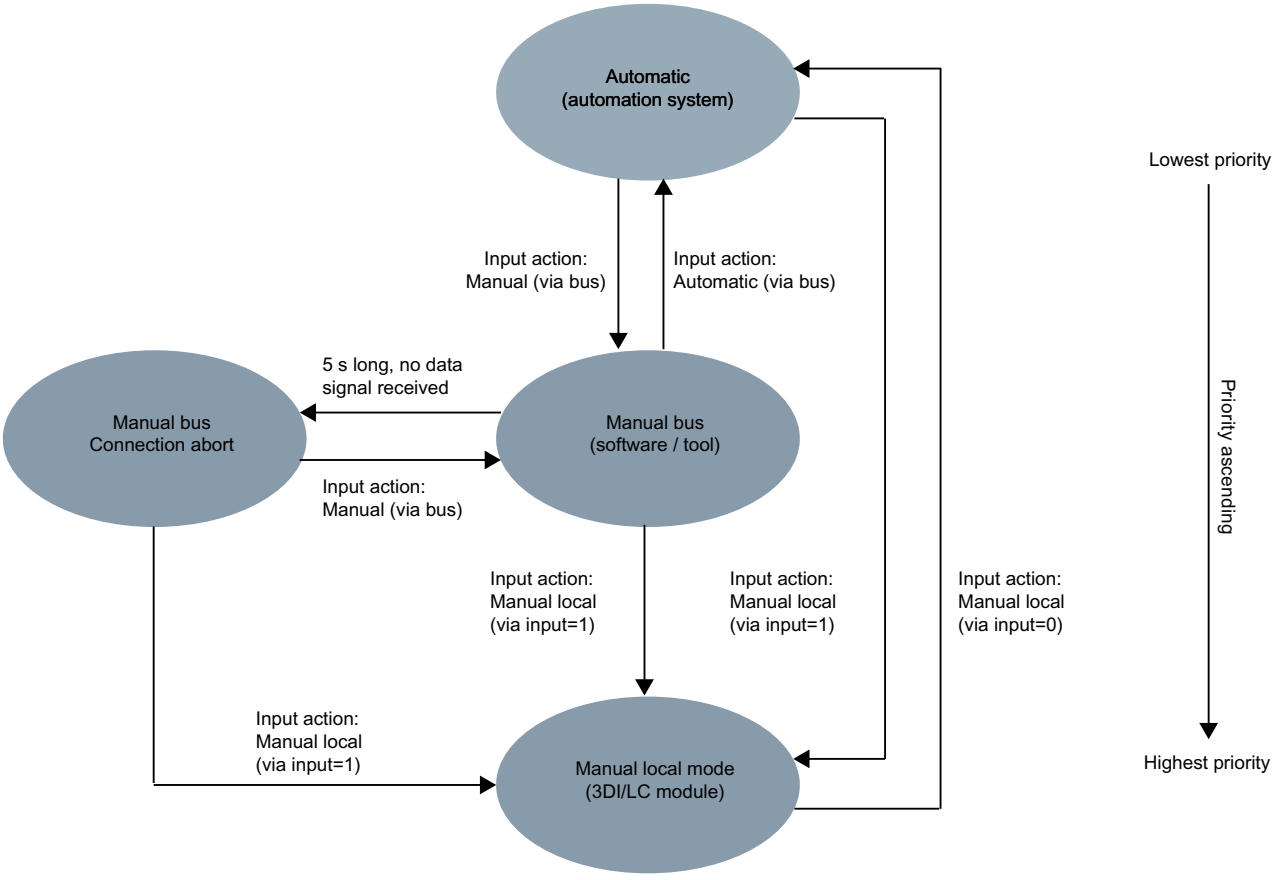

Figure 1-419 Operating modes

1) possible as of firmware version 1.2.0

7.5 Overload protection

Description

The approximate temperature of the motor is calculated using the measured motor currents and device parameters "Rated operating current" and "Tripping class". This indicates whether the motor is overloaded or is functioning in the normal operating range.

NOTE

Ensuring overload protection

Do not connect multiple motors to one motor starter due to overload protection, mutual interference between the motors, etc.

Response of the thermal motor model on restart

You set the response of the thermal motor model on restart with this parameter:

- Retention of the thermal motor model on restart

  If the motor starter has been disconnected from the 24 V power supply, the thermal motor model is at the same motor temperature rise state when the power supply is restored as it was before disconnection. This behavior protects the motor against overload in the case of brief failures of the 24 V power supply. With this setting, you can therefore specify that the motor starter retains the thermal motor model when the power supply is restored.
- Deletion of the thermal motor model on restart

  If the motor starter has been disconnected from the 24 V power supply for a longer period, for maintenance purposes, for example, the saved values can result in an incorrect interpretation of the motor state. With this setting, you can therefore specify that the motor starter deletes the thermal motor model when the power supply is restored.

In ATEX operation, fail-safe motor starters can only be parameterized to "Retention of the thermal motor model on restart", however.

Principle of operation

The electronics continuously calculate a model of the thermal load on the motor dependent on the operating time and the current load. The motor memory model charges when the motor is switched on. The motor memory model discharges after the motor is switched off.

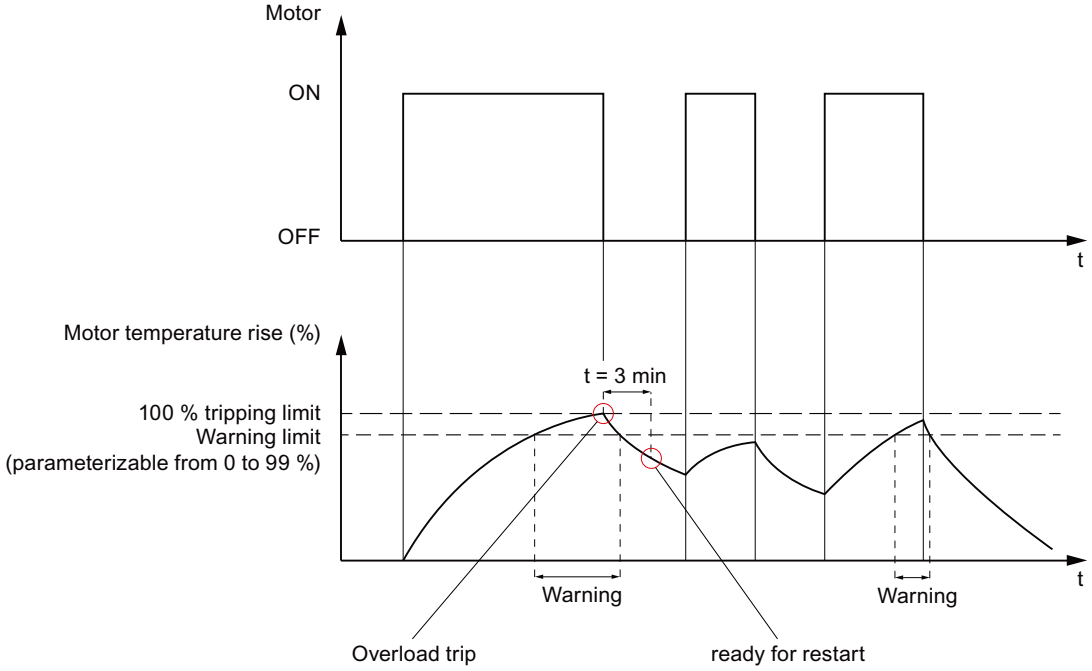

Figure 1-420 Principle of operation

Following an overload tripping operation, the motor memory model is fully discharged after approximately three minutes. You must wait for this cooling time to elapse before you can acknowledge the fault. If the control supply voltage fails, the motor starter can store the remaining cooling time if the relevant parameters have been set. When the control supply

voltage is restored, the remaining cooling time elapses before the load can be switched on again.

If you initiate a restart within a very short time after switching off the motor, it may be that the motor memory model has not yet fully discharged. This can result in an extremely fast overload trip after the restart. In continuous operation (partially charged motor memory model), the tripping times are reduced depending on the pre-charge.

Warning limit motor heating

The motor starter displays a warning if the motor heating limit is overshot. You use this parameter to preset a motor heating value in percent as a warning limit.

This function is deactivated with a warning limit for motor temperature rise of 0%.

If the warning limit for motor heating is exceeded, a group warning and the "Thermal motor model overload" maintenance alarm are output.

Response to overload - thermal motor model

You use this device parameter to specify how the motor starter is to respond to overload:

- Trip without restart
- Trip with restart

⚠ WARNING

Hazardous Voltage.
Can Cause Death, Serious Injury, or Property Damage.
When the cooling time has expired following an overload trip, and a RESET takes place, or automatic restart has been parameterized, the machine starts up immediately if a control command is active. People in the danger area may be injured.
Make sure that the danger area of the machine is kept clear of people.

- Warning: a general warning is set.

In ATEX operation, you can only parameterize fail-safe motor starters to "Trip without restart".

Trip class

The trip class (CLASS) specifies the maximum time within which a protective device must trip from a cold state at 7.2 x the setting current (motor protection to IEC 60947-2).

The tripping characteristics represent the time to trip as a function of the current multiple. The continuous black line in the following diagrams illustrates the tripping characteristic curve for three-pole symmetrical loads and for single-phase loads. The continuous red line illustrates the tripping characteristic curve for three-pole loads when one phase fails.

The following diagram shows the overload protection for CLASS OFF:

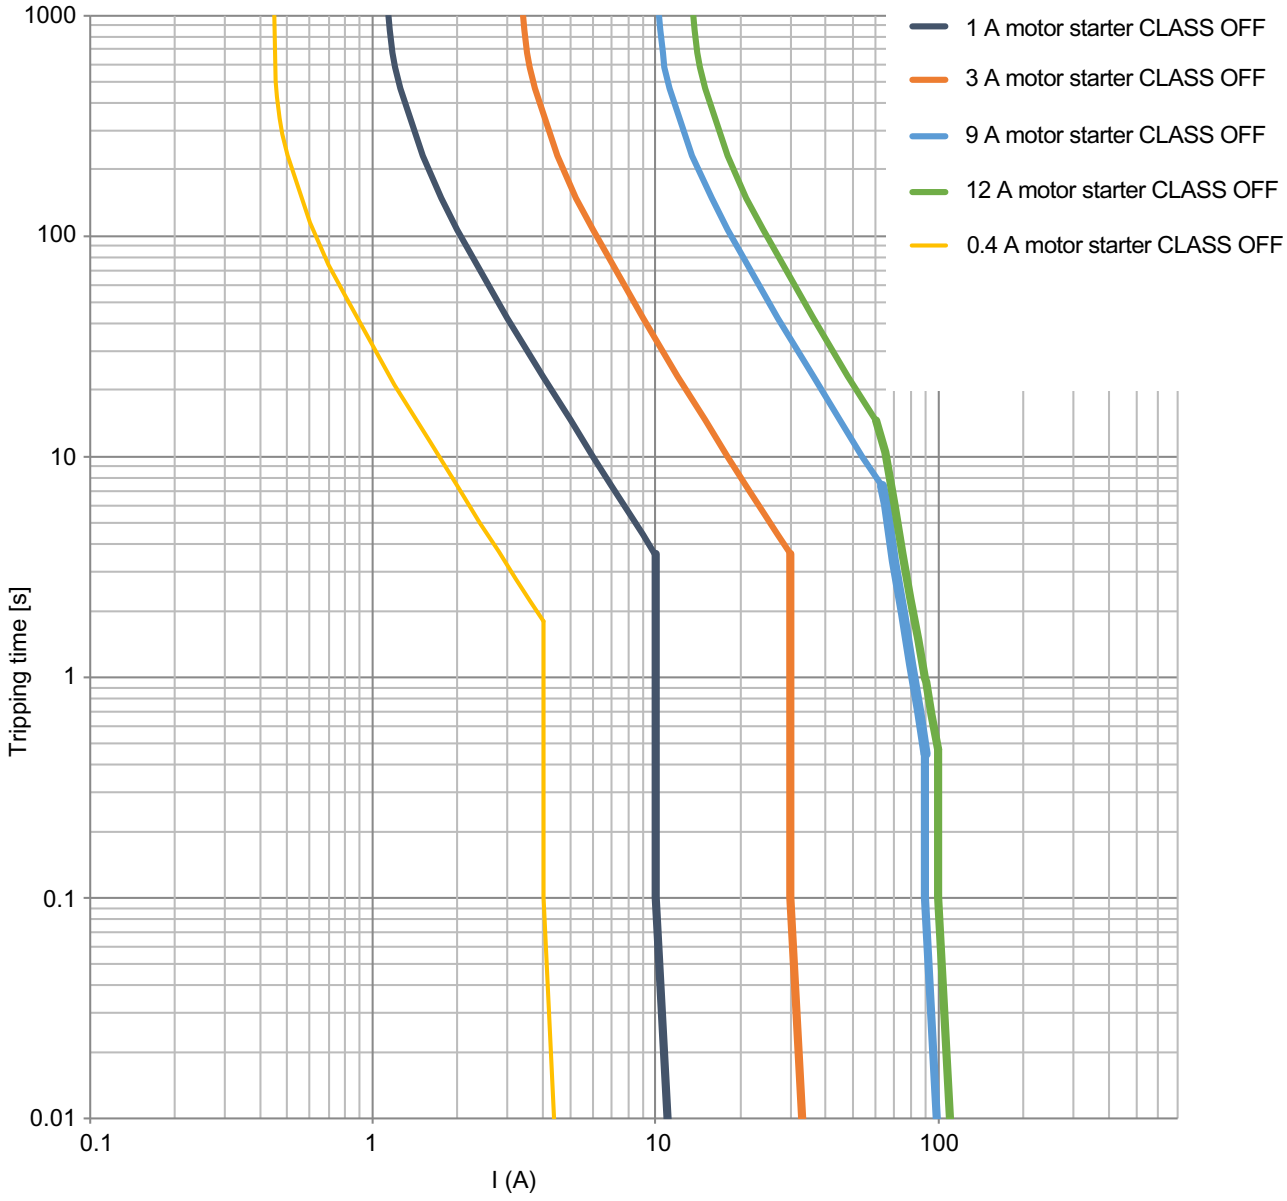

Figure 1-421 CLASS OFF overload protection

The following diagram shows the overload protection for CLASS 5:

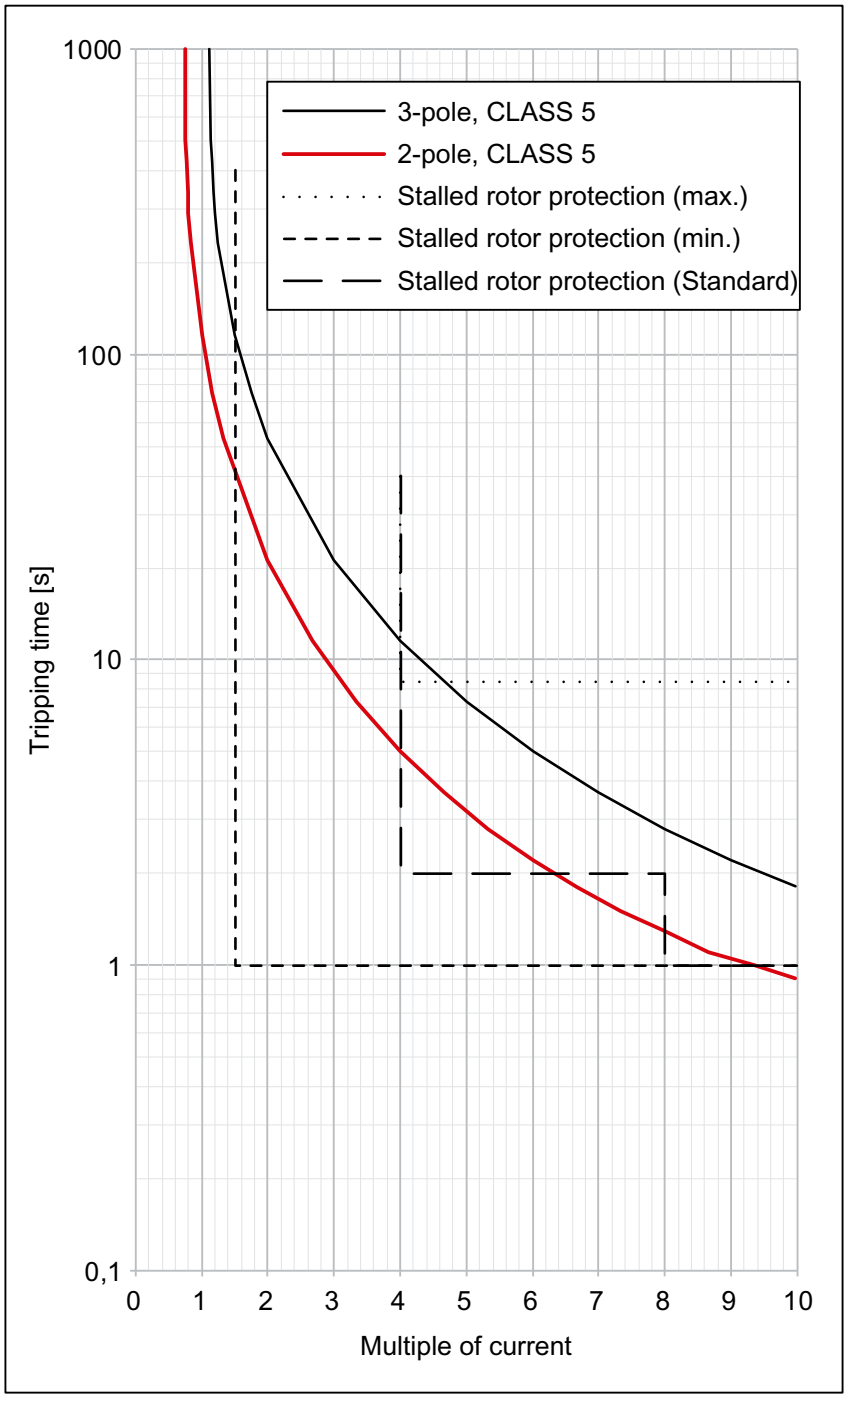

Figure 1-422 CLASS 5 overload protection

The following diagram shows the overload protection for CLASS 10:

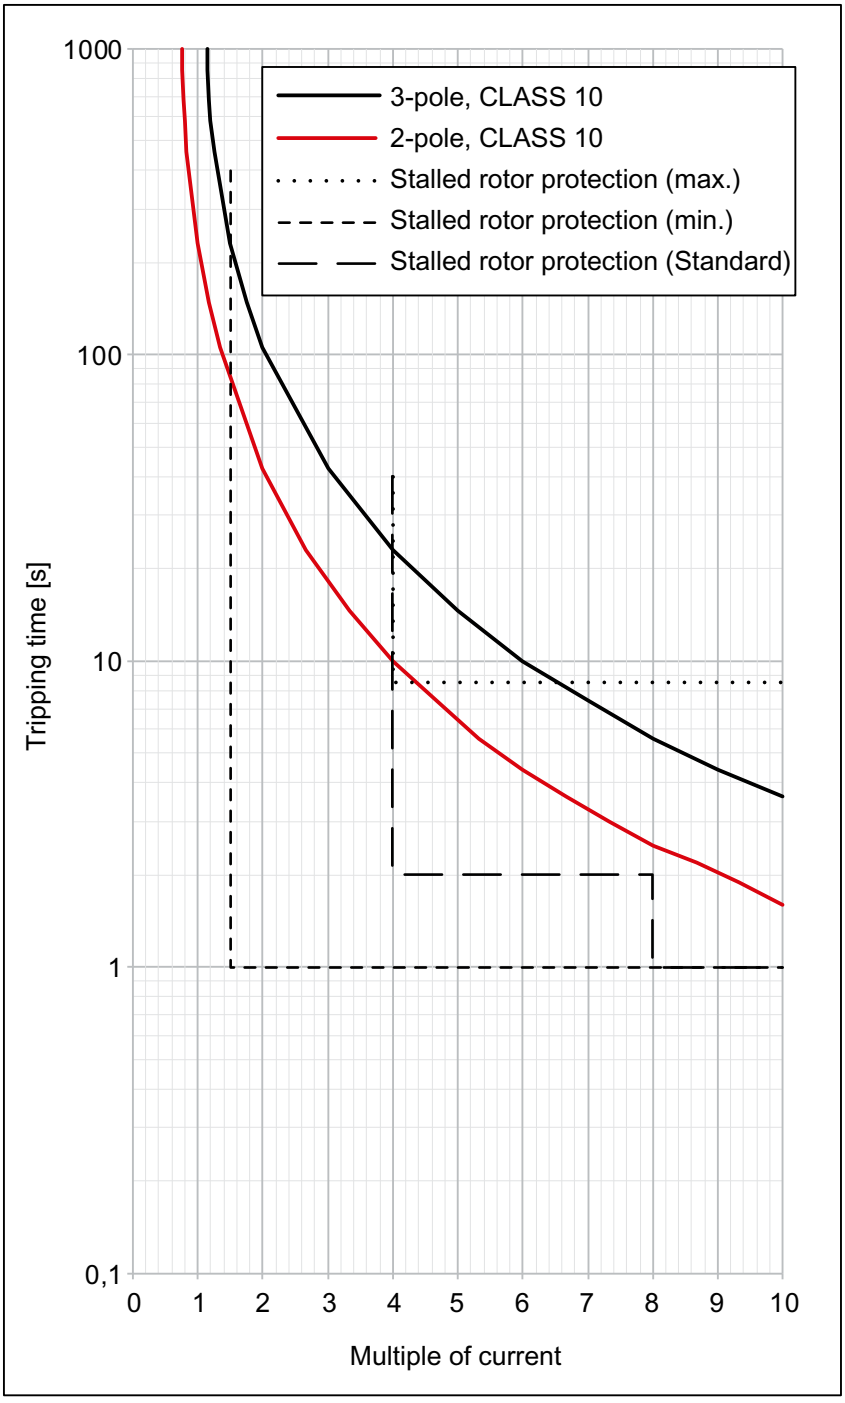

Figure 1-423 CLASS 10 overload protection

You can find out how to calculate the switching cycles in chapter Calculating switching cycles (Page 61).

The following trip classes can be parameterized according to IEC 60947-4-2:

- CLASS OFF
- CLASS 5 (10 A)
- CLASS 10

To protect the switching elements in the main circuit against impermissible operating states, an integrated intrinsic device protection is provided in the upper load range. At overload currents greater than 65 A, shutdown becomes effective earlier than with the motor protection function (intrinsic device protection model).

The setting range of the overload protection is 1:3.

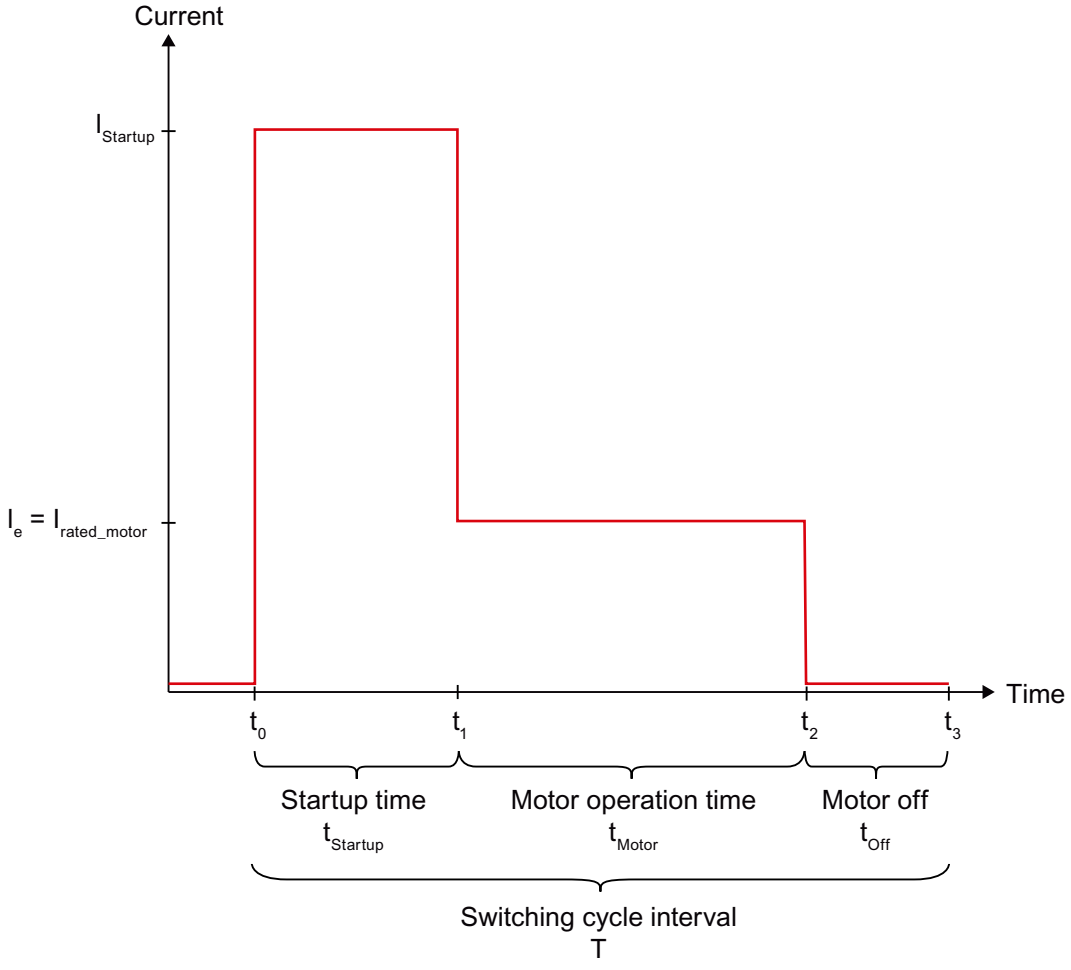
You can find more information about intrinsic device protection in chapter Device protection model (Page 70).

7.6 Calculating switching cycles

The switching cycles attainable by the ET200 SP motor starter are determined by the root-mean-square of the motor current I_{rms_motor}. The switching cycle considered is admissible if the following criterion is met:

$I_{rms_motor} \leq I_e * 1.05$

I_{rms_motor} is determined on the basis of the root-mean-squares of the motor currents during the startup time and the motor operation time taking the motor OFF time into account. In the following formula, I_e corresponds to the rated current of the connected motor.



x = starting current factor $I_{Startup}/I_e$

Table 1-783 Switching frequency per hour of the 3RK1308 motor starter for the switch-on duration of 0.5 s:

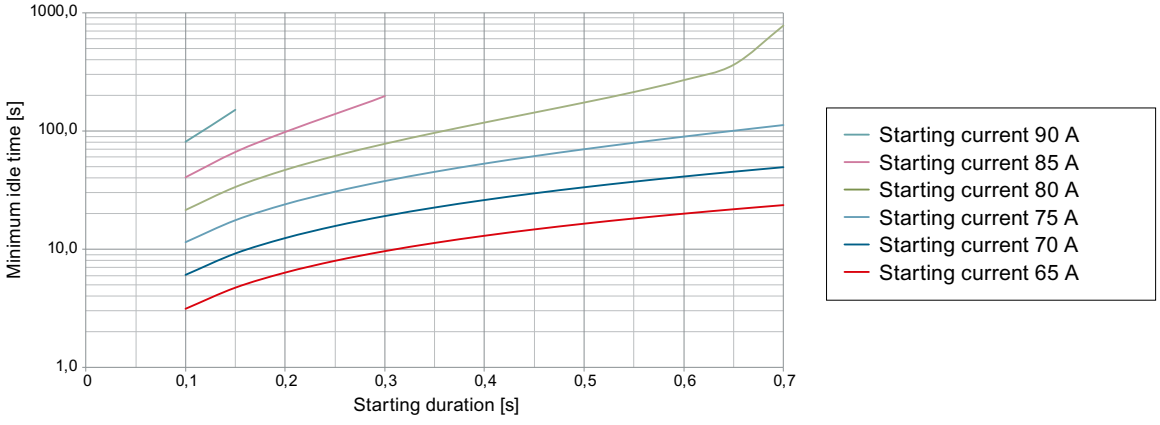
Current setting [A]		0.4	1	3	9	10	12
x = starting current factor $I_{Startup}/I_e$	Startup time [s]	Number of starting operations per h					
2.5	0.1	4131	4131	4131	4131	4131	4131
2.5	0.3	1377	1377	1377	1377	1377	1377
2.5	0.5	826	826	826	826	826	826
2.5	0.7	590	590	590	590	590	590
2.5	2	207	207	207	207	207	207
4	0.1	1446	1446	1446	1446	1446	1446
4	0.3	482	482	482	482	482	482
4	0.5	289	289	289	289	289	289
4	0.7	207	207	207	207	207	207
4	2	72	72	72	72	72	72
6	0.1	620	620	620	620	620	620
6	0.3	207	207	207	207	207	207
6	0.5	124	124	124	124	124	123
6	0.7	89	89	89	89	89	86
6	2	31	31	31	31	31	25
8	0.1	344	344	344	339	292	75
8	0.3	115	115	115	108	93	20
8	0.5	69	69	69	62	53	8
8	0.7	49	49	49	43	36	0

8	2	17	17	17	9	6	0
10	0.1	219	219	219	51	54	0
10	0.3	73	73	73	12	13	0
10	0.5	44	44	44	0	0	0
10	0.7	31	31	31	0	0	0
10	2	11	11	11	0	0	0

$$I_{rms_motor} = \sqrt{\frac{1}{T}\left[(x * I_e)^2 * t_{Startup} + I_e^{\,2} * t_{Motor}\right]}$$

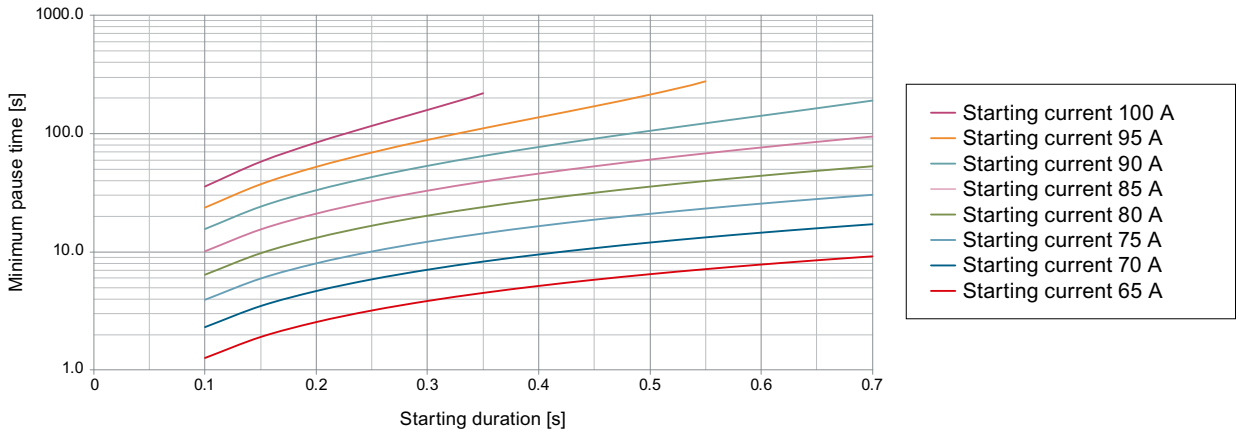
Switching cycle parameters

The following table shows all the parameters that you have to consider for calculation of the permissible switching cycle:



Parameters		Description	Conditions
Starting time	$t_{Startup}$ [s]	Time during which the motor accelerates up to its operating speed from standstill	The maximum is determined by the parameterized tripping class and the intrinsic device protection (see also Overload protection (Page 55)).
Starting current	$I_{Startup}$ [A]	Root-mean-square of the motor current that flows during the starting time. It is considered as a multiple x of the rated value of the motor I_{rated_motor} or of the parameterized rated operational current I_e. $I_{Startup}$ [A] = x * I_e [A]	The maximum is the permissible current of the relevant device class. Consider additional idle times in the case of starting currents in excess of 65 A (see example graphics). (Also see: Overload protection (Page 55) and the example graphics)
Motor operation time	t_{Motor}[s]	Time in which the motor is in operation after startup.	-
Rated operational current	I_e [A]	Root-mean-square of the motor current in the operating phase after the starting time or the parameterized value I_e of the motor starter	The permissible I_e is determined by the adjustment range of the motor starter used and its ambient temperature (see also: Overload protection (Page 55)).
Motor OFF time:	t_{Off} [s]	Idle time of the motor within the switching cycle	Consider additional idle times in the case of starting currents in excess of 65 A (see example graphics).
Switching cycle interval	T [s]	Total of t_{Off}, t_{Motor} and $t_{Startup}$	The maximum time is 300 s.

You use the switching cycle interval time to determine the permissible starting frequency per hour as follows:

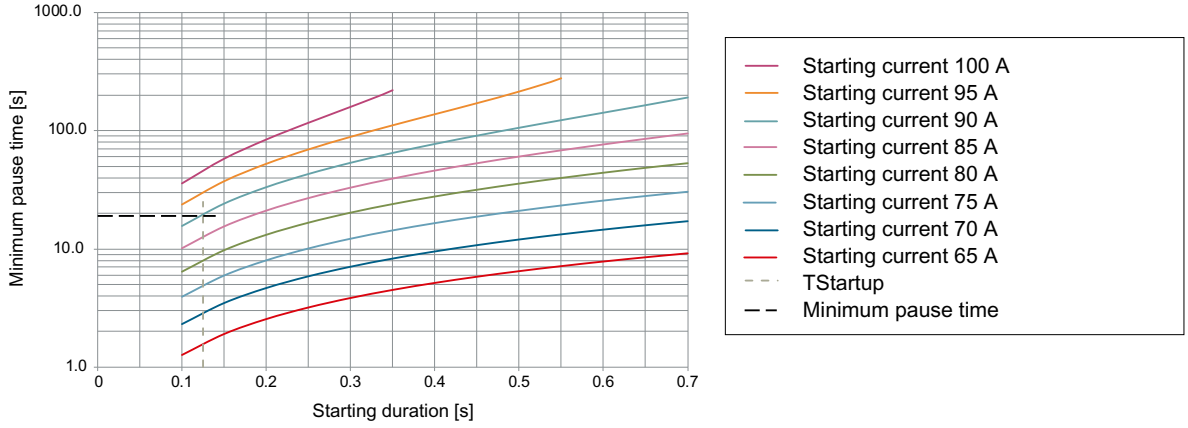


$$\text{Switching cycles [1/h]} = \frac{1}{T} * 3600$$

As from a starting current of 65 A in the case of the 9 A and 12 A motor starters, consider the device protection model for calculation of the switching cycles. The following graphics show the minimum idle time depending on the starting current:

Minimum idle time (T_{Off}) 9 A motor starter at $I_{Startup}/I_{rated_motor}$ = 8

Minimum idle time (T_{Off}) 12 A motor starter at $I_{Startup}/I_{rated_motor}$ = 8



Example for the minimum idle time (T_{Off}) 12 A motor starter at $I_{Startup}/I_{rated}$ = 8

The graphic below shows the minimum idle time of a 12 A motor starter with the following parameters:

I_{rated_motor} = 10.4 A

$I_{startup/Irated_motor}$ = 8.6; thus: $I_{Startup} \approx 89$ A

$T_{Startup}$ = 0.125 s $T_{Off} \geq 19$ s

7.7 Substation monitoring

You can determine various system states with the help of the motor current and the current limits.

System state	Current value	Protection by:
Motor operates more sluggishly, e. g. due to bearing damage	Current is higher than normal	Upper current limit Upper current warning limit
Motor operates more smoothly, e. g. because the system has run out of processing material.	Current is lower than normal	Lower current limit Lower current warning limit
Motor is blocked	Very high current flowing	Blocking protection
• Open circuit • Defective fuse • Motor idling • Power failure • No load connected	Very low current flowing Minimum load undershot	Residual current detection

7.7.1 Response to residual current detection

If the motor current drops to under 20% from the set operational current or below the minimum load limit in one of the phases, residual current detection responds. You use this device parameter to specify how the motor starter is to behave in the event of residual current being detected:

- Warning (not in the case of fail-safe motor starters)
- Tripping

NOTE

When the motor is switched on, residual current detection is suppressed for approximately 1 s.

This does not apply to fail-safe motor starters.

Residual current detection for motor starters with 0.1 ... 0.4 A

The following graphic shows the dependence of residual current detection on the set motor current in the case of motor starters with 0.1 to 0.4 A:

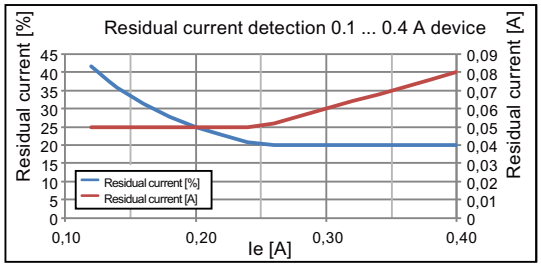


Figure 1-424 Residual current detection 0.1-0.4 A device

Residual current detection for motor starters with 0.3 ... 1 A

The following graphic shows the dependence of residual current detection on the set motor current in the case of motor starters with 0.3 to 1 A:

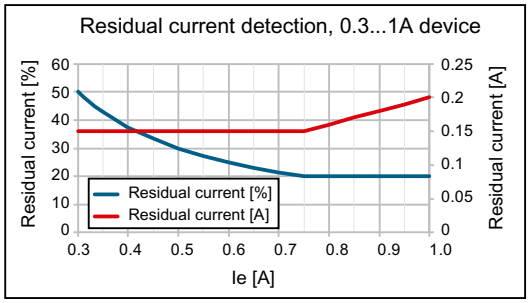

Figure 1-425 Residual current detection 0.3-1 A device

Residual current detection for motor starters with 0.9 ... 3 A

The following graphic shows the dependence of residual current detection on the set motor current in the case of motor starters with 0.9 to 3 A:

Residual current detection in the case of fail-safe motor starters with 4 ... 12 A

The following graphic shows the dependence of residual current detection on the set motor current in the case of motor starters with 4 to 12 A:

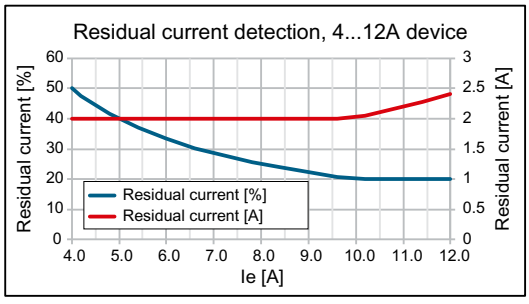

Figure 1-433 Residual current detection 4-12 A device

7.7.2 Upper/lower current warning limit

You can enter an upper and/or a lower current warning limit value. If the current warning values are exceeded or undershot, the motor starter responds with a warning message without tripping. The warning message is acknowledged as soon as the warning threshold is exceeded or undershot by 5%.

NOTE

The current warning thresholds are activated by default. You can deactivate the current warning thresholds, however. The current warning thresholds are not activated until the CLASS time expires.

Setting ranges

The table below shows the possible setting range for the lower and upper current warning limits:

Device parameters	Default setting	Setting range
Lower current warning limit	21.875%	• 18.75 ... 100% of I_e • 0% (= deactivated) Increment: 3.125%
Upper current warning limit	112.5%	• 50 to 400% of I_e • 0% (= deactivated) Increment: 3.125%

7.7.3 Upper/lower current limit

You can enter an upper and/or a lower current limit. The current limits are deactivated by default. If the current limits are overshot or undershot, the motor starter responds by tripping. The "I_e upper limit value violation" or "I_e lower limit value violation" message is issued. If the current exceeds the maximum rated operational current by a factor of ten, the motor starter shuts down the motor even if the current limit values are deactivated. An entry in the logbook (data set 73 (Page 131)) is generated.

Example

The following example shows an application for the upper and lower current limit:

- The viscosity of the mixed mass is too high, that is, the upper current limit has been overshot.
- No load because drive belt is broken. In other words, the lower current limit has been violated.

NOTE

The parameterized current warning thresholds are not activated until the CLASS time expires.

Setting ranges

The table below shows the possible setting range for the lower and upper current warning limits:

Device parameters	Default setting	Setting range
Lower current limit	Deactivated	• 18.75 ... 100 % of I_e • 0 % (= deactivated) Increment: 3.125 %
Upper current limit	Deactivated	• 50 to 400 % of I_e • 0 % (= deactivated) Increment: 3.125 %

7.7.4 Blocking time and blocking current

The blocking current specifies how much current is consumed by the motor (at rated voltage) when the drive is blocked.

If the motor current exceeds 400 % of the set motor current I_e for a time > 1 s after the motor ramps up, the blocking protection is tripped and a trip command is generated.

After the motor is switched on, the parameterized values for the blocking current and blocking time apply. A switchover to the fixed values (400 %, 1 s) takes place depending on the set motor protection class (CLASS 5/ 10 A → 5 s, CLASS 10, off → 10 s).

- The "Tripping due to motor blocking" and "Group fault" diagnostic messages are generated
- The statistic "Number of motor overload trips" is incremented by 1

If the parameter "Group fault diagnostics" is set to "Enabled", a corresponding diagnostic interrupt is set if blocking protection responds.

Setting ranges

The table below shows the possible setting range for the blocking current and the blocking time:

Device parameters	Default setting	Setting range
Blocking current	800 %	150 ... 1500 % of I_e Increment: 50 %
Blocking time	1 s	1 ... 7.5 s Increment: 0.5 s

7.7.5 Device protection model

To protect the switching elements in the main circuit against impermissible operating states, an integrated intrinsic device protection is provided in the upper load range. The device protection model consists of the relay protection model (dotted line) and the thermal motor model (continuous line) with the highest permissible current setting. The device protection is active 20 ms after the ON command. This means that, in the case of ET 200SP motor starters, an overload trip may occur in the upper current range before the motor protection trips. The device protection is active even when the overload protection is set to "Warn" and the "Response of the thermal motor model on restart" parameter is set to "Delete".

The motor starter operates within a permissible current range. The following graphic shows the permissible current range:

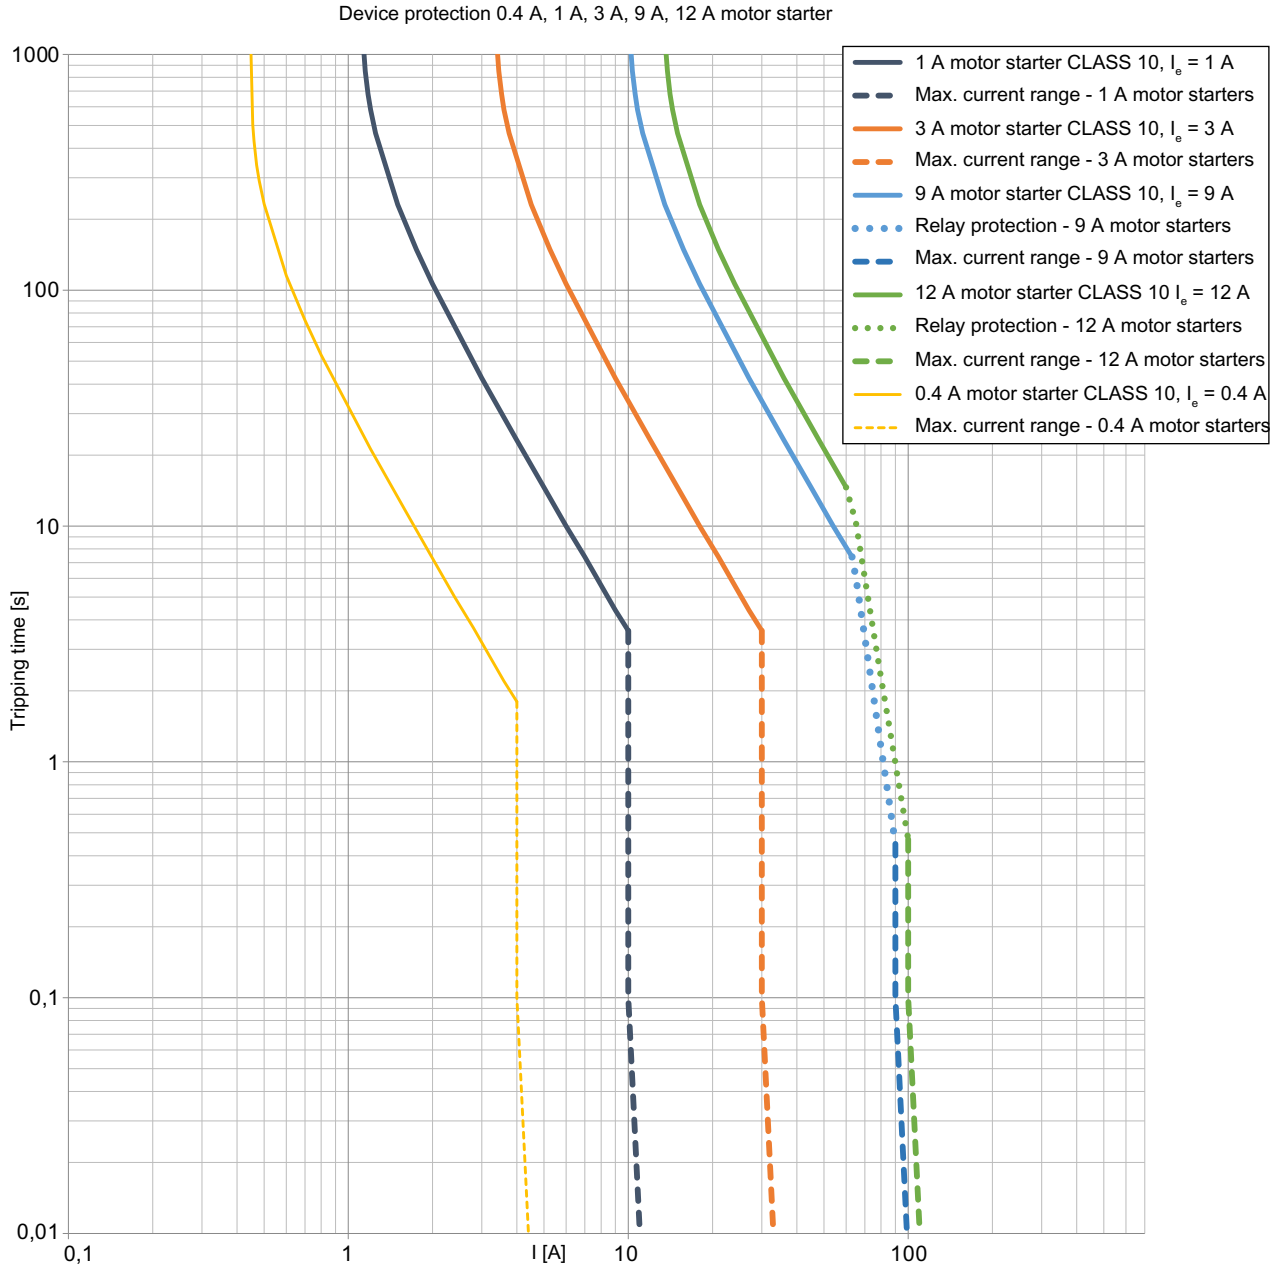

Figure 1-434 Device protection

How the motor starter's device protection works is described below.

Shutting down the motor starter within the permissible current range

The motor starter switches off in the following cases:

- The motor starter is too hot.
- The CLASS 10 tripping characteristic for the maximum current setting has been exceeded.
- The relay protection characteristic in the case of 9 A and in the case of 12 A motor starters has been exceeded.

Wait at least three minutes after shutting down the motor starter. Then trigger a trip reset. The motor starter is operable again.

Violation of the permissible current range

Switching elements may be damaged if the permissible current range (represented by the vertical line in the graphic) is exceeded. The motor starter switches off. The "Current measuring range overshot" message is issued. 9 A and 12 A motor starters switch off without the support of the semiconductors. This is referred to as "hard switching" and is output as a fault diagnosis.

To prevent response of the device protection, a motor's maximum starting current must not be higher than the motor starter's max. permissible current range.

NOTICE
Violation of the permissible current range **Fail-safe motor starters** are defective after overshoot of the permissible current range and cannot be activated again. Reactivation of **non-fail-safe motor starters** is possible. The service life of a non-fail-safe motor starter is, however, limited.

7.7.6 Temperature monitoring

The motor starter has an internal temperature monitoring function. If the motor starter exceeds its internal temperature warning threshold, the "Switching element hot" alarm is issued in data set 75 (Page 132). The motor starter switches off if the temperature continues to rise. The "Switching element overload" diagnostic message (object number 309) is issued in data set 92 (Page 133) if temperature monitoring responds.

You can trigger trip reset on the motor starter after a cooling time of at least three minutes. You can activate the motor starter again once it has sufficiently cooled down.

Fan control

The fan is controlled temperature-based by the internal temperature monitoring function. The thermal device protection model can also lead to the activation of the fan.

7.7.7 Asymmetry monitoring

Description

Three-phase asynchronous motors respond to slight asymmetries in the supply voltage with a higher asymmetric current consumption. As a result, the temperature in the stator and rotor windings of the drive increases. The ET 200SP motor starter protects the load against overload by issuing a warning or by tripping. You can parameterize whether a warning is output or tripping occurs.

NOTE
When the motor is switched on, asymmetry evaluation is suppressed for approx. 0.5 s.

Asymmetry limit

The asymmetry limit is a percentage value by which the motor current is allowed to deviate in each phase. Asymmetry is detected as soon as one of the three phases deviates by more than 40 % from the mean value of all phases.

Response to asymmetry

You use this device parameter to determine the behavior of the motor starter in the event of asymmetry:

- Warning (not permissible for fail-safe motor starters in ATEX operation)
- Tripping

Settings

Table 1-784 Settings for asymmetry monitoring

Device parameters	Default setting	Setting range
Response to asymmetry	Tripping	• Warn • Tripping

7.7.8 Short-circuit protection (fuses)

Description

The ET 200SP motor starter is equipped with integrated safety fuses as short-circuit protection. Short-circuit protection is implemented both between a phase and ground (= ground fault), and between two phases.

Switching performance

The ET 200SP motor starter switches off short-circuits in the motor or in the cables. The ET 200SP motor starter complies with the requirements of type of coordination 1 (IEC 60947-4-2).

On tested assemblies, the type of coordination defines the permissible condition of devices following a short-circuit. Type of coordination 1 means that the load feeder is non-operational after a short circuit has been cleared.

Messages and actions

After the fuse responds, the "Residual current detection" message is output in the case of non-fail-safe motor starters. The "Switching element defective" message is issued in the case of fail-safe motor starters. Then replace the starter.

7.8 Safety-related functions

7.8.1 Self-test

ET 200SP fail-safe motor starters run a self-test of the switching elements every time they are switched on and off.

Ensure a stable line power supply. An unstable power supply may lead to a situation in which the motor starter incorrectly signals a fault.

7.8.2 Response to safety-related tripping

The STO (Safe Torque Off) function is the safety function integrated in the fail-safe motor starter. It ensures the safe disconnection of torque-generating energy on the motor. Safety Torque Off prevents unintentional start-up in compliance with EN 60204-1, Section 5.4. The drive is safely free from torque. This state is monitored in the motor starter.

Safety-related tripping is achieved for the fail-safe motor starters thanks to the special arrangement and checking of the switching elements.

Safety-related tripping is performed by a low level ("0" signal) at the F-DI. As an alternative, safety-related tripping can be achieved by removing the 24 V supply voltage from the power bus.

In the case of fail-safe ET 200SP motor starters, the OFF state is defined as the safe state (Safety torque off). ET 200SP Failsafe motor starters are self-monitoring. A diagnostic message can be sent to the controller in the event of tripping via F-DI.

The signal (F-DI) is provided via the corresponding BaseUnit with F-DI-infeed or F-DI forwarding.

Settings

Table 1-785 Response to safety-related tripping

Device parameters	Default setting	Setting range
Response to safety-related tripping	No warning	• No warning • Warning

7.8.3 Ex motor application

Set the "Ex motor application" parameter if the fail-safe motor starter is to switch and protect an explosion-proof motor.

NOTE

ATEX Ex II (2) G D zones

You can use the fail-safe motor starter for explosion-proof motors that are situated in ATEX Ex II (2) G D zones.

An ATEX approval is not possible with the motor starter when it is used in 1-phase operation.

An ATEX approval is possible by means of further measures such as thermoclick.

NOTE

It is not possible to set the motor protection to Class OFF in EX operation.

Settings

Table 1-786 Settings for Ex motor application

Device parameters	Default setting	Setting range
Ex motor application	No	• No • Yes

The maintenance alarm 0x1036, "New safety-related parameters received", is issued if you have activated the "EX motor" parameter. Before the "EX motor" parameter is accepted, you must confirm it on the device with the blue button.

See also

Setting safety-related parameters (Page 106)

7.9 Response to CPU/master STOP

With this parameter, you set the response of the PIQ following a CPU STOP:

- Retain last value
  The last received and valid value of the process image of the outputs is retained.
- Switch substitute value 0
  The process image of the outputs is assigned the value "0". "Switch substitute value 0" is active even if the header module of the ET 200SP station is deenergized.

NOTE

The response to CPU/master STOP is only relevant in "Automatic" mode.

7.10 Group fault diagnostics/group warning diagnostics

You can use these parameters to determine whether diagnostics are enabled or disabled. If you set the group diagnostics parameter to "Disable", no diagnostic messages are output to the CPU. If you set the group warning diagnostics parameter to "Disable", no maintenance alarms are output.

You will find the requirements for the use of maintenance alarms in an Maintenance FAQ (https://support.industry.siemens.com/cs/ww/en/view/109485777).

Settings

Table 1-787 Settings for group fault/group warning diagnostics

Device parameter	Default setting	Setting range
Group fault diagnostics	Enable	• Disable • Enable
Group warning diagnostics	Disable	• Disable • Enable

7.11 Inputs

If you use the optional 3DI/LC module (3RK1908-1AA00-0BP0), the motor starter can execute various actions with the "Inputs" device function. The actions are parameterizable. The signals are evaluated on the 3DI/LC module for this purpose. Inputs 1 to 3 (DI 0.4 to 0.6) can be connected directly with contact elements or sensors.

The bit 2.5 in the process image of the inputs indicates whether a 3DI/LC module is inserted.

The signal states are transferred in parallel via the process image. In addition, the signal states in DS92 Read device diagnostics (Page 133) can be read out. The input actions of the individual digital inputs affect the motor starter functions independently of one another.

The input LC (local control) switches over to manual local mode. You cannot change the parameterization of the input. This input is always implemented as an NO contact. You can detect whether or not manual local is active if bits 0.7 and 1.6 are active in the process image input.

For information on this topic, see Chapter "Connecting the 3DI/LC module for the motor starter" in the ET 200SP System Manual (https://support.industry.siemens.com/cs/ww/de/view/58649293/en?dl=en).

Inputs for commissioning
To ensure operation of a motor in the unparameterized state of the ET 200SP motor starter with the aid of the 3DI/LC module, the input parameters in data set 201 are permanently assigned the following values by default:

- DI1: Motor CW
- DI2: Motor CCW
- DI3: Cold start (fail-safe motor starters as of V1.2.0)

This pre-parameterization is overwritten when the ET 200SP motor starter is parameterized.

Response to sensor supply overload

The supply voltage for the digital inputs is short-circuit proof. The current is limited to a maximum of 100 mA. If a short-circuit or overload situation occurs in the sensor supply, the switching elements (motor) are shut down and a group fault is output. Acknowledge the fault with Trip Reset.

⚠ WARNING

The digital inputs (1 to 4) are not isolated. The reference potential is M (5), and therefore SELV/PELV. Only supply the inputs with the 24 V DC output (6).
Do not connect any temperature sensors for winding control of motors if they do not have protective separation. Otherwise, in the event of a fault, a dangerous voltage may be transmitted to the sensor cables and thus to the SELV/PELV circuits. If these cables are then touched, it can lead to death, serious injury and enormous material damage.
You will find more information in chapter Connecting 3DI/LC module (Page 155).

Response to removal of the 3DI/LC module:

Bit 2.5 is reset in the process image input if you remove the 3DI/LC module during operation. You can evaluate the bit and thus indicate unintentional removal. The inputs are not open-circuit-proof.

⚠ WARNING

The motor can continue to run with the corresponding parameterization
When you remove the 3DI/LC module, the motor can continue to run with the appropriate parameterization.

Input signal delay

The input signal delay is fixed at 10 ms.

Input n signal

You can use this device parameter to determine whether or not the input level of the inputs is to be saved.

- Retentive, i.e. latching mode (edge evaluation)
  Regardless of the input signal present, the action can only be deactivated again by a further event and remains active even after cancellation until it is overwritten by another action (e.g. process image of the outputs).
- Non-retentive, that is, jog (level evaluation)
  This input action is active as long as the input is active.

Input n level

You use this device parameter to specify the input logic:

- NC contact
- NO contact

NOTE

Parameterization only as NO contact.
For "Input n action": "Emergency start", "Motor CW", "Motor CCW", "Cold start" and "Trip reset", "Input n level" can only be parameterized as an NO contact.

NOTE

Change from NC contact to NO contact
If "Input n level" is changed from a normally closed contact to a normally open contact and the associated "Input n action" is parameterized as "Trip without restart", the "Input tripping" message bit is set and shut down accordingly in the case of an open input due to the input delay!

NOTE

Applied input voltage
If input voltage is applied (input active), the value "1" is transferred to the controller regardless of the "Input n level" parameter.

Input n action

Different actions can be triggered when an input signal is present. You can parameterize the following actions dependent on "Input n level", "Input n signal" and "Mode".

NOTE

If "Input n-signal" = retentive, and "Input n-action" = motor CW/CCW, at least one input must always be parameterized with input action "Tripping ..." or "Quick Stop". If this rule is violated, the motor starter will reject the parameters with the relevant diagnostic message.

Table 1-788 Input n action

Input n action	Input n level	Input n signal	Operating mode	Description
No action	NO/NC	n. ret./ret.	All	No direct action on the motor starter. Evaluation und further processing possible using the process image.
Trip without restart	NO/NC	n. ret.	All	• Results in tripping of the motor. • Must be acknowledged once the cause of the tripping has been rectified (initial status).
Trip with restart (AUTO RESET)	NO/NC	n. ret.	All	• Results in tripping of the motor. • Acknowledged automatically after the cause of the trip has been rectified (initial status).
Trip end position CW	NO/NC	n. ret.	All	• The motor is switched off regardless of the direction of rotation. • A fault is generated and reported. • The motor can only be switched on with "Motor CCW"
Trip end position CCW	NO/NC	n. ret.	All	• The motor is switched off regardless of the direction of rotation. • A fault is generated and reported. • The motor can only be switched on with "Motor CW"
Group warning	NO/NC	n. ret./ret.	All	• The diagnosis "Group warning" is output. • The motor starter is not switched off.
Emergency start	NO	n. ret.	All	• Starts the load when an ON command is issued despite the fact that an internal trip command is present. • Intrinsic device protection of the motor starter remains active and prevents the device from being destroyed. • Only allowed as an NO contact • Not parameterizable when the "EX motor" parameter is active.
Motor CW Motor CCW (with reversing starters only)	NO	n. ret./ret.	Manual local mode	• The motor starter must be in "manual local" mode for these actions. • Motor CW: Switching the motor on or off • Motor CCW: Switching the motor on or off • Only allowed as an NO contact • n. ret. The input action is active while the input signal is pending. • ret.: The action becomes active by means of the rising edge of the input and remains active regardless of the level. The action is reset by the input action "Quick Stop" or "group fault".
Quick Stop	NO/NC	n. ret./ret.	All	• Motor is switched off direction-independently without group fault. • "Quick Stop" takes priority over "Motor CW" and "Motor CCW"
Quick Stop clockwise	NO/NC	n. ret./ret.	All	• Motor is switched off with "Motor CW" without group fault. • "Quick Stop" takes priority over "Motor CW"

Input n action	Input n level	Input n signal	Operating mode	Description
Quick Stop counter-clockwise	NO/NC	n. ret./ret.	All	• Motor is switched off with "Motor CCW" without group fault. • "Quick Stop" takes priority over "Motor CCW" • The action is only available for reversing starters.
Trip RESET	NO	n. ret.	All	• "Trip RESET" is triggered once. • "Trip RESET" is only possible as NO contact.
Cold start	NO	n. ret.	All	Enables switch-on without main power. If the main power supply is nevertheless present (current flowing), an internal trip command is generated. For fail-safe motor starters as of firmware version V1.2.0
Operational trip end position CW	NO/NC	n. ret.	All	The motor is tripped regardless of the direction of rotation (CW or CCW). • The motor can only be switched on with "Motor CCW". • The parameter can only be implemented as "non-retentive". • A group fault is not generated, but a diagnostic message is set in data set 92.
Operational trip end position CCW	NO/NC	n. ret.	All	The motor is tripped regardless of the direction of rotation (CW or CCW). • The motor can only be switched on with "Motor CW". • The parameter can only be implemented as "non-retentive". • A group fault is not generated, but a diagnostic message is set in data set 92.
NO: NO contact NC: NC contact ret.: Retentive n. ret.: non-retentive (activation and deactivation of the input action follows the status of the input signal (= jog))				

Settings

Table 1-789 Settings for inputs

Device parameters	Default setting	Setting range
Input signal delay	• 10 ms	-
Input 1 level	• NO contact	• NC contact • NO contact
Input 2 level		
Input 3 level		
Input 1 action	• Motor CW	• No action • Trip without restart • Trip with restart
Input 2 action	• Motor CCW (RS) • No action (DS)	

Device parameters	Default setting	Setting range
Input 3 action	• Cold start	• Trip end position CW • Trip end position CCW • Group warning • Emergency start • Motor CW • Motor CCW • Quick Stop (direction-independent) • Quick Stop clockwise • Quick Stop counter-clockwise • Trip RESET • Cold start • Operational trip end position CW • Operational trip end position CCW
Input 1 signal	• Non-retentive	• Retentive • Non-retentive
Input 2 signal		
Input 3 signal		

7.12 Manual local (local control)

Manual local control with the ET 200SP motor starter is only possible when the 3DI/LC module is inserted. A digital input is permanently assigned the function "Manual local" (LC connection). If the digital input is active, that is, "manual local" is requested, the ET 200SP motor starter changes to manual local mode even in the case of motor ON. To exit manual local mode, the manual local input must be inactive and the motor must be switched off via the DI module. That is, with active input action "Motor CCW" or "Motor CW", the ET 200SP motor starter remains in manual local mode and thus in the "Motor ON" state as long as the input action is not interrupted.

NOTE

Removal during operation

If the 3DI/LC module is removed from the ET 200SP motor starter during manual local mode, this results immediately in shutdown of the running motor and then to exiting of manual local mode.

If a removed 3DI/LC module is plugged onto the ET 200SP motor starter while "manual local" is active, a changeover is made to manual local mode.

The motor starter assumes automatic mode when manual local mode is ended, i.e. the motor starter switches to the control priority of the CPU. The motor can start immediately when CW or CCW command is pending via the process image of the outputs.

7.13 Trip without restart

The action "Trip without restart" results in the following behavior:

- The motor is tripped. Acknowledge disconnection via Trip Reset after remedying the cause of tripping. You can then switch on the motor again.
- The parameter can only be implemented as "non-retentive".
- A group fault is generated and a diagnostics entry created.

7.14 Trip with restart

The action "Trip with restart" results in the following behavior:

- The motor is tripped.
- Acknowledged automatically after the cause of the trip has been rectified (input status).
- The parameter can only be implemented as "non-retentive".
- A group fault is generated and a diagnostics entry created.

7.15 Trip emergency end position CW

If the motor control command is not equal to "Motor OFF", the diagnostic interrupt "Trip end position CW responded" incoming is triggered when a 0 → 1 edge is detected at the digital input. This diagnostic interrupt results in internal tripping of the motor when emergency start is deactivated. The interrupt "Trip end position CW" is reported as outgoing (DS92 entry is deleted) if the motor control command is "Motor OFF". If the motor control command "Motor CW" is issued in the case of trip end position CW DI static "1", an incoming diagnostic message "trip end position CW" is triggered (only if the diagnostic message was already outgoing or has been deleted). This diagnostic message prevents renewed switch-on of the motor in the CW direction of rotation (emergency start deactivated).

The action "Trip end position CW" results in the following behavior:

- The motor is tripped regardless of the direction of rotation (CW or CCW).
- You can switch the motor back on again after deletion of the control command "Motor CW/CCW".
- The motor can only be switched on with "Motor CCW".
- The parameter can only be implemented as "non-retentive".
- A group fault is generated and a diagnostics entry created.
- Emergency trip end position CW can be overridden by emergency starting.

Example

The following example shows the "trip end position CW" with digital input 1 parameterized to "Trip end position CW":

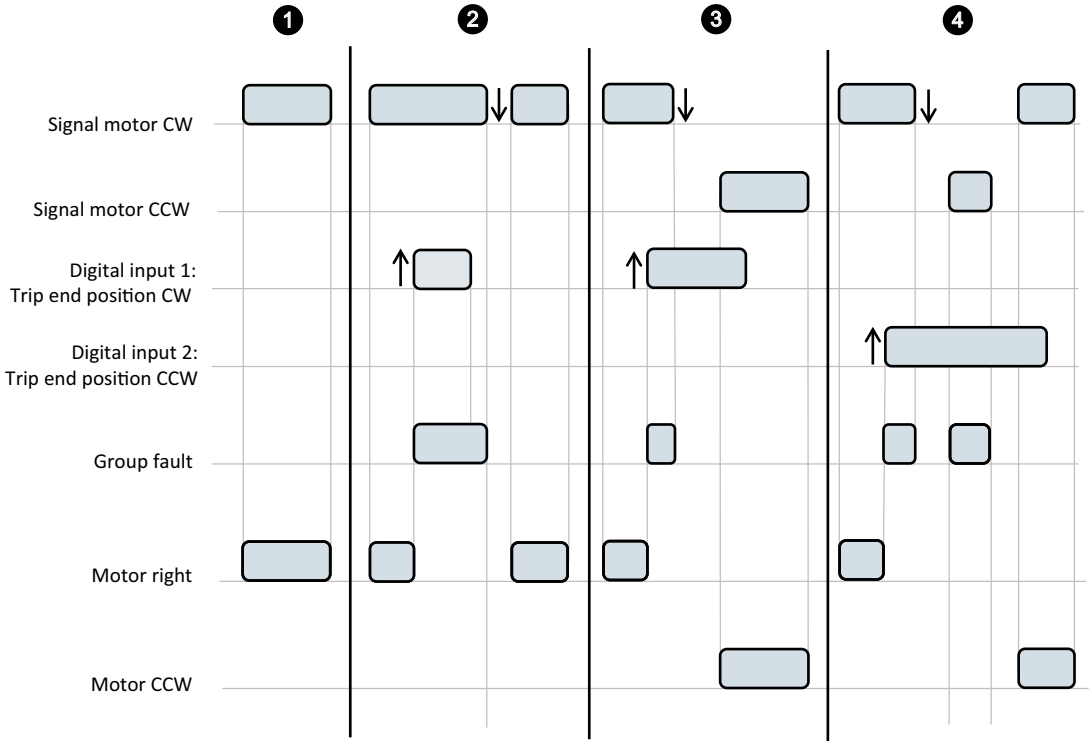

Figure 1-435 Example of trip end position CW

① You switch the motor on by means of "Motor CW". The motor is running.

② You switch the motor on by means of "Motor CW". The motor is running. The motor is switched off by setting the digital input 1 (parameterized to input action 1 = Trip end position CW). A group fault is generated at the same time by the starter. To switch the motor back on again, digital input 1 and the signal "Motor CW" must be reset again. Thereafter you can start the motor again via the signal "Motor CW". The group fault is deleted when the signal "Motor CW" is canceled.

③ You switch the motor on by means of "Motor CW". The motor is switched off by setting the digital input 1 (parameterized to input action 1 = Trip end position CW). A group fault is generated at the same time by the starter. While digital input 1 is set, you can only run the motor counter-clockwise. The group fault is deleted when the signal "Motor CW" is canceled.

④ You switch the motor on by means of "Motor CW". The motor is also switched off by setting the digital input 2 (parameterized to input action 1 = Trip end position CCW). A group fault is generated at the same time by the starter. While digital input 2 is set, you can only run the motor clockwise. To switch the motor back on again, digital input 2 and the signal "Motor CW" or "Motor CCW" must be reset again. Thereafter you can start the motor again via the signal "Motor CW". The group fault is deleted when the signal "Motor CW" is canceled.

7.16 Trip emergency end position CCW

If the motor control command is not equal to "Motor OFF", the diagnostic interrupt "Trip end position CCW responded" incoming is triggered when a 0 → 1 edge is detected at the digital input. This diagnostic interrupt results in internal tripping of the motor when emergency start is deactivated. The interrupt "Trip end position CCW" is reported as outgoing (entry 92 is deleted) if the motor control command is "Motor OFF". If the motor control command "Motor CCW" is issued in the case of trip limit CCW DI static "1", an incoming diagnostic message "trip end position CCW" is triggered (only if the diagnostic message was already outgoing or has been deleted). This diagnostic message prevents renewed switch-on of the motor in the CCW direction of rotation (emergency start deactivated).

The action "Trip end position CCW" results in the following behavior:

- The motor is tripped regardless of the direction of rotation (CW or CCW).
- You can switch the motor back on again after deletion of the control command "Motor CW/CCW".
- The motor can only be switched on with "Motor CW".
- The parameter can only be implemented as "non-retentive".
- A group fault is generated and a diagnostics entry created.
- Emergency trip end position CCW can be overridden by emergency starting.

7.17 Group warning

The action "Group warning" results in the following behavior:

- A "group warning" is generated.
- An entry with the object number 304 (byte 0, bit 7) is generated in the DS92 Read device diagnostics (Page 133).
- A logbook entry is created in the DS75 logbook - Read events (Page 132).
- The motor is not tripped.
- A maintenance alarm is generated when group warning diagnostics is enabled.

7.18 Emergency start

Description

Emergency start enables restart despite an internal trip command. Emergency start is possible if there is an ON switching command for the motor. The motor is switched on despite a pending trip cause. At a limit trip, the motor starts in the opposite direction.

Emergency starting is not possible in the following situations:

- When you are using a fail-safe motor starter in ATEX operation
- If a device fault is active
- If there is no switched/unswitched 24 V DC supply voltage, or if the supply voltage is outside the specified range.
- The blocking protection has responded
- If a process image error is active

You can activate the function "Emergency start" as follows:

- PIQ 0.4 "Emergency start"
- Via the 3DI/LC module
- Via manual bus mode
- In manual bus mode via DS68

Messages and actions

Table 1-790 Messages and actions emergency start

Message	Action
Emergency start active	Remains pending while emergency start is active, even if the motor is switched off.

7.19 Motor CW

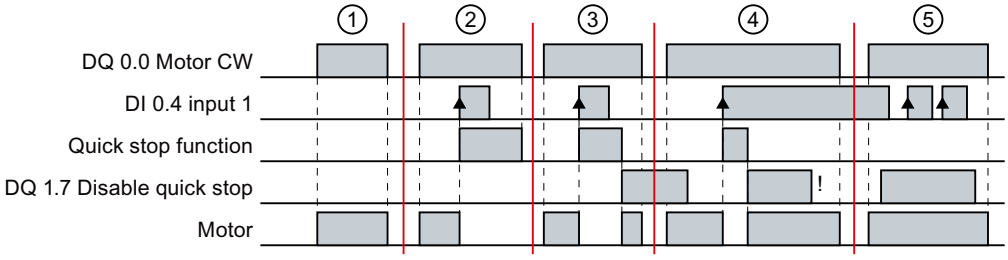
In automatic mode, the motor is activated or deactivated in the CW direction with the aid of the process image of the outputs. If you would like to control the motor via the 3DI/LC module, activate the LC input on the 3DI/LC module (manual local mode). Bit 0.0 "Motor CW" in the process image of the outputs is ignored in manual local mode.

The parameter can only be implemented as an "NO contact".

If "Input n-signal" = retentive, and "Input n-action" = Motor-CW/CCW, at least one input must always be parameterized with the "Tripping ... " or "Quick Stop" input action.
If this rule is violated, the motor starter will reject the parameters with the relevant diagnostic message.

7.20 Motor CCW

In automatic mode, the motor is activated or deactivated in the CCW direction with the aid of the process image of the outputs. If you would like to control the motor via the 3DI/LC module, activate the LC input on the 3DI/LC module (manual local mode). Bit 0.1 "Motor CCW" in the process image of the outputs is ignored in manual local mode.



The parameter can only be implemented as an "NO contact".

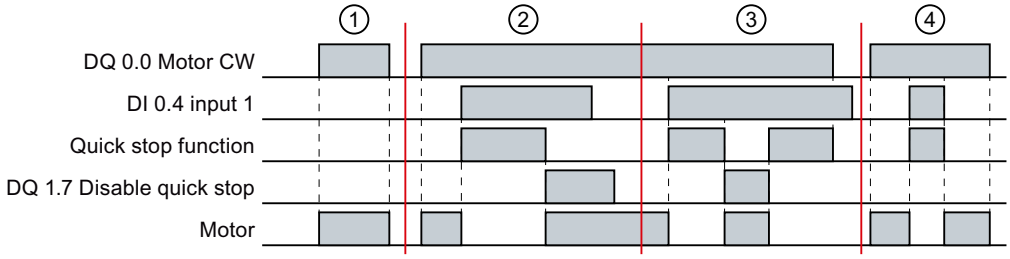
If "Input n-signal" = retentive, and "Input n-action" = Motor-CW/CCW, at least one input must always be parameterized with the "Tripping ... " or "Quick Stop" input action.
If this rule is violated, the motor starter will reject the parameters with the relevant diagnostic message.

7.21 Quick Stop direction-independent

- Motor is tripped without group fault.
- "Quick Stop" takes priority over "Motor CW" and "Motor CCW"
- The input action responds to the active edge of the input signal, which means that deactivation is possible when the static input signal "Quick stop" is present.
- The input trigger is reset through cancelation of the "Motor CW" and "Motor CCW" control commands, or by means of "Disable quick stop" (in the process image). This applies only in the case of control via manual local mode or in the case of a retentive Quick Stop signal.
- The motor is tripped regardless of the direction of rotation.

Example 1: Input 1 signal = retentive/edge-triggered

① The motor is switched on by "Motor CW".



② Motor is switched on by "Motor CW", then switched off by the rising edge at digital input 1 (parameterized to input action 1 = Quick Stop). By revoking the "Motor CW" command, the Quick Stop function is reset.

③ Motor is switched on by "Motor CW", then switched off by the rising edge at digital input 1. By setting Disable quick stop, the Quick Stop function is reset and the motor runs "CW" again until the "Motor CW" command is revoked.

④ Motor is switched on by "Motor CW", then switched off by the rising edge at digital input 1. By setting Disable quick stop, the Quick Stop function is reset and the motor runs "CW" again. Although the static digital input signal 1 (DI2) is still present, the motor continues to run and is only reset by revoking the "Motor CW" command.
Reason: The input action is edge-triggered.

⑤ Motor is switched on by "Motor CW" and continues to run uninterrupted since Disable quick stop continuously overwrites the edges of the signal of digital input 1 (DI2).

Example 2: Input 1 signal = non-retentive

① The motor is switched on and off by "Motor CW".

② The motor is switched on by "Motor CW", then switched off by the level at digital input 1 (parameterized with input action 1 = Quick Stop). The Quick Stop function is reset by Disable quick stop. The motor is switched on again since "Motor CW" is still active.

③ The motor is switched off by the level at digital input 1. The "Quick Stop" function is reset by setting "Disable quick stop". As the level "Motor CW" is still active, the motor runs "CW" again until the "Disable quick stop" command is revoked.

④ Motor is switched on by "Motor CW", then switched off by the level at digital input 1. While the "Quick Stop" function is active, the motor remains switched off and starts up again when "Quick Stop" is revoked until "Motor CW" is switched off.

7.22 Quick Stop clockwise

The action "Quick Stop CW" results in the following behavior:

- The motor is switched off with pending signal "Motor CW" without group fault
- The motor is not switched off with pending signal "Motor CCW"
- "Quick Stop CW" takes priority over "Motor CW"
- The input action responds to the active edge of the input signal, which means deactivation is possible when the static input signal "Quick Stop" is present.
- The input trigger is reset through cancelation of the control commands "Motor CW" or "Disable quick stop" (in the process image). This applies only in the case of control via manual local mode or in the case of a retentive Quick Stop signal.

7.23 Quick Stop counter-clockwise

The action "Quick Stop CCW" results in the following behavior:

- The motor is switched off with pending signal "Motor CCW" without group fault
- The motor is not switched off with pending signal "Motor CW"
- "Quick Stop CCW" takes priority over "Motor CCW"
- The input action responds to the active edge of the input signal, Deactivation is possible when the static input signal "Quick Stop" is present.
- The input trigger is reset through cancelation of the commands "Motor CCW" or "Disable quick stop" (in the process image). This applies only in the case of control via manual local mode or in the case of a retentive Quick Stop signal.

NOTE

No quick stop CW in the case of direct-on-line starters
You cannot use quick stop CCW in combination with direct-on-line starters.

7.24 Trip RESET

"Trip RESET" acknowledges all the errors/faults that are currently active and that can be acknowledged. An error/fault can be acknowledged if its cause has been rectified or if it is no longer present.

Trip RESET is triggered by:

- Loading a valid parameterization
- Remote RESET via PLC (PIQ bit 0.3 Trip RESET)
- Remote RESET via input actions (if parameterized)
- TEST/RESET button on the ET 200SP motor starter
- Power-on reset (switching off and on again of the 24 V supply voltages on the device)

NOTE

TRIP RESET as input n signal
The "Trip Reset" action is only possible as an "input n signal" (non-retentive).

7.25 Cold start

Description

The "cold start" function enables control of a motor without error messages. The motor starter responds here as if the main power supply were connected to the system. Thus, in the commissioning phase, for example, the relevant control commands are accepted from the controller and the relevant messages are sent.

The "cold start" function enables activation of the motor starter without a main power supply. The motor starter responds here as if the main power supply were connected to the system. The error message "Residual current detection/tripping" is suppressed. Thus, in the

commissioning phase, for example, the relevant control commands are accepted from the controller and the relevant messages are sent.

NOTE
The "cold start" function is not possible for the command "Motor on" in an ATEX configuration.

NOTE
If the main power supply is nevertheless present (current flowing), an internal trip command is generated.

NOTE
The "cold start" action is only permissible as an "input n level" (NO contact) and only as an "input n signal" (non-retentive).

You can activate the "cold start" function as follows:

- PIQ 0.7 "Cold start"
- Via the 3DI/LC module
- In manual bus mode via DS68

7.26 Operational trip end position CW

If the motor control command is not equal to "Motor OFF", an operational trip of the motor is triggered when a signal change at the operational trip end position CW DI is detected. This motor tripping triggered by the operational trip end position is revoked by the motor control command "Motor OFF". If the motor control command "Motor CW" is issued in the case of operational trip end position CW DI static "1", an operational trip is triggered again. This motor tripping triggered by the operational trip end position prevents renewed switch-on of the motor in the CW direction of rotation.

The action "Operational trip end position CW" results in the following behavior:

- The motor is tripped regardless of the direction of rotation (CW or CCW).
- The motor can only be switched on with "Motor CCW".
- The parameter can only be implemented as "non-retentive".
- A group fault is not generated, but a diagnostic message is set in data set 92.
- Operational trip end position CW cannot be overridden by emergency start.

7.27 Operational trip end position CCW

If the motor control command is not equal to "Motor OFF", an operational trip of the motor is triggered when a signal change at the operational trip end position CCW DI is detected. This motor tripping triggered by the operational trip end position is revoked by the motor control command "Motor OFF". If the motor control command "Motor CCW" is issued in the case of operational trip end position CW DI static "1", an operational trip is triggered again. This motor tripping triggered by the operational trip end position prevents renewed switch-on of the motor in the CCW direction of rotation.

The action "Operational trip end position CCW" results in the following behavior:

- The motor is tripped regardless of the direction of rotation (CW or CCW).
- The motor can only be switched on with "Motor CW".
- The parameter can only be implemented as "non-retentive".
- A group fault is not generated, but a diagnostics message is set in data set 92.
- Operational trip end position CCW cannot be overridden by emergency start.

7.28 Chatter monitoring

- The following two events trigger the chatter monitoring (it does not matter which channel is used for the switch-on command):
  - There is a new switch-on command within 500 ms after the last switch-on command.
  - There is a switch-on command within the interlock time (standard: 55 to 170 ms after switch-off command, safety: 95 ms to 195 ms after switch-off command).
- The number of new switch-on commands within 500 ms is stored in the statistics data (Page 137).
- 0x311 is sent as a diagnostic interrupt (frequency too high).
- The warning 0x311 (frequency too high) is canceled if no further switch-on command has occurred within 1.5 s.

7.29 Logbook

Description

The logbooks contain a chronological list of device faults, trips and events that are assigned a time stamp, thus creating a log. The log is stored internally so that the causes can be evaluated at a later stage.

Logbooks

Three logbooks that can be read as a data set are available:

- DS72: DS72 logbook - Read device error (Page 128)
- DS73: DS73 logbook - Read triggering operations (Page 131)
- DS75: DS75 logbook - Read events (Page 132)

The operating hours (see Chapter DS95 Read statistics (Page 137)) of the device in seconds are used as a time stamp. You can find the object numbers of the relevant messages in the

relevant data sets. The last 21 entries are stored in the logbooks. You can read out the entries with the relevant data sets. The logbook is designed as a circular buffer. After 21 entries, the oldest entry is overwritten. The latest entry is at the first location.

In case of a retentive error "Fail-safe motor starter defective" (see DS72 logbook - Read device error (Page 128), "Assignment of object number to device fault message" table), the DS72, DS73 and DS75 logbooks are frozen when the supply voltage (24 V DC) is removed, i.e. no further entries are permitted.

Logbook - Read device errors

The logbook "Read device errors" contains all device errors/faults. The object numbers of the actual fault causes are entered, e.g. object number 476, "Current measurement defective".

Logbook - Read trips

The logbook "Read trips" contains all group faults. The object numbers of the actual fault causes are entered, e.g. "Switching element defective".

Logbook - Read events

The logbook "Read events" contains all warnings as well as certain actions. Incoming events are reported as incoming. In addition, some events are also reported as outgoing. Incoming entries are marked "+". Outgoing events are marked "-".

7.30 PROFIenergy

7.30.1 What is PROFIenergy?

PROFIenergy supports the following two functions:

- Energy saving function

  Supports targeted shutdown of loads during idle times.
- Measured value function

  Energy management is an instrument which is ideally suited to reducing energy consumption and thereby energy costs within a company both systematically and on a long term basis. The aim of energy management is to optimize the use of energy in a company - from the purchasing of energy through to the consumption of energy - economically and ecologically. The measured value function provides the measured values required for optimization.

7.30.2 PROFIenergy in the motor starter

The ET 200SP motor starter supports the "Energy saving function" and "Measured value function" for the motor current. These are identified as commands, since they trigger reactions in the ET 200SP motor starter.

In addition, the ET 200SP motor starter also provides so-called services that provide information on the status of the motor starter as defined in PROFIenergy. These can then be evaluated and further processed in the user program.

Using PROFIenergy with the ET 200SP motor starter

SIEMENS provides two function blocks for using PROFIenergy:

- PE_START_END (FB815) supports the switch to an energy-saving mode.
- PE_CMD (FB816) supports the reading out of measured values and the switch to an energy-saving mode

You will find further information in the document entitled "Common Application Profile PROFIenergy, Technical Specification for PROFINET Version V1.1 Edition 2, Dec. 2013, Order Number 3802" published by PROFIBUS International (PI).

NOTE

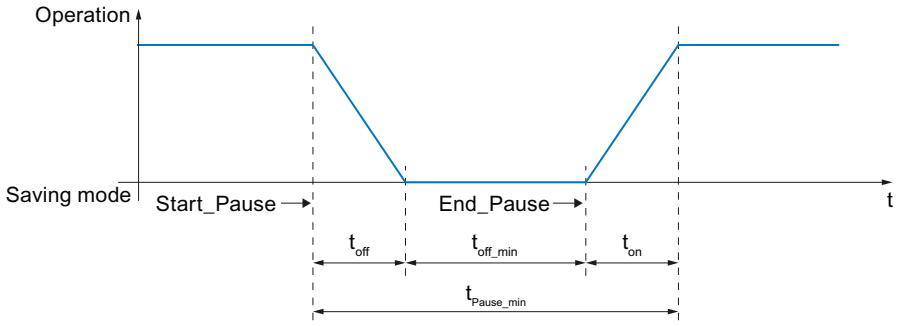
PROFIenergy is not possible with PROFIBUS interface modules.

NOTE

The PROFIenergy function is available with firmware version V3.3 of the interface modules.

Commands

The following tables show the supported commands:



Control commands	
Start_Pause	The starter switches to energy-saving mode.
Start_Pause_with_time_response	The starter switches to energy-saving mode and signals its minimum idle times.
End_Pause	The starter switches back to operating mode.

Status commands	
PE_Identify	Provides a list of supported PROFIenergy commands/functions.
PEM_Status	Returns the current mode.
PEM_Status_with_time_response	Returns the extended status of the current mode.
Query_Modes	
List_Energy_Saving_Modes	Provides a list of supported energy-saving modes.
Get_Mode	Provides the parameter values with which the energy-saving function works.
Query_Version	Shows the implemented PROFIenergy profile.
Query_Measurement	
Get_Measurement_List	Provides a list of supported measured values.

Status commands	
Get_Measurement_List_with_object_-number	Provides a list of supported measured values and the associated object number.
Get_Measurement_Values	Provides the requested measured values.
Get_Measurement_Values_with_obje-ct_number	Provides the requested measured values together with the object number.

The ET 200SP motor starter operates with the following PROFIenergy modes (PE modes):

PE_Mode_ID = 255	Ready to operate
PE_Mode_ID = 01	Energy-saving mode

t_{off}	Time_to_Pause	Time the starter requires in order to change to energy saving mode. With the ET 200SP motor starter, this time is always 100 ms.
t_{off_min}	Time_min_length_of_stay	Minimum time that the device spends or should spend in saving mode. For the ET 200SP motor starter: 150 ms
t_{on}	Time_to_operate	Time that will elapse before the starter changes back to the operating state. For the ET 200SP motor starter: 100 ms (due to startup sequence)
t_{Pause_min}	Time_min_Pause	Time that is compared with t_{Pause} (is transferred together with the "Start_Pause" command to the motor starter); if $t_{Pause} \geq t_{Pause_min}$, the device switches to saving mode.

"Measured value function" command

Measured values for energy need to be supplied for efficient energy management. The PROFIenergy specification offers various measured values from which to choose, each of which is assigned a measured value ID. The ET 200SP motor starter supports the instantaneous values of the phase current and the mean value of the phase currents as measured values.

The measured values are uniquely identified by IDs. The following measured value IDs 7, 8, 9, and 33 are supported:

- ID = 7: Current rms value of the phase current a (L1)
- ID = 8: Current rms value of the phase current b (L2)
- ID = 9: Current rms value of the phase current c (L3)
- ID = 33: Mean value of the three phase currents (a+b+c)/3

The current values are transferred with the following tolerances:

- Domain = 0x03 → IEC 61557-12
- Class = 0x0B → 5 %

The result is that the measured values are transferred with an accuracy of 5 % relative to the maximum configurable rated operational current I_e.

Reaction of the starter when energy-saving mode is activated

Shutdown of the motor by suppression of the PIQ bits (Motor CW, Motor CCW). The other PIQ bits (e.g. Trip RESET) remain active.

Interactions with the various operating modes

- PROFIenergy is operative only in Automatic mode
- Manual local mode is not influenced by PROFIenergy; it is still possible to switch to manual mode and thereby to control the motor manually
- Both cyclic and acyclic data transmission (PIQ, PII, data sets, diagnostics, alarms, etc.) to and from the motor starter are still possible

Prerequisites for the starter to switch to energy-saving mode (min. idle time, etc.)

The changeover to "Pause" energy-saving mode only becomes effective when the idle time sent is greater than the device-specific minimum idle time. This means that a switch is only performed when the pause is longer than the motor starter requires to switch the main energy for the load off and on again.

The switch to energy-saving mode is recorded in the "Events" logbook. Entry: "Energy saving mode active"

7.31 Firmware update

Introduction

During operation it may be necessary to update the firmware (e.g. to extend the available functions). You update the firmware of the motor starter with the help of firmware files.

NOTE

Note the preconditions for a firmware update/downgrade
You can find the preconditions for a firmware update/downgrade in the Siemens Industry Online Support under the entry Firmware update for ET 200SP motor starter (https://support.industry.siemens.com/cs/ww/en/view/109486088).

Loading and installing a firmware update

- Click "Product Support" on the Siemens Industry Online Support (https://support.industry.siemens.com/) page.
- In the product tree selection field, select "Automation engineering → Automation systems → SIMATIC industrial automation systems → Controllers → IO systems → ET 200 systems for the control cabinet → ET 200SP".

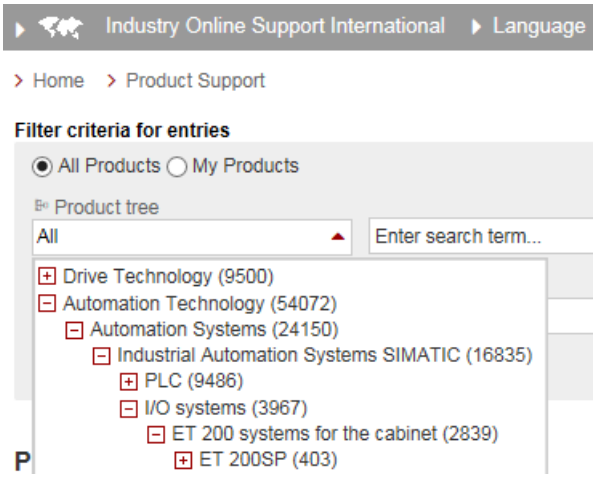

Figure 1-436 ET 200SP in the product tree

- Navigate to the specific type of module that you want to update.
- Under "Product information → Support", click on the "Software downloads" link.
- Download the required firmware update files.
